- When CO is passed over solid NaOH heated to 200°C, it forms
a. Na₂CO₃ b. H₂CO₃ c. HCOONa d. All of these
- Which of the following does not illustrate the anomalous properties of lithium?
a. Li is much softer than the other group 1 metals
b. The melting point and boiling point of Li are comparatively high
c. Li forms a nitride Li₃N unlike group 1 metals
d. The ion of Li and its compounds are more heavily hydrated than those of rest of the group 1 elements
- Which of the following pairs cannot exist together in solution?
a. Na₂CO₃ and NaHCO₃ b. NaHCO₃ and NaOH
c. Na₂CO₃ and NaOH d. NaOH and NaCl
- Sodium peroxide, a yellow solid, when exposed to air becomes white due to the formation of
a. H₂O₂ b. Na₂O
c. Na₂O and O₃ d. NaOH and Na₂CO₃
- The products obtained on heating LiNO₃ will be
a. LiNO₂ + O₂ b. Li₂O + NO₂ + O₂
c. Li₃N + O₂ d. Li₂O + OH + O₂
- Identify the correct formula for halides of alkaline earth metals.
a. BaCl₂ · 6H₂O b. CaCl₂ · 6H₂O
c. BaCl₂ · 4H₂O d. SrCl₂ · 4H₂O
- LiF is almost insoluble in water whereas LiCl is soluble not only in water but also in acetone. This is because of
a. high hydration enthalpy of Li⁺
b. low hydration enthalpy of Li⁺
c. more ionic character in LiCl
d. None of the above
- Consider the following statements.
I. BeO is insoluble but BeSO₄ is soluble in water.
II. BaO is insoluble but BaSO₄ is soluble in water.
III. LiI is more soluble than KI in ethanol.
The true statements are
a. I and II b. I and III c. II and III d. I, II and III
- Which of the following statements is/are incorrect regarding the s-block elements?

- I. Francium is highly radioactive element.
 II. Oxides and hydroxides of alkali metals and alkaline earth metals are not alkaline in nature.
 III. Sodium and potassium are the only two *s*-block elements which are found in large proportion in biological fluids.
 IV. Biological function of *s*-block elements is due to maintenance of ion balance and nerve impulse condition.
- a. Only I b. I and III c. II and III d. Only III

15. Match the Column I with Column II and choose the correct option from the codes given below.

Column I	Column II
A. Sodium	1. Present in biological fluid
B. Beryllium	2. Radioactive element
C. Francium	3. Lower abundance
D. Calcium	4. Alkali metal
	5. Alkaline earth metal

Codes

	A	B	C	D		A	B	C	D
(a)	1	4	2	5	(b)	1	2	3	4
(c)	3	1	2	5	(d)	4	5	2	1

16. Which of the following is/are correct pair(s) regarding diagonally related elements?
 a. Beryllium and aluminium b. Lithium and magnesium
 c. Sodium and aluminium d. Both a. and b.
17. The decomposition temperature is maximum for
 a. MgCO_3 b. CaCO_3
 c. BaCO_3 d. SrCO_3
18. Which of the following metal salts has highest conductivity in aqueous medium?
 a. Li^+ b. Cs^+ c. Na^+ d. K^+
19. In case of alkali metals, the covalent character decreases in the order
 a. $\text{MI} > \text{MBr} > \text{MCl} > \text{MF}$
 b. $\text{MCl} > \text{MI} > \text{MBr} > \text{MF}$
 c. $\text{MF} > \text{MCl} > \text{MBr} > \text{MI}$
 d. $\text{MF} > \text{MCl} > \text{MI} > \text{MBr}$
20. Correct order of thermal stability of K_2CO_3 , CaCO_3 , MgCO_3 and BeCO_3 is
 a. $\text{BeCO}_3 < \text{MgCO}_3 < \text{CaCO}_3 < \text{K}_2\text{CO}_3$
 b. $\text{K}_2\text{CO}_3 < \text{MgCO}_3 < \text{CaCO}_3 < \text{BeCO}_3$
 c. $\text{MgCO}_3 < \text{BeCO}_3 < \text{CaCO}_3 < \text{K}_2\text{CO}_3$
 d. $\text{BeCO}_3 < \text{MgCO}_3 < \text{K}_2\text{CO}_3 < \text{CaCO}_3$

21. Which of the following sequence of chemical reaction is correct?

22. The ore of potassium is
 a. bauxite b. dolomite c. carnallite d. cryolite
23. Which of the following is duralumin alloy?
 a. $\text{Mg} + \text{Cu} + \text{Al} + \text{Mn}$ b. $\text{Mg} + \text{Cu}$
 c. $\text{Cu} + \text{Al}$ d. $\text{Mg} + \text{Al}$
24. When sodium is reacted with limited supply of oxygen, the main compound formed is
 a. Na_2O_4 b. Na_2O c. Na_3O d. Na_2O_2
25. Metallic magnesium is prepared by
 a. electrolysis of molten MgCl_2
 b. displacement of Mg by iron from MgSO_4 solution
 c. electrolysis of aqueous solution of $\text{Mg}(\text{NO}_3)_2$
 d. reduction of MgO by coke
26. The element which is not present in asbestos, is
 a. Si b. Ca c. Ba d. Mg
27. The molarity of Na^+ , when the average concentration of Na^+ in human blood serum is about 3.4 g L^{-1} , is
 a. 8.4 b. 2.3 c. 0.68 d. 0.15
28. Caesium is the most reactive metal in the alkali metal series because
 a. it exerts considerable attractive force on valence electrons
 b. it is a heavier metal
 c. its incomplete shell is nearest to the nucleus
 d. its valence electron has the highest principal quantum number than the valence electron of any of the others
29. When oxygen reacts with potassium, which of the following is preferentially formed?
 a. K_2O_4 b. KO_2
 c. K_2O_3 d. K_2O
30. Which of the following is different from other three oxides?
 a. Cr_2O_3 b. MgO
 c. SnO d. ZnO
31. Nitrogen dioxide cannot be prepared by heating
 a. KNO_3 b. $\text{Pb}(\text{NO}_3)_2$
 c. $\text{Cu}(\text{NO}_3)_2$ d. AgNO_3
32. The correct decreasing order of ionisation enthalpy of alkali metals is
 a. $\text{Na} > \text{Li} > \text{K} > \text{Rb}$ b. $\text{Rb} < \text{Na} < \text{K} < \text{Li}$
 c. $\text{Li} > \text{Na} > \text{K} > \text{Rb}$ d. $\text{K} < \text{Li} < \text{Na} < \text{Rb}$
33. The gas evolved on heating Na_2CO_3 is
 a. CO_2 b. water vapour
 c. CO d. No gas is evolved
34. A mixture contains two moles of Na_2CO_3 and 1 mole of Li_2CO_3 . What will be the volume of CO_2 formed on heating this mixture and the data is converted to STP?
 a. 22.4 L b. 44.8 L c. 50.2 L d. 11.2 L

35. An aqueous solution of sodium carbonate is alkaline because sodium carbonate is a salt of
 a. weak acid and weak base
 b. strong acid and weak base
 c. weak acid and strong base
 d. strong acid and strong base
36. Sodium is heated in air at 350°C to form A. Compound A when reacts with carbon dioxide forms sodium carbonate and Y. Here, Y is
 a. hydrogen peroxide b. hydrogen
 c. ozone d. oxygen
37. On reacting with NaOH, which gives inflammable gas?
 a. Zn b. S c. I_2 d. NH_4Cl
38. When washing soda is heated,
 a. CO_2 is released b. $\text{CO} + \text{CO}_2$ is released
 c. CO is released d. water vapour is released
39. In the synthesis of sodium carbonate, the recovery of ammonia is done by treating NH_4Cl with $\text{Ca}(\text{OH})_2$. The by-product obtained in this process is
 a. CaCl_2 b. NaCl c. NaOH d. NaHCO_3
40. Solvay process is not used to prepare KHCO_3 . Which of the following reactions will produce KHCO_3 ?
 a. $\text{KHSO}_4 + \text{KCl} \longrightarrow$
 b. Magnesia process
 c. $\text{KNO}_3 + \text{H}_2\text{O} \longrightarrow$
 d. Calcium carbonate and silver chloride
41. The chemical name of soda ash is
 a. sodium bicarbonate b. sodium hydroxide
 c. sodium carbonate d. None of these
42. In the electrolytic process for the manufacturing of NaOH from NaCl solution, the ion discharged at the anode is
 a. OH^- b. O^-
 c. Cl^- d. All of these
43. Anhydrous magnesium chloride is prepared by
 a. dissolving Mg in dil. HCl
 b. dissolving MgO in dil. HCl
 c. passing Cl_2 over red hot mixture of $\text{MgO} + \text{C}$
 d. All of the above
44. A substance which gives brick red flame and breaks down on heating to give oxygen and a brown gas, is
 a. magnesium nitrate
 b. calcium nitrate
 c. barium nitrate
 d. strontium nitrate
45. A chemical A is used for the preparation of washing soda to recover ammonia. When CO_2 is bubbled through an aqueous solution of A, the solution turns milky. It is used in white washing due to disinfectant nature. What is the chemical formula of A?
 a. $\text{Ca}(\text{HCO}_3)_2$ b. CaO c. $\text{Ca}(\text{OH})_2$ d. CaCO_3
46. Element A burns in nitrogen to give an ionic compound B. Compound B reacts with water to give C and D. The solution of C becomes milky on bubbling carbon dioxide. The element A is
 a. Li b. Mg c. Ca d. Be
47. The metal ion which plays an important role in muscle contraction is
 a. Be^{2+} b. Mg^{2+} c. Ca^{2+} d. Ba^{2+}
48. Mix calcium sulphate with conc. HCl and forms a paste. Bring a pinch of this paste near to the flame, what colour will you obtain?
 a. Brick red b. Apple green
 c. Golden yellow d. Crimson red
49. In curing cement plasters, water is sprinkled from time to time. This helps in
 a. converting sand into silicic acid
 b. keeping it cool
 c. developing interlocking needle like crystals of hydrated silicates
 d. hydrating sand and gravel mixed with cement
50. What will be the oxidation states of nitrogen and alkali metal respectively when the nitrogen and alkali metal react with each other?
 a. -3 and +1 b. -1 and +1
 c. -1 and -1 d. -3 and -1
51. What will you get when you heat hydrated CaSO_4 to 125°C instead of 200°C ?
 a. $\text{CaO} + \text{SO}_3$ b. CaSO_4
 c. $\text{CaSO}_4 \cdot \frac{3}{4} \text{H}_2\text{O}$ d. $(\text{CaSO}_4)_2 \cdot \text{H}_2\text{O}$
52. The ease of adsorption of the hydrated alkali metal ions on an ion-exchange resins follows the order
 [CBSE-AIPMT 2012]
 a. $\text{Li}^+ < \text{K}^+ < \text{Na}^+ < \text{Rb}^+$ b. $\text{Rb}^+ < \text{K}^+ < \text{Na}^+ < \text{Li}^+$
 c. $\text{K}^+ < \text{Na}^+ < \text{Rb}^+ < \text{Li}^+$ d. $\text{Na}^+ < \text{Li}^+ < \text{K}^+ < \text{Rb}^+$
53. Which of the following represent the correct composition of Sorel cement?
 a. Portland cement + MgO b. $\text{CaSiO}_3 \cdot \text{MgCO}_3$
 c. $\text{MgCl}_2 \cdot \text{CaSiO}_3$ d. $\text{MgCl}_2 \cdot 5\text{MgO} \cdot x\text{H}_2\text{O}$
54. Formula of plaster of Paris is
 a. $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ b. $2(\text{CaSO}_4 \cdot 1/2 \text{H}_2\text{O})$
 c. $2\text{CaO} \cdot \text{H}_2\text{O}$ d. CaCO_3
55. Which of the following is not contained by Portland cement?
 a. Ca_3PO_4 b. CaSiO_3 c. CaSiO_4 d. $\text{Ca}_3\text{Al}_2\text{O}_6$
56. The name given to the mixture of MgCl_2 and MgO is
 a. double salt b. Portland cement
 c. Sorel cement d. None of these
57. Which of the following statements is correct?
 a. Plaster of Paris can be obtained by hydration of gypsum
 b. Gypsum is obtained by heating plaster of Paris
 c. Plaster of Paris is obtained from gypsum by oxidation

- d.** Plaster of Paris contains higher percentage of calcium than gypsum
- 58.** Except lime, a major constituent of Portland cement is
a. silica **b.** alumina **c.** iron oxide **d.** magnesium
- 59.** Bleaching powder is obtained by the reaction of chlorine with
a. dry CaO
b. moist slaked lime
- c.** concentrated solution of Ca(OH)_2
d. dilute solution of Cu(OH)_2
- 60.** Which of the following ions is/are responsible for biological functions such as maintenance of ion balance and nerve impulse conduction?
a. Na^+ **b.** K^+
c. Mg^{2+} **d.** All of these

BITSAT Archives

- 1.** Salt $A + S \xrightarrow{\text{BaCl}_2} B \xrightarrow{\text{BaCl}_2}$ White precipitate
 A is paramagnetic in nature and contains about 55% K. Thus, A is [2013]
a. K_2O **b.** K_2O_2
c. KO_2 **d.** K_2SO_4
- 2.** The decomposition temperature is maximum for [2012]
a. MgCO_3 **b.** CaCO_3
c. BaCO_3 **d.** SrCO_3
- 3.** When some amount of zinc is treated separately with excess of sulphuric acid and excess of sodium hydroxide solution, the ratio of volumes of hydrogen evolved is [2012]
a. 1 : 1 **b.** 1 : 2 **c.** 2 : 1 **d.** 2 : 3
- 4.** The product(s) of the reaction, [2011]
 $\text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O} \longrightarrow$ is/are
a. $2\text{NaOH} + \text{CO}_2$ **b.** $\text{Na}_2\text{CO}_3 + \text{H}_2\text{CO}_3$
c. 2NaHCO_3 **d.** None of these
- 5.** Sodium carbonate reacts with SO_2 in aqueous medium to give [2011]
a. NaHSO_3 **b.** $\text{Na}_2\text{S}_2\text{O}_3$
c. NaHSO_4 **d.** Na_2SO_4
- 6.** Anhydrous, a drying agent is [2010]
a. $\text{Mg(ClO}_4)_2$ **b.** $\text{Sr(ClO}_4)_2$
c. $\text{Ca(ClO}_4)_2$ **d.** $\text{Ba(ClO}_4)_2$
- 7.** $\text{Mg} + \text{NO}_2$ on burning give [2010]
a. N_2 **b.** NO
c. N_2O **d.** N_2O_5
- 8.** A metal X on heating in nitrogen gas gives Y. Y on treatment with water gives a colourless gas which when passed through CuSO_4 solution gives a blue colour. Y is [2009]
a. $\text{Mg(NO}_3)_2$ **b.** Mg_3N_2
c. NH_3 **d.** MgO
- 9.** Which of the following statements are correct for alkali metal compounds?
 I. Superoxides are paramagnetic in nature.
 II. The basic strength of hydroxides increases down the group.
 III. The conductivity of chlorides in their aqueous solutions decreases down the group.
 IV. The basic nature of carbonates in aqueous solution is due to cationic hydrolysis. [2008]
a. I, II and III **b.** I and II
c. II, III and IV **d.** III and IV
- 10.** Setting of plaster of Paris involves [2007]
a. oxidation with atmospheric oxygen
b. combination with atmospheric CO_2
c. dehydration
d. hydration to yield another hydrate
- 11.** The ionic conductance is least for [2007]
a. Cs^+ **b.** Rb^+ **c.** K^+ **d.** Na^+
- 12.** Which one of the following substances is used in the laboratory for a fast drying of neutral gases? [2007]
a. Phosphorus pentoxide
b. Active charcoal
c. Anhydrous calcium chloride
d. Na_2PO_4
- 13.** Which out of the following compounds is called photographers fixer? [2007]
a. Na_2SO_3 **b.** $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$
c. Na_2SO_2 **d.** Na_2S
- 14.** Which of the following is called Berthelot's salt? [2006]
a. $(\text{NaPO}_3)_6$ **b.** NaOCl **c.** KClO_3 **d.** KHF_2
- 15.** Milk of magnesia is used as [2005]
a. antichlor **b.** antacid
c. antiseptic **d.** food preservative
- 16.** Solvay process is used for the manufacturing of [2005]
a. NaOH **b.** Na_2CO_3
c. NH_3 **d.** NaCl

Answer with Solutions

Practice Exercise

- (b) Alkali metal hydroxides, i.e. KOH is highly soluble in water.
- (c) Due to very large size of sulphate ions, the magnitude of lattice energy of alkaline earth metal sulphates remains almost constant. Thus, their solubility is only governed by hydration energy which decreases from Be^{2+} to Ba^{2+} .
- (d) For anion to cation ratio to be low, the anion must be small and cation must be large, i.e. Cs^+F^- .
- (a) Alkali metal oxides (Na_2O) are most basic followed by alkaline earth metals. Al_2O_3 is however amphoteric.
- (d) Stability of a compound depends upon its enthalpy of formation ΔH_f . The more negative value of ΔH_f shows more stability of a compound.

Thus, KCl is more stable and LiCl is least stable.

$$\Delta H_f \text{ for LiCl} = -408.8 \text{ kJ mol}^{-1}$$

$$\Delta H_f \text{ for NaCl} = -412.5 \text{ kJ mol}^{-1}$$

$$\Delta H_f \text{ for CsCl} = -433 \text{ kJ mol}^{-1}$$

$$\Delta H_f \text{ for KCl} = -436 \text{ kJ mol}^{-1}$$

- (c) $\text{NaOH} + \text{CO} \xrightarrow{200^\circ\text{C}} \text{HCOONa}$
(Solid) Sodium formate
- (a) Li is not softer than the other group 1 metals. Actually, Li is harder than other alkali metals.
- (b) NaHCO_3 and NaOH both reacts to form Na_2CO_3 .
- (d) In the presence of moisture and CO_2 , Na_2O_2 is converted into NaOH and Na_2CO_3 .
- (b) $2\text{LiNO}_3 \xrightarrow{\Delta} \text{Li}_2\text{O} + 2\text{NO}_2 + \frac{1}{2} \text{O}_2$
- (b) The correct formula of halides of alkaline earth metals is

- (a) LiF is almost insoluble in water due to its high lattice energy but LiCl is soluble in water due to high hydration energy of Li^+ ions. LiCl is also soluble in acetone due to its predominantly covalent nature (because covalent character increases with increase in the size of anion).
- (b) If lattice energy > hydration energy, the compound (BeO) is insoluble in water.
If lattice energy < hydration energy, the compound (BeSO_4) is soluble in water.
LiI is more covalent because Li^+ is smallest and polarised I^- (anion) to maximum extent, so it is more soluble than KI in ethanol.
- (c) Statements II and III are incorrect because oxides and hydroxides of alkaline earth metals and alkali metals are alkaline in nature. Apart from Na and K, Ca and Mg are also found in biological fluid.

- (d) $\text{A} \rightarrow 4, \text{B} \rightarrow 5, \text{C} \rightarrow 2, \text{D} \rightarrow 1$

- (d)

- (c) Greater the electropositive character, more will be the stability and high decomposition temperature.

Among the given options, Ba has maximum electropositive character and hence, highest decomposition temperature.

- (b) Cs^+ has maximum ionic mobility due to low value of hydration enthalpy. It is a large size ion.
- (a) Fajan's rule states that more is the polarising power of anion, greater is the covalent character.
- (a) As the basicity of metal hydroxide increases down the group, thermal stability of their carbonates increases in the same order. As we know, group 1 compounds are more stable than group 2 compounds. Hence, correct order is

- (d) $2\text{Na} + 2\text{H}_2\text{O} \longrightarrow 2\text{NaOH} + \text{H}_2 \uparrow$

In the case of options (a), (b) and (c), the last step on heating

- (c) $\text{KCl} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ (carnallite) is an ore of potassium.

- (a) Cu - 4%, Mg - 0.05%,
Mn - 0.5%, Al - 95%

- (b) $4\text{Na} + \text{O}_2 \longrightarrow 2\text{Na}_2\text{O}$

- (a) Electrolysis of molten MgCl_2

- (c) Asbestos is $\text{CaMg}_3(\text{SiO}_3)_4$.

- (d) Molarity (M)

$$= \frac{\text{Weight of solute / litre of solution}}{\text{Molecular weight of solute}}$$

$$= \frac{3.4 \text{ g L}^{-1}}{21.2} = 0.15$$

- (d) When valence electron is in the highest quantum shell, the ionisation energy is lowest and hence, reactivity is highest.

- (b) $\text{K} + \text{O}_2 \longrightarrow \text{KO}_2$ (superoxide)

- (b) MgO is basic while other three are amphoteric oxides.

31. (a) Only nitrates of heavy metals and lithium decompose on heating to produce NO_2 .
32. (c) The correct decreasing order of ionisation enthalpy of alkali metals are as follows

33. (d) On heating Na_2CO_3 , no gas is evolved.

34. (a) Decomposition of Li_2CO_3

Na_2CO_3 is thermally stable, i.e. it does not give CO_2 gas on heating.

Hence, volume of CO_2 formed on heating the mixture at STP = 22.4 L

35. (c) An aqueous solution of sodium carbonate is alkaline in nature because it is a salt of weak acid and strong base.

36. (d) $\text{Na} + \text{O}_2 \xrightarrow{350^\circ\text{C}} \underset{\text{A}}{\text{Na}_2\text{O}_2}$

37. (a) On reacting with NaOH solution, Zn gives inflammable gas.

38. (d) $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O} \xrightarrow{\Delta} \text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O} \xrightarrow{\Delta} \underset{\text{Na}_2\text{CO}_3 + \text{H}_2\text{O} \uparrow}{\text{Na}_2\text{CO}_3 + \text{H}_2\text{O} \uparrow}$

39. (a) $2\text{NH}_4\text{Cl} + \text{Ca}(\text{OH})_2 \longrightarrow \text{CaCl}_2 + 2\text{NH}_3 + 2\text{H}_2\text{O}$

40. (b) **Magnesia Process or Prech's Process** Carbon dioxide is passed into a solution of potassium chloride at 290 K in the presence of hydrated magnesium carbonate, potassium hydrogen carbonate get precipitated.

This process is known as magnesia method.

41. (c) Na_2CO_3 (anhydrous) is called soda ash, sodium bicarbonate is called baking soda and sodium hydroxide is called caustic soda.

42. (c) $\text{Cl}^- \longrightarrow \text{Cl} + \text{e}^-$

43. (c) Anhydrous MgCl_2 is obtained by passing chlorine gas over red hot mixture of MgO and C .

44. (b) Brick red colour is given by Ca which O_2 and brown colour are given by NO_2 group.

45. (c) For the recovery of ammonia, $\text{Ca}(\text{OH})_2$ is used during the preparation of washing soda.

46. (c) Carbon dioxide turns only lime water milky. Thus, the compound C must be $\text{Ca}(\text{OH})_2$ and the element A must be Ca . The reactions are as follows:

47. (c) Ca^{2+} plays an important role in muscle contraction.

48. (a) The colour of the paste in the flame is brick red.

49. (c) Water is sprinkled on cement plasters to bind hydrated crystals of silicates to one another.

50. (a) Alkali metal reacts with nitrogen to produce nitride.

where, oxidation state of $\text{M} = +1$

$$\text{N} = -3$$

51. (d) On heating hydrated CaSO_4 to 125°C , $(\text{CaSO}_4)_2 \cdot \text{H}_2\text{O}$ is obtained.

52. (b) Ease of adsorption of the hydrated alkali metal ions on an ion exchange resins decreases as the size of alkali metal ions increases. Since, the order of size of alkali metal ions is

Thus, the ease of adsorption follows the order

53. (d) Mixture of MgCl_2 and MgO is called Sorel cement.

Sorel cement = $\text{MgCl}_2 \cdot 5\text{MgO} \cdot x\text{H}_2\text{O}$

54. (b) The formula for plaster of Paris is $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$.

55. (a)

56. (c) When a saturated solution of MgCl_2 is mixed with MgO , the resulting paste sets to a hard marble like mass which consists of oxychloride ($\text{MgO} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$). The paste is known as Sorel cement.

57. (d) Plaster of Paris is obtained when gypsum is heated to 120°C .

58. (a) Silica 20 -25%, CaO (quicklime) 60 -70%

59. (c) $\text{Ca}(\text{OH})_2 + \text{Cl}_2 \longrightarrow \text{Ca}(\text{OCl})_2 + \text{H}_2\text{O}$

60. (d) Na^+ , K^+ , Ca^{2+} , Mg^{2+} all are responsible for maintenance of ion balance and nerve impulse system in biological system.

16

Metallurgy

Earth Crust

It is the source of many elements. Aluminium is the most abundant metal of earth crust and iron comes second. *The percentages of different elements in earth crust are*

O-49%, Si-26%, Al-7.5%, Fe-4.2%, Ca-3.2%, Na-2.4%, K-2.3%, Mg-2.3%, H-1%

Metals occur in two forms in nature (i) in native state and (ii) in combined state.

Minerals and Ores

The substance (or compound) in the form of metal which is found in nature, is called a mineral and the mineral from which extraction of metal is beneficial and cheap, is called an ore.

Thus, all ores are minerals but all minerals are not ores.

Types of Ores

Depending upon the nature of associated group or atom, ores are of following types:

- (i) **Oxide ores** Haematite (Fe_2O_3), zincite (ZnO) etc.
- (ii) **Sulphide ores** Galena (PbS), cinnabar (HgS), argentite (Ag_2S), ruby silver ($\text{Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$) etc.
- (iii) **Carbonate ores** Magnesite (MgCO_3), siderite (FeCO_3) etc.
- (iv) **Sulphate ores** Gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), Glauber's salt ($\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$) etc.
- (v) **Silicate ores** Willemite (Zn_2SiO_4), feldspar ($\text{NaAlSi}_3\text{O}_8$) etc.

Nitrate ores are rare because all nitrates are water soluble and at higher temperature, they decompose into oxides or metal.

Gangue or Matrix

The impurities associated with the ore, are called gangue or matrix.

Metallurgy

Extraction of a metal from its ores, is known as metallurgy. Metallurgy of a metal includes several metallurgical operations depending upon the nature of metal, its ore and impurities.

Steps Involved in the Extraction of Metals

Various steps/processes involved in the extraction of a metal are as follows :

Concentration of Ores

Removal of unwanted materials from the ores, is known as concentration of ores or **ore dressing**.

Some of the important procedures are described below :

Hydraulic Washing (Levigation)

In this process, an upward stream of running water is used to wash the powdered ore. The lighter gangue particles are washed away and the heavier ores are left behind. The oxide ores of iron (Fe_3O_4 and Fe_2O_3) are concentrated by this method.

Magnetic Separation

This is based on the differences in magnetic properties of the ore components. If either the ore or the gangue is capable of being attracted by a magnetic field, this process is used. In electrostatic separation, electrically charged surfaces are used to separate metallic particles from non-metallic particles of ore.

Froth Floatation Method

This method is used for the concentration of sulphide ores. In this process, a suspension of the powdered ore is made with water. Collectors and froth stabilisers are added to it.

NOTE

- (i) Collectors (e.g. pine oil, fatty acids, xanthates etc.) enhance non-wettability of the mineral particles and froth stabilisers (e.g. cresols, aniline) stabilise the froth.
- (ii) Sometimes, it is possible to separate two sulphide ores by adjusting proportion of oil to water or by using depressants. e.g. In case of an ore containing ZnS and PbS , the depressant used is NaCN .

Leaching

It is often used if the ore is soluble in some solvent (i.e. acids, bases or other chemicals) but not the impurities. e.g.

- (i) **Leaching of alumina from bauxite** (Baeyer's process)

The resulting solution is filtered, cooled and pH is adjusted by neutral with CO_2 causing precipitation of aluminium hydroxide.

Sodium silicate remains in the solution and hydrated alumina is filtered, dried and heated to give back pure Al_2O_3 .

- (ii) **In the metallurgy of silver and gold**

Extraction of Crude Metal from Concentrated Ore

It involves in two major steps:

1. Conversion of Concentrated Ore to Oxide

The following steps are considered under the conversion of concentrated ore to oxide:

Calcination

Strong heating of ore in the absence of air, e.g.

Usually carbonates and hydroxides are converted into oxides by this method. Volatile impurities of S, As and P are removed as their volatile oxides.

Roasting

Strong heating of ore in the presence of air, e.g.

The sulphide ores of copper are heated in reverberatory furnace.

2. Reduction of Oxide to Metal

Reduction of the metal oxide to metal, takes place when heated with reducing agents such as C (coke) or CO or even another metal. This process is known as **smelting**.

Some metal oxides get reduced easily while others are very difficult to be reduced.

NOTE Some metals like Fe dissolve the reducing agent used (carbon) in their extraction. This can be removed by heating the impure metal with more of the ore. Misch metal is used as a reducing agent for extraction of pure vanadium. Hydrogen is used as a reducing agent in extraction of pure tungsten and vanadium.

Thermodynamics of Metallurgy

To understand the variation of temperature requirement for thermal reactions and suitable reducing agent for a given metal oxide (M_xO_y), Gibbs energy interpretations are made.

Gibbs equation, $\Delta G = \Delta H - T\Delta S$

where, ΔH = enthalpy change

ΔG = Gibbs free energy

T = temperature

ΔS = entropy change

$$\Delta G^\circ = -2.303 RT \log K$$

and K = equilibrium constant

If $\Delta G = -ve$, process is spontaneous,

$\Delta G = +ve$, process is non-spontaneous,

$\Delta G = 0$, process is at equilibrium.

A reaction with positive ΔG can still be made to occur by coupling it with another reaction having large negative ΔG . Such coupling is easily understood through **Ellingham diagram**.

Gibbs Energy (ΔG°) vs T plots (Ellingham Diagram)

From Ellingham diagram, it is evident that metals which have more negative $\Delta_f G^\circ$ of their oxides, can reduce those metal oxides for which $\Delta_f G^\circ$ is less negative.

- Reduction can also be done by using Al, H_2 etc. By Al, oxides of Cr, Fe and Mn are reduced. A mixture of Fe_2O_3 and Al is called **thermite mixture**.
- Highly electropositive metals like Na, K and Al are reduced by the electrolysis of their fused salts. e.g.

Refining

The metal obtained from the above processes is not 100% pure, hence called **crude metal**. From the impure metal, the metal of high purity is obtained by refining. Several techniques are used in refining depending upon the differences in properties of the metal.

Distillation

This process is very useful for low boiling metals like zinc, cadmium and mercury. The impure metal is evaporated to obtain the pure metal as distillate.

Liquation

In this method, low melting metals like tin, bismuth and lead can be made to flow on a sloping surface of a reverberatory furnace and heated above their melting point. In this way, it is separated from higher melting impurities.

Electrolytic Refining

Copper is refined by using an electrolytic method.

Zone Refining

This method is based on the principle that the impurities are more soluble in the melt than in the solid state of the metal. This method is very useful for producing semiconductors and other metals of very high purity, e.g. germanium, silicon, boron, gallium and indium.

Vapour Phase Refining

In this method, the metal is converted into its volatile compound. It is then decomposed to give pure metal, e.g.

(i) Mond process for refining nickel

(ii) van-Arkel method for zirconium, titanium, vanadium or thorium

Chromatographic method

This method is based on the principle that different components of a mixture are adsorbed differently on an adsorbent.

Extraction of Metals

The metals like aluminium, copper, zinc and iron can be extracted from their ores in the following ways:

Aluminium Ore-Bauxite ($\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$)

Flow Chart for Al Extraction

Copper Ore-Copper Pyrites (CuFeS_2)

Flow Chart for Cu Extraction

Zinc Chief Ore–Zinc Blende (ZnS)**Flow Chart for Zinc Extraction****Iron Chief Ore–Haematite (Fe_2O_3)****Flow Chart for Fe Extraction**

Reduction zone (Upper most part of blast furnace, temperature range 500 to 800 K).

Combustion zone (Temperature 2170 K)

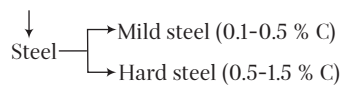

Slag formation zone (Temperature range: $900\text{--}1500\text{ K}$)

Melting zone (Temperature range $1500\text{--}1600\text{ K}$) Molten iron (1600 K as pig iron)

Impurities – 4% C + S, P, Si and Mn in small amount.

Practice Exercise

- Among the following statements, the incorrect one is
 - calamine and siderite are carbonates
 - argentite and cuprite are oxides
 - zinc blende and pyrites are sulphides
 - malachite and azurite are ores of copper
- Cassiterite is an ore of
 - Mn
 - Ni
 - Sb
 - Sn
- A metal becomes quite hard due to the presence of small impurity because the impurities
 - reduce the number of mobile electrons
 - reduce the number of slide planes
 - reduce the crystal symmetry
 - change the lattice structure of metals
- Statement I** Nitrate ores are very rare.
Statement II Bond dissociation energy of N_2 is very high.
 Which of these statement(s) is/are true?
 - Only I
 - Only II
 - Neither (a) nor (b)
 - Both (a) and (b)
- The metal found always in the free state, is
 - Au
 - Ag
 - Cu
 - Na
- Which of the following metals is extracted by the electrometallurgical method?
 - Cu
 - Fe
 - Na
 - Ag
- In the froth floatation process for the facilitation of ores, the ore particles float because
 - their surface do not get easily wetted by water
 - they are light
 - they bear electrostatic charge
 - they are not soluble
- The pyrometallurgical operations mainly involve the use of
 - complexation
 - high temperature
 - sulphide ores
 - electrolysis
- Froth floatation process for the concentration of Cu illustrates the practical application of
 - adsorption
 - absorption
 - sedimentation
 - coagulation
- Chemical used as a depressant in separating ZnS from PbS in froth-floatation process, is
 - NaCN
 - NaCl
 - BaCl₂
 - ZnSO₄
- Which of the following ores is not concentrated by froth floatation process?
 - Pyrolusite
 - Pentlandite
 - Zinc blende
 - Copper pyrites
- How do we separate two sulphide ores by froth floatation method?
 - By adding pine oil
 - By adding sodium cyanide
 - By adding foaming agent
 - By passing air
- Commonly used collectors in froth floatation method are
 - pine oil
 - coconut oil
 - fatty acids
 - xanthates
 - I, II, and III
 - II, III, IV
 - I, III, and IV
 - I, II, and IV
- Removal of the unwanted materials from the ore is known as
 - benefaction
 - dressing
 - concentration
 - Either (a) or (b) or (c)
- The process by which lighter earthly particles are made free from heavier particles by washing with water, is called
 - leaching
 - levigation
 - benefication
 - None of these
- Which of the following metals is extracted by auto reduction?
 - Zinc
 - Iron
 - Copper
 - Aluminium
- Among the following pairs of oxides, which pair cannot be reduced by carbon to give the respective metals?
 - Fe₂O₃, ZnO
 - PbO, Fe₃O₄
 - Cu₂O, SnO₂
 - CaO, K₂O
- Which of the following fluxes is used to remove acidic impurities in metallurgical process?
 - Silica
 - Lime stone
 - Sodium chloride
 - Sodium carbonate
- Flux is used to
 - remove all impurities from ores
 - reduce metal oxide
 - remove silica
 - remove silica and undesirable metal oxide
- The process of converting hydrated alumina into anhydrous alumina, is called
 - roasting
 - smelting
 - dressing
 - calcination
- The chemical process in the production of steel from haematite ore involve
 - reduction
 - oxidation
 - reduction followed by oxidation
 - oxidation followed by reduction

22. Which one of the following reactions is an example of auto-reduction?
- $\text{Fe}_3\text{O}_4 + 4\text{C} \longrightarrow 3\text{Fe} + 4\text{CO}_2$
 - $\text{Cu}_2\text{O} + \text{C} \longrightarrow 2\text{Cu} + \text{CO}$
 - $\text{Cu}^{2+}(\text{aq}) + \text{Fe}(\text{s}) \longrightarrow \text{Cu}(\text{s}) + \text{Fe}^{2+}(\text{aq})$
 - $\text{Cu}_2\text{O} + \frac{1}{2}\text{Cu}_2\text{S} \longrightarrow 3\text{Cu} + \frac{1}{2}\text{SO}_2$
23. In order to carry out a reduction process, temperature is selected to make
- ΔG positive
 - ΔH positive
 - ΔG negative
 - ΔH negative
24. Smelting is involved in
- $\text{Fe}_2\text{O}_3 + 3\text{C} \xrightarrow{\text{Heat}} 2\text{Fe} + 3\text{CO}$
 - $2\text{PbS} + 3\text{O}_2 \xrightarrow{\text{Heat}} 2\text{PbO} + 2\text{SO}_2$
 - $\text{Al}_2\text{O}_3 + 2\text{H}_2\text{O} \xrightarrow{\text{Heat}} \text{Al}_2\text{O}_3 + 2\text{H}_2\text{O}$
 - $\text{Zn}_2\text{O}_3 \xrightarrow{\text{Heat}} \text{ZnO} + \text{CO}_2$
25. Specific gravity of slag is
- always less than that of molten metal
 - always higher than that of molten metal
 - same as that of molten metal
 - None of the above
26. The least stable oxide among the following, is
- Sb_2O_3
 - Ag_2O
 - CuO
 - ZnO
27. Which of the following statements about the advantage of roasting of sulphide ore before reduction is not true?
- $\Delta_r G^\circ$ of the sulphide is greater than those of CS_2 and H_2S
 - $\Delta_r G^\circ$ is negative for roasting of sulphide ore to oxide
 - Roasting of sulphide to oxide is thermodynamically feasible
 - Carbon and hydrogen are suitable reducing agents for metal sulphides
28. The value of $\Delta_r G^\circ$ for the formation of Cr_2O_3 is -540 kJ mol^{-1} and that of Al_2O_3 is -827 kJ mol^{-1} . Is the reduction of Cr_2O_3 with Al is feasible reaction?
- The data is incomplete
 - The reaction is feasible
 - The reaction is not feasible
 - The reaction may or may not be feasible
29. Use the relationship $\Delta G^\circ = -nFE^\circ_{\text{cell}}$ to estimate the minimum voltage required to electrolyse Al_2O_3 in the Hall-Heroult process
- $$\Delta_r G^\circ(\text{Al}_2\text{O}_3) = -1520 \text{ kJ mol}^{-1}$$
- $$\Delta_r G^\circ(\text{CO}_2) = -394 \text{ kJ mol}^{-1}$$
- 0.8 V
 - 1.60 V
 - 2.8 V
 - 3.0 V
30. Electrolytic refining's is used to purify which of the following metals?
- Cu and Zn
 - Ge and Si
 - Zr and Ti
 - Zn and Hg
31. Which of the following elements is extracted commercially by the electrolysis of an aqueous solution of its compound?
- Chlorine
 - Bromine
 - Sodium
 - Aluminium
32. For which metal, the property of forming volatile compounds is taken into advantage for its extraction?
- Nickel
 - Iron
 - Cobalt
 - Tungsten
33. Zone refining is based on the principle that
- impurities of low boiling metals can be separated by distillation
 - impurities are more soluble in molten metal than in solid metal
 - different components of a mixture are differently absorbed on an adsorbent
 - vapours of volatile compound can be decomposed into pure metal
34. In electrorefining of copper, some gold is deposited as
- anode mud
 - cathode mud
 - cathode
 - electrolyte
35. Which method of purification is represented by the following equation?
- $$\text{Ti}(\text{s}) + 2\text{I}_2(\text{g}) \xrightarrow{523 \text{ K}} \text{TiI}_4(\text{g}) \xrightarrow{1700 \text{ K}} \text{Ti}(\text{s}) + 2\text{I}_2(\text{g})$$
- Zone refining
 - Cupellation
 - Polling
 - van-Arkel
36. Impure nickel can be purified by
- electrolytic refining
 - Mond-carbonyl process
 - zone-refining process
 - van-Arkel process
37. To obtain pure germanium, which of the following methods of refining is preferred?
- Liquation
 - Zone-refining
 - Electrolytic method
 - Poling
38. Mond's process is used for the purification of
- Ni
 - Ti
 - Zr
 - Hg
39. In the metallurgy of aluminium,
- Al^{3+} is oxidised to Al (s)
 - graphite anode is oxidised to carbon monoxide and carbon dioxide
 - oxidation state of oxygen changes in the reaction at anode
 - oxidation state of oxygen changes in the overall reaction involved in the process
40. Al can be obtained by
- electrolysis of Al_2O_3 dissolved in Na_3AlF_6
 - heating alumina with cryolite
 - reducing Al_2O_3 by coke
 - reducing Al_2O_3 by chromium
41. Aluminothermic process is used for metallurgy of
- Pb
 - Ag
 - Al
 - None of these

42. Which of the following furnaces can be used to get above 3000°C temperature?
 a. Blast furnace b. Arc furnace
 c. Muffle furnace d. Reverberatory furnace
43. The process in which 10 g of green wood is used, is
 a. poling b. pickling
 c. anodising d. galvanising
44. The process used to produce tough pitch copper, is
 a. cupellation b. distillation
 c. poling d. zone-refining
45. In Mc-Arthur Forrest method, silver is extracted from the solution of $\text{Na}[\text{Ag}(\text{CN})_2]$ by the use of
 a. zinc b. magnesium
 c. copper d. iron

BITSAT Archives

1. Consider the following Ellingham diagram for carbon

Which of the following statements is incorrect for the above Ellingham diagram? [2014]

- a. Upto 710°C , the reaction of formation of CO_2 is energetically more favourable but above 710°C , the formation of CO is preferred
 b. Carbon can be used to reduce any metal oxide at a sufficiently high temperature

c. Carbon reduces many oxides at elevated temperature because ΔG° vs temperature line has a negative slope

2. In the extraction of Ag, Zn is removed from (Zn-Ag) alloy through [2013]
 a. cupellation b. fractional crystallisation
 c. distillation d. electrolytic refining
3. Pyrolusite is a/an [2011]
 a. oxide ore b. sulphide ore
 c. carbide ore d. None of the above
4. van-Arkel method is based on [2010]
 a. cupellation method b. furnace refining method
 c. poling method d. None of the above
5. Aluminium is present in [2010]
 a. gypsum b. carnallite c. asbestos d. diaspore
6. The extraction of which of the following metals involves basemeiserisation? [2009]
 a. Fe b. Ag c. Al d. Cu

Answer with Solutions

Practice Exercise

- (b) Argentite (Ag_2S) is a sulphide ore and cuprite (Cu_2O) is an oxide ore.
- (d) SnO_2 (tin stone) is also called cassiterite.
- (b) 4. (d)
- (a) Au is always found in free state.
- (c) Na is extracted by the electrometallurgical method.
- (a) In the froth floatation process for the facilitation of ores, the ore particles float because their surface do not get wetted by water.
- (b) High temperature is generally used in the pyrometallurgical process.
- (a) Basically, froth floatation method illustrates the practical application of adsorption.
- (a) PbS can be separated from ZnS in the presence of NaCN. It depresses the floatation property of ZnS by forming a complex $\text{Na}_2[\text{Zn}(\text{CN})_4]$.
- (a) 12. (b) 13. (c)
- (d) Removal of the unwanted materials from the ore is known as benefaction or dressing or concentration.
- (b) Levigation or hydraulic washing.
- (c) $\text{Cu}_2\text{S} + 2\text{Cu}_2\text{O} \longrightarrow 6\text{Cu} + \text{SO}_2$
- (d) Potassium and calcium are strong reductant, hence their oxides cannot be reduced by carbon.
- (b) Lime stone (CaCO_3) is a basic flux. It is used to remove acidic impurities like SiO_2 as CaSiO_3 (slag).

19. (d) Flux removes silica and undesirable metal oxide as silicate.
20. (d) In calcination, moisture or hydrated water is removed on heating.

21. (d) Haematite (Fe_2O_3) having little FeO is removed by acidic flux SiO_2 in the form of slag (FeSiO_3).
22. (d) $\text{Cu}_2\text{O} + \frac{1}{2}\text{Cu}_2\text{S} \longrightarrow 3\text{Cu} + \frac{1}{2}\text{SO}_2$
23. (c) $\Delta G = \Delta H - T\Delta S$
Temperature is chosen such that the sum of ΔG in the following two combined redox processes is negative
- $$\text{MnO} + A_{\text{red}} \longrightarrow \text{XM} + \text{AO}_{\text{oxi}}$$
24. (a) Smelting basically involves the reduction of oxides of metal with carbon or coke at high temperature.
25. (a) Specific gravity of slag is always less than molten metal.
26. (b) The least stable oxide is Ag_2O .
27. (d) Both C and H_2 are not suitable for reducing sulphide ore because $\Delta_f G^\circ$ of metal sulphide is more than that of CS_2 and H_2S which will be formed as a result of reduction.
28. (b) $\frac{4}{3}\text{Cr(s)} + \text{O}_2(\text{g}) \longrightarrow \frac{2}{3}\text{Cr}_2\text{O}_3(\text{s}); \Delta_f G^\circ = -540 \text{ kJ} \dots \text{(i)}$
 $\frac{4}{3}\text{Al(s)} + \text{O}_2(\text{g}) \longrightarrow \frac{2}{3}\text{Al}_2\text{O}_3(\text{s}); \Delta_f G^\circ = -827 \text{ kJ} \dots \text{(ii)}$
 On subtracting Eq. (i) from Eq. (ii)
 $\frac{2}{3}\text{Cr}_2\text{O}_3(\text{s}) + \frac{4}{3}\text{Al(s)} \longrightarrow \frac{2}{3}\text{Al}_2\text{O}_3(\text{s}) + \frac{4}{3}\text{Cr(s)};$
 $\Delta_f G^\circ = -287 \text{ kJ}$
 Since, ΔG° comes out to be negative, the reaction is feasible.
29. (b) $2\text{Al}_2\text{O}_3 + 3\text{C} \longrightarrow 4\text{Al} + 3\text{CO}_2$
 $\Delta_f G^\circ = 3\Delta_f G^\circ(\text{CO}_2) - 2\Delta_f G^\circ(\text{Al}_2\text{O}_3)$
 $= 3 \times (-394) - 2 \times (-1520) = 1858 \text{ kJ}$

$$= 1858 \times 10^3 \text{ J}$$

$$\therefore nFE^\circ = 1858 \times 10^3 \quad (n = 12 \text{ electrons})$$

$$\therefore E^\circ = \frac{1858 \times 10^3}{12 \times 96500} = 1.60 \text{ V}$$

30. (a) Impurities are highly soluble in molten state than their solid state.
31. (a) Electrolysis of aqueous solution of NaCl (brine) gives Cl_2 at anode.
32. (a) Nickel is extracted by Mond's process.
33. (b) CaSiO_3 is called slag which is fusible and lighter than the molten metal and is removed easily.
34. (a)
35. (d) van-Arkel (and de Boer) process is based on the thermal decomposition of a volatile compound like an iodide, which is first formed by direct combination of metal to be purified and iodine. Metal formed is in purest form. Titanium and zirconium are purified by this method.
36. (b) Mond-carbonyl process is used to purify impure Ni.
37. (b) Elements such as Ge, Si, Ga, etc., which are used as semiconductors, are refined by zone-refining.
38. (a) Mond's process is used for the purification of Ni.
39. (b) In the metallurgy of Al, graphite anode is oxidised to CO and CO_2 .
40. (a) Al can be obtained by electrolysis of Al_2O_3 dissolved in Na_3AlF_6 .
41. (d) Thermite process is not used for the metallurgy of Pb, Al and Ag.
42. (c) Muffle furnace is used to get above 3000°C temperature.
43. (a) Poling is the process in which 10 g of green wood is used. It acts as a reducing agent.
44. (c)
45. (b) In Mc-Arthur Forrest method, silver is extracted from the solution of $\text{Na}[\text{Ag}(\text{CN})_2]$ by the use of Mg.

BITSAT Archives

1. (d) Since, $\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ$
 where, ΔG° = standard Gibbs' free energy of the reaction
 ΔS° = standard entropy of the reaction
 ΔH° = standard enthalpy of the reaction
 T = temperature
 From the above equation, it is clear that ΔG° will be more negative when ΔS° is less negative (or ΔS° is high).
2. (c) The extraction of Ag using (Zn-Ag) alloy is called Parke's process. As zinc is volatile at 920° while Ag is not. Thus, on heating (Zn + Ag) alloy, zinc vaporises while Ag remains at the bottom of the vessel. Hence, Zn is removed from (Zn - Ag) alloy through distillation.

3. (a) Pyrolusite is MnO_2 . Thus, it is an oxide ore.

4. (d)

5. (d) Gypsum $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
 Carnallite $\text{KCl} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$
 Asbestos $\text{CaSiO}_3 \cdot 3\text{MgSiO}_3$
 Diaspore $\text{Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$

6. (d) In a bessemer converter, copper pyrites are oxidised to FeO and Cu_2O . FeO is slagged off. Cu_2O reacts with Cu_2S left unoxidised to give Cu.

17

p-Block Elements-I (Group 13 and 14)

Group-13 Elements : Boron Family

Boron (B), aluminium (Al), gallium (Ga), indium (In) and thallium (Th) are the members of group-13. Boron is non-metal while rest of the members are metals.

Important Properties

General Configuration ns^2, np^1

Oxidation State

Stability of +3 oxidation state decreases down the group and that of +1 oxidation state increases down the group due to inert pair effect. Fourth period and onwards effective nuclear charge increases due to poor shielding effect, therefore the radius of gallium (135 pm) is less than that of aluminium (143 pm) and down the group, inert pair effect increases.

Hydrides

Boron hydrides exist in dimeric or polymeric form. The simplest boron hydride is diborane, (B_2H_6). Aluminium forms only one colourless, solid polymeric hydride $(AlH_3)_n$, known as alane. Hydrides of Ga and In are not very much stable. B, Al and Ga form complex anionic hydrides, e.g. $NaBH_4$, $LiAlH_4$ and $LiGaH_4$.

All are strong reducing agents.

Halides

Halides have incomplete octet, therefore, have a high tendency to accept electrons and behave as Lewis acid.

BF_3 is a colourless gas, BCl_3 is a colourless fuming liquid while BI_3 is a white fusible solid. Due to back-bonding and resonance, the B—F bond of BF_3 gets a bond order of 1.33.

- AlCl_3 (anhydrous) is covalent and behaves as Lewis acid because Al^{3+} has small size and high polarising power but AlCl_3 (hydrated) is ionic in nature.
- Al^{3+} has small size due to the presence of vacant d -orbitals, therefore AlCl_3 easily gets hydrolysed in water and form octahedral $[\text{Al}(\text{OH})_6]^{3+}$ ion in which the hybridisation state of Al is sp^3d^2 .

Boron

Boron (B) is the first element of group 13 and occurs in two isotopic forms, i.e. ${}^{10}_5\text{B}$ (18%) and ${}^{11}_5\text{B}$ (82%). Its abundance in the earth crust is less than 0.001% by mass.

The important ores are

Borax	:	$\text{Na}_2 \text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$
Colemanite	:	$\text{Ca}_2 \text{B}_6\text{O}_{11} \cdot 5\text{H}_2\text{O}$
Panderinite	:	$\text{Ca}_2 \text{B}_6\text{O}_{11} \cdot 3\text{H}_2\text{O}$
Boracite	:	$2\text{Mg}_3 \text{B}_8\text{O}_{15} \cdot \text{MgCl}_2$
Kernite	:	$\text{Na}_2 \text{B}_4\text{O}_5(\text{OH})_4$

Properties

The main properties of boron are as follows:

- It is a hard solid (melting point = 2076°C , boiling point = 3927°C) and is a bad conductor of heat and electricity.
- It exists in two allotropic forms namely crystalline and amorphous. Crystalline form is chemically inert and black while amorphous form is chemically active and brown coloured solid.
- Action of acids**

$$\text{B} + 3 \text{HNO}_3 \longrightarrow \text{H}_3 \text{BO}_3 + 3 \text{NO}_2$$

$$2\text{B} + 3 \text{H}_2\text{SO}_4 \longrightarrow 2\text{H}_3\text{BO}_3 + 3 \text{SO}_2$$
- Action of alkalis** On fusion with alkalis, hydrogen is liberated.

$$2\text{B} + 6\text{NaOH} \longrightarrow 2\text{Na}_3\text{BO}_3 + 3 \text{H}_2$$

Uses

It is used as control rods in atomic reactors and as a deoxidiser

Anomalous Behaviour of Boron

Boron shows anomalous behaviour due to its small size and high nuclear charge/size ratio, high electronegativity and non-availability of d -electrons.

The main points of differences are:

- It is a typical non-metal whereas other members are metals.
- It shows allotropy and exists in two forms: crystalline and amorphous. Aluminium is a soft metal and does not exist in different forms.

Similarities with silicon

Due to its small size and similar charge/mass ratio, boron shows resemblance with silicon to exhibit diagonal relationship.

Some point of similarities

- Both boron and silicon are typical non-metals, having high melting and boiling points, nearly same densities ($\text{B} = 2.35 \text{ g mL}^{-1}$, $\text{Si} = 2.34 \text{ g mL}^{-1}$), low atomic volumes and bad conductor of heat. These are used as **semiconductors**.
- Both exist in amorphous and crystalline state and exhibit allotropy.

Borax ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$) [Sodium tetraborate decahydrate]

- It is the most important compound of boron. It is white crystalline solid.
- It dissolves in water to give an alkaline solution.

- On heating, it loses the water of crystallisation and swells up to form a mass of a bead.

- With acids, it gives orthoboric acid, a weak acid.

(v) **Structure**

Borax contains the tetrahedral units, i.e. $[\text{B}_4\text{O}_5(\text{OH})_4]^{2-}$.

**Boric Acid (H_3BO_3)**

- (i) It is a soft white crystalline solid, soapy to touch and less soluble in cold water.
- (ii) It is a weak monobasic acid. It is not a protonic acid but acts as a Lewis acid.

- (iv) **Structure of boric acid** shows that it has a layered structure in which planar BO_3 units are joined by H-bonds.
- (v) It is used as an antiseptic, eye wash, as food preservative, in glass industry and in pottery.

Diborane (B_2H_6)

It is a colourless, highly toxic gas with a boiling point of 180 K. It catches fire spontaneously upon exposure to air.

With ammonia, it gives borazine.

Borazine ($\text{B}_3\text{N}_3\text{H}_6$) is known as '**inorganic benzene**'.

However, at high temperature, inorganic graphite $(\text{BN})_x$ is obtained instead of borazine.

Structure of Diborane**Boron Trifluoride (BF_3)**

It is a colourless, pungent gas. The melting point and boiling point are -127.1°C and -99.9°C , respectively. It is exceedingly soluble in water, that's why it is collected over mercury.

Properties

- (a) It is an electron deficient compound and can accept a lone pair of electron, thus behaves as Lewis acid.
- (b) BF_3 combines with water to form two types of hydrates, i.e. $\text{BF}_3 \cdot \text{H}_2\text{O}$ (melting point $= 10.18^\circ\text{C}$) and $\text{BF}_3 \cdot 2\text{H}_2\text{O}$ (melting point 6.36°C). It gets hydrolysed in aqueous solutions yielding boric acid and hydrofluoroboric acid.

If BF_3 is present in excess, it is dissolved in HF to give hydrofluoroboric acid $\text{H}[\text{BF}_4]$.

**Reaction of Aluminium with Acids and Alkalies**(a) **Action of water**(b) **Action of alkalies**(c) **Action of acids**

Al becomes passive in HNO_3 due to oxidation and formation of a thin oxide film on its surface.

Thus, conc. HNO_3 may be stored in Al vessels.

Group-14 Elements : Carbon Family

Carbon(C), silicon (Si), germanium (Ge), tin (Sn) and lead (Pb) are the members of group 14. Carbon is the seventeenth most abundant element by mass in the earth's crust. C is non-metal, Si, Ge are metalloids and Sn, Pb are metals.

Important Properties**General Configuration ns^2np^2** **Catenation**

The tendency for catenation is maximum in carbon due to maximum strength of C—C bond (bond energy of C—C = 354 kJ/mol) and it decreases down the group as

Allotropy

All the members except Pb show allotropy.

There are some allotropes of carbon given below :

Diamond

It is the purest, hardest form of carbon with high refractive index and density. In it, each carbon atom (sp^3 -hybridised) is tetrahedrally surrounded by four other carbon atoms. It is three dimensional polymer. It does not conduct electricity as it has no free electrons.

Graphite

It has two dimensional structure. sp^2 -hybridised carbon atom forms three covalent bonds with three other carbon atoms in the same plane and the 4th electron of each carbon remains free and is responsible for electrical conductivity of graphite.

Fullerenes

These are the only pure form of carbon. C_{60} molecule contains 12 five membered rings and 20 six membered rings. The five membered rings are connected to six membered rings while six membered rings are connected to both five and six membered rings.

Oxidation States

The common oxidation states are +4 and +2. Carbon also exhibits negative oxidation states, i.e. -4. Down the group, stability of +4 oxidation state decreases and of +2 oxidation state increases due to inert pair effect.

Reactivity Towards Water

Carbon, silicon and germanium are not affected by water. Tin decomposes with steam to form dioxide and dihydrogen gas.

Lead remains unaffected by water, probably because of a protective oxide film formation.

Oxides

CO_2 , SiO_2 and GeO_2 are acidic, whereas SnO_2 and PbO_2 are amphoteric in nature.

- Among monoxides, CO is neutral, GeO is distinctly acidic whereas SnO and PbO are amphoteric.
- Monomeric form of CO_2 is stable due to non-availability of d -orbitals. Carbon has tendency to form a multiple bond ($\text{O}=\text{C}=\text{O}$) but SiO_2 exists in three dimensional polymeric form and has high melting point and it is solid at room temperature.

Halides Group

IV A elements form covalent tetrahalides of the type MX_4 (X = halogen) having tetrahedral structure, except PbBr_4 and PbI_4 .

The order of thermal stability of tetrahalides is

Thermal stability and volatility of tetrahalides with a common central atom fall with the increase in the molecular mass of the tetrahalides, e.g.

Except CCl_4 , other tetrachlorides are easily hydrolysed by water due to the availability of empty d -orbitals in them.

Silica (SiO_2)

It is commonly called as silica. It occurs in earth's crust as crystalline quartz, tridymite and cristobalite. Amorphous variety flint is also found.

Methods of Preparation

- It is obtained by heating silicon in oxygen as

$$\text{Si} + \text{O}_2 \longrightarrow \text{SiO}_2$$
- Pure SiO_2 is prepared in its amorphous forms as a white powder by reacting SiCl_4 or SiF_4 with water as

$$\text{SiCl}_4 + 2\text{H}_2\text{O} \longrightarrow \text{SiO}_2 + 4\text{HCl}$$

$$\text{SiF}_4 + 2\text{H}_2\text{O} \longrightarrow \text{SiO}_2 + 4\text{HF}$$

The latter method is normally less used as SiO_2 further reacts with HF to form H_2SiF_6 (fluorosilicic acid).

Silicates

- A large number of silicate minerals exist in nature. Some of the examples are feldspar, zeolites, mica and asbestos. The basic structural unit of silicates is SiO_4^{4-} .
- The SiO_4^{4-} unit is neutralised by positively charged metal ions, if all the four corners are shared with other tetrahedral units.

Silicates are of following types :

- Orthosilicates** Simple silicates containing SiO_4^{4-} tetrahedra.
- Pyrosilicate** Two tetrahedral units share one O-atom to obtain $\text{Si}_2\text{O}_7^{6-}$ anion.
- Cyclic silicates** Two tetrahedral units share two oxygen atoms and form $(\text{SiO}_3^{2-})_n$ or $(\text{SiO}_3)^{2n-}$ anion.
- Chain silicates** Share two oxygen atoms, $(\text{SiO}_3^{2-})_n$ or $(\text{SiO}_3)^{2n-}$ are obtained.
- Sheet silicates** Involve sharing of three O-atoms per tetrahedron to form $(\text{Si}_2\text{O}_5^{2-})_n$.
- Three dimensional silicates** All the four corners (O-atoms) of SiO_4^{4-} tetrahedra are shared with other.

Silicones

- (i) These are synthetic organosilicon compounds which has repeated unit of R_2SiO .
 (ii) These are prepared from alkyl halides.

Highly cross-linked silicone polymer is obtained by the hydrolysis of $RSiCl_3$.

- (iii) They are used as sealant, greases electrical insulators and for water proofing of fabrics. Being biocompatible, they are also used in surgical and cosmetic plants.

Silicon tetrachloride (SiCl₄)

Preparation

It is prepared by heating Si or SiC with Cl₂.

Properties

(i) It is a volatile liquid, having boiling point 330.57 K.

Uses

- (i) Silica gel is used as a catalyst in petroleum industry and as an adsorbent in column chromatography.
 (ii) Si obtained after reduction of silica gel is used for making transistors, computer chips and solar cells.

Zeolites

Zeolites are microporous aluminosilicate having general formula $M_{x/n}[AlO_2]_x[SiO_2]_ymH_2O$.

Uses

- (i) They are used as molecular sieves to separate the molecules of different sizes.
 (ii) They are used as catalyst.

Practice Exercise

- Boron fibres are used in making
 - bullet-proof jacket
 - light composite material for aircraft
 - Both (a) and (b)
 - None of the above
- Match the columns and choose the correct options from the codes given below.

Column I	Column II
A. Orthoboric acid	1. $Na_2B_4O_7 \cdot 4H_2O$
B. Borax	2. $Na_2B_4O_7 \cdot 10H_2O$
C. Kernite	3. H_3BO_3

Codes

A	B	C	A	B	C
a. 1	2	3	b. 3	2	1
c. 2	1	3	d. 1	3	2

- Boron cannot form which one of the following anions?
 - BF_6^{3-}
 - BH_4^-
 - $B(OH)_4^-$
 - BO_2^-

- Heating of an aqueous solution of aluminium chloride to dryness will give
 - $Al(OH)Cl_2$
 - Al_2O_3
 - Al_2Cl_6
 - $AlCl_3$
- When orthoboric acid (H_3BO_3) is heated, the residue is
 - boron
 - metaboric acid
 - boric anhydride
 - borax
- Borax on heating with cobalt oxide forms a blue bead of
 - $Co(BO_2)_2$
 - $CoBO_2$
 - $Co_4(BO_3)_2$
 - $Na_3Co(BO_3)_2$
- Borax bead test is responded by
 - divalent metals
 - trivalent metals
 - light metals
 - metal which forms coloured metaborates
- Which of the following is a component of ruby?
 - $CaCO_3$
 - $MgCO_3$
 - Al_2O_3
 - $Al(OH)_3$
- Tincal is
 - $Na_2CO_3 \cdot 10H_2O$
 - $NaNO_3$
 - $Na_2B_4O_7 \cdot 10H_2O$
 - $NaCl$

10. Boric acid is used in carom boards for smooth gliding of pawns because
 a. H_3BO_3 molecules are loosely chemically bonded and hence soft
 b. its low density makes it fluffy
 c. it can be powdered to a very small grain size
 d. H-bonding in H_3BO_3 gives it a layered structure

11. Boric acid when burnt with ethyl alcohol gives a green edged flame due to the combustion of
 a. boron trifluoride
 b. metaboric acid
 c. ethyl borate
 d. orthoboric acid

12. In diborane, two H—B—H angles nearly are
 a. 60° , 120°
 b. 95° , 120°
 c. 95° , 150°
 d. 120° , 180°

13. Which of the following statements are correct regarding diborane?

I. Two bridged hydrogen atoms and two boron atoms lie in one plane.

II. Out of six B—H bonds, two bonds can be described in terms of 3 centre-2 electron bonds.

III. Out of six B—H bonds, four B—H bonds can be described in terms of 3 centre-2 electron bonds.

IV. Four terminal B—H bonds are two centre-two electrons regular bonds.

- a. I, II and IV
 b. II, III and IV
 c. I and II
 d. III and IV
14. The species which does not exist, is
 a. $[\text{AlF}_6]^{3-}$
 b. $[\text{GaF}_6]^{3-}$
 c. $[\text{InF}_6]^{3-}$
 d. $[\text{BF}_6]^{3-}$

15. In Al_2Cl_6 ,

I. six Al—Cl bonds are of same length and two of different length.

II. the angle Al—Cl—Al is 87° .

III. four Al—Cl bonds are of same length and two of different length.

IV. the angle Cl—Al—Cl is 93° and 110° .

Which statements are correct?

- a. I, II and III
 b. II, III and IV
 c. I, III and IV
 d. I, II and IV

16. Consider the following statements,

I. BBr_3 is stronger acid than BF_3 .

II. $p\pi-p\pi$ back bonding occurs in the halides of boron but not in the halides of aluminium.

III. Borazine is less reactive than boron.

IV. Al is unstable in air and water.

The set of incorrect statement is

- a. I and II
 b. II and III
 c. III and IV
 d. None of these

17. B—F bonds in BF_3 are weakly acidic. The main factor responsible is

- a. $p\pi-p\pi$ back bonding
 b. $p\pi-d\pi$ back bonding
 c. three centred- two electron bonds in BF_3
 d. large electronegativity of F

18. Which of the following statements is incorrect for aluminium chloride (Al_2Cl_6) ?

- a. It exists as a dimer in solvents like benzene and carbon disulphide
 b. The aluminium atom is tetrahedrally surrounded by four chlorine atoms
 c. Each aluminium atom forms three covalent bonds and one coordinate bond
 d. In the vapour state, aluminium chloride does not exist as a dimer

19. AlCl_3 achieves stability by forming a dimer. Structure of this dimer is

- a. 
 b. 
 c. 
 d. None of these

20. Which of the following reactions will not give the anhydrous AlCl_3 ?

- a. By heating $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$
 b. By passing dry HCl gas on heated aluminium powder
 c. By passing dry chlorine gas on heated aluminium powder
 d. By passing dry chlorine gas over a heated mixture of alumina and coke

21. The tendency of Ge, Sn, Pb to show +2 oxidation state, increases in the sequence

- a. $\text{Ge} = \text{Sn} < \text{Pb}$
 b. $\text{Ge} < \text{Sn} < \text{Pb}$
 c. $\text{Ge} > \text{Sn} > \text{Pb}$
 d. $\text{Ge} > \text{Sn} = \text{Pb}$

22. The order of catenation of C, Si, Ge, Sn is

- a. $\text{C} < \text{Si} < \text{Ge} < \text{Sn}$
 b. $\text{C} > \text{Si} > \text{Ge} > \text{Sn}$
 c. $\text{C} \gg \text{Si} > \text{Ge} \approx \text{Sn}$
 d. $\text{C} \approx \text{Si} \gg \text{Ge} \approx \text{Sn}$

23. The hybridisation of the central atom in SiF_6^{2-} , $[\text{GeCl}_6]^{2-}$ and $[\text{Sn}(\text{OH})_6]^{6-}$ is

- a. sp^3d
 b. sp^3d^2
 c. sp^3
 d. sp^3d^3

24. Graphite conducts electricity due to the

- a. highly delocalised nature of π -electrons
 b. highly localised nature of π -electrons
 c. highly polarised nature of π -electrons
 d. None of the above

25. Graphite is a soft, solid lubricant, extremely difficult to melt. The reason for this anomalous behaviour is that graphite

- a. is an allotropic form of diamond
 b. has molecules of variable molecular masses like polymers

- c. has carbon atoms arranged in large plates of rings of strongly bound carbon atoms with weak interplate bonds
d. is a non-crystalline substance
26. Carborundum is obtained when silica is heated at high temperature with
a. carbon
b. carbon monoxide
c. carbon dioxide
d. calcium carbonate
27. The mixture of CO and H₂ is known as
a. producer gas
b. synthesis gas
c. water gas
d. Both (b) and (c)
28. A mixture of CO and N₂ is known as
a. synthesis gas
b. water gas
c. producer gas
d. All of these
29. Water gas is used as an industrial fuel because
a. on combustion, it further produces CO₂
b. on combustion, it loses heat
c. on combustion, it produces CO₂ and liberates heat
d. None of the above
30. Silica gel is used as a/an
a. dehydrating agent (drying agent)
b. dehydrogenating agent
c. reducing agent
d. oxidising agent
31. (Me)₂SiCl₂ on hydrolysis will yield
a. (Me)₂Si=O
b. $[\text{O}-(\text{Me})_2\text{Si}-\text{O}]_n^-$
c. Me₂SiCl(OH)
d. (Me)₂Si(OH)₂
32. Consider the following statements,
I. GeCl₄ in HCl forms H₂[GeCl₆].
II. Trisilyl amine is pyramidal.
III. SnCl₄ is more stable than SnCl₂.
IV. Ge(OH)₂ is amphoteric.
The correct statements are
a. I and IV
b. II and III
c. I and II
d. III and IV
33. Name of the structure of silicates in which three oxygen atoms of [SiO₄]⁴⁻ are shared, is
a. pyrosilicate
b. sheet silicate
c. linear chain silicate
d. three dimensional silicate
34. An inorganic compound X, made of two most occurring elements in the earth's crust and used in building construction, when reacts with carbon, forms a diatomic molecule, which is poisonous in nature. Compound X may be
a. SiO₂
b. Al₂O₃
c. CaO
d. CO₂
35. An inorganic compound containing (3c-2e) and (2c-2e) bonds when reacts with NH₃ at a certain temperature, gives a compound X which is isostructural with benzene and when reacts at high temperature, forms a substance Y. The substance Y is
a. B₂H₆
b. B₃N₃H₆
c. inorganic graphite
d. B₂H₆ · 2NH₃
36. The shape of gaseous SnCl₂ is
a. tetrahedral
b. linear
c. angular
d. T-shaped
37. Mark the oxide which is amphoteric in character.
a. CO₂
b. SiO₂
c. SnO₂
d. CaO
38. SiH₄ and O₂ mixture on bubbling through water and bubbles coming in contact with air,
a. burns with a luminous flame
b. vertex rings of finely divided silica are formed
c. SiH₄ + 2O₂ → SiO₂ + 2H₂O, reaction occurs
d. All of the above
39. Ionisation enthalpy (Δ_iH_i in kJ mol⁻¹) for the elements of group-13 follows the order
a. B > Al > Ga > In > Tl
b. B < Al < Ga < In < Tl
c. B < Al > Ga < In > Tl
d. B > Al < Ga > In < Tl
40. Two elements P and Q react separately with highly electropositive metal to form binary compounds, which upon hydrolysis yield mixture of boranes and silanes. P and Q respectively are
a. B, Al
b. Si, B
c. B, Si
d. Al, B
41. Which of the following is most stable?
a. Sn²⁺
b. Ge²⁺
c. Si²⁺
d. Pb²⁺
42. The correct stability order for boron halides is
a. BF₃ > BCl₃ > BBr₃ > BI₃
b. BCl₃ > BF₃ > BBr₃ > BI₃
c. BI₃ > BBr₃ > BCl₃ > BF₃
d. BBr₃ > BCl₃ > BI₃ > BF₃
43. Aluminium metal is corroded in coastal places near to the sea, it is due to protective oxide film,
a. is removed by sea water
b. reacts with sea water
c. is attacked by salt present in sea water
d. reacts with sand particles
44. Which of the following elements form both neutral as well as acidic oxides?
a. Sn
b. Si
c. C
d. P
45. Al₂O₃ can be converted into anhydrous AlCl₃ by heating from
a. a mixture of Al₂O₃ and carbon in dry Cl₂ gas
b. Al₂O₃ with Cl₂ gas
c. Al₂O₃ and HCl gas
d. Al₂O₃ with NaCl in solid state

BITSAT Archives

- Which of the following statements are incorrect in context of borax? [2013]
 - It is made up of two triangular BO_3 units and two tetrahedral BO_4 units
 - One mole of borax can be used as a buffer
 - It is a useful primary standard for titrating against acids
 - Aqueous solution of borax can be used as a buffer
- For the properties mentioned, the correct trend for the different species is in [2013]

- Strength as Lewis acid— $\text{BCl}_3 > \text{AlCl}_3 > \text{GaCl}_3$
 - Inert pair effect— $\text{Al} > \text{Ga} > \text{In}$
 - Oxidising property— $\text{Al}^{3+} > \text{In}^{3+} > \text{Tl}^{3+}$
 - First ionisation enthalpy— $\text{B} > \text{Al} > \text{Tl}$
- Which glass has the highest percentage of lead? [2007]
 - Soda glass
 - Flint glass
 - Jena glass
 - Pyrex glass

Answer with Solutions

Practice Exercise

- (c)
- (b) Orthoboric acid is H_3BO_3
 Borax is $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$
 Kernite is $\text{Na}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$
- (a) Due to absence of $2d$ -orbital, maximum covalency is four. Thus, BF_6^{3-} is not formed.
- (b) Aqueous solution of AlCl_3 is acidic due to hydrolysis.

$$\text{AlCl}_3 + 3\text{H}_2\text{O} \rightleftharpoons \text{Al}(\text{OH})_3 + 3\text{HCl}$$
 On strong heating, $\text{Al}(\text{OH})_3$ is converted into Al_2O_3 .

$$2\text{Al}(\text{OH})_3 \xrightarrow{\Delta} \text{Al}_2\text{O}_3 + 3\text{H}_2\text{O}$$
- (c)
$$\text{H}_3\text{BO}_3 \xrightarrow[\text{above } 70\text{ K}]{\Delta} \text{HBO}_2 \xrightarrow{\Delta} \text{B}_2\text{O}_3$$
 Orthoboric acid Metaboric acid Boric anhydride
- (a)
$$\text{Na}_2\text{B}_4\text{O}_7 \longrightarrow 2\text{NaBO}_2 + \text{B}_2\text{O}_3$$

$$\text{B}_2\text{O}_3 + \text{CoO} \longrightarrow \text{CoO} \cdot \text{B}_2\text{O}_3 \text{ or } \text{Co}(\text{BO}_2)_2$$
 Blue bead
- (d) Metals forming coloured bead can be identified by borax bead test.
- (c) Al_2O_3 is a component of ruby ($\text{Al}_2\text{O}_3 + \text{Cr}_2\text{O}_3$), red precious stone.
- (c) Naturally occurring crude borax is called tincal. Thus, it is chemically $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$.
- (d) Boric acid is used in carom boards for smooth gliding of pawns because H-bonding in H_3BO_3 gives it a layered structure.
- (c)
$$\text{H}_3\text{BO}_3 + 3\text{C}_2\text{H}_5\text{OH} \xrightarrow{-3\text{H}_2\text{O}} (\text{C}_2\text{H}_5)_3\text{BO}_3$$
 Boric acid Ethyl alcohol Ethyl borate
 It burns with green edged flame.
- (b) In diborane, two $\text{H}-\text{B}-\text{H}$ angles are nearly 95° and 120° .
- (a) The correct statements are I, II and IV.

- (d) BF_6^{3-} does not exist because there is no vacant d -subshell in boron.

- (b) The structure of Al_2Cl_6 is shown below

- (c) Borazine is more reactive than boron. Aluminium is stable in air and water.
- (a) It is $p\pi-p\pi$ bonding involving B and F-atom responsible for the acidic nature of boron halides as $\text{BF}_3 < \text{BCl}_3 < \text{BBr}_3 < \text{BI}_3$.
 Smaller, atom shows more back bonding.
- (d)
- (b)
- (a) Hydrated aluminium chloride undergoes hydrolysis to forms Al_2O_3 .

$$2\text{AlCl}_3 \cdot 6\text{H}_2\text{O} \longrightarrow 2\text{Al}(\text{OH})_3 + 6\text{HCl}$$

$$2\text{Al}(\text{OH})_3 \longrightarrow \text{Al}_2\text{O}_3 + 3\text{H}_2\text{O}$$
- (b) The tendency of Ge, Sn, Pb to show +2 oxidation state increases in the sequence $\text{Ge} < \text{Sn} < \text{Pb}$.
- (c) The order of catenation of C, Si, Ge, Sn is $\text{C} \gg \text{Si} > \text{Ge} \approx \text{Sn}$
- (b) The species like, SiF_6^{2-} , $[\text{GeCl}_6]^{2-}$, $[\text{Sn}(\text{OH})_6]^{2-}$ exist where the hybridisation of the central atom is sp^3d^2 .
- (a) Graphite conducts electricity due to the highly delocalised nature of π -electrons.
- (c) Graphite has carbon atoms arranged in large hexagonal layers with weak van der Waals' interactions between the layers.
- (a)
$$\text{SiO}_2 + 3\text{C} \xrightarrow[2300\text{ K}]{\text{High temp.}} \text{SiC} + 2\text{CO}$$
 Carborundum
- (d) Mixture of CO and H_2 is known as water gas as well as *syn* gas.

28. (c) Mixture of CO and N₂ is known as producer gas.
29. (c) Water gas on combustion produces CO₂ and liberate heat.
30. (a) Silica gel is used as dehydrating agent as it removes moisture from atmosphere.
31. (d) (Me)₂SiCl₂ on hydrolysis will yield (Me)₂Si(OH)₂.
32. (a) GeCl₄ in HCl forms H₂[GeCl₆]·Ge(OH)₂ is amphoteric. SnCl₂ is more stable than SnCl₄. Trisilyl amine is planar molecule.
33. (b) Sheet silicates are formed when three oxygen atoms (bridging O-atoms) of each (SiO₄)⁴⁻ unit are shared. .
34. (a) Two most abundant elements in the earth's crust are Si and oxygen and the compound made by them is SiO₂. This compound is used in building construction.
- $$\text{SiO}_2 + 2\text{C} \longrightarrow \text{Si} + \underset{\text{Poisonous}}{2\text{CO}}$$
35. (c)
36. (c) Gaseous SnCl₂ is angular with sp²-hybridisation.
37. (c) SnO₂ is amphoteric. It dissolves in acids as well as in alkalies.
38. (d) All these are characteristics noted during the process.
39. (d) Ionisation enthalpy (Δ_iH_i in kJ mol⁻¹) for the elements of group-13 follows the order
B > Al < Ga > In < Tl
40. (c) P and Q are boron and silicon respectively.
41. (d) Due to inert pair effect, Pb²⁺ is most stable.
42. (a) The stability order for boron halides is explained in terms of back-bonding.
43. (c) It is a reason for given fact.
44. (c) CO is neutral and CO₂ is acidic.
45. (a) Al₂O₃ + 3Cl₂(dry) + 3C → 2AlCl₃ + 3CO

BITSAT Archives

1. (b) Borax is Na₂B₄O₇·10H₂O in which 2 molecules of water among 10 molecules form a part of structure and exists as Na₂[B₄O₅(OH)₄]·8H₂O.
Methyl orange with pH value of 3.7 is used to detect end point. Aqueous solution of borax acts as buffer because borax is salt of strong base (NaOH) and weak acid (H₃BO₃).
2. (a) The tendency to behave as Lewis acid decreases with the increase in the size down the group. BCl₃ easily accepts a lone pair of electrons from ammonia to form BCl₃·NH₃. Hence, strength as Lewis acid
BCl₃ > AlCl₃ > GaCl₃
3. (b) Flint glass or lead glass has composition of K₂O·PbO·6SiO₂. It is used in making electric bulb and optical instruments

18

p-Block Elements-II

Group 15 Elements

Group 15 (VA) contains 5 elements, namely nitrogen (N), phosphorus (P), arsenic (As), antimony (Sb), bismuth (Bi), collectively called as **pnictogens** taken from Greek word '*pnigmis*' meaning suffocating.

Physical Properties

- (i) **Electronic configuration** The general electronic configuration of group 15 is ns^2np^3 .
- (ii) **Atomic and ionic radius** Atomic and ionic radius increase down the group, however arsenic shows exceptionally low value of atomic volume.
- (iii) **Ionisation energy** Ionisation energy of these elements is much higher due to increased nuclear charge and stable exactly half-filled electronic configuration.
- (iv) **Electronegativity** On moving down the group, it decreases due to gradual increase in the atomic radius of the elements.
- (v) **Non-metallic/metallic character** On moving down the group, metallic character increases.
- (vi) **Allotropy** All these elements except bismuth show allotropy.
- (vii) **Oxidation state** Elements of group VA exhibit maximum oxidation state of +5 by losing all the five electrons from their outer shell. +3 oxidation state is shown only when *p*-orbital electrons are used in bonding.
On moving down the group, +3 oxidation state becomes more stable due to inert pair effect. Nitrogen shows +5 to -3 oxidation states.

- (ii) **Electrothermal process** Phosphorus is obtained from direct reduction of mineral phosphorite by carbon in the presence of silica.

Allotropy of Phosphorus

- (i) **White phosphorus** is transparent, soft, poisonous, waxy solid, shows chemiluminescence and chemically more reactive.

- It acts as a strong reducing agent.
 $\text{P}_4 + 10\text{H}_2\text{SO}_4 \longrightarrow 4\text{H}_3\text{PO}_4 + 10\text{SO}_2 + 4\text{H}_2\text{O}$

- (ii) **Red phosphorus** is the stable form of phosphorus. It is odourless, non-poisonous and less reactive.

- (iii) **Black phosphorus** It is thermodynamically most stable at room temperature and has two forms :

- (a) **α -black phosphorus** It is very stable form and does not oxidise unless heated very strongly.
- (b) **β -black phosphorus** It is the only form of P whose structure is definitely known (crystalline).

- (iv) **Scarlet phosphorus** It resembles the red variety in its physical properties and white P in its chemical properties.

- (v) **Violet phosphorus** It is crystalline in nature.

Uses

Red P is widely used in the match industry because of its less reactivity and non-poisonous nature, while yellow P and zinc phosphide are used as a rat poison. ^{32}P is used in the treatment of leukemia and other blood disorders.

Important Compounds of N and P

Some important compounds of N and P are as follows :

Ammonia

Preparation

It is prepared by Haber's process.

Properties

The main properties of ammonia are as follows :

- (i) It is a light colourless gas with characteristic pungent smell and highly soluble in water.

- (iii) Ammonia has a strong tendency to donate its lone pair of electrons to other molecules and thus acts as a strong Lewis base.

- (iv) It reacts with Nessler's reagent (alkaline K_2HgI_4).

Nitric Acid or Aqua Fortis

Preparation

It is prepared by **Ostwald's process**.

Properties

The main properties of nitric acid are as follows:

- (a) Pure anhydrous HNO_3 is a colourless, water soluble pungent smelling, fuming liquid (boiling point -84.1°C).
- (b) On exposure to light, HNO_3 decomposes to NO_2 which imparts yellow colour.
- (c) It is extremely corrosive in nature.
- (d) In aqueous solution, nitric acid behaves as a strong acid giving H_3O^+ and NO_3^- ions.
- (e) Conc. HNO_3 is a strong oxidising agent.

- (f) Hot conc. HNO_3 attacks non-metals also.

Phosphine

Preparation

It is prepared in laboratory by the following reaction:

Properties

The main properties of phosphine are as follows:

- It is a colourless, poisonous garlic or rotten fish like smelling gas.
- It is weakly basic like ammonia, gives phosphonium compounds with acids.

$$\text{PH}_3 + \text{HBr} \longrightarrow \text{PH}_4\text{Br}$$
- Pure PH_3 does not burn spontaneously. However, on heating in air or oxygen forms P_2O_5 .

Phosphorus Trichloride

Preparation

PCl_3 is obtained by passing dry chlorine over heated white P.

Properties

Following are the properties of PCl_3 :

- PCl_3 is a colourless mobile liquid (boiling point = 349 K, freezing point = 161 K; density = 1.6 g/cm³) with a pungent smell. It fumes in moist air.
- It acts as a reducing agent.

$$3\text{PCl}_3 + \text{S}_2\text{Cl}_2 \longrightarrow \text{PCl}_5 + 2\text{PSCl}_3$$

$$3\text{PCl}_3 + \text{SOCl}_2 \longrightarrow \text{PCl}_5 + \text{POCl}_3 + \text{PSCl}_3$$
- It reacts with conc. H_2SO_4 .

Phosphorus Pentachloride (PCl_5)

Preparation

PCl_5 is prepared by the reaction of PCl_3 with excess of dry chlorine of white phosphorus with SO_2Cl_2 .

Properties

Following are the main properties of PCl_5 :

- PCl_5 is a colourless crystalline solid with pungent odour when pure.

- Upon heating, it sublimes below 173 K and can be melted (melting point = 421 K) by heating under pressure.

- It has the ability to dissociate as

- In moist air, it hydrolyses to POCl_3 and finally gets converted to H_3PO_4 .

Structure

X-ray studies show that solid PCl_5 consists of ionic lattices, i.e. tetrahedral $[\text{PCl}_4]^+$ cations and octahedral $[\text{PCl}_6]^-$ anions. In vapour state, it has trigonal bipyramidal shape (sp^3 -hybridisation).

Oxides of Nitrogen

$\text{N}_2\text{O}(g)$ is neutral, colourless gas, with sp hybridisation and linear geometry (it is also called laughing gas).

$\text{NO}(g)$ is colourless, neutral gas. It also contains odd number of electrons (paramagnetic) but in solid or liquid state, it exists in dimeric form and have paired electrons (diamagnetic). It is very reactive and harmful to health.

N_2O_3 is blue solid. It is acidic and planar with sp^2 hybridisation.

$\text{NO}_2(g)$ is brown, acidic gas with angular shape and sp^2 hybridisation. It contains odd number of valence electrons (paramagnetic). On dimerisation, it gets converted to stable N_2O_4 molecule with even number of electrons (diamagnetic).

N_2O_4 is colourless solid/liquid. It is acidic with planar geometry and sp^2 hybridisation. Its covalency is four (total number of bonds with central atom).

N_2O_5 is colourless, acidic solid with planar shape and sp^2 hybridisation and four covalency.

Structure of Oxides and Oxoacids of Phosphorus

The structures of some important oxyacids of phosphorus are summarised below:

Group 16 Elements

The group VI A contains 5 elements, i.e. oxygen, sulphur, selenium, tellurium and polonium and known as **oxygen family**.

The first four members are non-metals and collectively known as **chalcogens** (metal ores mainly occur in the form of oxide, sulphides etc). The outermost shell electronic configuration is ns^2, np^4 (n = number of shells).

Physical Properties

Group 16 elements show following trends in their physical properties :

- Metallic character** On moving down the group, the metallic character increases down the group from oxygen to polonium because of decrease in ionisation energy.
- Oxidation states** Group VIA elements show oxidation state of +2, +4 and +6 due to the promotion of electrons to vacant d -orbitals. But down the group, +4 oxidation state becomes more stable.

Chemical Properties

Following are the main chemical properties of group 16 elements :

- Hydrides** All the elements of the oxygen family form stable hydrides of the type H_2M either by directly combining with hydrogen or by the action of acids on metal sulphides, selenides and tellurides.

H_2O is a liquid due to hydrogen bonding and others are colourless gases with unpleasant smell.

Compounds $H_2O > H_2S > H_2Se > H_2Te$ (all sp^3 -hybridised)

Bond angle $104.5^\circ \ 92.5^\circ \ 91^\circ \ 90^\circ$

The decreasing bond dissociation enthalpy of the $M-H$ bond is due to increase in the size of M which explains the increasing acidic character of hydrides down the group.

- Halides** All the elements of the oxygen family form a number of halides like OF_2 , ClO_2 , S_2F_2 , SF_4 , etc.
- Oxides** These form oxides of the type MO_2 and MO_3 . e.g. SO_2 , TeO_2 , etc.

Anomalous Behaviour of Oxygen

Oxygen, the first member of group 16 differs from rest of the members due to its small size, high electronegativity and non-availability of d -orbitals in the valence shell.

- (i) Oxygen exhibits an oxidation state of -2 only except in O_2F_2 and OF_2 where it has $+1$ and $+2$ state and in peroxides where it has -1 state whereas other members show $+4$ and $+6$ oxidation states in addition to $+2$ oxidation state.
- (ii) Oxygen is capable of forming $p\pi-p\pi$ bonds. The other elements of this group do not show the tendency to exhibit such multiple bonding, sulphur and phosphorus show $p\pi-d\pi$ bonding.

Important Compounds of O and S

Some important compounds of oxygen and sulphur are :

Dioxygen

Preparation

- (i) **Laboratory method** $2KClO_3 \xrightarrow[\Delta]{MnO_2} 2KCl + 3O_2$
- (ii) **By electrolysis of water** (Acidified water)

Properties

- (i) Colourless, odourless, tasteless gas which is slightly soluble in water. Liquid oxygen exhibits paramagnetism.
- (ii) It is non-inflammable but a supporter of combustion.
- (iii) $O=O$ bond dissociation energy is high, therefore it reacts with metals or non-metals after external heating to start the reaction.

Ozone

It is formed in the upper layer of atmosphere by the action of UV rays from sun on oxygen. It prevents the UV rays from entering the earth's atmosphere. CFCs, common refrigerants deplete the ozone layer.

Preparation

Properties

- It is pale blue gas with pungent odour. It is diamagnetic and poisonous.
- Ozone is unstable; $2O_3 \xrightarrow{\text{Heat}} 3O_2$

- It acts as a powerful oxidising agent. It liberates iodine from neutral KI solution and the liberated I_2 turns starch paper blue.

- Alkaline KI is oxidised to potassium iodate and periodate.

Mercury loses its meniscus in contact with ozone (tailing of mercury).

Allotropic forms of Sulphur

It exists in several allotropic forms.

Rhombic Sulphur (α -sulphur)

It is common crystalline form of sulphur, yellow in colour, melting point 114.5°C and specific gravity 2.06. Its crystals are prepared by evaporating sulphur solution in CS_2 . It is insoluble in water but readily soluble in CS_2 .

Monoclinic Sulphur (β -sulphur)

It is stable above 95.6°C . Its crystals are amber yellow in colour, melting point 119°C , specific gravity 1.98. It is insoluble in CS_2 . It is prepared by melting rhombic sulphur in a dish followed by cooling till crust is formed.

At 95.6°C , both forms are stable. This temperature is called **transition temperature**. S_8 rings in both the forms is puckered and has a crown shape.

Plastic Sulphur

It is obtained by pouring boiling sulphur into cold water. It is amber brown in colour, specific gravity 1.95 and insoluble in CS_2 .

Milk of Sulphur

It is obtained by boiling milk of lime with sulphur and decomposing the products formed with HCl. It is used in medicines.

Colloidal Sulphur

It is prepared by passing H_2S through a solution of an oxidising agent such as nitric acid, etc.

Colloidal sulphur changes into ordinary form on heating.

Sulphuric Acid

It is called as 'oil of vitriol' because in early days, it was prepared from ferrous sulphate crystals (green vitriol) and has an oily appearance.

Preparation

Industrial preparations of sulphuric acid are as follows:

(a) Contact process

SO_3 is absorbed in 98% H_2SO_4 to get oleum.

(b) Lead chamber process

Properties

The main properties of sulphuric acid are as follows:

- Pure sulphuric acid is colourless but commercial acid is yellow in colour due to the presence of impurities.
- H_2SO_4 has associated structure due to intermolecular hydrogen bonding which accounts for its high boiling point and viscosity.

- Conc. H_2SO_4 acts as a dehydrating agent.

The residue of carbon is called **sugar charcoal**.

Uses

Sulphuric acid is used

- as a dehydrating agent and in petroleum refining.
- for pickling, i.e. cleaning of metal surface before electroplating, in making lead storage batteries.

Structure of Oxoacids of Sulphur

Sulphur shows following oxyacids:

(i) Sulphuric acid (H_2SO_4)

(ii) Thiosulphuric acid ($\text{H}_2\text{S}_2\text{O}_3$)

(iii) Pyrosulphuric acid ($\text{H}_2\text{S}_2\text{O}_7$)

(iv) Peroxomonosulphuric acid (H_2SO_5)

Group 17 Elements

Group VIIA of long form of periodic table consists of the non-metallic elements, fluorine (F), chlorine (Cl), bromine (Br), iodine (I) and astatine (At). These non-metallic elements are collectively known as halogens as their salts are usually found in water (Greek word-Halo means sea salt producer).

Physical Properties

- Electronic configuration** The outermost shell electronic configuration is ns^2, np^5 .
(where, n = number of shells)

- Electronegativity** The halogens are the most electronegative elements. On moving down the group, the electronegativity decreases.

- Oxidation state** All these elements show an oxidation state of -1 . Except fluorine, other elements also show $+1, +3, +5$ and $+7$ oxidation states due to the presence of vacant d -orbitals in their valence shell.

- Non-metallic character** All these elements are non-metallic in nature due to their high ionisation energy and high electronegativities. On moving down the group, the non-metallic character gradually decreases.

Chemical Properties

- (i) **Oxidising power** On moving down the group, the oxidising power decreases from F to I, i.e.

Thus, I^- is the strongest reducing agent, while F^- is the strongest oxidising agent.

- (ii) **Reaction with oxygen** Halogens form binary compounds with oxygen but most of them are unstable. Decreasing order of stability of oxides formed by halogens is

Oxides of Halogens

Oxides of fluorine	OF_2 and O_2F_2
Oxides of chlorine	Cl_2O , ClO_2 , Cl_2O_6 , Cl_2O_7
Oxides of bromine	Br_2O , BrO_2 , BrO_3
Oxides of iodine	I_2O_5

- (iii) **Reaction with metals** Halogens react with metals to form metal halides. The ionic character of the halides decreases in the order

- (iv) **Reaction with hydrogen** Halogens react with hydrogen to form hydrogen halides. Their affinity for hydrogen decreases from F to I.

- (v) **Interhalogen compounds** Halogens react with themselves to produce a number of interhalogen compounds (XX_n , where $n = 1, 3, 5$ or 7).

Examples of Interhalogen Compounds

XX'	ClF , BrF , $BrCl$, ICl , IBr , IF
XX'_3	ClF_3 , BrF_3 , IF_3 , ICl_3 (I_2Cl_6)
XX'_5	ClF_5 , BrF_5 , IF_5
XX'_7	IF_7

- (vi) **Pseudo halogens** There are many uni-negative groups which show characteristics of halide ions. These are called pseudohalides or pseudohalide ions. The covalent dimers of pseudohalide ions are called pseudohalogens.

NOTE Pseudohalide ions, being made up of two heteroatoms can function as ambidentate ligands.

Examples of Pseudohalogens and Their Formulae

Pseudohalide ions	Formulae	Pseudohalogens	Formulae
Cyanide	CN^-	Cyanogen	$(CN)_2$
Cyanate	OCN^-	Oxocyanogen	$(OCN)_2$
Thiocyanate	SCN^-	Thiocyanogen	$(SCN)_2$
Selenocyanate	$SeCN^-$	Selenocyanogen	$(SeCN)_2$
Azidothiocarbonate	$SCSN_3^-$	Azidocarbon disulphide	$(SCSN_3)_2$

Anomalous Behaviour of Fluorine

Fluorine differs from the rest of the halogens because of its small size, high charge density, non-availability of d -orbitals and low bond dissociation energy.

Important unique behaviour of fluorine is given below:

- F is very reactive because of its low bond dissociation energy. However, in Cl_2 and Br_2 , $X-X$ bond is stronger.
- HF has a high tendency to form H-bond. Thus, it is a liquid (boiling point = $19^\circ C$) while HCl, HBr and HI are gases under ordinary conditions.
- Hydrofluoric acid being a dibasic acid (H_2F_2) forms two series of salt such as $NaHF_2$, Na_2F_2 while HCl, HBr and HI are monobasic in nature.

Chlorine

It was discovered in 1774 by Scheele by the action of HCl on MnO_2 .

Manufacturing of Chlorine

Chlorine can be manufactured by the following two processes:

Deacon's Process

Electrolytic Process

It is also obtained as a by-product in many chemical reactions.

Properties of Chlorine

- It is a greenish yellow gas with pungent and suffocating odour which is about 2-5 times heavier than air. It is highly soluble in water.
- Chlorine reacts with a number of metals and non-metals to form chlorides.

- (iii) Chlorine reacts with compounds containing hydrogen, it has great affinity for hydrogen.

- (iv) I. $2\text{NaOH} + \text{Cl}_2 \longrightarrow \text{NaCl} + \underset{\text{Sodium hypochlorite}}{\text{NaOCl}} + \text{H}_2\text{O}$
(Cold, dilute)

- (v) $2\text{Ca(OH)}_2 + 2\text{Cl}_2 \longrightarrow \text{Ca(OCl)}_2 + \text{CaCl}_2 + 2\text{H}_2\text{O}$

The composition of bleaching powder is

- (vi) Chlorine water on standing loses its yellow colour due to the formation of HCl and HOCl.

Nascent oxygen formed by HOCl is responsible for oxidising and bleaching properties of chlorine.

Coloured substance + [O] $\longrightarrow$ Colourless substance

- (vii) It oxidises ferrous to ferric and sulphite to sulphate, sulphur dioxide to sulphur trioxide and iodine to iodate.

Uses of Chlorine

Some important uses of chlorine are as follows:

- (i) In the manufacturing of dyes, drugs and some organic compounds like DDT, carbon tetrachloride, refrigerants, etc.
- (ii) In the preparation of poisonous gases such as phosgene (COCl_2), tear gas (CCl_3NO_2) and mustard gas ($\text{ClCH}_2\text{CH}_2\text{SCH}_2\text{CH}_2\text{Cl}$).

Compounds of Halogens

Hydrogen Chloride (HCl)

It bleaches vegetable or organic matter in the presence of moisture. Bleaching effect of chlorine is permanent.

Preparation of HCl

In laboratory, it is prepared by heating NaCl with conc. H_2SO_4 .

Properties of HCl

- (i) It is a colourless and pungent smelling gas which is extremely soluble in water.
- (ii) Its boiling point is 189 K and freezing point is 159 K.
- (iii) It gives white fumes of NH_4Cl on reaction with NH_3 .

- (iv) It decomposes salts of weaker acids as:

When three parts of conc. HCl are mixed with one part of conc. HNO_3 , **aqua-regia** is formed. It dissolves noble metals, i.e. Au, Pt.

Uses of HCl

- (i) In the manufacturing of chlorine, NH_4Cl and glucose (from corn starch).
- (ii) In medicines and as a laboratory reagent.
- (iii) For extracting glue from bones and purifying bone black.

Oxoacids of halogens

Fluorine forms only one oxoacid HOF, known as fluoric (I) acid or hypofluorous acid due to high electronegativity and small size. Chlorine, bromine and iodine form four series of oxoacid. They are stable only in aqueous solutions or in the form of their salts.

Oxoacids of Halogens

Halic (I) acid (Hypohalous acid)	HOF (Hypofluorous acid)	HOCl (Hypochlorous acid)	HOBr (Hypobromous acid)	HOI (Hypoiodous acid)
Halic (III) acid (Halous acid)	—	HOClO (Chlorous acid)	—	—
Halic (V) acid (Halic acid)	—	HOClO ₂ (Chloric acid)	HOBrO ₂ (Bromic acid)	HOIO ₂ (Iodic acid)
Halic (VII) acid (Perhalic acid)	—	HOClO ₃ (Perchloric acid)	HOBrO ₃ (Perbromic acid)	HOIO ₃ (Periodic acid)

Structures of Oxoacids of Chlorine

Acidic strength increases as oxidation number increases.

HClO_4 is the strongest acid for the same oxidation number of halide.

The oxidising power of oxoacids of chlorine follows the order

It is because with the increase in the oxidation number of halogen atom in oxoacids, oxidising power decreases.

Group 18 Elements

The zero (or 18) group of the periodic table consists of six gaseous elements namely helium (He), neon (Ne), argon (Ar), krypton (Kr), xenon (Xe) and radon (Rn). Except radon, all of them are present in very small amounts in the atmosphere, hence they are also known as **rare gases** or **noble gases**.

Physical Properties

- (i) **Electronic configuration** These gases have highly stable ns^2np^6 configuration.
- (ii) **Boiling points** On moving down the group, the boiling point increases with increase in size.
- (iii) **Ionisation energy and electron affinity** These gases have stable ns^2np^6 (fully-filled) configuration, thus have no tendency to add or lose electron. Hence, their ionisation energy is very high and electron affinity is zero.
- (iv) **Heat of vaporisation and polarisability** These gases possess very low values of heat of vaporisation due to the presence of very weak van der Waals' forces between their monoatomic molecules.
- (v) **Solubility** Noble gases are slightly soluble in water and their solubility generally increases on moving down the group.
- (vi) **Adsorption** Except helium, all the noble gases are adsorbed by charcoal and the ease of adsorption increases down the group.
- (vii) **Liquefaction** Ease of liquefaction increases down the group from He to Rn due to increase in intermolecular forces.
- (viii) **Conductivity** Noble gases have high electrical conductivity at low pressure.
- (ix) These gases are monoatomic gases ($C_p/C_v = 1.667$).

Chemical Properties

In general, noble gases are not very reactive.

Their inertness to chemical reactivity is attributed to the following reasons:

- (i) The noble gases have completely filled ns^2np^6 electronic configurations in their valence shells.
- (ii) The noble gases have very high ionisation energies.
- (iii) The electron affinities of noble gases are almost zero.

Xenon-Fluorine Compounds

Xenon forms three binary fluorides XeF_2 , XeF_4 and XeF_6 as follows:

Properties of Xenon-Fluorine Compounds

All fluorides of xenon are colourless crystalline solids and sublime readily at 298 K. They are powerful fluorinating agents. These are readily hydrolysed even by traces of water.

Xenon fluorides may react with fluoride ion acceptors to form cationic species or fluoride ion donors to form fluoro anions.

(M = Na, K, Rb or Cs)

Xenon-Oxygen Compounds

Hydrolysis of XeF_4 and XeF_6 with water gives XeO_3 .

Partial hydrolysis of XeF_6 gives oxyfluorides XeOF_4 and XeO_2F_2 .

XeO_3 is a colourless explosive solid and has a pyramidal molecular structure. XeOF_4 is a colourless volatile liquid and has a square pyramidal molecular structure.

Practice Exercise

- When conc. HNO_3 is heated with P_2O_5 , it forms
a. N_2O b. NO c. NO_2 d. N_2O_5
- A hydride of nitrogen which is acidic, is
a. NH_3 b. N_2H_4 c. N_2H_2 d. N_3H
- Extra pure N_2 can be obtained by heating
a. NH_3 with CuO b. NH_4NO_3
c. $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ d. $\text{Ba}(\text{N}_3)_2$
- The number of σ bonds in P_4O_{10} is
a. 6 b. 16 c. 20 d. 7
- PH_3 , the hydride of phosphorus is
a. metallic b. ionic
c. non-metallic d. covalent
- Among the following compounds, the most acidic is
a. As_2O_3 b. P_2O_5 c. Sb_2O_3 d. Bi_2O_3
- Among the following, the number of compounds that can react with PCl_5 to give POCl_3 , is
 $\text{O}_2, \text{CO}_2, \text{SO}_2, \text{H}_2\text{O}, \text{H}_2\text{SO}_4, \text{P}_4\text{O}_{10}$
a. 1 b. 2 c. 3 d. 4
- Nitrogen shows different oxidation states in the range
a. 0 to +5 b. -3 to +5
c. -5 to +3 d. -3 to +3
- Which of the following acids possess oxidising, reducing and complex forming properties?
a. HCl b. HNO_2 c. H_2SO_4 d. HNO_3
- When conc. H_2SO_4 is heated with P_2O_5 , the acid is converted to
a. sulphur trioxide
b. sulphur dioxide
c. sulphur
d. a mixture of sulphur dioxide and sulphur trioxide
- Strong reducing behaviour of H_3PO_2 is due to
a. low oxidation state of phosphorus
b. presence of two $-\text{OH}$ groups and one $\text{P}-\text{H}$ bond
c. presence of one $-\text{OH}$ group and two $\text{P}-\text{H}$ bonds
d. high electron gain enthalpy of phosphorus
- The molecule having smallest bond angle is
a. NCl_3 b. AsCl_3 c. SbCl_3 d. PCl_3
- Which of the following statements is wrong?
a. The stability of hydrides increases from NH_3 to BiH_3 in group 15 of the periodic table
b. Nitrogen cannot form $d\pi-p\pi$ bond
c. $\text{N}-\text{N}$ single bond is weaker than the $\text{P}-\text{P}$ single bond
d. N_2O_4 has two resonance structures

- Maximum covalency of nitrogen is
a. 3 b. 5 c. 4 d. 6
- Which of the following statements is wrong?
a. $\text{N}-\text{N}$ single bond is stronger than the $\text{P}-\text{P}$ single bond
b. PH_3 can act as a ligand in the formation of coordination compound with transition elements
c. NO_2 is paramagnetic in nature
d. Covalency of nitrogen in N_2O_5 is four
- Which of the following elements can be involved in $p\pi-d\pi$ bonding?
a. Carbon b. Nitrogen
c. Phosphorus d. Boron
- Bond dissociation enthalpy of $E-\text{H}$ (E = element) bonds is given below.

Compound	NH_3	PH_3	AsH_3	SbH_3
$\Delta_{\text{diss}}(E-\text{H})/\text{kJ mol}^{-1}$	389	322	297	255

Which of the following compounds will act as strongest reducing agent?

- NH_3 b. PH_3 c. AsH_3 d. SbH_3
- Density of N_2 gas prepared from air is slightly higher than that of nitrogen prepared by chemical reaction from a compound of nitrogen because aerial nitrogen contains
a. CO_2
b. argon
c. some N_2 molecules analogous to O_2
d. greater amount of N_2 molecules derived from N^{15} isotope
 - Which of the following statements is incorrect?
a. White and red phosphorus react with chlorine at room temperature
b. White phosphorus is metastable while red phosphorus is stable
c. White phosphorus is lighter than red phosphorus
d. White phosphorus is highly poisonous while red phosphorus is not
 - Red phosphorus is chemically less reactive because
a. it does not contain $\text{P}-\text{P}$ bonds
b. it does not contain tetrahedral P_4 molecules
c. it does not catch fire in air even upto 400°C
d. it has a polymeric structure
 - Ammonia (NH_3) on heating with carbon dioxide under pressure gives
a. NH_4HCO_3 b. $(\text{NH}_4)_2\text{CO}_3$
c. $\text{NH}_2\text{COONH}_4$ d. $(\text{NH}_4)_2\text{CO}$

22. Ammonia is mainly manufactured for fertilisers by the reaction

a. $2\text{NH}_4\text{Cl} + \text{Ca}(\text{OH})_2 \longrightarrow \text{CaCl}_2 + 2\text{H}_2\text{O} + 2\text{NH}_3$
 b. by passing an electric discharge in a mixture of N_2 and H_2
 c. by reducing the by-product nitric acid
 d. by passing a mixture of N_2 and H_2 under pressure and moderate temperature over a catalyst

23. In PCl_5 , phosphorus shows

a. sp^2 -hybridisation b. sp^3 -hybridisation
 c. sp^3d -hybridisation d. sp^3d^2 -hybridisation

24. In modern process, manufacturing of phosphorus is occurred by

a. heating a mixture of phosphorite mineral with sand and coke in electric furnace
 b. heating calcium phosphate with coke
 c. heating bone-ash with coke
 d. heating the phosphate mineral with sand

25. Which of the following compounds is not an interpseudo halogen?

a. Cl_2N_3 b. BrCN
 c. ClCN d. ICN

26. The number of hydrogen atoms attached to phosphorus atom in hypophosphorus is

a. three b. one
 c. two d. zero

27. Which of the following statements is true?

a. H_3PO_3 is a stronger acid than H_2SO_3
 b. In aqueous medium, HF is a stronger acid than HCl
 c. HClO_4 is a weaker acid than HClO_3
 d. HNO_3 is a stronger acid than HNO_2

28. In solid state, PCl_5 is a

a. covalent solid
 b. octahedral structure
 c. ionic solid with $[\text{PCl}_6]^+$ octahedral and $[\text{PCl}_4]^-$ tetrahedral
 d. ionic solid with $[\text{PCl}_4]^+$ tetrahedral and $[\text{PCl}_6]^-$ octahedral

29. Ionisation enthalpy of group 15 elements

I. decreases down the group due to the gradual increase in atomic size.
 II. is higher than that of group 14 elements in the corresponding periods.
 III. the order of successive ionisation enthalpies is $\Delta_i H_1 < \Delta_i H_2 < \Delta_i H_3$

Which of the above statements is/are true?

a. I and II b. II and III
 c. I and III d. I, II and III

30. **Assertion** (A) Heavier elements of group 15 do not form $p\pi-p\pi$ bonds.

Reason (R) Their atomic orbitals cannot have effective overlapping due to their large size.

Choose the most suitable option.

a. Both A and R are correct, R is the correct explanation of A
 b. Both A and R are correct; R is not the correct explanation of A
 c. A is correct, R is incorrect
 d. R is correct, A is incorrect

31. Consider the following statements,

I. Covalency of N is restricted to four.
 II. N cannot form $d\pi-p\pi$ bond as the heavier element can.
 III. P and As cannot form $d\pi-d\pi$ bond with transition elements when their compounds like $\text{P}(\text{C}_2\text{H}_5)_3$ and $\text{As}(\text{C}_6\text{H}_5)_3$ act as ligands.

Which of the above statements are true?

a. I and II b. II and III c. I and III d. All of these

32. Complete the following reactions.

Here, I, II and III refer to

I	II	III
a. N_2	Mg_3N_2	NH_3
b. 2N_2	Mg_3N	NH_3
c. 2N_2	Mg_3N	2NH_3
d. N_2	Mg_3N_2	2NH_3

33. $\text{NH}_2\text{CONH}_2 + 2\text{H}_2\text{O} \longrightarrow \dots\text{A}\dots$

In the above equation, A and B respectively are

a. $(\text{NH}_4)_2\text{CO}_3$ and CO_2
 b. $(\text{NH}_4)_2\text{CO}_3$ and CO
 c. $(\text{NH}_4)\text{CO}_3$ and CO
 d. $(\text{NH}_4)\text{CO}_3$ and CO_2

34. The correct decreasing order for the acidic strength of oxides of nitrogen is

a. $\text{N}_2\text{O}_5 > \text{N}_2\text{O}_3 > \text{N}_2\text{O}_4 > \text{NO} > \text{N}_2\text{O}$
 b. $\text{NO} > \text{N}_2\text{O} > \text{N}_2\text{O}_3 > \text{N}_2\text{O}_4 > \text{N}_2\text{O}_5$
 c. $\text{N}_2\text{O} > \text{NO} > \text{N}_2\text{O}_3 > \text{N}_2\text{O}_4 > \text{N}_2\text{O}_5$
 d. $\text{N}_2\text{O}_5 > \text{N}_2\text{O}_4 > \text{N}_2\text{O}_3 > \text{NO} > \text{N}_2\text{O}$

35. Brown ring test for nitrates depends on

I. the ability of Fe^{2+} to reduce nitrates to nitric oxide.
 II. its reaction with Fe^{2+} to form a brown coloured complex.

Which of the above statements regarding brown test for nitrates is/are true?

a. Only I
 b. Only II
 c. Both I and II
 d. Neither I nor II

36. The correct increasing order of acidic strength of oxyacids of group 15 elements is
 a. $\text{H}_3\text{SbO}_4 < \text{H}_3\text{PO}_4 < \text{H}_3\text{AsO}_4 < \text{HNO}_3$
 b. $\text{H}_3\text{SbO}_4 < \text{H}_3\text{AsO}_4 < \text{H}_3\text{PO}_4 < \text{HNO}_3$
 c. $\text{HNO}_3 < \text{H}_3\text{SbO}_4 < \text{H}_3\text{AsO}_4 < \text{H}_3\text{PO}_4$
 d. $\text{H}_3\text{PO}_4 < \text{H}_3\text{AsO}_4 < \text{H}_3\text{SbO}_4 < \text{HNO}_3$
37. Reaction of HNO_3 with C, P, S and I respectively give
 a. CO, H_3PO_4 , H_2SO_4 and HIO_2
 b. CO_2 , P_2O_5 , SO_2 and I_2O_5
 c. CO_2 , H_3PO_3 , H_2SO_3 and HIO_3
 d. CO_2 , H_3PO_4 , H_2SO_4 and HIO_3
38. Phosphine is used in
 a. holme's signals
 b. smoke screens
 c. Both a. and b.
 d. Neither a. nor b.
39. In trimetaphosphate ion, the number of O-atoms, P—O—P bonds and unit negative charges respectively are
 a. 3, 6 and 3
 b. 9, 6 and 3
 c. 6, 6 and 3
 d. 9, 3 and 3
40. Complete the following reactions:
 I. $8\text{NH}_3 + 3\text{Cl}_2 \longrightarrow \text{I}$
 (Excess)
 II. $\text{NH}_3 + 3\text{Cl}_2 \longrightarrow \text{II}$
 (Excess)
- | | |
|--|---------------------------------------|
| I | II |
| a. $6\text{NH}_4\text{Cl} + \text{N}_2$ | $\text{NCl}_3 + 3\text{HCl}$ |
| b. $\text{NCl}_3 + 3\text{HCl}$ | $6\text{NH}_4\text{Cl} + \text{N}_2$ |
| c. $\text{NCl}_3 + \text{N}_2$ | $6\text{NH}_4\text{Cl} + 3\text{HCl}$ |
| d. $6\text{NH}_4\text{Cl} + 3\text{HCl}$ | $\text{NCl}_3 + \text{N}_2$ |
41. The number of S—S bonds in sulphur trioxide trimer (S_3O_9) is
 a. three
 b. two
 c. one
 d. zero
42. Oxidation states of O in OF_2 and O_2F_2 respectively are
 a. +1 and +2
 b. +1 and +3
 c. +2 and +3
 d. +2 and +1
43. Water is much less volatile than H_2S because
 a. H_2O has a bond angle of nearly 150°
 b. hydrogen is loosely bonded with the sulphur
 c. sulphur atom is less electronegative than oxygen atom
 d. sulphur atom is more electronegative than oxygen atom
44. Correct decreasing order of O—O bond length in O_2 , O_3 and H_2O_2 is
 a. $\text{O}_2 > \text{H}_2\text{O}_2 > \text{O}_3$
 b. $\text{H}_2\text{O}_2 > \text{O}_2 > \text{O}_3$
 c. $\text{H}_2\text{O}_2 > \text{O}_3 > \text{O}_2$
 d. $\text{O}_2 > \text{O}_3 > \text{H}_2\text{O}_2$
45. Uses of ozone (O_3) includes
 I. as an oxidising agent in the manufacturing of KMnO_4 .
 II. as a germicide, disinfectant and for sterilisation.
 III. for bleaching oils, flour, ivory, starch, etc.
 The correct set of uses of ozone is
 a. I and II
 b. II and III
 c. I and III
 d. All of these
46. Angular shape of ozone molecule consists of
 a. 1 σ and 1 π bond
 b. 2 σ and 2 π bonds
 c. 1 σ and 2 π bonds
 d. 2 σ and 1 π bond
47. Consider the following reaction,

$$2\text{SO}_2(g) + \text{O}_2(g) \xrightarrow{\text{Catalyst}} 2\text{SO}_3(g)$$

 Identify the catalyst
 a. V_2O_5
 b. CuCl_2
 c. MnO_2
 d. Either (a) or (b)
48. Peroxoacids of sulphur are
 a. $\text{H}_2\text{S}_2\text{O}_8$ and H_2SO_5
 b. $\text{H}_2\text{S}_2\text{O}_8$ and $\text{H}_2\text{S}_2\text{O}_7$
 c. $\text{H}_2\text{S}_2\text{O}_7$ and $\text{H}_2\text{S}_2\text{O}_6$
 d. H_2SO_5 and $\text{H}_2\text{S}_2\text{O}_7$
49. Consider the following statements,
 I. S—S bond is present in $\text{H}_2\text{S}_2\text{O}_6$.
 II. In peroxodisulphuric acid ($\text{H}_2\text{S}_2\text{O}_8$), sulphur is in +6 oxidation state.
 The correct set of statement is
 a. Only I
 b. Only II
 c. Both I and II
 d. Neither I nor II
50. On treating PCl_5 with H_2SO_4 , sulphuryl chloride (SO_2Cl_2) is formed as the final product. This shows that H_2SO_4
 a. is a derivative of SO_2
 b. is a dibasic acid
 c. has great affinity for water
 d. has two hydroxyl groups in its structure
51. Carborundum is obtained when silica is heated at high temperature with
 a. carbon
 b. carbon monoxide
 c. carbon dioxide
 d. calcium carbonate
52. Red lead is
 a. PbO
 b. Pb_3O_4
 c. PbO_2
 d. Pb_4O_3
53. Which of the following halides is least stable and has doubtful existence?
 a. Cl_4
 b. GeI_4
 c. SnI_4
 d. PbI_4
54. The mixture of conc. HCl and HNO_3 made 3 : 1 ratio contains
 a. ClO_2
 b. NOCl
 c. NCl_3
 d. N_2O_4

55. For making good quality mirrors, plates flint glass are used. These are obtained by floating molten glass over a liquid metal which does not solidify before glass. The metal used can be

a. tin b. sodium
c. magnesium d. mercury

56. When I^- is oxidised by MnO_4^- in alkaline medium, I^- converts into

a. IO_3^- b. I_2 c. IO_4^- d. IO^-

57. The van der Waals' forces in halogens decrease in the order

a. $\text{F}_2 > \text{Cl}_2 > \text{Br}_2 > \text{I}_2$ b. $\text{I}_2 > \text{Br}_2 > \text{Cl}_2 > \text{F}_2$
c. $\text{Br}_2 > \text{Cl}_2 > \text{F}_2 > \text{I}_2$ d. $\text{Cl}_2 > \text{Br}_2 > \text{I}_2 > \text{F}_2$

58. Decreasing order of reducing power of hydrogen halides is

a. $\text{HI} > \text{HBr} > \text{HCl} > \text{HF}$ b. $\text{HF} > \text{HI} > \text{HBr} > \text{HCl}$
c. $\text{HI} > \text{HF} > \text{HBr} > \text{HCl}$ d. None of these

59. Cl_2O is an anhydride of

a. HClO_4 b. HOCl c. HClO_2 d. Cl_2O_3

60. A gas X is passed through water to form a saturated solution. The aqueous solution on treatment with AgNO_3 gives a white precipitate.

The saturated aqueous solution also dissolves Mg ribbon with evolution of colourless gas Y . X and Y respectively are

a. CO_2 and Cl_2 b. Cl_2 and CO_2
c. Cl_2 and H_2 d. H_2 and Cl_2

61. In the oxyacids of chlorine, $\text{Cl}-\text{O}$ bond contains

a. $d\pi-d\pi$ bonding b. $p\pi-d\pi$ bonding
c. $p\pi-p\pi$ bonding d. None of these

62. The stability of the halides of group 16 elements decreases in the order

a. $\text{Br}^- > \text{I}^- > \text{Cl}^- > \text{F}^-$
b. $\text{F}^- > \text{I}^- > \text{Cl}^- > \text{Br}^-$
c. $\text{F}^- > \text{Cl}^- > \text{Br}^- > \text{I}^-$
d. $\text{I}^- > \text{Cl}^- > \text{Br}^- > \text{F}^-$

63. Arrange the following acids in the correct increasing order of their acidic strength:

HCl , HBr , HI , HF

a. $\text{HI} < \text{HBr} < \text{HCl} < \text{HF}$
b. $\text{HF} < \text{HCl} < \text{HBr} < \text{HI}$
c. $\text{HCl} < \text{HBr} < \text{HI} < \text{HF}$
d. $\text{HBr} < \text{HI} < \text{HF} < \text{HCl}$

64. Consider the following statements,

I. Fluorine forms two oxides OF_2 and O_2F_2 .
II. OF_2 is thermodynamically stable at 298 K.
III. O_2F_2 oxidises plutonium to PuF_6 .

The correct set of statements is,

a. I and II b. II and III
c. I and III d. I, II and III

65. Reduction potentials of some ions are given below.

Ion	ClO_4^-	IO_4^-	BrO_4^-
Reduction potential E°/V	$E^\circ = 1.19 \text{ V}$	$E^\circ = 1.65 \text{ V}$	$E^\circ = 1.74 \text{ V}$

Arrange them in decreasing order of oxidising power.

a. $\text{ClO}_4^- > \text{IO}_4^- > \text{BrO}_4^-$ b. $\text{IO}_4^- > \text{BrO}_4^- > \text{ClO}_4^-$
c. $\text{BrO}_4^- > \text{IO}_4^- > \text{ClO}_4^-$ d. $\text{BrO}_4^- > \text{ClO}_4^- > \text{IO}_4^-$

66. Consider the following statements,

I. Among halide ions, iodine is the most powerful reducing agent.

II. HOCl is stronger acid than HOBr .

III. HF is stronger acid than HCl .

IV. Fluorine is the only halogen that does not show variable oxidation states.

The correct set of statements is

a. I, II and III b. II and IV
c. I, II and IV d. I, II, III and IV

67. Among the $\text{C}-\text{X}$ bond (where, $\text{X} = \text{Cl}, \text{Br}, \text{I}$) the correct decreasing order of bond energy is

a. $\text{C}-\text{I} > \text{C}-\text{Cl} > \text{C}-\text{Br}$
b. $\text{C}-\text{I} > \text{C}-\text{Br} > \text{C}-\text{Cl}$
c. $\text{C}-\text{Cl} > \text{C}-\text{Br} > \text{C}-\text{I}$
d. $\text{C}-\text{Br} > \text{C}-\text{Cl} > \text{C}-\text{I}$

68. $4\text{HCl} + \text{O}_2 \xrightarrow{\text{CuCl}_2} 2\text{Cl}_2 + 2\text{H}_2\text{O}$

The above reaction of chlorine preparation is of

a. Deacon's process b. Contact process
c. Either (a) or (b) d. None of these

69. Bleaching powder is an example of

a. a complex salt b. an acidic salt
c. a basic salt d. a mixed salt

70. I. $2\text{NaOH} + \text{Cl}_2 \longrightarrow \dots \text{A} \dots + \dots \text{B} \dots + \text{H}_2\text{O}$
(cold and dil.)

II. $6\text{NaOH} + 3\text{Cl}_2 \longrightarrow \dots \text{C} \dots + \dots \text{D} \dots + 3\text{H}_2\text{O}$
(hot and conc.)

Here, A , B , C and D refer to

A	B	C	D
a. NaCl	NaClO_3	NaOCl	5NaCl
b. 5NaCl	NaClO_3	NaOCl	NaCl
c. NaCl	NaOCl	5NaCl	NaClO_3
d. 5NaCl	NaOCl	NaCl	NaClO_3

71. The reactions in which conc. H_2SO_4 is used as an oxidising agent are

I. $2\text{HI} + \text{H}_2\text{SO}_4 \longrightarrow \text{I}_2 + \text{SO}_2 + 2\text{H}_2\text{O}$

II. $\text{NaCl} + 2\text{H}_2\text{SO}_4 \longrightarrow \text{NaHSO}_4 + \text{HCl}$

III. $\text{CaF}_2 + \text{H}_2\text{SO}_4 \longrightarrow \text{CaSO}_4 + 2\text{HF}$

IV. $\text{Cu} + 2\text{H}_2\text{SO}_4 \longrightarrow \text{CuSO}_4 + \text{SO}_2 + 2\text{H}_2\text{O}$

Choose the correct option.

a. I and II b. II and III
c. I and III d. I and IV

72. Hydrolysis of one mole of peroxodisulphuric acid will yield
 a. two moles of peroxomonosulphuric acid
 b. two moles of sulphuric acid
 c. one mole each of sulphuric acid, peroxomonosulphuric acid and hydrogen peroxide
 d. one mole of sulphuric acid and one mole of peroxomonosulphuric acid
73. Enthalpy of molecular oxygen is almost identical with that of
 a. neon b. argon c. helium d. xenon
74. The ease of liquefaction of noble gases increases in the order
 a. $\text{He} < \text{Xe} < \text{Ar} < \text{Kr} < \text{Ne}$ b. $\text{Xe} < \text{Kr} < \text{Ar} < \text{He} < \text{Ne}$
 c. $\text{He} < \text{Ne} < \text{Ar} < \text{Kr} < \text{Xe}$ d. $\text{Xe} < \text{He} < \text{Ne} < \text{Ar} < \text{Kr}$
75. Among XeO_3 , XeO_2F_2 and XeF_6 , the molecules having same number of lone pairs on Xe are
 a. XeO_3 and XeO_4
 b. XeO_3 and XeO_2F_2
 c. XeO_4 and XeF_6
 d. XeO_3 , XeO_4 and XeF_6
76. In the ring test for NO_3^- ion, a brown ring is formed due to the formation of
 a. $\text{FeSO}_4 \cdot \text{NO}_2$ b. $\text{FeSO}_4 \cdot \text{HNO}_3$
 c. $[\text{Fe}(\text{H}_2\text{O})_5(\text{NO})]^{2+}$ d. $[\text{Fe}(\text{H}_2\text{O})_4(\text{NO})_2]^{2+}$
77. Which of the following statements regarding sulphur is incorrect?
 a. S_2 molecule is paramagnetic
 b. The vapour at 200°C consists mostly of S_8 rings
 c. At 600°C , the gas mainly consists of S_2 molecules
 d. The oxidation state of sulphur is never less than +4 in its compounds
78. Which one of the following reactions of xenon compounds is not feasible?
 a. $\text{XeO}_3 + 6\text{HF} \longrightarrow \text{XeF}_6 + 3\text{H}_2\text{O}$
 b. $3\text{XeF}_4 + 6\text{H}_2\text{O} \longrightarrow 2\text{Xe} + \text{XeO}_3 + 12\text{HF} + 1.5 \text{O}_2$
 c. $2\text{XeF}_2 + 2\text{H}_2\text{O} \longrightarrow 2\text{Xe} + 4\text{HF} + \text{O}_2$
 d. $\text{XeF}_6 + \text{RbF} \longrightarrow \text{Rb}[\text{XeF}_7]$
79. Which of the following acids forms three series of salts?
 a. H_3PO_2 b. H_3BO_3 c. H_3PO_4 d. H_3PO_3
80. The correct decreasing order of the acidic strength of HClO , HClO_2 , HClO_3 , HClO_4 is
 a. $\text{HClO} > \text{HClO}_2 > \text{HClO}_3 > \text{HClO}_4$
 b. $\text{HClO}_4 > \text{HClO}_3 > \text{HClO}_2 > \text{HClO}$
 c. $\text{HClO}_4 > \text{HClO}_2 > \text{HClO} > \text{HClO}_3$
 d. $\text{HClO}_3 > \text{HClO} > \text{HClO}_4 > \text{HClO}_2$
81. The hybrid state of halogen atom is sp^3 in
 a. ClO_4^-
 b. ClO^-
 c. ClO_3^-
 d. All of the above
82. Interhalogen compounds are
 a. covalent molecules
 b. diamagnetic in nature
 c. volatile solids/liquids at 298 K except ClF
 d. All of the above
83. Interhalogen compounds can be used as
 I. non-aqueous solvents.
 II. fluorinating agents.
 The correct use(s) is/are
 a. Only I
 b. Only II
 c. Both I and II
 d. Neither I nor II
84. **Assertion** (A) $\text{X}-\text{X}'$ bond in interhalogens is weaker than $\text{X}-\text{X}$ bond in halogens.
Reason (R) Interhalogen compounds are more reactive than halogens (except fluorine).
 a. Both A and R are correct; R is the correct explanation of A
 b. Both A and R are correct; R is not the correct explanation of A
 c. A is correct; R is incorrect
 d. R is correct; A is incorrect
85. Which of the following statements are correct?
 I. Among halogens, radius ratio between iodine and fluorine is maximum.
 II. Leaving $\text{F}-\text{F}$ bond, all halogens have weaker $\text{X}-\text{X}$ bond than $\text{X}-\text{X}'$ bond in interhalogens.
 III. Among interhalogen compounds, maximum number of atoms are present in iodine fluoride.
 IV. Interhalogen compounds are more reactive than halogen compounds.
 The correct option is
 a. I, II and III
 b. I, III and IV
 c. II, III and IV
 d. I and II
86. **Assertion** (A) SF_6 is known but SCl_6 is not.
Reason (R) Due to small size of F.
 a. Both A and R are correct; R is the correct explanation of A
 b. Both A and R are correct; R is not the correct explanation of A
 c. A is correct; R is incorrect
 d. R is correct; A is incorrect

BITSAT Archives

- The reaction of P_4 with X leads selectively to P_4O_6 .
 X is [2013]
 - dry O_2
 - moist O_2
 - mixture of O_2 and N_2
 - O_2 in the presence of aqueous $NaOH$
- The acidic strength for the hydrides of group 15 follows the order [2013]
 - $NH_3 > PH_3 > AsH_3 > SbH_3$
 - $NH_3 < PH_3 < AsH_3 < SbH_3$
 - $NH_3 > PH_3 > SbH_3 > AsH_3$
 - $NH_3 < PH_3 < SbH_3 < AsH_3$
- The molecules BF_3 and NF_3 both are covalent compounds but BF_3 is non-polar and NF_3 is polar. The reason is that [2012]
 - boron is a metal and nitrogen is a gas in uncombined state
 - BF_3 bonds have no dipole moment whereas NF_3 bond have dipole moment
 - atomic size of boron is smaller than that of nitrogen
 - BF_3 is symmetrical molecule whereas NF_3 is unsymmetrical
- Sodium carbonate reacts with SO_2 in aqueous medium to give [2011]

a. $NaHSO_3$	b. $Na_2S_2O_3$
c. $NaHSO_4$	d. Na_2SO_4
- The highest bond strength is shown by [2010]

a. $O-O$ bond	b. $S-S$ bond
c. $Se-Se$ bond	d. $Te-Te$ bond
- Which one of the following is pyrophosphoric acid? [2009]

a. H_3PO_4	b. $H_4P_2O_7$
c. $H_4P_2O_5$	d. H_3PO_4
- Which of the following has maximum dipole moment? [2009]

a. NCI_3	b. NBr_3
c. NH_3	d. NI_3
- Chlorine acts as a bleaching agent only in the presence of [2009]

a. dry air	b. moisture
c. sunlight	d. pure oxygen
- Helium-oxygen mixture is used by deep sea divers in the presence of nitrogen-oxygen mixture because [2009]
 - helium is much less soluble in blood than nitrogen
 - nitrogen is much less soluble in blood than helium
 - due to high pressure deep under the sea, nitrogen and oxygen react to give poisonous nitric oxide
 - nitrogen is highly soluble in water
- Distinguishing reagent between silver and lead salt is [2009]
 - H_2S gas
 - dil. HCl solution
 - $[NH_2Cl \text{ (solid)} + NH_4OH]$ solution
 - $[NH_2Cl \text{ (solid)} + (NH_4)CO_3]$ solution
- Identify B in the following reaction: [2008]

$$H_4SiO_4 \xrightarrow[-H_2O]{1000^\circ C} A \xrightarrow[\Delta]{\text{Carbon}} B + CO$$
 - Corundum
 - Quartz
 - Silica
 - Carborundum
- The correct order of reducing abilities of hydrides of group 15 elements is [2008]
 - $NH_3 < PH_3 < AsH_3 < SbH_3 < BiH_3$
 - $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$
 - $NH_3 < PH_3 > AsH_3 > SbH_3 > BiH_3$
 - $SbH_3 > BiH_3 > AsH_3 > NH_3 > PH_3$
- Which one of the following pentafluorides cannot be formed? [2007]

a. PF_5	b. AsF_5
c. SbF_5	d. BiF_5
- Which of the following is most volatile compound? [2007]

a. HI	b. HCl
c. HBr	d. HF
- SO_2 does not act as a/an [2006]

a. bleaching agent	b. oxidising agent
c. reducing agent	d. dehydrating agent
- Which noble gas is not found in atmosphere? [2006]

a. Ne	b. Ar	c. Rn	d. Kr
-------	-------	-------	-------
- In P_4O_{10} , [2009]
 - second bond in $P=O$ is formed by $p\pi - d\pi$ back bonding
 - $P=O$ bond is formed by $p\pi - p\pi$ bonding
 - $P=O$ bond is formed by $d\pi - d\pi$ bonding
 - $P=O$ bond is formed by $d\pi - d\pi - 3 \sigma$ back bonding
- Dinitrogen pentoxide (N_2O_5), a colourless solid, is prepared by [2005]
 - heating NH_2NO_2 with an excess of oxygen
 - dehydrating HNO_2 with CaO
 - dehydrating HNO_3 with P_4O_{10}
 - heating a mixture of HNO_2 and $Ca(NO_3)_2$
- Incorrect statement for pyrophosphorus acid ($H_4P_2O_5$) is [2005]
 - It contains P in + 5 oxidation state
 - It is dibasic acid
 - It is strongly reducing in nature
 - It contains one $P-O-P$ bond

Answer with Solutions

Practice Exercise

- (d) $4\text{HNO}_3 + 2\text{P}_2\text{O}_5 \xrightarrow{\Delta} 2\text{N}_2\text{O}_5 + 4\text{HPO}_3$
- (d) $[\text{N} \equiv \text{N}^+ - \text{N}^-]^- \longrightarrow [\text{N}^- - \text{N}^+ \equiv \text{N}]^-$
- (d) $\text{Ba}(\text{N}_3)_2 \xrightarrow{\text{Heat}} \text{Ba(s)} + 3\text{N}_2(\text{g}) \uparrow$
- (b)
- (d) PH_3 is a covalent hydride.
- (b) Pentoxides are more acidic than trioxides and their acidic character decreases down the group from N to Bi.
- (d) $\text{SO}_2, \text{H}_2\text{O}, \text{H}_2\text{SO}_4, \text{P}_4\text{O}_{10}$
- (b) -3 to +5
- (b) HNO_2 , in its oxidation number of nitrogen is +3 (i.e. in between -3 to +5).
- (a) $2\text{H}_2\text{SO}_4 + 2\text{P}_2\text{O}_5 \longrightarrow 2\text{SO}_3 + 4\text{HPO}_3$
- (c) Due to the presence of one —OH group
- (c) As we move down the group, the repulsion of bond pair and lone pair of central atom decreases.
- (a) $\text{BiH}_3 < \text{SbH}_3 < \text{AsH}_3 < \text{PH}_3 < \text{NH}_3$
Least stable Most stable
- (c) Nitrogen does not show pentacovalency due to non-availability of *d*-orbitals.
- (a)
- (c) Due to availability of *d*-orbitals
- (d) The reducing nature increases from NH_3 to SbH_3 .
- (b) Air contains 1% argon which is heavier than N_2 .
- (a) Red phosphorus is less reactive than white phosphorus.
- (d) It is a reason for the given fact.
- (c) $2\text{NH}_3 + \text{CO}_2 \xrightarrow{\Delta} \text{NH}_2\text{COONH}_4 \xrightarrow{\text{On heating}} \text{NH}_2\text{CONH}_2 + \text{H}_2\text{O}$
- (d) By Haber's process
- (c) P in PCl_5 has sp^3d -hybridisation.
- (a) $\text{Ca}_3(\text{PO}_4)_2 + 3\text{SiO}_2 \longrightarrow 3\text{CaSiO}_3 + \text{P}_2\text{O}_5$
 $2\text{P}_2\text{O}_5 + 10\text{C} \longrightarrow \text{P}_4 + 10\text{CO}$
- (a) Cl_2N_3 is not an interpseudo halogen.
- (c)
- (d) $\text{H} \longrightarrow \text{O} \longrightarrow \text{N}^+ \begin{matrix} \text{O} \\ \text{O}^- \end{matrix}$,
 $\text{H} \longrightarrow \text{O} \longrightarrow \text{N}=\text{O}$
Polarity along O—H in HNO_3 is more in comparison to O—H in HNO_2 .

- (d)
- (d)
- (a) Heavier elements of group 15 do not form $p\pi - p\pi$ bonds as their atomic orbitals are so large and diffuse that they cannot have effective overlapping.
- (a) P and As form $d\pi - d\pi$ bond with transition elements when their compounds like $\text{P}(\text{C}_2\text{H}_5)_3$ and $\text{As}(\text{C}_6\text{H}_5)_3$ act as ligands.
- (d)
- (a) $\text{NH}_2\text{CONH}_2 + 2\text{H}_2\text{O} \longrightarrow (\text{NH}_4)_2\text{CO}_3$
 $\rightleftharpoons 2\text{NH}_3 + \text{H}_2\text{O} + \text{CO}_2$
- (d) $\text{N}_2\text{O}_5 > \text{N}_2\text{O}_4 > \text{N}_2\text{O}_3 > \text{NO} > \text{N}_2\text{O}$
- (c) Both the statements are correct.
 $\text{NO}_3^- + 3\text{Fe}^{2+} + 4\text{H}^+ \longrightarrow \text{NO} + 3\text{Fe}^{3+} + 2\text{H}_2\text{O}$
 $[\text{Fe}(\text{H}_2\text{O})_6]^{2+} + \text{NO} \longrightarrow [\text{Fe}(\text{H}_2\text{O})_5(\text{NO})]^{2+} + \text{H}_2\text{O}$
Brown coloured complex
- (b) $\text{H}_3\text{SbO}_4 < \text{H}_3\text{AsO}_4 < \text{H}_3\text{PO}_4 < \text{HNO}_3$
- (d) Reaction of HNO_3 with C, P, S and I gives $\text{CO}_2, \text{H}_3\text{PO}_4, \text{H}_2\text{SO}_4$ and HIO_3 respectively.
- (c) The spontaneous combustion of phosphine is technically used in Holme's signals. Containers containing calcium carbide and calcium phosphide are pierced and thrown in the sea when the gases evolved burn and serve as a signal. It is also used in smoke screens.
- (d) In trimetaphosphate ion, the number of O-atoms, P—O—P bonds and unit negative charges are 9, 3, 3 respectively.
- (a) (I) $8\text{NH}_3 + 3\text{Cl}_2 \longrightarrow 6\text{NH}_4\text{Cl} + \text{N}_2$
(Excess)
(II) $\text{NH}_3 + 3\text{Cl}_2 \longrightarrow \text{NCl}_3 + 3\text{HCl}$
(Excess)
- (d) S_3O_9 is as

- (d) Oxidation states of O in OF_2 and O_2F_2 are +2 and +1 respectively.
- (c) Water is much less volatile than H_2S because sulphur atom is less electronegative than oxygen atom.
- (c) $\text{H}_2\text{O}_2 > \text{O}_3 > \text{O}_2$
- (d) **Uses of ozone**
As a germicide, disinfectant and for sterilising water. Also used for bleaching oils, ivory, flour, starch, etc. It acts as an oxidising agent in the manufacturing of KMnO_4 .

46. (d) Angular shape of ozone molecule consists of two σ and one π -bond.

48. (a) Peroxoacids of sulphur are $\text{H}_2\text{S}_2\text{O}_8$ and H_2SO_5 .

49. (a) In $\text{H}_2\text{S}_2\text{O}_6$, S—S bond is present.

50. (d) When PCl_5 reacts with sulphuric acid, sulphuryl chloride (SO_2Cl_2) is formed as the final product. It shows that it has two hydroxyl groups in its structure.

52. (b) Pb_3O_4 or $\text{PbO}_2 \cdot 2\text{PbO}$ is called red lead.

53. (d) Pb^{4+} will readily oxidise iodide and itself will get reduced to Pb^{2+} . Thus, PbI_2 will be formed,

54. (b) $3\text{HCl} + \text{HNO}_3 \longrightarrow \text{NOCl} + 2\text{H}_2\text{O} + 2[\text{Cl}]$

55. (a) Melting point of tin is lower than that of glass.

56. (a) $2\text{MnO}_4^- + \text{H}_2\text{O} + \text{I}^- \longrightarrow 2\text{MnO}_2 + 2\text{OH}^- + \text{IO}_3^-$

57. (b) van der Waals' forces increase with increase in the size and molecular weight of the atom.

58. (a) The order of reducing power of halide ions is

59. (b) $\text{Cl}_2\text{O} + \text{H}_2\text{O} \longrightarrow 2\text{HClO}$

Chlorine has +1 oxidation state in Cl_2O and HOCl .

60. (c) $\text{Cl}_2 + \text{H}_2\text{O} \xrightarrow{\text{X}} \text{HOCl} + \text{HCl}$

61. (b) Cl is sp^3 -hybridised having electrons in d -orbitals and p -electrons of oxygen gives rise to $p\pi - d\pi$ bonding to Cl—O bond.

62. (c) Elements of group 16 form a large number of halides of the type EX_6 , EX_4 and EX_2 , where E is an element of the group and X is a halogen. $\text{F}^- > \text{Cl}^- > \text{Br}^- > \text{I}^-$

63. (b) Correct increasing order of their acidic strength is

64. (d) Fluorine forms two oxides, i.e. OF_2 and O_2F_2 . OF_2 is thermodynamically stable at 298 K. These oxides are essentially oxygen fluorides because of the higher electronegativity of fluorine than oxygen. Both are strong fluorinating agents. O_2F_2 oxidises plutonium to PuF_6 and the reaction is used in removing plutonium as PuF_6 from spent nuclear fuel.

65. (d) Greater the SRP value of species, higher will be its oxidising power. Hence, on the basis of the reduction potential of ions, the decreasing order of oxidising power is $\text{BrO}_4^- > \text{ClO}_4^- > \text{IO}_4^-$.

66. (c) HF is a weaker acid than HCl.

67. (c) Among the C—X bond (where, $X = \text{Cl}, \text{Br}, \text{I}$), the correct decreasing order of bond energy is $\text{C}—\text{Cl} > \text{C}—\text{Br} > \text{C}—\text{I}$

68. (a)

69. (d) A mixed salt is one which gives more than one type of cations or anions, e.g. $\text{Ca}^{2+} + \text{OCl}^- + \text{Cl}^-$.

70. (c)

71. (d) In the following reactions, conc. H_2SO_4 is used as an oxidising agent.

73. (d) Enthalpy of molecular oxygen (1175 kJ mol^{-1}) is almost identical with that of xenon (1170 kJ mol^{-1}).

74. (c) 75. (b) 76. (c)

77. (d) Oxidation states of sulphur in H_2S is -2 . Thus, incorrect (valency can be less than 4).

78. (a) XeF_6 has much tendency to hydrolyse. The reverse reaction is more spontaneous.

79. (c) Structure of H_3PO_4 is

H_3PO_4 has 3 —OH groups, i.e. has three ionisable H-atoms and hence forms three series of salts. These three possible series of salts for H_3PO_4 are as follows NaH_2PO_4 , Na_2HPO_4 and Na_3PO_4 .

80. (b) The correct decreasing order of the acidic strength of oxoacids of chlorine is

81. (d)

82. (d) Interhalogen compounds are covalent molecules and diamagnetic in nature. These are volatile solids or liquids at 298 K except ClF .

83. (c)

84. (b) Interhalogen compounds are more reactive than halogens (except fluorine). This is because $\text{X}-\text{X}'$ bond in interhalogens is weaker than $\text{X}-\text{X}$ bond. All these

undergo hydrolysis giving halide ion derived from the smaller halogen and a hypohalite (when XX'), halite (when XX'_3), halate (when XX'_5) and perhalate (when XX'_7) anion derived from the larger halogen.

85. (b) Among halogens, radius ratio between iodine and fluorine is maximum. Among interhalogen compounds,

maximum number of atoms are present in iodine fluoride. Interhalogen compounds are more reactive than halogen compounds.

86. (a) SF_6 is known but SCl_6 is not. It is due to the small size of fluorine. Six F^- ions can be accommodated around sulphur while chloride ion is comparatively larger in size, thus there will be interatomic repulsion.

BITSAT Archives

- (c) The reaction of P_4 and X leads selectively to P_4O_6 because N_2 prevents the further reaction of P_4O_6 into P_4O_{10} .
- (b) $NH_3 < PH_3 < AsH_3 < SbH_3$
- (d) BF_3 is symmetrical planar, although it has polar bonds but resultant dipole moment is zero. In NF_3 , lone pair cause distortion, hence polarity arises.
- (a) $Na_2CO_3 + 2SO_2 + H_2O \longrightarrow 2NaHSO_3 + CO_2$
- (b) As the size increases, bond strength decreases. But S—S bond is stronger than O—O bond because of smaller size of O-atoms.
- (b)
- (c) The electronegativity difference is highest in case of N—H bonds, therefore NH_3 has the highest dipole moment.
- (b) Bleaching action of chlorine is only in the presence of moisture.
- (a) He- O_2 (80%-20%) mixture is used by deep sea divers for artificial respiration. Because of low intermolecular force in He, it is much less soluble in aqueous solutions (as compared to N_2) such as blood and does not cause "caisson sickness" or "bends" by bubbling out of blood

when the worker moves from high pressure (while in deep sea) to atmospheric pressure.

- (b) On adding dil. HCl to silver and lead salts, white precipitate of chlorides of Ag and Pb are obtained which on heating with water are separated from each other as $PbCl_2$ is soluble in hot water but AgCl is not.
- (d) $H_4SiO_4 \xrightarrow[-2H_2O]{1000^\circ C} SiO_2 \xrightarrow[\Delta]{C} \underset{\text{Carborundum}}{SiC} + CO$
- (c) $NH_3 < PH_3 > AsH_3 > SbH_3 > BiH_3$
- (d) The +5 oxidation state of Bi is unstable due to inert pair effect. Thus, BiF_5 cannot be formed.
- (b) Boiling point of HF is highest due to H-bonding. For other halogen acids, boiling point increases in the order $HCl < HBr < HI$. Therefore, most volatile (with lower boiling point) is HCl.
- (d) SO_2 does not act as a dehydrating agent.
- (b) The noble gas which is not found in atmosphere is argon (Ar).
- (a) The terminal bond formed is $p\pi - d\pi$ bonding.
- (c) $P_4O_{10} + 4HNO_3 \longrightarrow 4HPO_3 + 2N_2O_5$
- (a) It contains phosphorus in +3 oxidation state.

19

d- and *f*-Block Elements

d-Block Elements

d-block elements are present from fourth period onwards. There are mainly three series of the transition metals, (a) 3*d*-series (Sc to Zn), (b) 4*d*-series (Y to Cd) and (c) 5*d*-series (La to Hg, omitting Ce to Lu).

d-block elements are known as **transition elements** because their position in the periodic table is in between the *s*-block and *p*-block elements.

Electronic Configuration

3rd group	4th group	5th group	6th group	7th group
$ns^2(n-1)d^1$	$ns^2(n-1)d^2$	$ns^2(n-1)d^3$	$ns^1(n-1)d^5$	$ns^2(n-1)d^5$
Sc	Ti	V	Cr	Mn
Y	Zr	Nb	Mo	Tc
La	Hf	Ta	W	Re
8th group	9th group	10th group	11th group	12th group
$ns^2(n-1)d^6$	$ns^2(n-1)d^7$	$ns^2(n-1)d^8$	$ns^1(n-1)d^{10}$	$ns^2(n-1)d^{10}$
Fe	Co	Ni	Cu	Zn
Ru	Rh	Pd	Ag	Cd
Os	Ir	Pt	Au	Hg

- Unlike Cr and Mo, W has electronic configuration as $ns^2(n-1)d^4$.

General Characteristics of *d*-Block Elements

- Transition elements show all the properties of metals like metallic lustre, conductivity, malleability, ductility, high tensile strength except mercury which is liquid at room temperature.
- Their atomic radii is intermediate between *s*- and *p*-block elements.
- These elements possess high melting and boiling points, high enthalpies of vaporisation, atomisation and hydration of ions.
- Their first ionisation enthalpy is higher than that of *s*-block elements but less than that of *p*-block elements.
- These elements are electropositive in nature and show variable oxidation states.
- Generally, these elements are paramagnetic in nature and form coloured compounds.
- These elements form interstitial compounds with elements like C, H, B and N and show catalytic behaviour.

Metallic Character

With the exception of Zn, Cd and Hg, all the transition elements are much harder and less volatile. Although hardness and brittleness are associated with covalent bonding between metal atoms, while the overlapping of unfilled *d*-orbitals of metals causes covalent bonding, the valence *s*-electrons are responsible for metallic bonding. Cu, Ag and Au are particularly outstanding in their thermal and electrical conductivities.

Oxidation States

Some common oxidation states of 3*d*-series elements are shown below:

Name of the elements	Oxidation states shown by 3 <i>d</i> -series
Sc	+3
Ti	+2, +3, +4
V	+2, +3, +4, +5
Cr	+1, +2, +3, +4, +5, +6
Mn	+2, +3, +4, +5, +6, +7
Fe	+2, +3, +4, +5, +6
Co	+2, +3, +4
Ni	+2, +3, +4
Cu	+1, +2
Zn	+2

Ionic Radii

The trend for ionic radii is same as that of atomic radii.

- Ionic radii decreases with increase in oxidation state.
- Ionic radii of cations present in the same oxidation state, decreases with increase in atomic number.

Catalytic Properties

Transition metals have two incomplete outermost shells and ability to adopt multiple oxidation states and to form complexes, therefore used as a catalyst. Transition metals also provide larger surface area for the reactant to be adsorbed.

Magnetic Properties

When a magnetic field is applied to substances, mainly two types of magnetic behaviours are observed: diamagnetism and paramagnetism. The magnetic moment is determined by the number of unpaired electrons (*n*) which is given by

$$\mu = \sqrt{n(n+2)} \text{ BM} \quad (\text{BM} = \text{Bohr Magnetron})$$

where, *n* = number of unpaired electrons

If *n* = 0, the substance is diamagnetic.

If *n* ≠ 0, the substance is paramagnetic.

Interstitial Compounds

Transition elements possess a tendency to trap atoms like H, B, C, N in their interstitial spaces of their lattices, e.g. TiH_{1.7}, VH_{0.56}. These compounds are very hard, chemically inert and have higher melting points than that of pure metals.

I. Iron (Fe)

Ores Haematite – Fe₂O₃

Magnetite – Fe₃O₄

Iron pyrites – FeS₂

Extraction

1. Concentration

- Gravity separation method
- Magnetic separator

3. Reduction/Smelting

Pig iron

Wrought iron is prepared by 'pudding process.'

Steel is obtained by Bessemer process.

Properties of Iron

It is a grey-white lustrous metal. It is highly tensile, ductile, malleable, magnetic metal etc.

Some important reactions

Compounds of Iron

1. Ferric Chloride (FeCl₃)

Preparation

- (a) $2\text{Fe} + 3\text{Cl}_2 \longrightarrow 2\text{FeCl}_3$
 (b) $2\text{Fe} + 4\text{HCl} + \text{Cl}_2 \longrightarrow 2\text{FeCl}_3 + 2\text{H}_2$
 (c) $\text{Fe}_2\text{O}_3 + 6\text{HCl} \longrightarrow 2\text{FeCl}_3 + 3\text{H}_2\text{O}$

Properties

Hydrated FeCl₃·6H₂O is a yellow, deliquescent, crystalline solid, soluble in water, alcohol etc., and anhydrous FeCl₃ is a dark solid.

2. Ferrous Sulphate (FeSO₄·7H₂O) (Green Vitriol)

Preparation

- (a) $\text{FeCO}_3 + \text{H}_2\text{SO}_4 \longrightarrow \text{FeSO}_4 + \text{H}_2\text{O} + \text{CO}_2$
 (b) $\text{FeS} + \text{H}_2\text{SO}_4 \longrightarrow \text{FeSO}_4 + \text{H}_2\text{S}$ (Kipp's apparatus)

Properties

It is light green crystalline solid, soluble in water efflorescent and isomorphous with MgSO₄·7H₂O.

II. Copper (Cu)

Ores Copper pyrites – CuFeS₂

Copper glance – Cu₂S

Cuprite – Cu₂O

Malachite – CuCO₃·Cu(OH)₂

Properties of Copper

- Copper is reddish golden coloured metal, soft, malleable, ductile and second best conductor next only to silver, molten metal adsorbs SO₂(g).
- $2\text{Cu} + \text{H}_2\text{O} + \text{CO}_2 + \text{O}_2 \longrightarrow \text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$
- $8\text{Cu} + 6\text{H}_2\text{O} + 2\text{SO}_2 + 5\text{O}_2 \longrightarrow \text{CuSO}_4 \cdot 3\text{Cu}(\text{OH})_2$
- $\text{Cu} + 4\text{HNO}_3(\text{conc.}) \longrightarrow \text{Cu}(\text{NO}_3)_2 + 2\text{H}_2\text{O} + 2\text{NO}_2$

III. Zinc (Zn)

Ores Zinc blende – (ZnS)

Calamine – ZnCO₃

Zincite – ZnO

Properties of Zinc

- Bluish white crystalline metal, brittle at ordinary temperature, malleable and ductile.
- $2\text{Zn} + \text{O}_2 \xrightarrow{\Delta} 2\text{ZnO}$
- $\text{Zn} + \text{H}_2\text{O} \longrightarrow \text{ZnO} + \text{H}_2$
- $4\text{Zn} + 3\text{H}_2\text{O} + \text{CO}_2 + 2\text{O}_2 \longrightarrow \text{ZnCO}_3 \cdot 3\text{Zn}(\text{OH})_2$
- $\text{Zn} + 4\text{HNO}_3 \xrightarrow{(\text{conc. and hot})} \text{Zn}(\text{NO}_3)_2 + 2\text{NO}_2 + 2\text{H}_2\text{O}$
- $\text{Zn} + 2\text{NaOH} \longrightarrow \text{Na}_2\text{ZnO}_2 + \text{H}_2$

Compounds of Zn

1. Zinc Oxide (ZnO)

Preparation

- (a) $2\text{Zn} + \text{O}_2 \longrightarrow 2\text{ZnO}$
 (b) $\text{Zn}(\text{NO}_3)_2 \xrightarrow{\Delta} 2\text{ZnO} + 4\text{NO}_2 + \text{O}_2$

Properties

- It is white, light powder insoluble in water. On heating, becomes yellow.
- $\text{ZnO} + \text{H}_2 \longrightarrow \text{Zn} + \text{H}_2\text{O}$
- $\text{ZnO} + 2\text{NaOH} \longrightarrow \text{Na}_2\text{ZnO}_2 + \text{H}_2\text{O}$

2. Zinc Sulphide (ZnS)

Preparation

- (a) $\text{ZnSO}_4 + \text{H}_2\text{S} \longrightarrow \text{ZnS} + \text{H}_2\text{SO}_4$
 (b) $2\text{ZnO} + 3\text{S} \xrightarrow{\Delta} 2\text{ZnS} + \text{SO}_2$
 (c) $\text{ZnCl}_2 + \text{H}_2\text{S} + 2\text{NH}_3 \longrightarrow \text{ZnS} + 2\text{NH}_4\text{Cl}$

Properties

- ZnS is a white solid insoluble in water and soluble in mineral acids. It turns yellow in light.
- It also shows phosphorescence.

3. Zinc Sulphate (ZnSO₄·7H₂O) (White Vitriol)

Properties

- It is highly soluble in water.
- $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O} \xrightarrow[100^\circ\text{C}]{\Delta} \text{ZnSO}_4 \cdot 6\text{H}_2\text{O} \xrightarrow[280^\circ\text{C}]{\Delta} \text{ZnSO}_4$
- $\text{ZnSO}_4 \xrightarrow[760^\circ\text{C}]{\Delta} \text{ZnO} + \text{SO}_3$
- It is isomorphous with epsom salt and green vitriol.

IV. Mercury (Hg)

Ore Cinnabar – HgS

Alloy Formation

Alloy is the homogeneous solid solution of two or more metals. Transition metals have approximate same size, therefore in molten form, they can fit to each other's crystalline structures and form homogeneous mixture to form the alloy, e.g. brass (copper-zinc) and bronze (copper-tin), etc.

Other Important Compounds

Copper Sulphate ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$) (Blue Vitriol)

Preparation

- (a) $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2 + 2\text{H}_2\text{SO}_4 \longrightarrow 2\text{CuSO}_4 + 3\text{H}_2\text{O} + \text{CO}_2$
 (b) $\text{CuO} + \text{H}_2\text{SO}_4 \longrightarrow \text{CuSO}_4 + \text{H}_2\text{O}$

Properties

- It is a deep blue coloured crystalline solid, fairly soluble in water.
- $2\text{CuSO}_4 \xrightarrow{750^\circ\text{C}} 2\text{CuO} + 2\text{SO}_2 + \text{O}_2$
- $\text{CuSO}_4 + 2\text{NH}_4\text{OH} \longrightarrow \text{Cu}(\text{OH})_2 + (\text{NH}_4)_2\text{SO}_4$
- $2\text{CuSO}_4 + 4\text{KI} \longrightarrow \text{Cu}_2\text{I}_2 + \text{I}_2 + 2\text{K}_2\text{SO}_4$
- $2\text{CuSO}_4 + 4\text{KCN} \longrightarrow 2\text{Cu}(\text{CN})_2 + 2\text{K}_2\text{SO}_4$

Uses

It is used

- in electroplating, electric batteries, etc.
- in medicine as antiseptic.
- to make Fehling's solution.

Potassium Dichromate ($\text{K}_2\text{Cr}_2\text{O}_7$)

Preparation

Sodium dichromate is more soluble than potassium dichromate. Chromates and dichromates are interconvertible in aqueous solution depending upon pH of the solutions.

Structure

Properties

Sodium and potassium dichromates are strong oxidising agents thus, acidified $\text{K}_2\text{Cr}_2\text{O}_7$ will oxidise iodides to iodine, sulphides to sulphur, tin (II) to tin (IV) and iron (II) salts to iron (III).

The half-reactions of reductants are

Uses

- $\text{K}_2\text{Cr}_2\text{O}_7$ is used as an oxidising agent in volumetric analysis.
- It is used in mordant dyes, leather industry, photography (for hardening of film), cleaning glass ware.
- It is used in chromyl chloride test.

Potassium Permanganate (KMnO_4)

Preparation

Properties

It acts as a strong oxidising agent.

- In the presence of dil. H_2SO_4 , KMnO_4 is reduced to manganous salt.

To acidify KMnO_4 , only H_2SO_4 is used and not HCl or HNO_3 because HCl reacts with KMnO_4 and produce Cl_2 while HNO_3 itself acts as an oxidising agent.

Alkaline or neutral KMnO_4 solution oxidises I^- to IO_3^- , $\text{S}_2\text{O}_3^{2-}$ to SO_4^{2-} , Mn^{2+} to MnO_2 , etc.

Acidic KMnO_4 solution oxidises oxalate to CO_2 , iron (II) to iron (III), nitrites to nitrates and iodides to iodine.

Uses

- In the laboratory preparation of Cl_2 .
- As an oxidising agent, disinfectant.
- In the making of Baeyer's reagent.

Structure of permanganate ion

Mercury Halides

Mercury forms halides in two oxidation states, +1 and +2, e.g. Hg_2Cl_2 , HgCl_2

Preparation

Mercury (I) chloride is prepared by heating a mixture of mercury (II) chloride and mercury in iron vessel.

It can also be obtained by reduction of mercury (II) chloride by reducing agents like tin (II) chloride in limited quantity.

Properties

- (i) $2\text{Hg}_2\text{Cl}_2 \longrightarrow 2\text{HgCl}_2 + 2\text{Hg}$
- (ii) $\text{Hg}_2\text{Cl}_2 + 2\text{NH}_3 \longrightarrow \text{Hg}(\text{NH}_2)\text{Cl} + \text{Hg} + \text{NH}_4\text{Cl}$

Silver Nitrate (Lunar Caustic) (AgNO_3)

Preparation

Properties

- Colourless crystalline compound soluble in H_2O and alcohol with mp 212°C .
- When exposed to light, it decomposes hence, stored in a brown coloured bottle.

- It is reduced to metallic Ag by more electropositive metals like Cu, Zn, Mg and also by PH_3 .

- It dissolves in excess of KCN.

Silver Halide (Silver Bromide)

Preparation

Properties

It is a soft, pale-yellow, water insoluble salt. It has fcc structure.

Tris (triphenylphosphine product)

Tris (triphenylphosphine product)

Photography

Ordinary black and white photographic film consists of a celluloid strip that has been coated with a gelatin emulsion containing silver halides, usually AgBr.

Inner-Transition Elements(f-Block Elements)

Lanthanoids

Properties

General configuration $[\text{Xe}] 4f^{1-14}, 5d^{0-1}, 6s^2$

All the lanthanoids are silvery white soft metals and tarnish rapidly in air.

- Atomic and ionic size, from left to right, decreases due to increase in nuclear charge. This is known as **lanthanoid contraction**.
- The hydroxides are ionic and basic. The basic strength decreases from $\text{Ce}(\text{OH})_3$ to $\text{Lu}(\text{OH})_3$ due to lanthanoid contraction
- Many trivalent lanthanoid ions are coloured both in the solid state and in aqueous solutions. Neither La^{3+} nor Lu^{3+} ion shows any colour but the rest do so. Lanthanoid ions with xf -electrons have similar colour to those with $(14-x)$ f -electrons.
- The lanthanoid ions other than the f^0 type (La^{3+} and Ce^{4+}) and the f^{14} type (Yb^{2+} and Lu^{3+}) are all paramagnetic. The paramagnetism arises to maximum in neodymium.

Oxidation states Ce^{4+} (some elements) is favoured by its noble gas configuration, but it is a strong oxidant reverting to the common +3 state. The E°_{value} for $\text{Ce}^{4+}/\text{Ce}^{3+}$ is +1.74 V, the reaction rate is very slow and hence, $\text{Ce}(\text{IV})$ is a good analytical reagent.

Pr, Nd, Tb and Dy also exhibit +4 state but only in oxides. Eu^{2+} is formed by losing two s -electrons and its f^7 configuration accounts for the formation of this ion. However, Eu^{2+} is a strong reducing agent changing to the common +3 state. Similarly, Yb^{2+} which has f^{14} configuration is a reductant, Tb^{4+} has half-filled f -orbitals and it is an oxidant.

Reactivity Lanthanoids are very reactive metals like alkaline earth metals.

Actinoids

Properties

- General configuration $[\text{Rn}] 5f^{1-14}, 6d^{0-2}, 7s^2$
- Actinoids exhibit a range of oxidation states due to comparable energies of $5f, 6d$ and $7s$ orbitals. The general oxidation state of actinoids is +3.
- All the actinoids are strong reducing agents and very reactive.
- Actinoids also react with oxygen, halogen, hydrogen and sulphur, etc., like lanthanoids.
- Actinoids are radioactive in nature and therefore, it is difficult to study their chemical nature.
- The atomic and ionic radii of actinoids decreases regularly across the series due to poor shielding effect of $5f$ -electrons. This is known as **actinoid contraction**.
- The allocation of electrons to the $5f$ or $6d$ -orbitals in the actinoid atoms is more uncertain than the allocation to

the $4f$ or $5d$ orbitals in the lanthanoid atoms because the external shielding of the $5f$ electrons is less than that of the $4f$ -electrons.

Comparison of Actinoids and Lanthanoids

Lanthanoids	Actinoids
These elements show +2 and +4 oxidation states along with +3.	These elements show variable oxidation states like +4, +5, +6, +7 along with +3.
Most of the ions of lanthanoid are coloured.	The ions of actinoid are also coloured.
These elements show less tendency towards complex formation.	These elements show greater tendency towards complex formation.
Except promethium, these elements are non-radioactive.	These elements are highly radioactive.
These are less basic.	These are more basic.

Practice Exercise

- The incorrect statement for transition elements is
 - the last electron of these elements enters in d -orbital
 - the common oxidation state of these elements is +3
 - the properties of these elements is intermediate between s - and p -block elements
 - the transition elements with smaller atomic radii is scandium
- Zinc does not exhibit variable valency due to
 - presence of complete filled d -orbitals
 - inert pair effect
 - presence of $4s$ -orbital
 - None of the above
- The metal which is considered as transition metal, is
 - zinc
 - cadmium
 - mercury
 - scandium
- The ground state electronic configuration of neutral titanium atom is
 - $[\text{Ar}]4s^2 4p^2$
 - $[\text{Ar}]3d^2 4s^2$
 - $[\text{Ar}]4s^2 p_x^1 p_y^1$
 - $[\text{Ar}]3d^5$
- Among the following electronic configurations of d -orbitals, the electronic configuration showing the highest magnetic moment is
 - $3d^2$
 - $3d^5$
 - $3d^7$
 - $3d^8$
- Magnetic moment
 - increases with increasing number of unpaired electrons
 - gives indication about the number of unpaired electrons present in the atom, molecule or ion
 - its unit is Bohr Magneton (BM). A single unpaired electron has 1.73 BM magnetic moment
 - All of the above
- Which of the following compounds will show magnetic moment of 1.72 BM?
 - $[\text{Ni}(\text{CN})_4]^{2-}$
 - $[\text{CoCl}_6]^{4-}$
 - $[\text{Cu}(\text{NH}_3)_4]^{2+}$
 - TiCl_4
- Interstitial compounds are formed when small atoms are trapped inside the crystal lattice of metals. Which of the following are the characteristic properties of interstitial compounds?
 - They have high melting points in comparison to pure metals.
 - They are very hard.
 - They retain metallic conductivity.
 - They are chemically very reactive.
 - I, II and III
 - II, III and IV
 - I, III and IV
 - I, II and IV
- The element with maximum number of oxidation states in their compounds is
 - Eu
 - La
 - Gd
 - Am
- When Fe metal is rusted, it is
 - isomerised
 - decomposed
 - reduced
 - oxidised
- Ferric sulphate on heating gives
 - SO_2 and SO_3
 - SO_2
 - SO_3
 - S

12. Iron is rendered passive by treatment with conc.
 - a. HCl
 - b. H_2SO_4
 - c. H_3PO_4
 - d. HNO_3
13. Which of the following is an important ore of iron?
 - a. Smaltite
 - b. Garnierite
 - c. Pentlandite
 - d. Haematite
14. The metal which corrodes readily in moist air, is
 - a. gold
 - b. silver
 - c. iron
 - d. nickel
15. Which one of the following forms of iron can give other forms of iron?
 - a. Wrought iron
 - b. Steel
 - c. Pig iron
 - d. Cast iron
16. The oxidation state of iron in $[\text{Fe}(\text{H}_2\text{O})_5\text{NO}]^{2+}$ is
 - a. 1
 - b. 2
 - c. 3
 - d. 4
17. In weak field ligand, which one of the following cations has maximum magnetic moment?
 - a. Fe^{2+}
 - b. Cu^{2+}
 - c. Ni^{2+}
 - d. Co^{2+}
18. In the test for nitrate, the composition of brown ring is
 - a. $\text{FeSO}_4 \cdot \text{N}_2\text{O}$
 - b. $\text{FeSO}_4 \cdot \text{NO}$
 - c. FeSO_4NO_2
 - d. $\text{Fe}(\text{NO}_3)_2$
19. Copper can be extracted from
 - a. kupfer nickel
 - b. dolomite
 - c. malachite
 - d. galena
20. The colour of light absorbed by an aqueous solution of CuSO_4 is
 - a. orange-red
 - b. blue-green
 - c. yellow
 - d. violet
21. For the ions, $\text{Cu}^{2+}(3d^9)$ and $\text{Cu}^+(3d^{10})$, the correct statement is
 - a. Cu^{2+} is more stable than Cu^+
 - b. Cu^{2+} is less stable than Cu^+
 - c. Cu^{2+} and Cu^+ ions are equally stable
 - d. stability of Cu^+ and Cu^{2+} depends on the nature of copper salts
22. When CuSO_4 reacts with aqueous KI, the products are
 - a. $\text{Cu}_2\text{I}_2 + \text{K}_2\text{SO}_4$
 - b. $\text{Cu} + \text{K}_2\text{SO}_4 + \text{I}_2$
 - c. $\text{CuI}_2 + \text{K}_2\text{SO}_4$
 - d. $\text{Cu}_2\text{I}_2 + \text{K}_2\text{SO}_4 + \text{I}_2$
23. Which of the following is formed, when copper (II) sulphate is treated with excess ammonia?
 - a. A black precipitate
 - b. A red precipitate
 - c. A deep blue solution
 - d. A white precipitate turning black
24. When copper nitrate is strongly heated, the compound obtained is
 - a. copper nitrite
 - b. copper
 - c. copper nitride
 - d. copper oxide
25. Hair dye contains
 - a. copper nitrate
 - b. gold chloride
 - c. silver nitrate
 - d. lead nitrate
26. Which of the following ions will finally give a black precipitate with Ag^+ ion?
 - a. SO_3^{2-}
 - b. Br^-
 - c. CrO_4^{2-}
 - d. $\text{S}_2\text{O}_3^{2-}$
27. In the cyanide extraction process of silver from argentite ore, the oxidising and reducing agent used respectively are
 - a. O_2 and CO
 - b. O_2 and Zn dust
 - c. HNO_3 and Zn dust
 - d. HNO_3 and CO
28. Turnbull's blue is a compound, called
 - a. ferricyanide
 - b. ferrous ferrocyanide
 - c. ferrous cyanide
 - d. ferri ferrocyanide
29. Calomel (Hg_2Cl_2) on reaction with ammonium hydroxide gives
 - a. HgO
 - b. Hg_2O
 - c. $\text{NH}_2 - \text{Hg} - \text{Hg} - \text{Cl}$
 - d. HgNH_2Cl
30. Nitriding is the process of surface hardening steel by treating it in an atmosphere of
 - a. NH_3
 - b. O_3
 - c. N_2
 - d. H_2S
31. Potassium dichromate is used
 - a. in leather industry
 - b. as an oxidant for the preparation of many azo compounds
 - c. Both (a) and (b)
 - d. None of the above
32. The structures of chromate and dichromate ions are A and B respectively. Here, A and B refer to
 - a. A - tetrahedral, B - octahedral
 - b. A - tetrahedral, B - two tetrahedral
 - c. A - octahedral, B - two tetrahedral
 - d. A - two octahedral, B - octahedral
33. Consider the following statements.
 - I. Sodium dichromate is less soluble than potassium dichromate.
 - II. Crystals of potassium dichromate are of orange colour.
 - III. The chromates and dichromates are interconvertible in aqueous solution depending upon pH of the solution.
 - IV. The oxidation states of chromate and dichromate are different.
 The correct statements are
 - a. I, II, III and IV
 - b. II and IV
 - c. I and III
 - d. I and II
34. The photographic industry relies on the special light-sensitive properties of ...I... Here, I refers to
 - a. AgCl
 - b. AgBr
 - c. PdCl_2
 - d. either (a) or (b)
35. What happens when FeSO_4 solution reacts with acidified KMnO_4 solution?
 - a. Iron (II) is oxidised
 - b. KMnO_4 is oxidised
 - c. Iron (II) is reduced
 - d. Iron (III) is reduced

36. When pyrolusite is fused with KOH, the colour of the product is
 a. red b. pink
 c. black d. green
37. Which of the following is wrong?
 a. $\text{K}_2\text{Cr}_2\text{O}_7 \longrightarrow$ Orange
 b. $\text{CuSO}_4 \cdot 5\text{H}_2\text{O} \longrightarrow$ Blue
 c. $\text{MnSO}_4 \longrightarrow$ Yellow
 d. $\text{Cr}_2(\text{SO}_4)_3 \longrightarrow$ Purple
38. In which of the following compounds, Mn has highest oxidation state?
 a. K_2MnO_4 b. MnO_2
 c. KMnO_4 d. Mn_3O_4
39. KMnO_4 is used
 a. in analytical chemistry
 b. as a favourite oxidant in preparative organic chemistry
 c. in bleaching of wool, cotton and silk
 d. All of the above
40. On addition of small amount of KMnO_4 to conc. H_2SO_4 , a green oily compound is obtained which is highly explosive in nature. Identify the compound from the following.
 a. Mn_2O_7 b. MnO_2
 c. MnSO_4 d. Mn_2O_3
41. There are 14 elements in actinoid series. Which of the following elements does not belong to this series?
 a. U b. Np
 c. Tm d. Fm
42. In context of the lanthanoids, which of the following statements is not correct?
 a. There is a gradual decrease in the radii of the members with increasing atomic number in the series
 b. All the members exhibit + 3 oxidation state
 c. Because of similar properties, the separation of lanthanoids is not easy
 d. Availability of 4f electrons results in the formation of compounds in + 4 state for all the members of the series
43. Knowing that the chemistry of lanthanoids (Ln) is dominated by its +3 oxidation state, which of the following statements is incorrect?
 a. Because of the large size of the Ln (III) ions, the bonding in its compounds is predominantly ionic in character
 b. The ionic sizes of Ln (III) decrease in general with increasing atomic number
 c. Ln (III) compounds are generally colourless
 d. Ln (III) hydroxides are mainly basic in character
44. The basicity of lanthanoid hydroxides across the lanthanoid series
 a. decreases
 b. increases
 c. first decreases and then increases
 d. first increases and then decreases
45. Among the following lanthanoid ions, the paramagnetic ion is
 a. Yb^{2+} b. Eu^{2+}
 c. Lu^{3+} d. Ce^{4+}
46. The actinoids include the ...A... elements from ...B... to ...C... Here, A, B and C refer to
 a. A - fourteen, B - Th, C - Lr
 b. A - twelve, B - Lr, C - Th
 c. A - thirteen, B - Lr, C - Th
 d. A - fourteen, B - Th, C - Lr
47. Larger number of oxidation states are exhibited by the actinoids than those by the lanthanoids, the main reason being
 a. 4f orbitals are more diffused than the 5f orbitals
 b. lesser energy difference between 5f and 6d than between 4f and 5d orbitals
 c. more energy difference between 5f and 6d than between 4f and 5d orbitals
 d. more reactive nature of the actinoids than the lanthanoids
48. The f-block consists of series.
 a. two b. three
 c. four d. five
49. Actinoids possess
 a. variable valency
 b. 12 elements
 c. all synthetic elements
 d. only short-lived isotopes
50. The lanthanoid contraction is related to
 a. atomic radii
 b. atomic as well as ionic radii, M^{3+}
 c. valence electrons
 d. oxidation states
51. Lanthanoids and actinoids differ from each other because
 a. of the presence of partially filled outermost shells
 b. actinoids are radioactive in nature
 c. they show common oxidation state of + 3
 d. both are known as inner-transition elements
52. The one which is not the characteristic property of transition element, is
 a. diamagnetic behaviour b. formation of complexes
 c. catalytic activity d. variable oxidation states
53. Dichromate ions in alkaline medium exist as
 a. CrO_4^{2-} b. CrO_3
 c. Cr^{3+} d. Cr^{4-}
54. The correct formula for diamine silver chloride is
 a. $[\text{Ag}(\text{NH}_3)_2]\text{Cl}$
 b. $[\text{Ag}(\text{NH}_2)_3]\text{Cl}$
 c. $\text{AgCl} \cdot \text{NH}_3$
 d. $[\text{Ag}(\text{NH}_4)_2]\text{Cl}$
55. Which of the following oxides is used as a whole pigment?
 a. ZnO b. FeO c. NiO d. CuO

BITSAT Archives

- Mercury is a liquid metal because [2014]
 - it has a completely filled d -orbital that causes d - d overlapping
 - it has completely filled d -orbital that prevents d - d overlapping
 - it has a completely filled s -orbital
 - it has a small atomic size
- When a solution of potassium chromate is treated with an excess of dilute nitric acid, [2013]
 - Cr^{3+} and $\text{Cr}_2\text{O}_7^{2-}$ are formed
 - $\text{Cr}_2\text{O}_7^{2-}$ and H_2O are formed
 - CrO_4^{2-} is reduced to Cr^{3+}
 - CrO_4^{2-} is oxidised to $\text{Cr}_2\text{O}_7^{2-}$
- In the extraction of Ag, Zn is removed from (Zn-Ag) alloy through [2013]
 - cupellation
 - fractional crystallisation
 - distillation
 - electrolytic refining
- Green vitriol is [2012]
 - ferrous sulphate
 - tin oxide
 - zinc oxide
 - ferrous carbonate
- Pyrolusite is a/an [2011]
 - oxide ore
 - sulphide ore
 - carbide ore
 - Not an ore
- When potassium ferrocyanide crystals are heated with conc. H_2SO_4 , the gas evolved is [2011]
 - SO_2
 - NH_3
 - CO_2
 - CO
- van-Arkel method is based on [2010]
 - cupellation method
 - furnace refining method
 - poling method
 - None of the above
- Oil paintings turn blackish after some time. The salt formed is [2010]
 - SnS
 - CuS
 - PbS
 - CdS
- The extraction of which of the following metals involves bessemerisation? [2009]
 - Fe
 - Ag
 - Al
 - Cu
- A metal X on heating in nitrogen gas gives Y . Y on treatment with water gives a colourless gas which when passed through CuSO_4 solution gives a blue colour. Y is [2008]
 - $\text{Mg}(\text{NO}_3)_2$
 - Mg_3N_2
 - NH_3
 - MgO

Answer with Solutions

Practice Exercise

- (d) Scandium is the first element of $3d$ series and possesses largest atomic radii because atomic radii decrease on moving along the period.
- (a) Zinc contains completely filled d -orbitals and exhibit stable electronic configuration, therefore it does not easily lose their electrons and hence, does not exhibit variable valency.
- (d) Zinc, cadmium and mercury of group 12 have full d^{10} configuration in their ground state as well as in their common oxidation states and thus, are not regarded as transition metals.
- (b) The ground state electronic configuration of Ti is $[\text{Ar}] 3d^2 4s^2$
- (b)
- (d) The magnetic moment is determined by the number of unpaired electrons and is calculated by using the 'spin-only' formula, i.e. $\mu = \sqrt{n(n+2)} \text{ BM}$
where, n is the number of unpaired electrons and μ is the magnetic moment in units of Bohr Magnetron (BM).
A single unpaired electron has a magnetic moment of 1.73 Bohr Magnetron (BM).
- (c) Cu has +2 oxidation state in $[\text{Cu}(\text{NH}_3)_4]^{2+}$.
Electronic configuration of Cu^{2+} ($Z = 29$) is $[\text{Ar}]^{18} 3d^9 4s^0$
Number of unpaired electrons (n) = 1
Magnetic moment = $\sqrt{n(n+2)} \text{ BM} = \sqrt{1(1+2)} = 1.73 \text{ BM}$
- (a) Interstitial compounds have high melting points in comparison to pure metals. They are very hard and retain metallic conductivity. They are chemically inert.
- (d)
- (d) Fe is oxidised, $\text{Fe} \longrightarrow \text{Fe}^{2+} + 2e^-$
- (c) $\text{Fe}_2(\text{SO}_4)_3 \xrightarrow{\Delta} \text{Fe}_2\text{O}_3 + 3\text{SO}_3$
- (d) Conc. HNO_3 renders iron passive by forming a thin protective film of Fe_3O_4 on its surface.
- (d) Haematite (Fe_2O_3)
Garnierite is hydrated double silicate of Mg and Si having 5-8% Ni. Pentlandite (NiS) ore associated with copper and iron pyrite.
- (c) Iron is covered by a layer of hydrated iron oxide ($\text{Fe}_2\text{O}_3 \cdot x\text{H}_2\text{O}$), i.e. rust on exposure to moist air.
- (c) The iron produced in the blast furnace is known as pig iron.

16. (a) H_2O is a neutral ligand but NO possesses +1 oxidation state in the compound of Fe .

Hence, oxidation state of Fe in the given compound is calculated as

$$x + 0 + 1 = 2; x = +1$$

17. (a) Fe^{2+} has maximum number of unpaired electrons.

18. (b) $3\text{Fe}^{2+} + \text{NO}_3^- + 4\text{H}^+ \longrightarrow \text{NO} + 3\text{Fe}^{3+} + 2\text{H}_2\text{O}$

19. (c) Copper can be extracted from malachite $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$.

20. (a) The aqueous solution of CuSO_4 consists of the complex $[\text{Cu}(\text{H}_2\text{O})_4]^{2+}$ ion which absorbs in orange-red region and impart deep blue colouration to the solution.

21. (a)

22. (d) $2[\text{CuSO}_4] + 2\text{KI} \longrightarrow \text{CuI}_2 + \text{K}_2\text{SO}_4$

23. (c) Tetraamino cupric ion is formed.

24. (d) $2\text{Cu}(\text{NO}_3)_2 \xrightarrow{\Delta} 2\text{CuO} + 4\text{NO}_2 + \text{O}_2$

25. (c) Hair dye contains silver nitrate.

26. (d) $2\text{Ag} + \text{S}_2\text{O}_3^{2-} \longrightarrow \text{Ag}_2\text{S}_2\text{O}_3$, white ppt which readily changes to yellow, orange, brown and finally black due to the formation of silver sulphide.

27. (b) The reactions involved in the extraction of silver by cyanide process are

In the first reaction, sulphide is oxidised by oxygen to SO_2 and in the second reaction, silver ion is reduced by Zn to Ag . Therefore, O_2 is oxidising agent and Zn is reducing agent.

28. (b) Ferrous ferrocyanide, $\text{Fe}_2[\text{Fe}(\text{CN})_6]$ is Turnbull's blue.

29. (d) $\text{Hg}_2\text{Cl}_2 + 2\text{NH}_3 \longrightarrow \text{HgNH}_2\text{Cl} + \text{Hg} \downarrow + \text{NH}_4\text{Cl}$
- White Black

30. (a) When steel is treated in the presence of NH_3 , iron nitride on the surface of steel is formed which imparts a hard coating. This process is called nitriding.

31. (c) $\text{K}_2\text{Cr}_2\text{O}_7$ is used in leather industry and as an oxidant for the preparation of many azo compounds.

32. (b) The structures of chromate and dichromate ions are tetrahedral and two tetrahedrals, respectively.

33. (c)

34. (b) The photographic industry relies on the special light sensitive properties of AgBr .

35. (a) $5\text{Fe}^{2+} + \text{MnO}_4^- + 8\text{H}^+ \longrightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O} + 5\text{Fe}^{3+}$

36. (d) $\text{MnO}_2 + 2\text{KOH} + [\text{O}] \longrightarrow \text{K}_2\text{MnO}_4 + \text{H}_2\text{O}$

K_2MnO_4 produced is green in colour.

37. (c) MnSO_4 is light pink.

38. (c) It is +7.

In others, (a) + 6 (b) + 4 (d) + 8/3

39. (d) KMnO_4 is used in analytical chemistry, as a favourite oxidant in preparative organic chemistry in bleaching of wool, cotton and silk.

40. (a) On addition of small amount of KMnO_4 to conc. H_2SO_4 , a greeny oily compound is obtained which is highly explosive in nature. This compound is Mn_2O_7 .

41. (c) The element, Tm does not belong to actinoid series.

42. (d) Formation of + 4 state requires very high energy, thus incorrect.

43. (c) Lanthanoids in +3 oxidation state usually have unpaired electron in f -subshell and impart characteristic colour in solid as well as in solution state due to $f-f$ transition (except lanthanum and lutetium).

44. (a) On moving from left to right across the lanthanoid series, basicity of lanthanoid hydroxides decreases.

45. (b) The valence shell electronic configuration of the given ions are

Hence, Eu^{2+} is paramagnetic as it contains 7 unpaired electrons.

46. (a) The actinoids include the fourteen elements from Th to Lr .

47. (b) Lanthanoids $[\text{Xe}] 4f^{1-14} 5d^{0-1} 6s^2$

Lanthanoids and actinoids use core d and f -orbitals also to show higher oxidation state. As actinoids have comparatively low energy difference between f and d -orbitals, thus show more oxidation states.

48. (a) The f -block consists of two series of lanthanoids and actinoids.

49. (a)

50. (b) Lanthanoid contraction is related to both atomic and ionic radii, M^{3+} .

51. (b) All lanthanoids except promethium are non-radioactive whereas all actinoids are radioactive in nature.

52. (a) Since, the d -orbitals are partially filled in transition metal atoms/ions, they exhibit paramagnetism and not diamagnetism.

53. (a) $2\text{OH}^- + \text{Cr}_2\text{O}_7^{2-} \longrightarrow 2\text{CrO}_4^{2-} + \text{H}_2\text{O}$

54. (a) Diammine means 2NH_3 in the coordination sphere.

55. (a)

BITSAT Archives

1. (b) The electronic configuration of mercury is $[\text{Xe}] 4f^{10}, 5d^{10}, 6s^2$. Its d -subshell is completely filled, thus, it prevents the overlapping of d -orbitals (d - d overlapping). Hence, it is liquid at room temperature.

2. (b) The reaction of K_2CrO_4 with dilute nitric acid is represented as

3. (c)

4. (a) $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ is known as green vitriol.

5. (a) Pyrolusite is MnO_2 . Thus, it is an oxide ore.

6. (d) $\text{K}_4[\text{Fe}(\text{CN})_6] + 6\text{H}_2\text{SO}_4 + 6\text{H}_2\text{O} \longrightarrow 2\text{K}_2\text{SO}_4 + \text{FeSO}_4 + 3(\text{NH}_4)_2\text{SO}_4 + 6\text{CO}$

7. (d) van-Arkel method is based on vapour phase refining.

8. (c)

9. (d) In a bessemer converter, copper pyrites are oxidised to FeO and Cu_2O . FeO is slagged off. Cu_2O reacts with Cu_2S left unoxidised to give Cu .

10. (b) Only NH_3 gas gives deep blue solution with CuSO_4 . NH_3 is obtained by the reaction of nitride of metal with water.

20

Coordination Compounds and Organometallics

Complex or Coordination Compounds

These are those molecular compounds which retain their identity in solid as well as in aqueous solution. In these compounds, metal atoms are bound to a number of anions or neutral molecules by coordinate bonds. A part of these compounds is not dissociated in solution and its behaviour is different than its constituents.

Important Terms

1. Complex Ion

It is an electrically charged species in which central metal atom or ion is surrounded by number of ions or molecules.

2. Ligands

The ions or molecules bound to the central atom/ion in the coordination entity are called ligands.

Types of Ligands

(i) **Unidentate ligand** It is bound to a metal ion through a single donor atom.

e.g. H_2O , NH_3 , CO , Cl^- , NH_2^- etc.

(ii) **Didentate ligand** It is bound to a metal ion through two donor atoms.

(iii) **Polydentate ligand** It is bound to a metal ion through several donor atoms, e.g. ethylene diamine tetra acetate ion $[\text{EDTA}]^{4-}$.

(iv) **Ambidentate ligands** It can ligate through two different atoms.

e.g. $-\text{NO}_2$, $-\text{ONO}$, $-\text{SCN}$, $-\text{NCS}$ etc.

(v) **Chelate ligands** may be di or polydentate ligands which form closed ring with central metal ion. Closed ring is known as chelate ring and this process is called chelation.

More the number of chelate rings in a complex, complex will be more stable. The number of such ligating groups is called the **denticity**.

3. Coordination Number

The number of chemical bonds formed by the ligands with central metal atom or ion is called the coordination number of that complex.

In case of monodentate ligand, it is equal to the number of ligands while in bidentate ligand it is equal to the $2 \times$ number of ligands present in the complex.

4. Coordination Sphere

The central metal ion and the ligands attached to it are enclosed in square bracket which is known as coordination sphere. The ionisable group written outside the bracket is known as counter ions.

5. Oxidation Number of Central Atom

The charge of the complex if all the ligands are removed along with the electron pairs that are shared with the central atom, is called oxidation number of central atom.

Nomenclature of Coordination Compounds

1. Cationic Complex $[\text{Co}(\text{NH}_3)_4\text{Cl}(\text{NO}_2)]\text{NO}_3$

2 1 3
Tetraamminechloronitrocobalt (III) nitrate

- Prefixes mono, di, tri etc.,..... are used to indicate the number of the individual ligands and ligands are named in alphabetical order.
- Central metal atom and its oxidation state is indicated by Roman numeral in parenthesis.
- Name of ionisable anion.

2. Anionic Complex $\text{K}_3[\text{Fe}(\text{CN})_6]$

1 3 2
Potassiumhexacyanoferrate (III)

- Name of ionisable metal.
- Name of ligand in alphabetical order.
- Central metal atom + ate and oxidation state.

3. Neutral Complex $[\text{Pt}(\text{NH}_3)_2\text{Cl}(\text{NO}_2)]$

2 1
Diamminechloronitrito-N-platinum (II)

- Name of ligands in alphabetical order.
- Central metal atom and its oxidation state.

NOTE The oxidation state of Fe is + 2 in sodium nitroprusside, $\text{Na}_2[\text{Fe}(\text{CN})_5\text{NO}]$ and it has the ligand nitrosonium ion, NO^+ . When $\text{Fe}^{2+}(\text{aq})$ is added to $\text{K}_3[\text{Fe}(\text{CN})_6]$, the product obtained is Turnbull's blue but on addition of $\text{Fe}^{3+}(\text{aq})$ to $\text{K}_4[\text{Fe}(\text{CN})_6]$, the product Prussian blue is obtained.

Isomerism in Coordination Compounds

It is a phenomenon, in which compounds have the same molecular formula but different physical and chemical properties on account of different structures. These compounds are called **isomers**.

1. Stereo Isomerism

It occurs due to different arrangements of ligands around central metal atom.

It is of two types, i.e. geometrical isomerism and optical isomerism.

- (i) **Geometrical Isomerism** It arises in heteroleptic complexes due to different possible geometric arrangements of the ligands. Important examples of this behaviour are found in square planar and octahedral complexes.

(a) Square planar complex of formula $[\text{MX}_2\text{L}_2]$

(X and L are unidentate)

Two X ligands may be arranged adjacent to each other in a *cis*-isomer or opposite to each other in a *trans*-isomer.

e.g. $[\text{Pt}(\text{NH}_3)_2\text{Cl}_2]$

(b) Square planar complex of the type $[\text{MABXL}]$ (where A, B, X, L are unidentate) shows three isomers, two *cis* and one *trans*. Such isomerism is not possible for tetrahedral geometry.

e.g. $[\text{Pt}(\text{NH}_3)(\text{Br})(\text{Cl})(\text{Py})]$

(c) Square planar complex of type $\text{M}(\text{XL})_2$, here, XL is unsymmetrical didentate ligand, e.g. $[\text{Pt}(\text{gly})_2]$

(d) Octahedral complexes of formula $[\text{MX}_2\text{L}_4]$ in which the two ligands X may be oriented *cis* or *trans* to each other, e.g. $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]^+$.

(e) Octahedral complexes of formula $[\text{MX}_2\text{A}_2]$ (where X are unidentate ligands and A are didentate ligands) form *cis* and *trans*-isomers, e.g. $[\text{CoCl}_2(\text{en})_2]$.

- (f) **Octahedral coordination entities of the type $[Ma_3b_3]$** like $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]$. If three donor atoms of the same ligands occupy adjacent positions at the corners of an octahedral face, we have the *facial (fac)* isomer. When the positions are around the meridian of the octahedron, we get the *meridional (mer)* isomer.

NOTE Tetrahedral complexes do not show geometrical isomerism. Octahedral complexes of type $[\text{M}(\text{AA})_3]$, MA_6 and MA_5B do not show geometrical isomerism. $\text{MA}_2\text{X}_2\text{Y}_2$ shows both optical and geometrical isomerism.

- (ii) **Optical Isomerism** It arises when mirror images cannot be superimposed on one another. These mirror images are called **enantiomers**. The two forms are called *dextro (d)* and *laevo (l)*.

Optical isomerism is common in octahedral complexes having atleast one didentate ligand.

e.g. $[\text{Co}(\text{en})_3]^{3+}$, $[\text{PtCl}_2(\text{en})_2]^{2+}$ etc.

2. Structural Isomerism

In structural isomerism, isomers have different bonding pattern.

Different types of structural isomerism is as follows :

- (i) **Linkage isomerism** It arises in a coordination compound containing ambidentate ligand.
e.g. $[\text{Co}(\text{NH}_3)_5(\text{NO}_2)]\text{Cl}_2$ and $[\text{Co}(\text{NH}_3)_5(\text{ONO})]\text{Cl}_2$
- (ii) **Coordination isomerism** It arises from the interchange of ligands between cationic and anionic entities of different metal ions present in a complex.
e.g. $[\text{Co}(\text{NH}_3)_6][\text{Cr}(\text{CN})_6]$ and $[\text{Cr}(\text{NH}_3)_6][\text{Co}(\text{CN})_6]$
- (iii) **Ionisation isomerism** When the ionisable anion exchange with anion ligand.
e.g. $[\text{Co}(\text{NH}_3)_5\text{SO}_4]\text{Br}$ and $[\text{Co}(\text{NH}_3)_5\text{Br}]\text{SO}_4$
- (iv) **Solvate isomerism** It is also known as “hydrate isomerism”. In this case water is involved as a solvent.
e.g. $[\text{Cr}(\text{H}_2\text{O})_6]\text{Cl}_3$, $[\text{Cr}(\text{H}_2\text{O})_5\text{Cl}]\text{Cl}_2 \cdot \text{H}_2\text{O}$ and $[\text{Cr}(\text{H}_2\text{O})_4\text{Cl}_2]\text{Cl} \cdot 2\text{H}_2\text{O}$

Bonding in Coordination Compounds

The bonding formation in coordination compounds can be explained by using the two approaches as given below :

Werner's Theory

- (i) In complex compounds, metal atom exhibit two types of valencies—primary valency and secondary valency.
- (ii) Primary valencies are satisfied by anions only while secondary valencies are satisfied by ligands. Primary valency depends upon oxidation number of central metal atom while secondary valency represents the coordination number of central metal atom.

- (iii) Primary valencies are ionisable and are non-directional while secondary valencies are non-ionisable and directional. Therefore, geometry of complex is decided by secondary valencies.

e.g. $[\text{Cr}(\text{H}_2\text{O})_6]\text{Cl}_3$ has primary valency = 3 (ON of Cr) and secondary valency = 6 (CN of Cr)

EAN (Effective Atomic Number) Rule

The EAN is calculated by using following formula :

$$\text{EAN} = Z - x + 2c$$

where, Z = atomic number of metal

x = number of electrons lost by the metal in complex formation (oxidation number)

c = number of pairs of electrons accepted by metal (coordination number)

Complex	EAN ($Z - x + 2c$)	e^- in next inert gas
(Complexes whose central atom obeys EAN rule)		
$[\text{Pd}(\text{NH}_3)_6]^{4+}$	$46 - 4 + 2 \times 6 = 54$	54 (Xe)
$\text{K}_4[\text{Fe}(\text{CN})_6]$	$26 - 2 + 2 \times 6 = 36$	36 (Kr)

Valence Bond Theory

According to this theory, the metal atom or ion under the influence of ligands form inner orbital and outer orbital complex. These hybridised orbitals are allowed to overlap with ligand orbitals that can donate electron pairs for bonding.

1. Six Ligands (unidentate) Octahedral Entity

Such complexes are of the following two types :

- (i) **Inner orbital complexes** (hyperligated complexes) which are formed due to strong field ligands or low spin ligands, has hybridisation d^2sp^3 and shape of complex will be octahedral.

(a) **Inner orbital complex $[\text{Co}(\text{NH}_3)_6]^{3+}$**

All electrons are paired, therefore complex will be diamagnetic in nature.

- (ii) **Outer orbital complexes** (hypoligated complexes) which are formed due to weak field ligands or high spin ligands, has sp^3d^2 -hybridisation.

Generally, halides (F^- , Cl^- , Br^- , I^-), SCN^- , S^{2-} form outer orbital complexes and other ligands form inner orbital complexes.

e.g.

(b) **Outer Orbital Complex** $[CoF_6]^{3-}$

Complex has unpaired electrons, therefore it will be paramagnetic in nature.

2. Four-ligands (unidentate), Tetrahedral and Square Planar Entity

Tetrahedral complexes can also form inner orbital or outer orbital complexes, characteristics of which are shown below:

Generally, halide (F^- , Cl^- , Br^- , I^-) ligands, $[Ni(CO)_4]$, $[Co(CO)_4]$, $[Zn(NH_3)_4]^{2+}$ complexes form outer orbital complexes and other form inner orbital complexes, e.g.

Type of hybridisation	Geometrical shape	d-orbitals used	CN	Common examples
sp^3	Tetrahedral	—	4	$[Zn(NH_3)_4]^{2+}$ $[Ni(CO)_4]$
dsp^2/sp^2d	Square planar	$d_{x^2-y^2}$	4	$[Ni(CN)_4]^{2-}$
sp^3d	Trigonal bipyramidal	d_{z^2}	5	$[Ni(CN)_5]^{3-}$
d^2sp^3	Octahedral inner orbital complex	$d_{z^2}, d_{x^2-y^2}$	6	$[Fe(CN)_6]^{3-}$
sp^3d^2	Octahedral counter orbital complex	$d_{x^2-y^2}, d_{z^2}$	6	$[Co(H_2O)_6]^{2+}$ $[FeF_6]^{3-}$, $[CoF_6]^{3-}$

Limitations of Valence Bond Theory

It suffers from the following shortcomings:

- It involves a number of assumptions.
- It describes bonding in coordination compounds only qualitatively.
- It does not describe the detailed magnetic properties of coordination compounds.
- It does not give a quantitative interpretation of the thermodynamic or kinetic stabilities of coordination compounds.
- It does not make exact predictions regarding the tetrahedral and square planar structures of 4-coordinate complexes.
- It does not distinguish between weak and strong ligands.

Crystal Field Theory (CFT)

The splitting of five d-orbitals into lower and higher energy levels due to approach of ligands, is known as crystal field theory. The five d-orbitals in a gaseous metal atom/ion have same energy.

Crystal Field Splitting in Octahedral Coordination Entities

- Energy separation is denoted by Δ_o (the subscript o, is for octahedral). This is also known as crystal field splitting energy (CFSE).
- The energy of the two e_g orbitals (higher energy orbitals) will increase by $(3/5) \Delta_o$ and that of the three t_{2g} (lower energy orbitals) will decrease by $(2/5) \Delta_o$.
- If $\Delta_o < P$, the fourth electron enters one of the e_g orbitals giving the configuration $t_{2g}^3 e_g^1$. Ligands for which $\Delta_o < p$ are known as weak field ligands and form high spin complexes.

- If $\Delta_o > P$, it becomes more energetically favourable for the fourth electron to occupy a t_{2g} orbital with configuration $t_{2g}^4 e_g^0$. Ligands which produce this effect are known as strong field ligands and form low spin complexes.
- Where, P represents the energy required for electron pairing in a single orbital (pairing energy).

Crystal Field Splitting in Tetrahedral Coordination Entities

In tetrahedral coordination entities, $\Delta_t = (4/9)\Delta_o$.

Consequently, the orbital splitting energies are not sufficiently large for forcing pairing and therefore, low spin configurations are rarely observed. Due to less crystal field stabilisation energy, it is not possible to pair electrons and so all the tetrahedral complexes are high spin.

Spectrochemical Series

An arrangement of ligands in order of increasing crystal field strength is spectrochemical series.

Magnetic Properties

The diamagnetic (repulsion from the applied magnetic field due to the presence of paired electrons) and paramagnetic (attraction towards the applied magnetic field due to the presence of unpaired electrons) behaviour of coordination compound is explained on the basis of crystal field theory.

e.g. Co^{3+} ion shows diamagnetic properties in $[Co(NH_3)_6]^{3+}$ complex ion but in $[CoF_6]^{3-}$, it shows paramagnetic properties. In $[Co(NH_3)_6]^{3+}$ complex ion, NH_3 acts as a strong ligand which causes pairing of electrons.

In this case, energy required to pair up the electrons is smaller than Δ_o . Whereas in $[CoF_6]^{3-}$ complex, F^- acts as a weak ligand that does not allow the pairing of electrons as energy required to pair the electrons is higher than Δ_o .

Colour of the Complexes

The electrons can be excited from lower energy to higher energy state by the absorption of even lower energy radiations. Thus, due to $d-d$ transition of the electrons, coordination compounds show different colours.

Stability Constants

Stability of a complex can be expressed in terms of stability constant, k . If the complex is ML_n and β_n is the overall formation constant, then

$$M + nL \rightleftharpoons ML_n$$

$$\beta_n = \frac{[ML_n]}{[M][L]^n} = k_1 \times k_2 \times k_3 \dots k_n$$

where, $k_1, k_2, \dots, k_n$ are called stepwise formation constants. [Alternatively $1/k$ is known as instability constant.

Application of Coordination Compounds

Estimation of Hardness of Water

EDTA is used in the estimation of hardness of water by volumetric technique as it is hexadentate ligand and forms complex with various metal ions such as Ca^{2+} and Mg^{2+} .

Quantitative Analysis of Metal Ions

- (i) Separation of group II B sulphides from group II A sulphide is based upon the fact that sulphides of group II B forms complex sulphides with yellow ammonium sulphide that are soluble in water.

- (ii) Cu^{2+} ion is detected by the formation of deep blue coloured tetraamine copper sulphate complex $[Cu(NH_3)_4]SO_4$ by the addition of NH_3 to Cu^{2+} ions solution.

Extraction of Metals

The property of the formation of coordination compounds by the metals is used in the extraction of metals like Ag and Au.

Complex formed by nickel with carbonyl $[Ni(CO)_4]$ is used for the extraction and purification of nickel.

In Biological System

Cyclic ligands impart extra stability to coordinate compounds. Thus, Mg in chlorophyll and iron in haemoglobin are stable towards dissociation due to the formation of coordination compounds.

Haemoglobin of the blood gets oxygenated through the binding of dioxygen, O_2 to the ferrous ions in haemoglobin.

Organometallics

Compounds, in which a metal atom is directly attached with carbon atom of an organic compound or radical, are called organometallics. These compounds are broadly divided into three types, depending upon the bonding.

- (a) **σ -bonded Organometallics** Grignard reagent $(R-Mg)X$, TEL $(C_2H_5)_4Pb$, TMS (tetramethyl silane), $(CH_3)_4Si$, $(C_2H_5)_2Zn$ etc., are σ -bonded organometallic compounds.

- (b) **π -bonded Organometallics** These are formed mainly by transition metals. Examples are ferrocene, $[\text{Fe}(\eta^2 - \text{C}_5\text{H}_5)_2]$, dibenzene chromium $[\text{Cr}(\eta^6 - \text{C}_6\text{H}_6)_2]$, Zeisse's salt $\text{K}[\text{Pt}(\eta^2 - \text{C}_2\text{H}_4)\text{Cl}_3]$ etc.
- The prefixes η^2 , η^6 and η^2 indicate that 2, 6 and 2-carbon atoms are bound to the metal respectively.
- (c) **σ -and π -bonded Organometallics** Transition metal carbonyls are of this type, e.g. $[\text{Ni}(\text{CO})_4]$, $[\text{Fe}(\text{CO})_5]$ etc.

Some Important Organometallics

- (i) Grignard reagent (RMgX) is very useful in organic synthesis.
- (ii) *Zeigler-Natta* catalyst (TiCl_4 and aluminium) is used in catalysing polymerisation.
- (iii) TEL is used as antiknock compound in petroleum.

Practice Exercise

- According to Lewis, the ligands are
 - acidic in nature
 - basic in nature
 - neither acidic nor basic
 - some are basic and others are acidic
- Which of the following represent hexadentate ligand?
 - 2, 2-bipyridyl
 - DMG
 - Ethylenediamine
 - None of these
- In $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, copper is coordinated to
 - 5 water molecules
 - 4 water molecules
 - one sulphate ion
 - one water molecule
- Coordination number of Cr is six. A complex ion of Cr with $\text{C}_2\text{O}_4^{2-}$, en and superoxide ion, O_2^- has the formula, $[\text{Cr}(\text{C}_2\text{O}_4)_x(\text{en})_y(\text{O}_2)_z]^-$. The ratio $x:y:z$ will be
 - 1:1:1
 - 1:1:2
 - 1:2:2
 - 2:1:1
- The oxidation number of Fe in $\text{K}_4[\text{Fe}(\text{CN})_6]$ is
 - 2
 - 3
 - 0
 - 1
- Identify the species with an atom in +6 oxidation state present in the following complexes.
 - CrO_2Cl_2
 - $[\text{Cr}(\text{CN})_6]^{3-}$
 - $[\text{NiF}_6]^{2-}$
 - MnO_4^-
- The oxidation state of cobalt in

$$\left[(\text{NH}_3)_4\text{Co} \begin{array}{c} \text{NH} \\ \diagup \quad \diagdown \\ \text{NO}_2 \end{array} \text{Co}(\text{NH}_3)_4 (\text{NO}_3)_4 \right]$$
 is
 - 2
 - 3
 - 4
 - 6
- The coordination number of Co in $[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$ is
 - 2
 - 5
 - 6
 - 1
- The type of isomerism shown by $[\text{Co}(\text{en})_2(\text{NCS})_2]\text{Cl}$ and $[\text{Co}(\text{en})_2(\text{NCS})\text{Cl}]\text{NCS}$ is
 - coordination
 - ionisation
 - linkage
 - All of the above
- Which of the following compound would exhibit coordination isomerism?
 - $[\text{Cr}(\text{H}_2\text{O})_6]\text{Cl}_3$
 - $[\text{Cr}(\text{NH}_3)_6][\text{Co}(\text{CN})_6]$
 - $[\text{Cr}(\text{en})_2]\text{NO}_2$
 - $[\text{Ni}(\text{NH}_3)_6][\text{BF}_4]_2$
- The planar complex *Mabcd* gives
 - two optical isomers
 - two geometrical isomers
 - three optical isomers
 - three geometrical isomers
- Which will not show geometrical isomerism?
 - $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]^+$
 - $[\text{Co}(\text{en})_3]^{3+}$
 - $[\text{Co}(\text{en})_2\text{Cl}_2]\text{Cl}$
 - $[\text{Cr}(\text{NH}_3)_4\text{Cl}_2]\text{Cl}$
- Geometrical isomerism is shown by
 - $[\text{Ni}(\text{NH}_3)_5\text{Br}]^+$
 - $[\text{Cr}(\text{NH}_3)_4(\text{en})]^{3+}$
 - $[\text{Co}(\text{en})_3]^{3+}$
 - $[\text{Co}(\text{NH}_3)_2(\text{en})_2]^{3+}$
- Optical isomerism is exhibited by
 - $[\text{Cr}(\text{NH}_3)_6]^{3+}$
 - $[\text{Cr}(\text{en})(\text{H}_2\text{O})_4]^{3+}$
 - trans*- $[\text{Cr}(\text{en})_2\text{Cl}_2]^+$
 - $[\text{Cr}(\text{en})_3]^{3+}$
- The number of isomers of $[\text{Cu}''(\text{NH}_3)_4][\text{Pt}''\text{Cl}_4]$ are
 - 6
 - 3
 - 4
 - 5
- Amongst the following pair of enantiomers is given by
 - $[\text{Cr}(\text{NH}_3)_6][\text{Co}(\text{CN})_6]$
 - $[\text{Co}(\text{en})_2\text{Cl}_2]\text{Cl}$
 - $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]\text{NO}_2$
 - $[\text{Pt}(\text{NH}_3)_4][\text{PtCl}_6]$
- $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]\text{NO}_2$ and $[\text{Co}(\text{NH}_3)_4\text{Cl}(\text{NO}_2)]\text{Cl}$ exhibit which type of isomerism?
 - Geometrical
 - Optical
 - Linkage
 - Ionisation
- The difference in colour is due to
 - optical isomerism
 - geometrical isomerism
 - linkage isomerism
 - nuclear isomerism

19. EAN of iron in $K_4[Fe(CN)_6]$ is
 a. 36 b. 34 c. 38 d. 40
20. Which of the following complexes will give white precipitate with $BaCl_2$ solution?
 a. $[Cr(NH_3)_5SO_4]Cl$ b. $[Co(NH_3)_4Cl_2]NO_2$
 c. $[Cr(NH_3)_5Cl]SO_4$ d. Both (a) and (c)
21. Sodium nitroprusside when added to an alkaline solution of sulphide ions produces purple colouration due to the formation of
 a. $Na[Fe(H_2O)_5NOS]$ b. $Na_4[Fe(CN)_5NOS]$
 c. $Na_3[Fe(CN)_5NOS]$ d. $Na_4[Fe(H_2O)_5NOS]$
22. Which of the following has highest conductivity in water?
 a. $Fe_3[Fe(CN)_6]_2$ b. $K_3[Fe(CN)_6]$
 c. $Ag(NH_3)_2Cl$ d. $[Cr(NH_3)_6]Cl_6$
23. How many moles of $AgCl$ would be obtained, when 100 mL of 0.1 M $Co(NH_3)_5Cl_3$ is treated with excess of $AgNO_3$?
 a. 0.01 b. 0.02
 c. 0.03 d. None of these
24. High spin complex $[FeCl_6]^{3-}$ has the d -configuration as
 a. $t_{2g}^3 e_g^2$ b. t_{2g}^5 c. $t_{2g}^2 e_g^3$ d. e_g^5
25. Unpaired electrons in $[FeCl_6]^{3-}$ and $[Fe(CN)_6]^{3-}$ are respectively
 a. 5 and 2 b. 5 and 1 c. 3 and 2 d. 2 and 3
26. Among the complexes, $[Ni(CO)_4]$, $[Ni(CN)_4]^{2-}$ and $[NiCl_4]^{2-}$,
 a. $[Ni(CO)_4]$ is diamagnetic but $[Ni(CO)_4]$ and $[Ni(CN)_4]^{2-}$ are paramagnetic
 b. $[Ni(CN)_4]^{2-}$ and $[Ni(CO)_4]$ are diamagnetic but $[NiCl_4]^{2-}$ is paramagnetic
 c. $[NiCl_4]^{2-}$ and $[Ni(CO)_4]$ are diamagnetic but $[Ni(CN)_4]^{2-}$ is paramagnetic
 d. $[NiCl_4]^{2-}$ and $[Ni(CN)_4]^{2-}$ are diamagnetic but $[Ni(CO)_4]$ is paramagnetic
27. Which of the following shell form an octahedral complex?
 a. d^4 (low spin) b. d^2 (high spin)
 c. d^6 (low spin) d. None of these
28. The geometry of the compound $[Pt(NH_3)_2Cl_2]$ is
 a. square planar
 b. pyramidal
 c. tetrahedral
 d. octahedral
29. Which of the following is paramagnetic?
 a. $[Co(NH_3)_6]^{3+}$
 b. $[Ni(CO)_4]$
 c. $[NiF_4]^{2-}$
 d. $[Ni(CN)_4]^{2-}$
30. The value for crystal field stabilisation energy for an octahedral complex, $[CoCl_6]^{4-}$ is 18000 cm^{-1} . The value for crystal field stabilisation energy for tetrahedral complex is
 a. 16000 cm^{-1} b. 8000 cm^{-1}
 c. 20000 cm^{-1} d. 18000 cm^{-1}
31. The colour of the coordination compounds depends on the crystal field splittings. What will be the correct order of absorption of wavelength of light in the visible region, for the complexes, $[Co(NH_3)_6]^{3+}$, $[Co(CN)_6]^{3-}$ and $[Co(H_2O)_6]^{3+}$?
 a. $[Co(CN)_6]^{3-} > [Co(NH_3)_6]^{3+} > [Co(H_2O)_6]^{3+}$
 b. $[Co(NH_3)_6]^{3+} > [Co(H_2O)_6]^{3+} > [Co(CN)_6]^{3-}$
 c. $[Co(H_2O)_6]^{3+} > [Co(NH_3)_6]^{3+} > [Co(CN)_6]^{3-}$
 d. $[Co(CN)_6]^{3-} > [Co(NH_3)_6]^{3+} > [Co(H_2O)_6]^{3+}$
32. Which of the following species is not expected to be a ligand?
 a. No b. NH_4^+
 c. $NH_2CH_2CH_2NH_2$ d. CO
33. Which one of the following compounds is not colored?
 a. $Na_2[CuCl_4]$
 b. $Na_2[CdCl_4]$
 c. $[Cr(H_2O)_6]Cl_3$
 d. $K_3[Fe(CN)_6]$
34. Which of the following is paramagnetic?
 a. $K_4[Fe(CN)_6]$
 b. $K_3[Fe(CN)_6]$
 c. $Ni(CO)_4$
 d. $[Co(NH_3)_6]Cl_3$
35. The stabilisation of coordination compounds due to chelation is called the chelate effect. Which of the following is the most stable complex species?
 a. $[Fe(CO)_5]$
 b. $[Fe(CN)_6]^{3-}$
 c. $[Fe(C_2O_4)_3]^{3-}$
 d. $[Fe(H_2O)_6]^{3+}$
36. Which of the following is not an example of organometallic compound?
 a. Trimethyl boron
 b. Trimethyl aluminium
 c. Sodium ethoxide
 d. Tetracarbonyl nickel
37. Among the following, which is not the π -bonded organometallic compound?
 a. $K[PtCl_3(\eta^2-C_2H_4)]$ b. $Fe(\eta^5-C_5H_5)_2$
 c. $(CH_3)_4Sn$ d. $Cr(\eta^6-C_6H_6)_2$
38. Which is not a π -bonded complex?
 a. Zeise's salt
 b. Ferrocene
 c. Dibenzene chromium
 d. Tetraethyl lead

BITSAT Archives

- Which of the following will not form optical isomers? [2014]
 - $[\text{Co}(\text{en})_3]^{3+}$
 - $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]$
 - $[\text{Pt}(\text{en})_2\text{Cl}_2]^{2+}$
 - $[\text{CrCl}_2(\text{ox})_2]^{3-}$
- The magnitude of Δ_o will be highest in which of the following complex. [2013]
 - $[\text{Cr}(\text{CN})_6]^{3-}$
 - $[\text{Cr}(\text{H}_2\text{O})_6]^{3+}$
 - $[\text{Cr}(\text{NH}_3)_6]^{3+}$
 - $[\text{Cr}(\text{C}_2\text{O}_4)_3]^{3-}$
- Which of the following is an outer d -orbital or high spin complex? [2013]
 - $[\text{Co}(\text{NH}_3)_6]^{3+}$
 - $[\text{Ni}(\text{CN})_4]^{2-}$
 - $[\text{NiCl}_4]^{2-}$
 - $[\text{CoF}_6]^{3-}$
- Which of the following is correct IUPAC name for $\text{K}_2[\text{Cr}(\text{CN})_2\text{O}_2(\text{O})_2\text{NH}_3]$? [2012]
 - Potassium amminecyanoperoxodioxo-chromatic (IV)
 - Potassium amminecyanoperoxodioxo-chromium (V)
 - Potassium amminecyanoperoxodioxo-chromium (VI)
 - Potassium amminedicyanodioxoper-oxochromate (VI)
- Ferrocene is an example of [2009]
 - sandwiched complex
 - π -bonded complex
 - a complex in which all the five carbon atoms of cyclopentadiene anion are bonded to the metal
 - All of the above
- $[\text{Co}(\text{NH}_3)_5\text{SO}_4]\text{Br}$ and $[\text{Co}(\text{NH}_3)_5\text{Br}]\text{SO}_4$ is a pair of isomers. [2008]
 - ionisation
 - ligand
 - coordination
 - hydrate
- The crystal field splitting energy for octahedral (Δ_o) and tetrahedral (Δ_t) complexes is related [2006]
 - $\Delta_t = \frac{4}{9} \Delta_o$
 - $\Delta_t = \frac{1}{2} \Delta_o$
 - $\Delta_o = 2\Delta_t$
 - $\Delta_o = \frac{4}{9} \Delta_t$

Answer with Solutions

Practice Exercise

- (b) All the ligands are Lewis bases.

- (b) Blue vitriol $[\text{CuSO}_4 \cdot 5\text{H}_2\text{O}]$ is a complex compound in which the coordination number of copper is 4, i.e. Cu^{2+} is attached to 4 water molecules. Hence, it can be correctly written as $[\text{Cu}(\text{H}_2\text{O})_4]\text{SO}_4 \cdot \text{H}_2\text{O}$.
- (b) The ratio of x, y and z be such that, total charge = -1
 $3 + 1(-2) + 1 \times 0 + 2(-1) = -1$
 The ratio of $x : y : z = 1 : 1 : 2$
- (a) $\text{K}_4[\text{Fe}(\text{CN})_6]$
 $4 \times (+1) + x + 6(-1) = 0$
 $4 + x - 6 = 0$
 $x = 2$

- (a) The oxidation state of Cr in CrO_2Cl_2 is +6.

- (c) In the complex $[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$, total number of the ligands linked to the central atom, cobalt is 6. Therefore, the coordination number of Co is 6.
- (b) These complexes show ionisation isomerism as they give different ions in solution.
- (b) Coordination isomerism is shown by the complexes, which have at least 2 metal atoms so that their ligand may interchange.
- (d) Madc type complex have three geometrical isomers.
- (b) $[\text{Co}(\text{en})_3]^{3+}$ cannot show geometrical isomerism, in it, Co-atom is linked with 3-same ligands.
- (d) Geometrical isomerism is exhibited by octahedral complexes like $[\text{Co}(\text{NH}_3)_2(\text{en})_2]^{3+}$.
- (d) Optical isomerism is exhibited by $[\text{Cr}(\text{en})_3]^{3+}$.
- (a) The possible number of isomers are,
 - $[\text{Cu}(\text{NH}_3)_4][\text{PtCl}_4]$
 - $[\text{Cu}(\text{NH}_3)_2\text{Cl}_2] \cdot [\text{PtCl}_2(\text{NH}_3)_2]$ *cis*
 - $[\text{Cu}(\text{NH}_3)_2\text{Cl}_2] \cdot [\text{PtCl}_2(\text{NH}_3)_2]$ *trans*

- (iv) $[\text{Cu}(\text{NH}_3)_3\text{Cl}][\text{PtCl}_3(\text{NH}_3)]$,
 (v) $[\text{Cu}(\text{NH}_3)\text{Cl}_3][\text{PtCl}(\text{NH}_3)_3]$ and
 (vi) $[\text{CuCl}_4][\text{Pt}(\text{NH}_3)_4]$
16. (b) Pair of enantiomers are non-superimposable mirror images. The complex $[\text{Co}(\text{en})_2\text{Cl}_2]\text{Cl}$ exhibits a pair of enantiomers.
17. (d) Ionisation isomerism is shown.
18. (c) The difference in colour is due to the formation of linkage isomers.
19. (a) $\text{EAN} = z - x + 2c = 26 - 2 + 2 \times 6 = 36$
20. (c) Only $[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{SO}_4$ gives sulphate ion.

$$[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{SO}_4 + \text{BaCl}_2 \longrightarrow [\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2 + \text{BaSO}_4$$

White ppt.
21. (b) $\text{Na}_2\text{S} + \text{Na}_2[\text{Fe}(\text{CN})_5\text{NO}] \longrightarrow \text{NH}_4[\text{Fe}(\text{CN})_5\text{NOS}]$
Sodium nitroprusside
Purple
22. (d) $[\text{Cr}(\text{NH}_3)_6]\text{Cl}_6 \xrightarrow{\text{H}_2\text{O}} [\text{Cr}(\text{NH}_3)_6]^{3+} + 6\text{Cl}^-$
 This complex gives 7 ions in solution. Conductivity of an electrolyte is directly proportional to number of ions produced. Hence, the conductivity of this complex will be the maximum.
23. (b) $\text{Co}(\text{NH}_3)_5\text{Cl}_3$ is an octahedral complex ionising in aqueous solution as

$$[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2 \longrightarrow [\text{Co}(\text{NH}_3)_5\text{Cl}]^{2+} + 2\text{Cl}^-$$

$$\text{Moles of } [\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2 = \frac{0.1}{1000} \times 100 = 0.01$$

$$\text{Moles of AgCl formed} = 2 \times \text{moles of } \text{Cl}^- \text{ in complex}$$

$$= 0.01 \times 2 = 0.02$$
24. (a) In $[\text{FeCl}_6]^{3-}$ complex, Cl^- is a weak field ligand. It does not cause pairing of electrons in $3d$ subshell of Fe^{3+} . Hence, configuration is $t_{2g}^3 e_g^2$.
25. (b) In the formation of $[\text{FeCl}_6]^{3-}$, Cl^- does not cause pairing because it is a weak field ligand; number of unpaired electrons are five.
 On the other hand, in $[\text{Fe}(\text{CN})_6]^{3-}$ complex, CN^- is a strong field ligand, it causes pairing so the number of unpaired electrons is one.
26. (b) The oxidation state of Ni in $[\text{Ni}(\text{CN})_4]^{2-}$ and $[\text{NiCl}_4]^{2-}$ is +2 while in $[\text{Ni}(\text{CO})_4]$ it is in zero oxidation state.
 Since, CO and CN^- are strong ligands therefore, they cause pairing of the unpaired electrons.
 Therefore, $[\text{Ni}(\text{CO})_4]$ and $[\text{Ni}(\text{CN})_4]^{2-}$ are diamagnetic. Whereas, Cl^- is a weak ligand that does not cause pairing of electrons, resulting in paramagnetic complex. Hence, $[\text{NiCl}_4]^{2-}$ is paramagnetic.
27. (c) d^1 , d^2 , and d^4 configurations cannot give rise to octahedral complexes, as octahedral complexes are formed either by d^2sp^3 -hybridisation in presence of strong ligands, called low spin complex as they have comparatively less unpaired electrons) or by sp^3d^2 -hybridisation (in presence of weak ligands, called high spin complex as they have comparatively more

unpaired electrons). d^6 can give rise to both low spin and high spin octahedral complexes in presence of strong and weak ligands respectively.

28. (a) The geometry of complex will be square planar.
29. (c) $[\text{NiF}_4]^{2-}$ has 2 unpaired electrons, hence it shows paramagnetic behaviour.
30. (b) The CFSE for tetrahedral complex is $\frac{4}{9} \Delta_o$ where Δ_o is CFSE for octahedral complexes. The value of Δ_o is 18000 cm^{-1} , therefore, the CFSE for tetrahedral complex is $\frac{4}{9}$ of 18000 cm^{-1} that is 8000 cm^{-1} .
31. (c) As we know that, strong field ligand splits the five degenerate energy levels with more energy separation than weak field ligand, i.e. as strength of ligand increases crystal field splitting energy increases.

Hence,
$$\Delta E = \frac{hc}{\lambda}$$

$$\Rightarrow \Delta E \propto \frac{1}{\lambda} \Rightarrow \lambda \propto \frac{1}{\Delta E}$$

As energy separation increases, the wavelength decreases.

Thus, the correct order is

Here, strength of ligand increases, ΔE increases CFSE increases and λ absorbed decreases.

32. (b) Ligand must donate a pair of electron or loosely held electron pair to metal and form a $M-L$ bond.

Among NH_4^+ does not have any pair of electron.

Hence, NH_4^+ is not a ligand.

33. (b) Those complexes, in which at least one unpaired electron is found, show colour due to $d-d$ transition of electrons. The complex $\text{Na}_2[\text{CdCl}_4]$ has no unpaired electron in Cd-atom. Hence, it is colourless as no $d-d$ transition can take place.
34. (b) $\text{K}_3[\text{Fe}(\text{CN})_6]$ (potassium ferricyanide) has an unpaired electron in Fe-atom, hence it shows paramagnetic behaviour.
35. (c)
36. (c) Sodium ethoxide is not an organometallic compound as in it sodium metal is attached to oxygen and not to carbon.

37. (c) $(\text{CH}_3)_4\text{Sn}$ is a σ -bonded organometallic compound.
38. (d) Zeise's salt = $\text{K}[\text{Pt}(\eta^2 - \text{C}_2\text{H}_4)\text{Cl}_3]$
 Ferrocene = $[\text{Fe}(\eta^5 - \text{C}_5\text{H}_5)_2]$
 dibenzene chromium = $[\text{Cr}(\eta^6 - \text{C}_6\text{H}_6)_2]$
 These three are π -bonded organometallics only TEL $(\text{C}_2\text{H}_5)_4\text{Pb}$ is a σ -bonded organometallic.

BITSAT Archives

1. (b) Optical isomerism is shown by only those complexes which lack symmetry. Complex $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]$ shows facial and meridional isomerism. Both isomers of this complex contain plane of symmetry. So, it will not form optical isomers.
2. (a) The crystal field splitting, Δ_o depends upon the field produced by the ligand and charge on the metal ion. In all these complexes of chromium, charge acquired by metal ion is +3. Therefore, Δ_o depends upon the field produced by the ligand. In accordance with the spectrochemical series, the increasing order of field strength is

Thus, CN^- is the strong field ligand and will produce highest magnitude of Δ_o .

3. (d) $[\text{Co}(\text{NH}_3)_6]^{3+}$ and $[\text{Ni}(\text{CN})_4]^{2-}$ are inner d -orbital or low spin complex and $[\text{NiCl}_4]^{2-}$ complex has sp^3 -hybridisation and has tetrahedral geometry while $[\text{CoF}_6]^{3-}$ is outer d -orbital or high spin complex.

Here, F^- is a weak ligand so no pairing of electron takes place

4. (d) The IUPAC name of $\text{K}_2[\text{Cr}(\text{CN})_2\text{O}_2(\text{O})_2(\text{NH}_3)]$ is potassium amminedicyanodioxoper-oxochromate (VI).
5. (d) Ferrocene is a sandwich complex compound in which all the five carbon atoms of cyclopentadiene anion are linked to the metal through pi-bonds.
- $[\text{Fe}(\eta^5 - \text{C}_5\text{H}_5)_2]$ Ferrocene $\rightarrow$ it has aromatic character.

6. (a) $[\text{Co}(\text{NH}_3)_5\text{SO}_4]\text{Br} \rightleftharpoons [\text{Co}(\text{NH}_3)_5\text{SO}_4]^+ + \text{Br}^-$
 $[\text{Co}(\text{NH}_3)_5\text{Br}]\text{SO}_4 \rightleftharpoons [\text{Co}(\text{NH}_3)_5\text{Br}]^{2+} + \text{SO}_4^{2-}$

the molecular formula of both of the above compounds is same but on ionisation they give different ions in solution, so they are called ionisation isomers.

7. (a) The crystal field splitting energy for octahedral (Δ_o) and tetrahedral (Δ_t) complexes is related to

$$\Delta_t = \frac{4}{9} \Delta_o$$

21

General Organic Chemistry

Concept of Organic Chemistry

Organic chemistry is a branch that deals with the study of C and H compounds and their derivatives. A large number of organic compounds have been synthesised till date because of unique property of C to catenate hence, the classification and nomenclature of organic compounds is necessary.

Tetravalency of Carbon

Liebel and van't Hoff studied the tetravalent nature and tetrahedral structure of carbon. The carbon atom is tetravalent which suggests that it forms four covalent bonds with four monovalent atoms or groups. Carbon forms a large number of organic compounds like methane, methyl alcohol, methanoic acid.

Structural Representation of Organic Compounds

Structural Formula

In this, all the bonds present between any two atoms are shown clearly

Condensed Formula

In this type of chemical formula, all the bonds are not shown clearly.

or

Bond Line Formula

In this, every fold and free terminal represents a carbon and lines represent the bond.

e.g.

Classification of Carbon and Hydrogen Atoms

- **Primary (1°) carbon atom** When carbon atom is attached with other carbon atom only.
- **Secondary (2°) carbon atom** When carbon atom is attached with two other carbon atoms.
- **Tertiary (3°) carbon atom** When carbon atom is attached with three other carbon atoms.
- **Quarternary (4°) carbon atom** When carbon atom is attached with four other carbon atoms.

Reactivity order of carbon atoms are as follows:

Classification of Organic Compounds

The organic compounds have been classified on the basis of carbon skeleton (structure) or functional groups or the concept of homology, i.e. the series in which two successive members differ by a $-\text{CH}_2$ unit or 14 unit mass.

Classification Based on Structure

On this basis, the organic compounds are classified as:

Classification Based on Functional Groups

The compounds of only carbon and hydrogen are called **hydrocarbons**. Hydrocarbons are considered as the parents of all the organic compounds. All other compounds are obtained from hydrocarbons by the replacement of one or more hydrogen atoms with other atoms or groups.

Various classes of compounds having some of the common functional groups are listed in the following table.

Class	Functional group
Olefins/Alkenes	$\text{>C}=\text{C}<$
Acetylenes/Alkynes	$-\text{C}\equiv\text{C}-$
Halides	$-\text{F}, -\text{Cl}, -\text{Br}, -\text{I}$ (Halo)
Alcohols	$-\text{OH}$ (Hydroxy)
Thiols	$-\text{SH}$
Aldehydes	$-\text{C}-\text{H}$ (Aldehydic) $\parallel$ O
Ketones	O $\parallel$ $-\text{C}-$ (Ketonic)
Ethers	$-\text{C}-\text{O}-\text{C}-$ (Alkoxy)
Carboxylic acid	O $\parallel$ $-\text{C}-\text{OH}$ (Carboxyl)
Sulphonic acid	$-\text{SO}_3\text{H}$
Amides	O $\parallel$ $-\text{C}-\text{NH}_2$ (Amide)
Amines	$-\text{N}<$ (Amino) H
Cyanides/Nitriles	$-\text{C}\equiv\text{N}$ (Cyano)
Nitro compounds	$-\text{N}<$ (Nitro) O
Esters	O $\parallel$ $-\text{C}-\text{O}-\text{C}-$ (Ester)
Acid halides	O $\parallel$ $-\text{C}-\text{X}$ (Acylhalide)

Homologous Series

A homologous series can be defined as a group of compounds in which the members have similar structural features and similar chemical properties and the successive members differ in their molecular formula by CH_2 group.

IUPAC Nomenclature for Organic Compounds

The IUPAC name of an organic compound denotes only one molecular structure.

The IUPAC name of any organic compound comprises of the following structure.

General structure of an IUPAC name

Word Root

This indicates the number of carbon atoms present in the parent chain [longest C—C linkages]. This word root includes → meth, eth, prop, but, pent, hex, hept, oct, non, dec.

Suffix

It is used to indicate the nature of C—C linkages whether it is saturated or unsaturated (primary suffix) and type of functional group present in the molecule (secondary suffix).

Organic compound	Functional group	Suffix
Alcohols	— OH	—ol
Aldehydes	—CHO (C) HO	Carbaldehyde —al
Ketones	(C) = O	—one
Carboxylic acids	— COOH — (C)OOH	—carboxylic acid —oic acid
Acid amides	—CO NH ₂ (C) O —NH ₂	—carboxamide —amide
Acid halides	$\begin{array}{c} \text{O} \\ \\ \text{—C—X} \end{array}$	—carbonyl halide
	$\begin{array}{c} \text{O} \\ \\ \text{—(C)—X} \\ \text{where, X = halogen} \\ \text{[F, Cl, Br, I]} \end{array}$	—oyl halide
Esters	$\begin{array}{c} \text{O} \\ \\ \text{—C—OR}^* \end{array}$	(R*) carboxylate
	—(C) —OOR	(R*) ...oate
Amines	—NH ₂	—amine
Nitriles	— C ≡ N	—carbonitrile
	— (C) ≡ N	—nitrile
Sulphonic acids	—SO ₂ , —OH	Sulphonic acid

R → any alkyl group

C → when C-atom is included in the main chain.

Rules for IUPAC Nomenclature

- (i) **Longest chain rule** The longest C—C linkage of a structure is its parent chain. It needs not to be straight chain, but can be of any combination which is longest.

- (ii) **Lowest locant rule** The numbering of the parent chain is done from that side where the value of locant substituent is minimum possible number.

- (iii) **Alphabetical order law** In case of multiple substitutions, the name of the substituents must be arranged in alphabetical order.
- (iv) **First point difference rule** If numbering cannot be resolved by lowest locant rule, i.e. functional groups are at equivalent positions, then the numbering should be done in such a way that functional group coming first in alphabetical order, will be having minimum possible value.
- (v) For complex group (like branched side chain), the nomenclature rules are same, the only difference is that the carbon through which the complex group is associated with main chain, is given number one always. For the purpose of distinction, the locant of side chain are indicated by a prime following them as 1', 2' etc., e.g. consider the structure given below

1,1-dimethyl group (complex group)

- (vi) In case of simultaneous presence of double and triple bond, i.e. if bonds are present at equal distance from the ends, then double bond must be preferred. If the position is not symmetrical, then the priority will be decided by lowest locant sum rule and first point difference rule.
- (vii) If the chain is having more than one functional group, the priority of the functional groups is given below
- $$\text{—COOH} > \text{—SO}_3\text{H} > \text{R}(\text{CO})_2\text{O} > \text{—COOR} > \text{—COX} > \\ \text{—CONH}_2 > \text{—CN} > \text{—CHO} > \text{C}=\text{O} > \text{—OH} > \text{NH}_2 > \text{—O—} > \text{C}=\text{C} > \text{C}\equiv\text{C} > \text{R—X} > \text{—NO}_2$$

IUPAC Nomenclature for Cyclic Compounds

For the nomenclature of cyclic compounds, general rules are followed:

- (i) The root word is equal to sides of polygon representing the compound. Primary prefix cyclo is used for alicyclic compounds.

- (ii) If length of side chain is greater than ring size, then ring is treated as alkyl substituent where side chain is substituent.

Nomenclature of Aromatic Compounds

Aromatic compounds are better known by their common name. IUPAC recognises and acknowledges the common nomenclature. Benzenoids are named as derivatives of benzene as per rules mentioned for alicyclic compounds. Benzene with small side chain are also having special name as benzyl, benzal, benzo, etc. Otherwise other common names like toluene, phenol, cresol, resorcinol, etc., are equally used.

Isomerism in Organic Chemistry

Organic compounds having the same molecular formula but different structures or orientations in space are known as isomers and the phenomenon is called isomerism.

Isomerism can be classified as follows:

1. Structural Isomerism

It arises because of the difference in the sequence of covalently bonded atoms in the molecule without reference to space.

It is sub-classified into following types:

- (i) **Chain isomerism** This arises due to the difference in length of C-chain (straight or branched). e.g. C_4H_{10}

- (ii) **Position isomerism** In such isomers, there is difference in the position of functional group or multiple bond or branched chain attached to the parent C-chain.

- (iii) **Functional isomerism** Such isomers contain different functional groups.

- (iv) **Metamerism** This type of isomerism is due to unequal distribution of substituents on either side of bivalent functional group, e.g. $CH_3CH_2OCH_2CH_3$ and $CH_3CH_2CH_2OCH_3$, $CH_3CH_2NHCH_2CH_3$ and $CH_3CH_2CH_2NHCH_3$.

- (v) **Tautomerism** This arises due to transfer of H-atom from one polyvalent atom to another. Tautomers exist in dynamic equilibrium.

- (a) **Keto-enol tautomerism** (α -H must be present)

- (b) **Nitro-acenitro tautomerism**

- (c) **Imine-enamine tautomerism**

Stereoisomerism

In this type of isomerism, isomers possess same molecular and structural formula but spatial arrangement of atoms is different.

They can be sub-classified in the following types:

Reaction Mechanism

Types of Bond Fissions

1. Homolytic Fission

It involves cleavage of covalent bond in such a way that each of the bonded atom takes away one electron out of the shared pair.

It is also called **free-radical cleavage** or **non-polar bond fission**.

2. Heterolytic Fission

The shared pair of electron is taken away by one of the atom (more electronegative atom).

Also called polar bond fission or ionic cleavage.

In the above example,

electronegativity of $B >$ electronegativity of A

Electron Displacement in Covalent Bonds

1. Inductive Effect

The displacement of an electron (shared) pair along the C-chain due to the presence of an electron withdrawing/donating group in the C-chain, is known as inductive effect (I -effect).

It is transmitted along the chain and is permanent.

I -effect can be of the following two types :

- (i) $-I$ -effect Any atom or group of atoms which attracts electrons more strongly than H is said to have negative inductive effect.

Groups introducing $-I$ -effect

- (ii) $+I$ -effect An atom or group which attracts electrons less strongly as compared to H, is said to have a positive inductive effect.

Groups producing $+I$ -effect

2. Electromeric Effect

It is a temporary effect operates only in π -electrons (i.e. multiple bonded compounds) in the presence of some attacking reagents.

The effect is called $+E$ if transference of π -electrons occurs towards the atom where attacking species attaches.

The effect is called $-E$ if transference of electrons occurs away from the atom where the attacking group attaches.

3. Resonance or Mesomeric Effect

Electron displacement relayed through conjugate system of multiple bonds in the C-chain causing permanent polarisation. It is essential that the atom having a lone pair of electrons or a group containing a π -bond.

The above 2 structures are called resonating structures.

Resonance hybrid (Actual structure)

Mesomeric effect is of the following two types :

- (a) $+M$ -effect Direction of electron displacement is away from the substituent.

Groups showing $+M$ -effect

- (b) $-M$ -effect Direction of electron displacement is towards the substituent.

Groups showing $-M$ -effect

4. Hyperconjugation

(Baker-Nathan effect or no bond resonance)

As a result of shifting of σ -electrons, there is a phenomenon of resonance in rest of the molecule. This is a type of σ - π resonance.

Applications of Hyperconjugation

- Relative stability of alkenes.
- Relative stability of alkyl carbonium ions or free radicals.
- The *o*, *p* and *m*-directing influence of some alkyl groups.

Various Reaction Intermediates**1. Carbocation $C^{\oplus}$**

$\begin{array}{c} | \\ -C^{\oplus} \\ | \end{array}$ organic species containing positively charged

C-atom which contains 6 electrons in its valence shell, are known as carbocations. $C^{\oplus}$ has planar geometry.

e.g. $H_3C^{\oplus}$ (Methyl carbocation), $R-\overset{\oplus}{CH_2}$ (1°), $R_2\overset{\oplus}{CH}$ (2°), $R_3\overset{\oplus}{C}$ (3°)

Relative Stability

- Alkyl carbocations** (explained by inductive and hyperconjugation effect)

i.e. $3^{\circ} > 2^{\circ} > 1^{\circ} > \text{CH}_3^{\oplus}$

- Aryl carbocations** (explained by resonance)

**Carbanion (C^{-})**

Species having such a C-atom that is bearing negative charge and surrounded by octet of electrons. They have pyramidal geometry.

e.g. CH_3^{-} , $(\text{CH}_3)_2\bar{\text{C}}\text{H}$, $(\text{CH}_3)\bar{\text{C}}\text{H}_2$ etc.

Relative Stability

- Alkyl carbanions** (explained by +I-effect)

i.e. $1^{\circ} > 2^{\circ} > 3^{\circ}$

- Benzylic, allylic and triphenyl methyl carbanions** (explained by resonance)

- Stability of C^{-} increases with *s* %.

**3. Free Radical (FR)**

Species having trivalent C-atom bearing no charge but have odd electrons or an unpaired electron, are known as free radicals. They are paramagnetic in nature. Generally, they are planar, formed due to homolytic bond cleavage.

e.g. $-\text{C}-\text{X} \longrightarrow -\text{C}^{\bullet} + \text{X}^{\bullet}$

$\text{CH}_3^{\bullet}$, $\text{CH}_2 = \text{CH}-\text{CH}_2^{\bullet}$, $\text{Cl}^{\bullet}$ etc.

Order of Stability

also $3^{\circ} > 2^{\circ} > 1^{\circ} > \text{CH}_3^{\bullet}$

Free radical generators $\longrightarrow$ Peroxides

4. Carbene

Species containing divalent C-atom bearing no charge and surrounded by 6 electrons. They are powerful electrophiles.

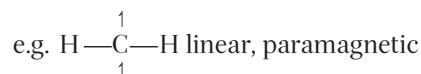

e.g. $:\text{CH}_2$, $:\text{CCl}_2$ etc.

There are two types of carbenes:

- Singlet carbene** (sp^2 -hybridised) Here the unshared electrons are paired and present in the same orbital.

- Triplet carbene** (sp -hybridised) Here the unshared electrons are not paired.

In general, a triplet carbene is more stable than a singlet carbene.

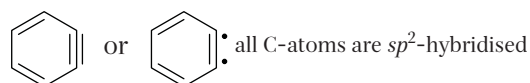

5. Nitrene

It is a neutral intermediate species containing N-atom having one bond pair and two lone pairs. It is electron deficient. They are analogous of carbenes.

e.g. $\text{H}-\ddot{\text{N}}^{\bullet}$, $\text{R}\ddot{\text{N}}^{\bullet}$ etc.

6. Benzyne

It is a neutral highly reactive intermediate in which the aromatic character are not markedly distributed,

Sidewise overlapping of sp^2 -orbitals forms π -bonds outside the ring and out of the plane of π -system of ring. Benzyne is very unstable.

Type of Reagents (or Attacking Species)

1. Electrophile (E^+)

They are neutral or positively charged species with deficiency of electrons and capable of accepting a pair of electrons (Lewis acid).

Positively charged species

Neutral species

2. Nucleophile (Nu^-)

They are neutral or negatively charged species which are capable of acting as donor of electron pair (Lewis base).

Negatively charged ions

Neutral species

3. Amphibiles

Amphibiles are those which act as both E^+ and Nu^- .

Types of Organic Reactions

1. Substitution Reaction

Such reactions involve the replacement of an atom or group of atoms by some other atom or group.

Substitution reaction are of the following types:

(a) Free radical substitution (FR intermediates)

(b) Nucleophilic substitution (Attacking species Nu^-)

(c) Electrophilic substitution

Substitution in benzene ring follows electrophilic substitution.

Mechanism

- During E^+ substitution, an electron donating group on benzene ring makes it more reactive. Such groups are $-\text{NH}_2$, $-\text{OH}$, OR , etc.
- A deactivating group is one which makes benzene less reactive. Such groups are $-\text{COOH}$, $>\text{C}=\text{O}$, $-\text{CHO}$, $-\text{NO}_2$, $-\text{CN}$ etc.

2. Addition Reactions

Reactions in which atoms or group of atoms are added to a molecule, are called addition reactions.

Addition reaction are of the following types :

(a) Electrophilic addition reactions

(b) Nucleophilic addition reaction (Intermediate $\rightarrow \text{Nu}^-$)

(c) Free radical addition (Intermediate – free radical)

Mechanism

Chain initiation $\text{RO}\cdot + \text{HBr} \longrightarrow \text{ROH} + \text{Br}\cdot$

Chain propagation

Chain termination $\text{Br}\cdot + \text{Br}\cdot \longrightarrow \text{Br}_2$

3. Elimination Reactions

Such reaction involves loss of atoms or groups from a molecule to form multiple bonds.

There are two types of mechanism:

(i) E 2 reaction Elimination bimolecular reaction involves one step only.

Rate equation $R = k [\text{halide}] [:\text{B}]$

Molecularity = 2, order = 2

Order of reactivity : $3^\circ > 2^\circ > 1^\circ$

(ii) E 1 reaction (Elimination unimolecular)

Rate equation $R = k[\text{RX}]$

Molecularity = 1, order = 1

4. Rearrangement Reactions

In such reactions, atom's sequence gets reshuffled to form a new structure, e.g. pinacol pinacolone rearrangement, Beckman rearrangement.

Practice Exercise

1. Which of the following are aromatic compounds?

- a. I. and III
b. I, II, and III
c. I, II, and IV
d. III, and IV
2. 3° carbon is present in the compound
a. cyclopropane
b. toluene
c. benzene
d. cyclohexane
3. Choose the compound in which all the carbon atoms have 66.7% *p*-character.
a. $\text{CH}_3-\text{C}\equiv\text{CH}$
b. $\text{CH}_2=\text{C}=\text{CH}-\text{CH}_3$
c. $\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$
d. $(\text{CH}_3)_2\text{C}=\text{CH}_2$
4. The bond between carbon atom (1) and carbon atom (2) in compound

- a. sp^3 and sp^2 -hybridised
b. sp^2 and sp^3 -hybridised
c. sp and sp^2 -hybridised
d. sp and sp -hybridised
5. Electronegativity of carbon atoms depends upon their state of hybridisation. In which of the following compounds, the carbon marked with asterisk, is most electronegative?
a. $\text{CH}_3-\text{CH}_2-\dot{\text{C}}\text{H}_2-\text{CH}_3$
b. $\text{CH}_3-\dot{\text{C}}\text{H}=\dot{\text{C}}\text{H}-\text{CH}_3$
c. $\text{CH}_3-\text{CH}_2-\dot{\text{C}}\equiv\text{CH}$
d. $\text{CH}_3-\text{CH}_2-\text{CH}=\text{CH}_2$
6. The hybridisation of C_2 carbon atom present in $\text{CH}_2=\text{C}=\text{CH}_2$ is
a. sp
b. sp^3
c. sp^2
d. sp^4

7. The kind of valency that exists in CaH_2 and C_2H_2 is

- a. electrovalency in CaH_2 and covalency in C_2H_2
b. electrovalency in both
c. covalency in CaH_2 and electrovalency in C_2H_2
d. covalency in both

8. 3-methyloctane can be represented in which of the following forms?

- d. All of the above

9. Which of the following is a heterocyclic alicyclic compound?

10. The IUPAC name of the isomer of $\text{CH}_3-\text{CH}=\text{NOH}$ would be

- a. methanamide
b. 1-amino-2-propanone
c. ethanamide
d. None of the above

11. Pyruvic aldehyde is nothing but

- a. methyl glyoxal
b. ethyl glyoxal
c. glyoxal
d. None of the above

12. The IUPAC name for the following compound is

- a. 4-ethyl-3-propyl hex-1-ene
b. 3-(1-ethylpropyl) hex-1-ene
c. 3-ethyl-4-propyl hex-5-ene
d. 3-ethyl-4-ethylheptane

13. The correct IUPAC name of

- a. 6-methyl-3-phenyl benzene-1-oic acid
 b. 6-methyl dibenzene-1-oic acid
 c. 3-(3-methyl phenyl) benzene-1-oic acid
 d. 3-(5-methyl phenyl) benzene-1-carboxylic acid

14. The IUPAC name of is

- a. 1-alkoxycyclopent-1-ene
 b. oxocyclohex-2-ene
 c. 2-methoxycyclopent-1-ene
 d. 5-oxocyclopent-1-ene

15. The IUPAC name of the compound shown below is

- a. 2-bromo-6-chlorocyclohex-1-ene
 b. 6-bromo-2-chlorocyclohexene
 c. 3-bromo-1-chlorocyclohexene
 d. 1-bromo-3-chlorocyclohexene

16. What is the correct IUPAC name of the following compound?

- a. 3-ethyl-1,1-dimethylcyclohexane
 b. 1-ethyl-3,3-dimethylcyclohexane
 c. 1,1-dimethyl-3-ethylcyclohexane
 d. None of the above

17. The correct IUPAC name of the given structures will be

Choose the correct option.

	I	II
a.	Hexane-dione	Hexa-1,3-diene-5-yne
b.	5-oxohexanoic acid	Hexa-1,3-diene-5-yne
c.	5-oxohexanoic acid	Hexadiene-5-yne
d.	3-oxohexanoic acid	Hexadiene-5-yne

18. The IUPAC name of

- a. ethylpentanoate
 b. 1-ethoxy-2-pentanone
 c. 5-ethoxy-4-pentanone
 d. ethyl-2-oxopentyl ether

19. The IUPAC name of

- a. 2-acetyl-1-buten-1-ol
 b. 3-(hydroxymethyl) 3-penten-2-one
 c. 3-ethylidene-4-hydroxy-2-butanone
 d. 3-acetyl-2-buten-4-ol

20. Which skeleton exhibit optical isomerism?

- a. $\text{C}-\text{C}-\text{C}-\text{C}-\text{COOH}$
 b. $\begin{array}{c} \text{C}-\text{C}-\text{C}-\text{C} \\ | \\ \text{COOH} \end{array}$
 c. $\begin{array}{c} \text{C}-\text{C}-\text{C}-\text{COOH} \\ | \\ \text{C} \end{array}$
 d. $\begin{array}{c} \text{C} \\ | \\ \text{C}-\text{C}-\text{COOH} \\ | \\ \text{C} \end{array}$

21. In which isomer of $\text{C}_7\text{H}_7\text{NO}_2$, there are two functional groups?

- a. Phenyl nitromethane
 b. *m*-nitrotoluene
 c. Anthranilic acid
 d. Benzylnitrite

22. The pair of functional group isomers is

- a. CH_3CONH_2 , $\begin{array}{c} \text{CH}_2\text{CHO} \\ | \\ \text{NH}_2 \end{array}$
 b. CH_3COOH , HCOOCH_3
 c. $\text{CH}_3-\text{CH}_2\text{OH}$, CH_3OCH_3
 d. All of the above

23. The compound C_nH_{2n} [$n = 4$] does not exhibit the which of the following isomerism?

- a. Chain
 b. Geometrical
 c. Position
 d. Optical

24. Geometrical isomerism is shown by

25. The compound 2, 3-dichlorobutane exhibits
 a. geometrical isomerism
 b. diastereoisomerism
 c. structural isomerism
 d. optical isomerism
26. The number of constitutional isomers of the formula $C_5H_{11}Br$ is
 a. 4
 b. 8
 c. 6
 d. 10
27. How many optical isomers are possible on monochlorination of 2-methyl butane?
 a. 2
 b. 4
 c. 6
 d. 8
28. The structural formula of 2-oxo-3-methyl-(N-bromo) butanamide is
 a. $CH_3-CH_2-CO-CO-NH-Br$
 b. $CH_3-\underset{\substack{| \\ CH_3}}{CH}-CO-CO-NH-Br$
 c. $CH_3CH-CO-CO-\underset{\substack{| \\ CH_3}}{NOBr}$
 d. $(CH_3)_3C-CO-CO-NHBr$
29. Match the items of Column I with the Column II and choose the correct option from the codes given below.

Column I (Structure of compounds)	Column II (Type of isomerism)
A. $CH_3CH_2CH_2CH_2CH_3$ and $CH_3-\underset{\substack{ \\ CH_3}}{CH}-CH_2-CH_3$	1. Chain isomerism
B. $CH_3CH_2CH_2OH$ and $CH_3-\underset{\substack{ \\ OH}}{CH}-CH_3$	2. Position isomerism
C. $CH_3-\overset{\substack{O \\ }}{C}-CH_3$ and $CH_3-CH_2-\underset{\substack{ \\ H}}{C}=O$	3. Metamerism
D. $CH_3OC_3H_7$ and $C_2H_5OC_2H_5$	4. Functional group isomerism

Codes

	A	B	C	D
a.	1	2	3	4
b.	2	3	1	4
c.	4	1	2	3
d.	1	2	4	3

30. Example of geometrical isomerism is
 a. 2-butanol
 b. 2-butene
 c. butanol
 d. 2-butyne

31. Among the following four structures I to IV,

It is true that

- a. all four are chiral compounds
 b. I and II are chiral compounds
 c. III is a chiral compounds
 d. II and IV are chiral compounds
32. The correct statement about the compounds A, B and C is
- $$\begin{array}{c} COOCH_3 \\ | \\ H-C-OH \\ | \\ H-C-OH \\ | \\ COOH \end{array}$$

A

$$\begin{array}{c} COOH \\ | \\ H-C-OH \\ | \\ H-C-OH \\ | \\ COOCH_3 \end{array}$$

B

$$\begin{array}{c} COOH \\ | \\ HO-C-H \\ | \\ HO-C-H \\ | \\ COOCH_3 \end{array}$$

C
- a. A and B are identical
 b. A and B are diastereomers
 c. A and C are enantiomers
 d. A and B are enantiomers
33. If $CH_3-\underset{\substack{| \\ CH_3}}{CH}-CHO$ gives up proton, the most stable carbanion would be

34. In which case, ionic mechanism is not followed?
 a. Reaction of acetylene and bromine water
 b. Reaction of HBr and propene in the presence of peroxide
 c. Reaction of ethyl bromide and alcoholic KOH
 d. Dehydration of ethyl alcohol catalysed by acid
35. Which compound is more sensitive to undergo S_N1 reaction?
 a. 2-bromobutane
 b. 2-bromo-2-methyl propane
 c. 2-methyl-1-bromo propane
 d. Bromoethane
36. The enol form of acetone contains]
 a. 9 σ -bonds, 2 π -bonds and 1 lone pair of electron
 b. 10 σ -bonds, 1 π -bond and 1 lone pair of electrons
 c. 9 σ -bonds, 1 π -bond and 2 lone pairs of electrons
 d. 8 σ -bonds, 2 π -bonds and 2 lone pairs of electrons

37. Consider the following carbocations,

The correct order for the stability of the above carbocations is

- a. I < III < IV < II b. III < IV < I < II
 c. IV < III < II < I d. II < IV < III < I
38. The solvent in which enol form of ethylacetoacetate is maximum, is
 a. CH₃COOH b. aqueous HCl
 c. *n*-hexane d. H₂O
39. Among the following compounds, the compound containing maximum enol contents in their solution, is

40. What is the correct order of decreasing stability of the following cations?

- a. II > I > III b. II > III > I
 c. III > I > II d. I > II > III
41. The correct stability order of the following free radicals is
 a. $(\text{CH}_3)_2\dot{\text{C}}\text{H} < (\text{CH}_3)_3\dot{\text{C}} < (\text{C}_6\text{H}_5)_3\dot{\text{C}} < (\text{C}_6\text{H}_5)_2\dot{\text{C}}\text{H}$
 b. $(\text{C}_6\text{H}_5)_2\dot{\text{C}}\text{H} < (\text{C}_6\text{H}_5)_3\dot{\text{C}} < (\text{CH}_3)_3\dot{\text{C}} < (\text{CH}_3)_2\dot{\text{C}}\text{H}$
 c. $(\text{C}_6\text{H}_5)_3\dot{\text{C}} < (\text{C}_6\text{H}_5)_2\dot{\text{C}}\text{H} < (\text{CH}_3)_3\dot{\text{C}} < (\text{CH}_3)_2\dot{\text{C}}\text{H}$
 d. $(\text{CH}_3)_2\dot{\text{C}}\text{H} < (\text{CH}_3)_3\dot{\text{C}} < (\text{C}_6\text{H}_5)_2\dot{\text{C}}\text{H} < (\text{C}_6\text{H}_5)_3\dot{\text{C}}$
42. Which one of the following species is not an electrophile?
 a. NO_2^+ b. H_3O^+
 c. Cl^+ d. BH_3

43. The correct decreasing order of priority for the functional groups of organic compounds in the IUPAC system of nomenclature, is

44. Correct order of nucleophilicity is

45. Consider the following transformations

Carbon species formed in I, II and III respectively are

- a. carbocation, carbanion and free radical
 b. free radical, carbocation and carbanion
 c. free radical, carbanion and carbocation
 d. carbanion, carbocation and free radical

46. Which is the most stable carbocation?

47. Select the correct statement about the following reaction :

- a. it can proceed via S_N2 mechanism
 b. configuration about chiral carbon is retained
 c. a racemic mixture is formed
 d. reaction is stereospecific

48. Consider the following reactions:

Select the correct statement.

- a. Inversion in both cases takes place
b. Retention in both cases takes place
c. Retention in I and inversion in II takes place
d. Racemisation in I and inversion in II takes place
49. Arrange the following in increasing order of acidic strength :
I. H_2SO_4 II. $(\text{CH}_3)_3\text{CH}(\text{SH})$
III. $\text{CH}_3\text{CH}_2^+\text{OH}_2$ IV. $\text{CH}_3\text{CH}_2\text{CH}_3$
a. $\text{IV} < \text{II} < \text{I} < \text{III}$ b. $\text{IV} < \text{II} < \text{III} < \text{I}$
c. $\text{IV} < \text{I} < \text{II} < \text{III}$ d. $\text{IV} < \text{III} < \text{II} < \text{I}$
50. Choose the correct order of stability of carbocation using concept of hyperconjugation.
-
- a. $\text{I} < \text{II} < \text{III} < \text{IV}$
b. $\text{IV} < \text{III} < \text{II} < \text{I}$
c. $\text{III} < \text{IV} < \text{II} < \text{I}$
d. All of the above
51. Chloroacetic acid is a stronger acid than acetic acid. This can be explained using
a. $-M$ -effect b. $-I$ -effect
c. $+M$ -effect d. $+I$ -effect
52. $\text{CH}_3\text{CH}_2\text{Cl}$ undergoes homolytic fission and produces
a. $\text{CH}_3\dot{\text{C}}\text{H}_2$ and $\dot{\text{Cl}}$ b. $\text{CH}_3\dot{\text{C}}\text{H}_2$ and Cl^-
c. $\text{CH}_3\text{CH}_2^\oplus$ and $\dot{\text{Cl}}$ d. $\text{CH}_3\dot{\text{C}}\text{H}_2$ and Cl^-

53. Which alkenol is stable?

54. Which of the following is not a free radical?

55. Among the following, the least stable resonance structure is

56. Carbocation stability

Alkyl radical stability

BITSAT Archives

1. Which of the following is correct order of stability of carbocation? [2014]

- a. $\text{IV} > \text{III} > \text{II} > \text{I}$
b. $\text{I} > \text{II} > \text{III} > \text{IV}$
c. $\text{III} > \text{II} > \text{I} > \text{IV}$
d. $\text{I} > \text{III} > \text{II} > \text{IV}$

2. Arrange these in correct order of decreasing reactivity.

- a. $\text{I} > \text{II} > \text{III} > \text{IV}$ b. $\text{I} > \text{III} > \text{II} > \text{IV}$ [2013]
c. $\text{IV} > \text{III} > \text{II} > \text{I}$ d. $\text{IV} > \text{III} > \text{I} > \text{II}$

3. In which of the following species only one type of hybridisation is present? [2012]

4. Which among the following is likely to show geometrical isomerism? [2011]

a. $\text{CH}_3\text{CH}=\text{NOH}$
 b. $\text{CH}_3\text{CH}=\text{CH}_2$
 c. $\text{CH}_2=\text{CH}-\text{CH}=\text{CCl}_2$
 d. $\text{CH}_3\text{C}(\text{Cl})=\text{C}(\text{CH}_3)_2$

5. The bond dissociation enthalpies of =CH , =CH , —CH follows the order [2010]

a. $sp > sp^2 > sp^3$ b. $sp^3 > sp^2 > sp$
 c. $sp^2 > sp > sp^3$ d. $sp > sp^3 > sp^2$

6. Most stable carbonium ion is [2010]

a. 
 b. 
 c. 
 d. 

7. $\text{CH}_3-\text{CH}-\text{CH}_2-\text{CH}_3$ is

a. 2-phenylbutane
 b. 3-phenylbutane
 c. 3-cyclohexylbutane
 d. 2-cyclohexylbutane

8. The IUPAC name of $\text{C}_2\text{H}_5-\text{O}-\text{CH}(\text{CH}_3)_2$ is

a. ethoxypropane
 b. 1,1-dimethyl ether
 c. 2-ethoxysopropane
 d. 2-ethoxypropane

9. The IUPAC name of the compound, [2007]

a. 2-amino-3-hydroxy propanoic acid
 b. 1-hydroxy -2-amino propan-3-oic acid
 c. 1-amino-2-hydroxy propanoic acid
 d. 3-hydroxy-2-amino propanoic acid

10. The compound which give the most stable carbonium ion on dehydration is [2007]

a. $\text{CH}_3\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$
 b. $(\text{CH}_3)_3\text{COH}$
 c. $\text{CH}_2=\text{CHCH}_2\text{CH}_2\text{OH}$
 d. $\text{CH}_3\text{CHOHCH}_2-\text{CH}_3$

11. Tautomerism is exhibited by [2007]

a. 
 b. 
 c. 
 d. 

12. The compound whose stereochemical formula is written below, exhibits x geometrical isomers and y optical isomers. [2006]

The values of x and y respectively are

a. 4 and 4 b. 2 and 2 c. 2 and 4 d. 4 and 5

13. The IUPAC name of the following compound is [2006]

a. 3, 5-dimethylcyclohexene
 b. 3, 5-dimethyl-1-cyclohexene
 c. 1, 5-dimethyl-5-cyclohexene
 d. 1, 3-dimethyl -5-cyclohexene

Answer with Solutions

Practice Exercise

- (c) I, II and IV are aromatic compounds [contain 6π - electrons].
- (b) In toluene, the carbon atom of the ring attached to CH_3 group is 3° .
- (c) $\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$

In this compound, each carbon is sp^2 -hybridised.

$$\text{Hence, \% of } p\text{-character} = \frac{2}{3} \times 100 = 66.67\%.$$

- (c) C_1 is sp and C_2 is sp^2 -hybridised.
- (c) Triple bonded carbon atoms are more electronegative than double and single bonded carbon atoms.
- (a) When C-atom is double bonded to adjacent carbon atoms, the carbon atoms become linear in shape due to the formation of two π -bonds simultaneously with two other C-atoms. Hence, hybridisation comes out to be sp .
- (a) Electrovalency in CaH_2 and covalency in C_2H_2 .
- (d) 3-methyloctane can be represented by all of the above forms.
- (c) Heterocyclic alicyclic compounds are the compounds in which any atom other than carbon is also present in the ring.
- (c) CH_3CONH_2 is the isomer of the given structure and its IUPAC name is ethanamide.

- (c) Pyruvic aldehyde has following structure

- (a) The given compound is shown as

The IUPAC name of above compound is 4-ethyl-3-propylhex-1-ene.

- (c) The given structure of the compound is shown below.

The IUPAC name will be 3-(3-methyl phenyl) benzene-1-oic acid.

- (b) The given structure of the compound is shown below.

- (c) Unsaturation (double bond) is given priority over halogen. So, the correct IUPAC name is 3-bromo-1-chlorocyclohexene

- (a)

3-ethyl-1,1-dimethylcyclohexane

- (b) I. $\text{CH}_3-\text{C}(=\text{O})-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{COOH}$
5-oxohexanoic acid

- (b) $\text{CH}_3-\text{CH}_2-\text{O}-\text{CH}_2-\text{C}(=\text{O})-\text{CH}_2-\text{CH}_2-\text{CH}_3$
1-ethoxypentan-2-one

- (b)

3-(hydroxymethyl) pent-3-ene-2-one

- (b) $\text{CH}_3-\overset{*}{\text{C}}\text{H}(\text{COOH})-\text{CH}_2-\text{CH}_3$

Only this compound has a chiral carbon-atom, hence it will show optical isomerism.

- (c)

Anthranilic acid

- (c) is an example of position isomer while (b) is of metamerism. $\text{CH}_3\text{CH}_2\text{OH}$ and CH_3OCH_3 are functional group isomers.

- (d) C_4H_8 does not exhibit optical isomerism.

- (c) The compound, $\text{H}_3\text{C}-\text{C}(\text{H})=\text{C}(\text{F})-\text{Br}$ exhibits geometrical isomerism. *E* (*trans*)-*Z* (*cis*) as isomers.

25. (d) The structure for 2, 3-dichlorobutane is

This compound contains two chiral centres (asymmetric carbons). Therefore, it exhibits optical isomerism.

26. (b) The compound $\text{C}_5\text{H}_{11}\text{Br}$ possesses 8 constitutional isomers.

27. (b) On chlorination of 2-methylbutane, 4 optically active isomers are formed.

28. (b) 2-oxo-3-methyl-(N-bromo) butanamide is

There is a methyl group at 3rd position and 'Br' at nitrogen atom in the compound.

29. (d)

30. (b) 2-butene contains a double bond and the groups attached with double bonded carbon are different therefore, it exhibits geometrical isomerism. The geometrical isomers are as

31. (b) Chiral compounds have at least one chiral centre, i.e. all four atoms or groups attached to carbon are different.

32. (d)

(i) Enantiomers are the pairs of optical isomers which are related as non-superimposable mirror images of each other.

(ii) Diastereomers are the pairs of optical isomers which cannot be related as non-superimposable mirror images of each other.

∴ The only correct statement about given structures is that (A) and (B) are enantiomers.

33. (c) This carbanion shows resonance

34. (b) In the presence of peroxide, the addition of HBr to propene follows free radical mechanism.

35. (b) Tertiary halides, generally undergo $\text{S}_{\text{N}}1$ reaction, as the tertiary carbocation, obtained in this mechanism, is quite stable.

36. (c) The enol form of acetone is shown below

It shows that this compound possesses 9 σ -bonds, 1 π -bond and 2 lone pairs of electrons on O-atom.

37. (a) Larger the number of α -H-atoms linked to a carbocation, more will be the stable carbocation. Hence, the correct order of stability is $\text{I} < \text{III} < \text{IV} < \text{II}$

38. (c)

39. (d) The compound must possess only keto group in order to show enol form.

The compound $\text{CH}_3 - \overset{\text{O}}{\parallel}{\text{C}} - \text{CH}_2 - \text{COOC}_2\text{H}_5$ contains keto group along with ester group which favours the enol formation by this keto group.

40. (a) Stability of carbocation increases with the dispersal of positive charge by the donation of electron density through +I-effect. The groups showing +I-effect are $-\text{OCH}_3$, $-\text{CH}_3$, $-\text{CH}_2-\text{OCH}_3$. Thus, the correct stability order of the given carbocations is $\text{II} > \text{I} > \text{III}$

41. (d) Larger the number of phenyl groups linked to a free radical, more the number of resonating structure and greater is the stability of free radical. Thus, the correct order for the stability of free radicals is

42. (b)

43. (b) $-\text{COOH} > -\text{SO}_3\text{H} > -\text{CONH}_2 > -\text{CHO}$

44. (d) Nucleophilicity $\propto \frac{1}{\text{Electronegativity of atom bearing negative charge}}$

45. (b) I. $\text{CH}_3 - \text{X} \longrightarrow \dot{\text{C}}\text{H}_3 + \text{X}^\bullet$
Free radicals

46. (c)

3° carbocation is more stable

47. (a) The reaction can proceed through S_N2 mechanism and it is stereospecific. A reaction is stereospecific when a particular stereoisomeric form of the starting material reacts in such a way that it gives a stereoisomeric form of the product.

48. (d)

49. (a) Acidic strength depends upon the tendency of a molecule to give a proton. Among the given, $\text{CH}_3\text{CH}_2\text{OH}_2^+$ readily gives a proton, so it is highly acidic. $\text{CH}_3\text{CH}_2\text{CH}_3$ has the least tendency to lose a proton, so its acidic strength is least among the given. Thus, the correct order of acidic strength is

50. (b) The stability of carbocation on the basis of hyperconjugation can be explained as hyperconjugation stabilises the carbocation because electron density from the adjacent π -bond helps in dispersing the positive charge.

In general, greater the number of alkyl groups attached to a positively charged carbon atom, the greater is the hyperconjugation interaction and stabilisation of the cation. Thus, we have the following relative stability of carbocation

Hence, stability of carbocation is directly proportional to number of alkyl group directly attached to carbocationic carbon.

51. (b)

52. (a) In homolysis, the covalent bond is broken in such a way that each resulting species known as free radical.

53. (b) and (c) are enols and will tautomerise into

54. (c) Dichlorocarbene ($:\text{CCl}_2$) is an electrophile.

55. (a)

56. (d) The observed order of alkyl radical stability is

BITSAT Archives

1. (d)

2. (c) This problem includes conceptual mixing of carbocation stability and reactivity of alcohol. Remove the $-\text{OH}$ group by dehydration and then arrange the carbocation in increasing order of correctly. Order of carbocation stability is same as S_N1 reactivity of alkyl halides.

Carbocation stability The carbocation is formed during the reaction of alcohol by removal of $-\text{OH}$. More stable the carbocation, more will be its reactivity of carbocation formed during reaction are as given

4. (a) Among the given, only $\text{CH}_3\text{CH}=\text{NOH}$ (oxime) satisfy the conditions essential for exhibiting geometrical isomerism. So, it will exhibit *syn-anti* geometrical isomerism.

5. (a)

6. (b)

7. (d) $\text{CH}_3-\overset{1}{\text{CH}}-\overset{2}{\text{CH}}-\overset{3}{\text{CH}_2}-\overset{4}{\text{CH}_3}$ 8. (d) $\text{C}_2\text{H}_5-\text{O}-\overset{2}{\text{CH}}(\overset{1}{\text{CH}_3})_2$

2-ethoxypropane

The above compound is an ether and its name is written as alkoxy. Oxy is attached with the lower group. Hence, the IUPAC name of above compound is 2-ethoxypropane.

9. (a) $\text{CH}_2-\text{CH}-\text{COOH}$
 $\quad \quad \quad | \quad \quad |$
 $\quad \quad \quad \text{OH} \quad \text{NH}_2$

2-amino-3-hydroxypropanoic acid

10. (b) $(\text{CH}_3)_3\text{C}-\text{OH} \xrightarrow[+\text{H}^+]{-\text{H}_2\text{O}} (\text{CH}_3)_3\text{C}^+$
 Tertiary Alcohol 3° carbocation (more stable)

Increasing order of stability of carbocation is

1° carbocation < 2° carbocation < 3° carbocation

11. (a) **Tautomerism** It is functional isomerism in which the isomers are readily interchangeable and maintain a dynamic equilibrium with each other.12. (b) $\text{CH}_3-\text{C}(\text{H})=\text{C}(\text{H})-\text{CH}_2-\text{CH}_2-\text{C}(\text{H})(\text{OH})-\text{CH}_3$

It exhibits 2 geometrical and 2 optical isomers.

13. (a)

IUPAC name : 3, 5-dimethylcyclohexene

22

Purification and Estimation of Organic Compounds

Purification

Methods of Purification of Organic Compounds

The methods employed for the purification of organic compounds are :

Filtration

It is based on the difference in filterability of different components of a solution. This method is used for the separation of insoluble solid components of the mixture from soluble components in a given solution, e.g. separation of sand from salt by dissolving in water.

Crystallisation

This method is used for the purification of organic compounds that are obtained in the pure form of their crystals. This technique is based upon the differences in the solubility of the compound and impurities in different solvents.

The common solvents used for dissolving organic compounds are water, alcohol, ether, benzene, petroleum and chloroform.

Sublimation

This technique is applied to those solids which convert directly into the gaseous state upon heating without converting them into liquid phase and the vapours give directly the pure solid substance.

Organic compounds like naphthalene, anthracene, camphor, benzoic acid, ammonium chloride, salicylic acid, iodine are purified through sublimation.

NOTE *A mixture of two or more sublimates cannot be separated by sublimation technique. Such mixtures are separated only by chemical methods.*

Distillation

It is based upon the difference in the boiling points of two liquids or two components and is generally used, if an organic liquid contains a non-volatile impurity.

Several distillation methods employed to separate mixtures are as follows :

- (i) **Simple distillation** Generally, the non-volatile impurities and organic liquids which differ in their boiling points by 30-50 K are separated by this process, e.g. a mixture of ether and toluene is separated by this method.
- (ii) **Fractional distillation** This technique is employed to those organic liquids which do not possess large difference in their boiling points. It is carried out in a fractionating column which increases the surface area for cooling the vapours of liquid.

e.g. Mixtures of acetone (329 K) and methyl alcohol (338 K), benzene (353 K) and toluene (383 K) are separated through this technique.

- (iii) **Steam distillation** This technique is applied to those compounds which are volatile in steam but insoluble in water and contain non-volatile impurities.

In this type of distillation, the mixture boils at that temperature, when the sum of vapour pressures of organic liquid (p_1) and that of steam (p_2) becomes equal to the atmospheric pressure (p).

Therefore, $p = p_1 + p_2$.

e.g. *ortho* and *para*-nitrophenols aniline, nitrobenzene, sandal wood oil and turpentine oil etc., are purified or obtained by this process.

- (iv) **Vacuum distillation** Certain liquids tend to decompose at a temperature below their boiling point. Such liquids are purified by carrying out their distillation under reduced pressure. Therefore, the liquid boils at lower temperature without undergoing decomposition.

e.g. The boiling point of glycerol is 563 K but it decomposes below this temperature. But when the pressure is reduced to 12 mm, glycerol boils at 453 K without decomposition.

Differential Extraction

In this technique, an aqueous solution of an organic compound, taken in a separating funnel is shaken with a suitable organic solvent in which organic compound is highly soluble. On shaking the funnel, organic layer separates out from an aqueous layer.

The common solvents used are chloroform, (CCl_4), ether, dichloromethane and ethanol. If the extraction is done in small amounts, the extraction will be more efficient and hence, larger amounts of organic compound are extracted.

Chromatography

This technique is used for the separation of an organic compound present in a mixture in very small amount.

Principle of Chromatography

This technique is based on the principle that the components of a given organic mixture is distributed between two phases : stationary and mobile phase.

The stationary phase may be a solid or tightly bound liquid supported over a solid whereas the mobile phase may be a liquid or gas.

The process of distribution depends upon the rate of differential movement of individual components through a stationary phase under the influence of a mobile phase (gas/liquid).

Types of Chromatography

Based upon the nature of stationary and mobile phase, various types of chromatography techniques along with their applications are listed below :

Type of chromatography	Mobile phase	Stationary phase	Application of chromatographic technique
Column (adsorption) chromatography	Liquid	Solid	Used for the purification of organic compounds for both commercial and small scale separations.
High performance liquid chromatography (HPLC)	Liquid	Solid	Used for the identification and characterisation of organic compounds for their quantitative and qualitative analysis.
Thin layer chromatography (TLC)	Liquid	Solid	Only for qualitative analysis.
Gas liquid chromatography (GLC)	Gas	Liquid	For both qualitative and quantitative analysis.
Paper chromatography	Liquid	Solid	For both quantitative and qualitative analysis of polar organic and inorganic compounds.

Estimation of Organic Compounds

Estimation of organic compounds are as follows :

Qualitative Analysis of Organic Compounds

This method involves the conversion of covalently bonded nitrogen, sulphur or halogens present in the organic compounds to corresponding water-soluble ions, in the form of sodium salts.

Detection of Carbon and Hydrogen

Organic compound when heated with CuO, carbon changes into CO₂ (tested with lime water which develops turbidity) and hydrogen to H₂O (tested with anhydrous copper sulphate which turns blue). This confirms the presence of C and H in organic compound.

Detection of Other Elements

Nitrogen, sulphur, halogens and phosphorus present in an organic compounds are detected by Lassaigne's test. The elements present in the organic compounds are converted from covalent form into the ionic form by fusing the compound with sodium metal.

Test for Nitrogen

Lassaigne's test is given by compounds carrying nitrogen and carbon. So, hydrazine (NH₂—NH₂) and hydroxyl amine (NH₂OH) do not give this test.

Test for Sulphur

Test for Halogens

The sodium fusion extract is acidified with nitric acid and then treated with silver nitrate.

AgCl-white ppt, AgBr-dull yellow ppt, AgI-bright yellow ppt

Test for Phosphorus

The compound is heated with an oxidising agent (like sodium peroxide), the phosphorus present in the compound is oxidised to phosphate. The solution is boiled with nitric acid and then treated with ammonium molybdate. A yellow colouration or precipitate indicates the presence of phosphorus.

Quantitative Analysis of Elements

After the detection of elements present in the organic compound, the percentage of different constituent elements is determined by the help of suitable methods. The knowledge of molecular mass and percentage composition helps in the determination of the molecular formula of the compound.

Estimation of C and H in an Organic Compound

Liebig method is used to determine the presence of C and H in an organic compound. In this method, known weight of organic compound is heated strongly with dry CuO in an atmosphere of CO₂ free air or oxygen.

Vapours of CO₂ passed through a weighed potash bulb, which results in increased weight of potash by the absorption of CO₂.

While the vapours of H₂O passed through CaCl₂ which leads to increased weight of CaCl₂. The increased weight of potash and CaCl₂ is used to determine the percentage of C and H.

$$\text{(i) \% of C} = \frac{12 \times W_{\text{CO}_2} \times 100}{44 \times W_{\text{organic compound}}}$$

$$\text{(ii) \% of H} = \frac{2 \times W_{\text{H}_2\text{O}} \times 100}{18 \times W_{\text{organic compound}}}$$

Estimation of N in an Organic Compound

There are two methods used to determine the percentage of N in an organic compound :

(i) Duma's method In this method, a known weight of organic compound is heated with dry CuO in a combustion tube to form CO₂ and water vapour while N₂ is set free. Although, some oxides of nitrogen may be formed but these oxides can be reduced to N₂ when passed through hot reduced copper spiral.

The vapours of N₂, H₂O and CO₂ pass through KOH solution, where N₂ gets collected over KOH solution. While H₂O and CO₂ are absorbed by KOH. The volume of N₂ is recorded from the level of KOH solution in nitrometer tube.

$$\% \text{ of N} = \frac{28 \times V_{\text{N}_2} \text{ at STP} \times 100}{22400 \times W_{\text{organic compound}}}$$

(ii) Kjeldahl's method This method is used for the estimation of N present in food stuffs, soil fertilisers and drugs. In this method, weighed amount of nitrogenous compound is heated strongly with conc. H₂SO₄ in the presence of K₂SO₄ (which raises boiling point of solution), N is converted quantitatively into ammonium sulphate.

Ammonia evolved is condensed and absorbed by a known volume of standard solution of HCl or H₂SO₄.

The percentage of N present in the compound is calculated by

$$\% \text{ of N} = \frac{14}{1000} \times \frac{V_{\text{acid}} \times N_{\text{acid}}}{W_{\text{organic compound}}} \times 100$$

Estimation of Halogen Present in an Organic Compound

Carius method In this method, halogen atom present in the organic compound is converted into insoluble silver halide which is separated and weighed.

From the weight of the silver halide, the percentage of halogens can be calculated as,

$$\% \text{ of Cl} = \frac{35.5}{143.3} \times \frac{W_{\text{AgCl formed}}}{W_{\text{compound}}} \times 100$$

$$\% \text{ of Br} = \frac{80}{188} \times \frac{W_{\text{AgBr formed}}}{W_{\text{compound}}} \times 100$$

$$\% \text{ of I} = \frac{127}{235} \times \frac{W_{\text{AgI formed}}}{W_{\text{compound}}} \times 100$$

Estimation of Sulphur Present in an Organic Compound

The sulphur present in an organic compound is also estimated through Carius method.

In this method, a weighed amount of organic compound is heated with fuming nitric acid in a Carius tube.

The sulphur of the compound is oxidised to sulphuric acid which is then precipitated as barium sulphate by adding excess of barium chloride solution.

From the weight of barium sulphate obtained, the percentage of sulphur is calculated as

$$\% \text{ of S} = \frac{32}{233} \times \frac{W_{\text{BaSO}_4 \text{ formed}}}{W_{\text{compound}}} \times 100$$

Estimation of Phosphorus Present in an Organic Compound

The phosphorus present in an organic compound is estimated only by Carius method. The weighed amount of organic compound is heated with conc. HNO_3 to convert the phosphorus present in the compound into phosphoric acid. Phosphoric acid reacts with magnesia mixture to form magnesium ammonium phosphate, $\text{Mg}(\text{NH}_4)\text{PO}_4$.

The compound, $\text{Mg}(\text{NH}_4)\text{PO}_4$ is collected, washed, dried and ignited to get magnesium pyrophosphate, $\text{Mg}_2\text{P}_2\text{O}_7$.

Knowing the weight of $\text{Mg}_2\text{P}_2\text{O}_7$, percentage of P can be calculated as

$$\% \text{ of P} = \frac{62}{222} \times \frac{W_{\text{Mg}_2\text{P}_2\text{O}_7 \text{ formed}}}{W_{\text{compound}}} \times 100$$

Estimation of Oxygen Present in an Organic Compound

Generally, oxygen is estimated as left over percentage, i.e. 100 minus percentage of other elements.

The percentage of oxygen can be derived from the amount of CO_2 or iodine produced.

$$\% \text{ of O} = \frac{32 \times m_1 \times 100}{44 \times m} \%$$

Practice Exercise

- Absolute alcohol is prepared by
 - fractional distillation
 - Kolbe's method
 - azeotropic distillation
 - vacuum distillation
- Aniline is purified by
 - steam distillation
 - simple distillation
 - vacuum distillation
 - extraction with a solvent
- Name the technique where extraction of compound takes place based on difference in solubility.
 - Differential extraction
 - Chromatography
 - Sublimation
 - Crystallisation
- The technique used for the separation of acetone and methanol, is
 - steam distillation
 - vacuum distillation
 - fractional distillation
 - simple distillation
- The best and latest technique for isolation, purification and separation of organic compound is
 - crystallisation
 - distillation
 - sublimation
 - chromatography
- The compound that does not give blue colour in Lassaigne's test is
 - aniline
 - glycine
 - hydrazine
 - urea
- When FeCl_3 is added to a (FeSO_4 + sodium extract) solution of compound, blood red colour appears. It shows the presence of
 - N and S in the compound
 - S in the compound
 - N and P in the compound
 - Br in the compound
- An organic compound on heating with CuO produces CO_2 but no water. The organic compound may be
 - carbon tetrachloride
 - chloroform
 - methane
 - ethyl iodide
- Which of the following complex formation indicates the presence of sulphur in the organic compound when sodium nitroprusside is added to sodium extract of the compound?
 - $\text{Fe}_4[\text{Fe}(\text{CN})_6]_3$
 - $\text{Na}_2[\text{Fe}(\text{NO})(\text{CN})_5]$
 - $\text{Fe}_4(\text{CNS})_3$
 - $\text{Na}_4[\text{Fe}(\text{CN})_5\text{NOS}]$
- In sulphur estimation, 0.157 g of an organic compound gives 0.4813 g of barium sulphate. The percentage of sulphur in the compound, is
 - 42.10
 - 52.10
 - 21.05
 - 40.01
- In Kjeldahl's method, ammonia from 5 g of food neutralises 30 cm^3 of 0.1 N acid. The percentage of nitrogen in the food is
 - 0.84
 - 0.4
 - 16.8
 - 1.68
- 0.765 g of an acid gives 0.535 g of CO_2 and 0.138 g of H_2O . Then, the ratio of the percentage of carbon and hydrogen is
 - 19 : 2
 - 18 : 11
 - 20 : 17
 - 1 : 7
- 0.59 g of an organic compound produces 112 mL nitrogen at NTP. The percentage of nitrogen in the compound through Duma's method is
 - 23.7
 - 27.5
 - 33.07
 - 16.8
- If 0.1 g of an organic compound containing phosphorus, produces 0.222 g of $\text{Mg}_2\text{P}_2\text{O}_7$, the percentage of phosphorus present in the compound is
 - 31
 - 0.2
 - 66
 - 62
- A compound of carbon, hydrogen and nitrogen contains three elements in the ratio of 9 : 1 : 3.5. The empirical formula of the compound is
 - $\text{C}_2\text{H}_4\text{N}$
 - $\text{C}_3\text{H}_4\text{N}$
 - $\text{C}_3\text{H}_6\text{N}$
 - $\text{C}_2\text{H}_6\text{N}$
- A substance is found to contain 7% nitrogen. The minimum molecular weight of it, is
 - 700
 - 100
 - 200
 - 70
- When FeCl_3 is added to the sodium extract of an organic compound containing both N and S, the red coloured precipitate is formed due to the formation of
 - $[\text{Fe}(\text{CN})_6]^{3-}$
 - $[\text{Fe}(\text{CNS})]^{2+}$
 - $[\text{Fe}(\text{CNS})_2]^+$
 - $[\text{Fe}(\text{CN})_6]^{4-}$

Answer with Solutions

- (c) Absolute alcohol (100% pure ethyl alcohol) is obtained from rectified spirit (95.87% ethanol + 4.13% water) by azeotropic distillation as it is an azeotropic mixture.
- (a) Aniline decomposes on its boiling point and it is also insoluble in water, hence it can be distilled with steam for purification.
- (a) Differential extraction is the technique where extraction of compound takes place based on difference in solubility.
- (c) The compounds acetone and methanol possess equal boiling points therefore, these are separated by fractional distillation technique.
- (d) Chromatography is the best and suitable technique used for the separation of organic compound from their impurities.
- (c) Hydrazine ($\text{NH}_2 \cdot \text{NH}_2$) has no carbon content, hence does not form NaCN in Lassaigne's test. Therefore, it does not give blue colour.
- (a) When N and S, both are present in compound, it forms NaCNS with sodium extract. This gives ferric thiocyanate with FeCl_3 solution, hence blood red colour develops.

- (a) Since, the compound on heating with CuO produces CO_2 which contains carbon. Again, it does not produce water, hence it does not contain hydrogen. So, the organic compound is carbon tetrachloride (CCl_4).
- (d) The formation of sodium thionitroprusside (purple) shows the presence of sulphur.

- (a) Molecular mass of $\text{BaSO}_4 = 137 + 32 + 64 = 233 \text{ g}$
233 g of BaSO_4 contains 32 g of sulphur.

$\therefore$ 0.4813 g of BaSO_4 will contain

$$= \frac{32 \times 0.4813}{233} \text{ g of sulphur}$$

$$\% \text{ of S} = \frac{32 \times 0.4813 \times 100}{233 \times 0.157} = 42.10$$

- (a) From Kjeldahl's method,

$$\% \text{ of N} = \frac{1.4 \times N \times V}{m} = \frac{1.4 \times 0.1 \times 30}{5} = 0.84$$

$$12. (a) \% \text{ of C} = \frac{12}{44} \times \frac{0.535}{0.765} \times 100 = 19.07$$

$$\% \text{ of H} = \frac{2}{18} \times \frac{0.138}{0.765} \times 100 = 2.004$$

Ratio of % of C : H = 19 : 2 (approx.)

- (a) % of N through Duma's method is given by

$$\% \text{ of N} = \frac{28 \times \text{Volume of N}_2 \text{ at STP}}{22400 \times \text{Mass of an organic compound}} \times 100$$

$$= \frac{28 \times 112 \times 100}{22400 \times 0.59} = 23.7$$

- (d) The percentage of P present in the organic compound is given by

$$\% \text{ of P} = \frac{62}{222} \times \frac{\text{Weight of Mg}_2\text{P}_2\text{O}_7}{\text{Weight of organic compound}} \times 100$$

$$= \frac{62}{222} \times \frac{0.222}{0.1} \times 100 = 62$$

- (b) The percentage (or mass) ratio = 9 : 1 : 3.5

$$\therefore \text{Mole ratio} = \frac{9}{12} : \frac{1}{1} : \frac{3.5}{14}$$

$$= 0.75 : 1 : 0.25$$

$$= 3 : 4 : 1$$

Hence, empirical formula = $\text{C}_3\text{H}_4\text{N}$

- (c) Atomic weight of nitrogen is 14. If one atom of nitrogen is present in compound, then it should have molecular weight = $\frac{14}{7} \times 100 = 200$

- (b) When FeCl_3 is added to the sodium extract of an organic compound containing both N and S, a red coloured precipitate of $[\text{Fe(CNS)}]^{2+}$ is formed.

23

Hydrocarbons

Concept of Hydrocarbons

Hydrocarbons means compounds containing carbon and hydrogen only. These may contain only single bonds or double/triple bonds along with single bond. Only single bond containing hydrocarbons are saturated hydrocarbons while that have multiple bond(s) ($=$ or $\equiv$ bond) along with single bonds are unsaturated compounds. Hydrocarbons are mainly obtained from petroleum, which is the major source of commercial energy.

Hydrocarbons are of different types and classified into three main categories :

- (i) Saturated hydrocarbons (alkanes)
- (ii) Unsaturated hydrocarbons (alkenes and alkynes)
- (iii) Aromatic hydrocarbons

Alkanes

Introduction

- $\Rightarrow$ Hydrocarbons having C—C single bond.
- $\Rightarrow$ General formula : C_nH_{2n+2}
- $\Rightarrow$ sp^3 -hybrid orbitals having tetrahedral geometry and bond angle $109^\circ 28'$.
- $\Rightarrow$ Also called paraffins (less reactive) as:
 - (a) strong C—C bond
 - (b) non-polar C—H bond

Isomerism

- (a) Chain isomerism

(b) Position isomerism

Preparation

[known as Sabatier-Sanderen's reaction].

3. From alkyl halides

(a) By reducing alkyl halides

Reducing agents Zn - Cu couple LiAlH_4 , Al-Hg amalgam, Na/K/alc. Li/Ni 300° , B_2H_6

[I_2 is removed as $2\text{P} + 3\text{I}_2 \longrightarrow 2\text{PI}_3$]

(b) Wurtz reaction

(c) Frankland's method $2\text{RX} + \text{Zn} \longrightarrow \text{R}-\text{R} + \text{ZnX}_2$

[Here, $\text{R}-\text{Zn}-\text{R}$ is formed which on reaction with $\text{R}-\text{X}$ gives higher alkane]

4. From aldehyde and ketone

(a) Clemmensen's reduction

(b) Wolf Kishner reduction

5. From carboxylic acid

(b) Decarboxylation

(c) Kolbe's electrolysis

6. From aluminium carbide

[Only CH_4 is formed by this reaction].

Physical Properties

2. Alkanes are colourless, odourless and tasteless.

3. Insoluble in water and soluble in organic solvents.

4. The mp of unbranched alkanes having 2, 4, 6, ... (even) carbon atoms is higher than that of alkanes having 3, 5, 7, ... (odd) carbon atoms.

5. Alkanes float on water as they have lower density.

6. Decreasing order of fuel capacity is :
branched > unbranched lower mol. wt. > higher mol. wt.
As the percentage of C in a hydrocarbon increases, its calorific value (fuel capacity) decreases.

Chemical Properties of Alkanes

Reactivity order : $3^\circ > 2^\circ > 1^\circ$ [for C—H bond]

Reactivity of halogen : $\text{F}_2 > \text{Cl}_2 > \text{Br}_2 > \text{I}_2$

$\Rightarrow$ Iodination is reversible process

To avoid this HIO_3 is used which destroys HI on its formation.

$\Rightarrow$ Chlorination by sulphuryl chloride

3. Sulphonation

Alkenes

Introduction

- ⇒ Hydrocarbons having C=C double bond.
- ⇒ General formula C_nH_{2n} ⇒ sp^2 -hybridisation.
- ⇒ Trigonal planar [(120°) bond angle].

Isomerism

Chain 1-butene, 2-methyl propene

Position 1-butene, 2-butene

Functional 1-butene, 2-butene,
2-methyl propene, cyclobutane etc.

Geometrical *cis*-2 butene, *trans*-2 butene

Preparation

2. Partial hydrogenation of alkynes

3. Dehydrohalogenation of alkyl halides

Ease of reaction: $3^\circ > 2^\circ > 1^\circ$ [alkyl halide]

By dehalogenation of *vicinal* halide.

4. Dehydration of alcohols $\text{ROH} \xrightarrow{\text{Conc. H}_2\text{SO}_4} \text{Alkene}$

Ease of dehydrogenation: $3^\circ > 2^\circ > 1^\circ$

Dehydrating agents

Al_2O_3 [350°C], P_2O_5 , H_3PO_4 , anhyd. ZnCl_2 , conc. H_2SO_4 .

Mechanism

5. Wittig reaction

6. Electrolysis of aqueous solution of sodium salts of carboxylic acids

Physical Properties

- $\text{C}_2-\text{C}_4 \rightarrow$ gases
 $\text{C}_5-\text{C}_{15} \rightarrow$ liquids $> \text{C}_{15} \rightarrow$ solids
- Insoluble in water, soluble in polar solvents.
- bp $\propto$ molecular weight
- More polar than corresponding alkanes.

Chemical Properties of Alkenes

1. Electrophilic addition reactions

Mechanism

(a) Hydrogenation

(b) Halogenation

The diagram illustrates the electrophilic addition of bromine to an alkene through three stages:

- Alkene + Br₂ → π-Complex:** An alkene (represented by a C=C double bond with four generic bonds) reacts with a bromine molecule (Br-Br). An arrow points from the C=C double bond to the Br-Br bond, indicating the formation of a π-complex.
- π-Complex → σ-Complex:** The π-complex rearranges to form a σ-complex. In this intermediate, one carbon is bonded to a bromine atom (Br) and the other carbon carries a positive charge (C⁺). A bromide ion (Br⁻) is shown nearby, indicating the heterolytic cleavage of the Br-Br bond.
- σ-Complex + Br⁻ → Dibromide:** The σ-complex reacts with the bromide ion (Br⁻). An arrow points from a lone pair on the bromide ion to the positively charged carbon. The final product is a dibromide, where both carbons are bonded to bromine atoms (Br).

$$\text{CH}_3-\text{CH}=\text{CH}_2 \xrightarrow[\text{Markownikoff's addition}]{\text{HX}} \text{CH}_3-\underset{\text{X}}{\text{CH}}-\text{CH}_3$$
$$\text{CH}_3-\text{CH}=\text{CH}_2 \xrightarrow[\text{Peroxide}]{\text{HBr}} \text{CH}_3-\text{CH}_2-\text{CH}_2-\text{Br}$$
$$\text{CH}_3-\text{CH}=\text{CH}_2 \xrightarrow{\text{H}\ddot{\text{O}}\text{Cl}^+} \text{CH}_3-\underset{\text{OH}}{\text{CH}}-\text{CH}_2\text{Cl}$$

$$\text{CH}_2=\text{CH}_2 \xrightarrow{[\text{O}]} 2\text{CO}_2 + \text{H}_2\text{O}$$

Introduction

- Hydrocarbons having $\text{C} \equiv \text{C}$ triple bond.
- General formula $\text{C}_n\text{H}_{2n-2}$
- sp -hybridisation [$(180)^\circ$ bond angle]
- **Isomerism**

Chain 1-pentyne, 3-methyl-1-butyne.

Position 1-pentyne, 2-pentyne

Functional 1-3 butadiene, 1-2 butadiene, cyclobutene, 1-butyne.

Preparation

- ### 1. From alkanes: Partial oxidation of methane

- $$\text{2. Synthesis: } 2\text{C} + \text{H}_2 \xrightarrow[\text{arc. (1100}^\circ\text{)}]{\text{Electric}} \text{HC} \equiv \text{CH}$$
- Ethyne

- ### 3. Dehalogenation of tetrahalides

- #### 4. From calcium carbide

Physical Properties

1. $C_2-C_4 \rightarrow$ gases
 $C_5-C_{14} \rightarrow$ liquids $> C_{14} \rightarrow$ solids.
2. Slightly soluble in water.
3. mp/bp $\propto$ molecular weight.

Chemical Properties of Alkynes

1. **Acidic characters of alkynes** The hydrogen atoms linked to triple bonded carbon atoms is highly acidic in nature.

The reactions involving highly acidic H-atoms are as follows:

Acetylene also reacts with sodamide to form mono and disodium acetylide and ammonia.

- (b) **Reaction with Tollen's reagent**

NOTE Greater the *s*-character present in a molecule higher is the acidity of molecule.

2. **Electrophilic addition reaction**
(Follows Markownikoff's rule)

- (a) **Addition of hydrogen**

- (b) **Addition of halogens** ($X = \text{Cl}, \text{Br}, \text{I}$)

- (c) **Addition of halogen acids**

3. **Nucleophilic addition reaction**

- (a) **Addition of water (H_2O) in presence of acids**

- (b) **Addition of arsenic trichloride (AsCl_3)**

- (c) **Addition of hydrogen cyanide (HCN)**

- (d) **Addition of acetic acid**

4. **Polymerisation**

5. **Oxidation of alkynes**

- (a) **By neutral KMnO_4**

- (b) **By acidic KMnO_4 (hot)**

(c) By ozone

Petroleum

The term petroleum originates from the Latin word (Petra-rock, Oleum-oil) meaning rock oil, mineral oil or earth oil. Petroleum is a thick viscous fluorescent liquid with dark green, brown or yellow colours. It was discovered by Colonel Drake in 1859.

Composition

It mostly consists of alkanes (C_1 to C_{40}) cycloparaffins, cycloalkanes and aromatic hydrocarbons. Some organic compounds containing N, S and O are also present.

Cracking

The process of getting lower hydrocarbons by heating hydrocarbons of higher boiling point. Cracking can be carried out in liquid or vapour phase.

Knocking

Knocking is the metallic sound produced due to irregular burning of the fuels and it depends upon the quality of the fuel which can be measured in terms of octane number.

Octane Number

The octane number of any sample is determined by matching its knocking property with a mixture of *iso*-octane and heptane in an experimental engine, e.g. octane number of triptane is 124.

Octane number is the percentage (by volume) of *iso*-octane present in a mixture of *iso*-octane and heptane which has the same knocking performance as the sample fuel.

Cetane Number

The efficiency of diesel oil is expressed in terms of cetane number. Cetane (hexadecane) is assigned cetane number 100 and α -methyl naphthalene is assigned zero. A diesel oil having cetane number 75 would have the same ignition property as a mixture; of 75% cetane and 25% α -methyl naphthalene.

Aromatic Hydrocarbons

The parent compound of aromatic hydrocarbons, is benzene (C_6H_6). Some homologues of benzene are:

The chief source of aromatic compounds, is still the coaltar, which is a residual component of destructive distillation of coal. The coaltar is further fractionally distilled, when various compounds are obtained at different range of temperature, as shown below in table:

Temperature range	Name of fraction	Major compounds
80°–170°C	Light oil	Benzene, toluene, xylenes etc.
170°–230°C	Middle oil	Phenol, cresol, naphthalene, pyridine etc.
230°–270°C	Heavy oil	Phenols, naphthol etc.
270°–360°C	Green oil or anthracene oil	Anthracene, phenanthrene
—	Pitch (left as residue)	Carbon

Aromaticity

Ring systems whether having benzene ring or not with the following characteristics are said to be aromatic.

1. Planarity
2. Complete delocalisation of the π - electrons in the ring
3. Presence of $(4n + 2)$ π -electrons in the ring, where n is an integer ($n = 0, 1, 2$). This is known as **Huckel's rule**.

Certain compounds such as pyrrole, furan etc., although do not contain benzene ring, but behaves like benzene. These compounds are called non-benzenoid aromatic compounds.

Benzene

- Discoverer – M. Faraday
- Structure established by – Kekule
- Hybridisation of each carbon – sp^2

Preparation**1. From sodium benzoate****2. From phenol****3. Synthesis**

(b) From *n*-hexane

**Physical Properties**

Benzene is a colourless, volatile liquid having characteristic odour, insoluble in water. Boiling point = 80.4°C

Chemical Properties

- 1. Electrophilic substitution** Benzene, despite being highly unsaturated compound, gives electrophilic substitution reactions, e.g. halogenation, sulphonation, nitration, Friedel-Crafts reactions etc.

**Mechanism**

Electrophile in nitration is nitronium ion (NO_2^+) and in sulphonation, it is SO_3H^+ ion.

Friedel-Crafts alkylation**Friedel-Crafts acylation****2. Addition of Chlorine**

Commercially, it is known as gammaxene and is an important insecticide.

3. Oxidation

4. Reduction

Carcinogenicity and Toxicity

Benzene and polynuclear hydrocarbons containing more than two benzene rings fused together, are toxic and said to possess cancer producing (carcinogenic) property. Such polynuclear hydrocarbons are formed on incomplete combustion of organic material like tobacco, coal and petroleum.

Directive Influence of Functional Group in Monosubstituted Benzene

The substituent already present in the benzene ring directs the incoming group either to *ortho* and *para* or to *meta*-position. *o, p*-directing groups increase the electron density on the ring and thus, increase the reaction rate while *m*-directing groups decrease the electron density on the benzene ring and thus, decrease the reaction rate.

e.g.

1. —OH group is *ortho, para*-directing.

In case of phenol, electron density is more concentrated on the two *o* and *p*-positions. Therefore, substitution is mainly in these positions.

—NH₂, —NHR, —NHCOCH₃, —OCH₃, —CH₃, —C₂H₅ are *o* and *p*-directing groups.

2. —NO₂ group is *meta*-directing.

- —NO₂, —CN, —CHO, —COR, —COOH, —COOR, —SO₃H are *meta*-directing groups.
- In case of haloarenes, halogens are highly deactivating because of $-I$ -effect but due to resonance, electron density on *o* and *p*-position increases, hence halogens are *o, p*-directing.

Practice Exercise

- Chlorination of *n*-butane gives the product
 - only 2-chlorobutane
 - only 1-chlorobutane
 - mixture of *s*-butyl chloride (excess) + *n*-butyl chloride
 - n*-butyl chloride and isobutyl chloride
- Consider the following reaction,

$$\text{CH}_3-\text{CH}_2-\text{CH}_2-\text{CH}_3 \xrightarrow{\text{AlCl}_3/\text{HCl}} \text{product}$$
 The reaction is named as
 - insertion
 - cracking
 - inversion
 - isomerisation
- The concentrated aqueous solution of potassium salts of acetic acid and propanoic acid are electrolysed. Which of the following hydrocarbons is/are produced?
 - Only CH₃CH₂CH₃
 - CH₃CH₃ and CH₃CH₂CH₂CH₃
 - CH₃CH₂CH₂CH₃, CH₃CH₂CH₃ and CH₃CH₃
 - Only CH₃CH₃
- A mixture of ethyl bromide and methyl bromide is subjected to Wurtz reaction. The mixture of alkanes so formed, consists of
 - propane and butane
 - ethane and propane
 - ethane, propane and butane
 - ethane and butane
- Pure methane can be prepared by
 - Wurtz reaction
 - Kolbe's electrolytic method
 - soda lime decarboxylation
 - reduction with H₂
- The reaction,

$$\text{C}_6\text{H}_5\text{Br} + 2\text{Na} + \text{BrCH}_3 \longrightarrow \text{C}_6\text{H}_5\cdot\text{CH}_3 + 2\text{NaBr}$$
 is known as
 - Wurtz reaction
 - Wurtz-Fittig reaction
 - Friedel-Crafts reaction
 - Berthelot synthesis

- $$\begin{aligned} \text{I. } \text{CH}_4 + \text{Cl}^\bullet &\xrightarrow{h\nu} \dot{\text{C}}\text{H}_3 + \text{H} - \text{Cl} \\ \text{II. } \text{Cl} - \text{Cl} &\xrightarrow{h\nu} 2\dot{\text{Cl}} \\ \text{III. } \dot{\text{C}}\text{H}_3 + \text{Cl}_2 &\longrightarrow \text{CH}_3 - \text{Cl} + \text{Cl}^\bullet \\ \text{IV. } \dot{\text{Cl}} + \dot{\text{Cl}} &\longrightarrow \text{Cl} - \text{Cl} \\ \dot{\text{C}}\text{H}_3 + \dot{\text{C}}\text{H}_3 &\longrightarrow \text{CH}_3 - \text{CH}_3 \end{aligned}$$

a. II, I, III and IV
b. I, II, III and IV
c. IV, III, II and I
d. II, III, I and IV

- (ii) $(\text{CH}_3)_3\text{CH} \xrightarrow{B} (\text{CH}_3)_3\text{COH}$
Here, A and B respectively are

- a. Zn(Hg)/HCl (conc.) and KMnO₄
 b. KMnO₄ and Zn(Hg)/conc. HCl
 c. H₂ / Ni and KMnO₄
 d. CH₃OH and C₂H₅OH
15. When 2-methyl butane-1-ol is dehydrated to give an alkene, the preferred product is
 a. 2-methyl but-1-ene b. but-1-ene
 c. 2-methyl but-2-ene d. but-2-ene
16. A cylinder of compressed gas that bears no label is supposed to contain either ethane or ethene. Combustion of the sample shows that 16 cm³ of the gas require 48 cm³ of oxygen for complete combustion. This shows that the gas is
 a. only ethane
 b. only ethene
 c. 1 : 1 mixture of two gases
 d. some unknown mixtures of the two gases
17. Cold and dil. KMnO₄ reacts with but-2-ene to form
 a. ethane-1, 2-diol b. butane-1, 4-diol
 c. butane-1, 3-diol d. butane-2, 3-diol
18. The conversion of ClCH=CH—Cl to Cl₂CH—CHCl₂ can be carried out with
 a. Cl₂ b. Cl₂ / hν
 c. Cl₂ / AlCl₃ d. Cl₂ / aq. NaOH
19. *iso*-butyl magnesium bromide with dry ether and ethyl alcohol gives
 a. $\text{CH}_3\underset{\begin{array}{c} | \\ \text{CH}_3 \end{array}}{\text{CH}}\text{CH}_2\text{OH}$ and $\text{CH}_3\text{CH}_2\text{MgBr}$
 b. $\text{CH}_3\underset{\begin{array}{c} | \\ \text{CH}_3 \end{array}}{\text{CH}}\text{CH}_3$ and $\text{MgBr(OC}_2\text{H}_5)$
 c. $\text{CH}_3\underset{\begin{array}{c} | \\ \text{CH}_3 \end{array}}{\text{CH}}\text{CH}=\text{CH}_2$ and Mg(OH)Br
 d. $\text{CH}_3\underset{\begin{array}{c} | \\ \text{CH}_3 \end{array}}{\text{CH}}\text{CH}_3$ and $\text{CH}_3\text{CH}_2\text{OMgBr}$
20. Which of the following will not show geometrical isomerism?
 a. $\begin{array}{ccc} \text{F} & & \text{H} \\ & \diagdown \quad \diagup & \\ & \text{C}=\text{C} & \\ & \diagup \quad \diagdown & \\ \text{Cl} & & \text{D} \end{array}$
 b. $\begin{array}{ccc} \text{F} & & \text{F} \\ & \diagdown \quad \diagup & \\ & \text{C}=\text{C} & \\ & \diagup \quad \diagdown & \\ \text{Cl} & & \text{Cl} \end{array}$
 c. $\begin{array}{ccccc} \text{H}_3\text{C} & & & & \text{C}_2\text{H}_5 \\ & \diagdown & & \diagup & \\ & \text{C}=\text{C} & & & \\ & \diagup & & \diagdown & \\ \text{H}_2\text{C}_2 & & & & \text{CH}_3 \end{array}$
 d. $\begin{array}{ccccc} \text{CH}_3 & & & & \text{CH}_3 \\ & \diagdown & & \diagup & \\ & \text{C}=\text{C} & & & \\ & \diagup & & \diagdown & \\ \text{H}_3\text{C} & & & & \text{C}_2\text{H}_5 \end{array}$
21. Anti-Markownikoff's addition of HBr is not observed in
 a. propene
 b. butene
 c. but-2-ene
 d. pent-2-ene

22. A compound *X* when passed through dil. H_2SO_4 containing HgSO_4 gives a compound *Y* which on reaction with HI and red phosphorus gives C_2H_6 . The compound *X* is
 a. ethene b. ethyne c. 2-butene d. 2-butyne
23. The addition of halogen to an alkene involves the formation of
 a. carbocation as the intermediate
 b. carbanion as the intermediate
 c. free radical as the intermediate
 d. halonium ion as the intermediate
24. The addition of HBr to 1-butene gives a mixture of products *A*, *B* and *C*

The mixture consists of

- a. *A* and *B* as major and *C* as minor products
 b. *B* as major, *A* and *C* as minor products
 c. *B* as minor, *A* and *C* as major products
 d. *A* and *B* as minor and *C* as major products
25. The principle organic product formed in the reaction.

- a. $\text{CH}_3 - \text{CHBr}(\text{CH}_2)_8\text{COOH}$
 b. $\text{CH}_2 = \text{CH}(\text{CH}_2)_8\text{COBr}$
 c. $\text{CH}_2\text{BrCH}_2(\text{CH}_2)_8\text{COOH}$
 d. $\text{CH}_2 = \text{CH}(\text{CH}_2)_7\text{CHBrCOOH}$
26. Identify of *Z* in the sequence

- a. $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{O} - \text{CH}_2\text{CH}_3$
 b. $\text{CH}_3\text{CH}_2 - \underset{\text{CH}_3}{\text{CH}} - \text{O} - \text{CH}_2\text{CH}_3$
 c. $\text{CH}_3 - (\text{CH}_2)_3 - \text{O} - \text{CH}_2 - \text{CH}_3$
 d. $\text{CH}_3 - (\text{CH}_2)_4 - \text{O} - \text{CH}_3$

27. The following reaction is an example of

- a. oxidation reaction
 b. reduction reaction
 c. α -elimination reaction
 d. β -elimination reaction

28. According to Markownikoff's rule, the major product formed by addition of HBr with propene is
 a. 1-bromopropane
 b. 1-bromo, 1-methyl ethane
 c. 2-bromopropane
 d. 2,2-dibromopropane

29. What will be the product of the following reaction?

- a. $\text{CH}_3\text{CH}_2\text{CH}_2\text{Br}$ b. $\text{CH}_3\text{CH}(\text{Br})\text{CH}_3$
 c. $\text{CH}_3\text{CBr}_2\text{CH}_3$ d. $\text{CH}_3 - \underset{\text{H}}{\text{C}} = \text{CH}_2$

Here, *A* and *B* respectively are

- a. propene and methanal b. propene and ethanal
 c. propene and ethanol d. propene and ethanal

Here, *A* is

- a. $\text{CH} \equiv \text{CH}$ b. $\text{CH}_3 - \text{C} \equiv \text{CH}$
 c. $\text{CH}_3 - \text{CH}_3$ d. $\text{CH} \equiv \text{C} - \text{NH}_2$

32. Which one of the following compounds will react with two mole of CH_3MgBr ?
 a. CH_3COOH b. $\text{CH}_3 - \text{C} = \text{C} - \text{CH}_3$
 c. $\text{HC} \equiv \text{C} - \text{CH}_2\text{OH}$ d. $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$

33. An organic compound on treatment with Br_2/CCl_4 , gives a bromoderivative alkene. The compound will be

- a. $\text{CH}_3\text{CH} = \text{CH}_2$ b. $\text{CH}_3\text{CH} = \text{CHCH}_3$
 c. $\text{HC} \equiv \text{CH}$ d. $\text{CH}_2 = \text{CH}_2$

34. Which of the following shows less reactivity towards Br_2 ?

- a. $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2$ b. $\text{CH}_3\text{CH} = \text{CH}_2$
 c. $\text{CH}_3 - \text{C} \equiv \text{C} - \text{CH}_3$ d. $\text{CH} \equiv \text{CH}$

35. Which one of the following does not dissolve in the conc. H_2SO_4 ?

- a. $\text{CH}_2 = \text{CH}_2$ b. $\text{CH} - \text{C} \equiv \text{C} - \text{CH}_3$
 c. $\text{CH}_3\text{CH}_2\text{C} \equiv \text{CH}$ d. $\text{CH} \equiv \text{CH}$

36. *n*-propyl bromide on treatment with ethanolic potassium hydroxide produces

- a. propanol-1 b. propene
 c. propanol-2 d. ethyl propyl ether

37. When an alkyne $RC\equiv CH$ is treated with cuprous ion in an ammoniacal medium one of the products is
 a. $RC\equiv CCu$ b. $CuC\equiv CH$
 c. $CuC\equiv CCu$ d. $RC\equiv CR$
38. Ozonolysis of 2,3-dimethyl-1-butene followed by reduction with zinc and water gives
 a. methanoic acid and 3-methyl-2-butanone
 b. methanal and 2-methyl-2-butanone
 c. methanal and 3-methyl-2-butanone
 d. methanoic acid and 2-methyl-2-butanone
39. Which of the following is the predominant product in the reaction of $HOBr$ with propene?
 a. 2-bromo-1-propanol
 b. 3-bromo-1-propanol
 c. 2-bromo-2-propanol
 d. 1-bromo-2-propanol
40. When propyne is treated with aqueous H_2SO_4 in presence of $HgSO_4$, the major product is
 a. propanal
 b. *n*-propyl hydrogen sulphate
 c. acetone
 d. propanol
41. What is the best way to carry out the following transformation?
 1-pentyne $\longrightarrow$ pentanal
 a. $HgSO_4 / H_2SO_4$
 b. H_2 / Lindlar's catalyst, O_3 , $Zn-H_2O$
 c. HIO_4 / H_2O
 d. $BH_3, H_2O_2 / NaOH$
42. On vigorous oxidation by permanganate solution $(CH_3)_2C=CHCH_2CHO$ gives
 a. $(CH_3)_2CO$ and $OHCCH_2CHO$
 b. $(CH_3)_2C(OH)-CH(OH)-CH_2CHO$
 c. $(CH_3)_2CO$ and $OHCCH_2COOH$
 d. $(CH_3)_2CO$ and $CH_2(COOH)_2$
43. Acidic hydrogen is present in
 a. ethyne b. ethene
 c. benzene d. ethane
44. Which of the following order is correct regarding acidic character of hydrocarbons given below?
 I. $CH\equiv CH > CH_2=CH_2 > CH_3-CH_3$
 II. $HC\equiv CH > CH_3C\equiv CH >> CH_3C\equiv CCH_3$
 a. Only I b. Only II
 c. Both I and II d. None of these
45. The hydrocarbon, which can react with sodium in liquid ammonia is
 a. $CH_3CH_2CH_2C\equiv CCH_2CH_2CH_3$
 b. $CH_3CH_2C\equiv CH$
 c. $CH_3CH\equiv CHCH_3$
 d. $CH_3CH_2C\equiv CCH_2CH_3$

46. Which of the following is non-aromatic?
 a. Benzene b. Tropylium cation
 c. Cyclopentadienyl anion d. Cyclooctatetraene
47. Toluene, on oxidation with $KMnO_4$ gives
 a. benzaldehyde b. phenol
 c. nitrotoluene d. benzoic acid
48. Ozonolysis of benzene gives
 a. 8 moles of glyoxal b. glycol
 c. 6 moles of glyoxal d. 3 moles of glyoxal
49. Benzene was discovered by
 a. Faraday b. Berthelot c. Kekule d. Huckel
50. In nitration of benzene, the active species is
 a. NO_2^- b. ONO^- c. NO_2^+ d. NO_3^-
51. Give the major product of the following reaction.

52. $PhCH_3$ on reaction with $Cl_2 + h\nu$ followed by Na / ether will give

53. The reaction of 1,3-butadiene and acetylene gives

54. When nitrobenzene is treated with Br_2 in the presence of FeBr_3 , the major product formed is *m*-bromonitrobenzene. Statements which are related to obtain the *m*-isomer are
- the electron density on *meta*-carbon is less than that on *ortho* and *para*-positions
 - the intermediate carbonium ion formed after initial attack of Br^+ at the *meta*-position is least destabilised
 - loss of aromaticity when Br^+ attacks at the *ortho* and *para*-positions and not at *meta*-position
 - easier loss of H^+ to regain aromaticity from the *meta*-position than from *ortho* and *para*-positions

55. A hydrocarbon reacts with HI to give X which on reaction with aqueous KOH forms Y . Oxidation of Y gives 3-methyl, 2-butanone. The hydrocarbon is

- $\text{CH}_3\text{CH}=\overset{\text{CH}_3}{\text{C}}-\text{CH}_3$
- $\text{CH}_2=\text{CH}-\underset{\text{CH}_3}{\text{CH}}-\text{CH}_3$
- $\text{CH}_3-\text{CH}_2-\underset{\text{CH}_3}{\text{CH}}-\text{CH}_3$
- $\text{CH}\equiv\text{C}-\underset{\text{CH}_3}{\underset{\text{CH}_3}{\text{CH}}}-\text{CH}_3$

56. A Friedel-Crafts reaction of benzene with chloroform produces

- $\text{C}_6\text{H}_5\text{CHCl}_2$
- $\text{C}_6\text{H}_5-\overset{\text{Cl}}{\underset{\text{H}}{\text{C}}}-\text{C}_6\text{H}_5$
- $\text{C}_6\text{H}_5-\overset{\text{C}_6\text{H}_5}{\underset{\text{H}}{\text{C}}}-\text{C}_6\text{H}_5$
- All of these

Here, A is

- H_2
- X^-
- HX
- Both b and c

58. Consider the following statements,

- The $-\text{OH}$ group present in the phenol is *ortho* and *para*-directing.
- Directive influence of a functional group in monosubstituted benzene depends on the nature of the substituent already present in the benzene ring.
- The $-\text{OH}$ group activates the benzene ring for the attack by an electrophile.
- Groups such as $-\text{NH}_2$, $-\text{NHR}$, $-\text{NHCOCH}_3$, $-\text{OCH}_3$, $-\text{CH}_3$, $-\text{C}_2\text{H}_5$, etc., are the examples of activating group.

Select the correct option.

- I and II
- II and III
- II, III and IV
- I, II, III and IV

X and Y are

- $\text{C}_6\text{H}_5\text{NHOH}$, $\text{C}_5\text{H}_4(\text{OH})\text{NH}_2$
- $\text{C}_6\text{H}_5-\text{N}_2\text{H}_4-\text{C}_6\text{H}_5$, $\text{C}_6\text{H}_4-\overset{\text{Cl}}{\underset{\text{Cl}}{\text{N}}}\text{C}_6\text{H}_4-\text{NH}$
- Both (a) and (b)
- None of the above

60. In the reaction,

X and Y are respectively,

- $\text{C}_6\text{H}_5\text{Cl}$ and $\text{C}_6\text{H}_5\text{SO}_3\text{H}$
- $\text{C}_6\text{H}_5\text{Cl}$ and $\text{C}_6\text{H}_5\text{OH}$
- $\text{C}_6\text{H}_4\text{Cl}_2$ and $\text{C}_6\text{H}_5\text{SO}_2$
- $\text{C}_6\text{H}_5\text{Cl}$ and $\text{C}_6\text{H}_5\text{CHO}$

61. Which of the following organic materials damage DNA of our body?

- Tobacco
- Coal
- Petroleum
- All of the above

BITSAT Archives

1. What will be the product of the reaction? [2014]

- a. $\text{CH}_3-\text{C}=\text{CH}_2$
 |
 CH_3
- b. $\text{CH}_3-\text{O}-\text{C}-\text{CH}_3$
 |
 CH_3
- c. $\text{CH}_3-\text{CH}_2-\text{CH}_2-\text{CH}_3$
- d. $\text{CH}_3-\text{CH}-\text{CH}_3$
 |
 CH_2

2. The types of the reactions for these are [2014]

- a.** elimination, substitution, addition, addition
b. addition, elimination, addition, substitution
c. elimination, addition, substitution, addition
d. substitution, elimination, addition, addition

3. Which of the following reaction produces most stable alkene? [2013]

- a.** 2-chloro butane
b. 2, 3-dichloro butane
c. 2, 2-dichloro butane
d. 2, 3-dichloro, 2, 3-dimethyl butane

4. IUPAC name and degree of unsaturation of compound X is [2013]

- a.** 2, 3-dimethyl bicyclo [2,2,1] hept-5 ene, 2
b. 1, 2-dimethyl bicyclo [2,2,1] hept-4 ene, 3
c. 5, 6-dimethyl bicyclo [2,2,1] hept-2 ene, 3
d. 4, 5-dimethyl bicyclo [2,2,1] hept-1 ene, 2

5. Lindane can be obtained by the reaction of benzene with [2012]

- a.** CH_3Cl / anhyd. AlCl_3 **b.** $\text{C}_2\text{H}_5\text{I}$ / anhyd. AlCl_3
c. CH_3COCl / anhyd. AlCl_3 **d.** Cl_2 in sunlight

6. What will be the main product when acetylene reacts with hypochlorous acid? [2012]

- a.** Trichloro acetaldehyde
b. Acetaldehyde
c. Dichloro acetaldehyde
d. Chloro acetaldehyde

7. In which of the following compounds, the bond length between hybridised carbon atom and other carbon atom is minimum? [2012]

- a.** Butane **b.** Propyne
c. Propene **d.** Butene

8. The treatment of benzene with *iso* -butene in the presence of sulphuric acid gives [2011]

- iso-butylbenzene
- tert-butylbenzene
- n-butylbenzene
- No reaction

9. Which of the following carbon atoms is most electronegative? [2011]

- a. I
b. II
c. III
d. All are equally electronegative

- 10.** The reaction/method that does not give an alkane is
a. catalytic hydrogenation of alkenes [2011]

- b.** hydrolysis of alkyl magnesium bromide
c. Kolbe's electrolytic method
d. dehydrohalogenation of an alkyl halide

- 11.** The most strained cycloalkane is [2010]

- a.** cyclopropane **b.** cyclobutane
c. cyclopentane **d.** cyclohexane

- 12.** Chain isomers of C_6H_{14} will be [2010]

- a.** 4 **b.** 5 **c.** 6 **d.** 7

13. Which of the following alkenes will react fastest with H_2 under catalytic hydrogenation conditions? [2009]

14. Which of the following reagents would you prefer to find out whether the hydrocarbon C_3H_4 contains one-triple bond or two-double bonds? [2009]

a. Fehling's solution
b. Ammoniacal $AgNO_3$ or $CuCl$ solution
c. Baeyer's reagent
d. Br_2/CCl_4

15. Which of the following compound(s) has *Z* configuration? [2008]

a. Only I b. Only II c. Only III d. I and III

16. $C_7H_8 \xrightarrow{2Cl_2, \text{Heat}} A \xrightarrow{Fe/Br_2} B \xrightarrow{Zn/HCl} C$

Here, the compound *C* is [2008]

a. 3-bromo 2, 4, = 6 -trichlorotoluene
b. *o*-bromotoluene
c. *p*-bromotoluene
d. *m*-bromotoluene

17. What is the product *A* in the following? [2006]

c. Both *a* and *b*

d. None of the above

18. How many asymmetric carbon atoms are present in (i) 1, 2-dimethylcyclohexane [2005]

(ii) 3-methylcyclopentene and

(iii) 3-methylcyclohexene

a. two, one, one
b. one, one, one
c. two, none, two
d. two, none, one

19. Bicyclo (1, 1, 0) butane is [2005]

Answer with Solutions

Practice Exercise

1. (c) *Sec*-butyl chloride will be formed in more quantity than *n*-butyl chloride as 2° hydrogen is more reactive.

2. (d)

This is known as isomerisation.

5. (c) Methane cannot be prepared by either Wurtz reaction, Kolbe's electrolytic method or by reduction of alkenes with H_2 . While acetic acid salt on heating with soda lime, gives methane.

6. (b) This reaction is called Wurtz-Fittig reaction and is a common method of preparing toluene.
7. (c) LPG (Liquified petroleum gas) contains almost 96% *n*-butane.
8. (c) Only red P and conc. HI convert —COOH group to —CH_3 .
9. (a) Boiling point $\propto$ number of carbons.
10. (b) $\text{C—C—C—C} \xrightarrow[\Delta]{\text{Br}_2} \text{C—C—C—C—Br} + \text{C—C—C—Br}$
 C
Major

As 2° free radical is more stable than 1° free radical.

11. (c) With increase in number of branched chains, the molecule attains the shape of a sphere. This results in smaller area of contact and therefore weak intermolecular forces between spherical molecules, which are overcome at relatively lower temperatures.
12. (a)
13. (d) $\text{C}_n\text{H}_{2n+2} + \left(\frac{3n+1}{2}\right) \text{O}_2 \longrightarrow n \text{CO}_2 + (n+1) \text{H}_2\text{O}$
14. (a) $\text{CH}_3\text{COCH}_3 \xrightarrow[2(\text{H})]{\text{Zn(Hg)/HCl}} \text{CH}_3\text{CH}_2\text{CH}_3 + \text{H}_2\text{O}$
 $(\text{CH}_3)_3\text{CH} \xrightarrow{\text{KMnO}_4} (\text{CH}_3)_3\text{COH}$
 3° alcohol
15. (a) Where the structure of the alkyl group permits, rearrangement takes place:
 $\text{CH}_3\text{—CH}_2\text{—CH(CH}_3\text{)—CH}_2\ddot{\text{O}}\text{H} + \text{H}^+ \longrightarrow$
 $\text{CH}_3\text{—CH}_2\text{—C(CH}_3\text{)=CH}_2$
 2-methyl but-2-ene
 (more stable than 2° carbocation)
16. (b) $\text{C}_x\text{H}_y + \left(x + \frac{y}{4}\right) \text{O}_2 \longrightarrow x \text{CO}_2 + \frac{y}{2} \text{H}_2\text{O}$
 1 vol. $\left(x + \frac{y}{4}\right)$ vol
 $16 \text{ cm}^3 16 \left(x + \frac{y}{4}\right) \text{ cm}^3$
 Now, we have $16 \left(x + \frac{y}{4}\right) = 48$
 Putting $x = 2$
 $16 \left(2 + \frac{y}{4}\right) = 48$
 or $y = 4$
 Hence, the hydrocarbon is C_2H_4 .

17. (d) Hydroxylation occurs

18. (a) $\text{ClCH=CHCl} \xrightarrow{\text{Cl}_2} \text{Cl}_2\text{CH—CHCl}_2$
 $\text{CH}_3\text{—CH—CH}_2\text{MgBr} \xrightarrow{\text{CH}_3} \text{CH}_3\text{—CH(CH}_3\text{)—CH}_3 + \text{Mg} \begin{matrix} \text{Br} \\ \text{OC}_2\text{H}_5 \end{matrix}$
19. (b) $\text{C}_2\text{H}_5\text{OH} \xrightarrow[\text{Dry ether}]{\text{CH}_3\text{—CH—CH}_2\text{MgBr}} \text{CH}_3\text{—CH(CH}_3\text{)—CH}_3 + \text{Mg} \begin{matrix} \text{Br} \\ \text{OC}_2\text{H}_5 \end{matrix}$

20. (d) When more than two similar groups are linked to double bonded carbon atoms, then alkenes does not show any geometrical isomerism.
21. (c) Anti-Markownikoff's addition cannot be seen in symmetrical alkenes, i.e. but-2-ene

22. (b) $\text{X} \xrightarrow[\text{HgSO}_4]{\text{Dil. H}_2\text{SO}_4} \text{Y} \xrightarrow[\text{HI}]{\text{Red P}} \text{CH}_3\text{—CH}_3$

Clearly, Y is $\text{CH}_3\text{—CHO}$ and X is $\text{CH}\equiv\text{CH}$.

23. (d) Halogenation process proceeds via following mechanism forming halonium ion as intermediate.

24. (a) HBr selectively adds to the alkenes through Markownikoff's addition.

25. (c) $\text{CH}_2=\text{CH—(CH}_2\text{)}_8\text{C(=O)OH} \xrightarrow[\text{Peroxide}]{\text{HBr}} \text{product}$
 via anti-Markownikoff's addition.

27. (d) This reaction is the example of β -elimination reaction since —OH group takes out one hydrogen atom from the β -carbon atom.

29. (a) Anti-Markownikoff's addition or peroxide effect or Kharash effect

Ozonolysis takes place in alkenes. So, A will be a double bond containing compound.

34. (d) The three membered ring of bromonium ion and alkyne has a full double bond, causing it to be more strained and less stable than the one from any alkene.

35. (d)

41. (d)

42. (d) C=C bond is cleaved and oxidised to —COOH, —CHO group is also oxidised to —COOH.

$(\text{CH}_3)_2\text{C=CHCH}_2\text{CHO} \longrightarrow (\text{CH}_3)_2\text{C=O}$
 $+ \text{HOOC—CH}_2\text{—COOH}$

43. (a) Terminal alkynes are acidic in nature.

44. (c) Both are correct. In (i) 1s-character defines correct trend of acidic strength as

acidic strength $\propto$ % s-character

In (ii) inductive effect defines acidic strength and polarity of C—H bond of alkyne. Group having +I-effect increases electron density around C—H bond hence decreases polarity and acidic strength of alkyne.

Only terminal alkyne is responsible for reaction with Na in liquid ammonia.

46. (d) According to Huckel's rule planar, closed cyclic structure having $(4n + 2)\pi$ electrons are aromatic.

47. (d) Toluene, in presence of different oxidising agent, gives different products on oxidation.

48. (d) Ozonolysis of benzene gives 3 moles of glyoxal.

49. (a) Benzene was discovered by M. Faraday, who obtained this gas by the pyrolysis of whale oil.
50. (c) In nitration of aromatic nucleus, the attacking species is an electrophile, i.e. nitronium ion (NO_2^+). It is obtained by the reaction of conc. HNO_3 and H_2SO_4 .

51. (b)
52. (d) Side chain substitution followed by Wurtz reaction.
53. (b) Diel's Alder reaction in the presence of dienophile, diene will produce the product via 6 MCTS mechanism.

54. (b) $-\text{NO}_2$ is a *m*-directing and deactivating group, hence σ -complex is formed by attack of Br^+ at *meta*-position will be most stable.

55. (b) Hydrocarbon $\xrightarrow{\text{HI}}$ X $\xrightarrow{\text{Alc. KOH}}$ Y $\xrightarrow{[\text{O}]}$ C—C—C—C
|
CH₃
||
O

As per the information Y should be C—C—C—C

61. (d) Tobacco, coal and petroleum damages DNA of our body and causes cancer.

BITSAT Archives

1. (a) When tertiary alkyl halide is treated with sodium alkoxide than elimination reaction competes over substitution reaction because alkoxides are not only nucleophiles but strong base as well. Therefore, alkenes are formed instead of ethers.

2. (a) I. **Elimination reaction**

II. **Substitution reaction**

Here, Cl replaces by OH.

III. **Addition reaction**

IV. **Addition reaction**

3. (d) According to Saytzeff's rule, more substituted (alkylated) alkene are more stable.

Conjugation Greater the conjugation greater will be the stability of product.

Hence, D has maximum stability, which is stabilised by conjugation as well as Saytzeff's rule.

4. (c)

IUPAC name = 5, 6 -dimethyl bicyclo [2, 2, 1] hept-2-ene

Molecular formula of compound is C₉H₁₄.

Degree of unsaturation can be calculated as

$$u = (C + 1) - \frac{H}{2} + \frac{N}{2}$$

where, u = degree of unsaturation

C = number of carbons

H = number of hydrogen

N = number of nitrogen

Hence, for a compound having molecular formula C₉H₁₄ the degree of unsaturation may be calculated as

$$u = (9 + 1) - \frac{14}{2} = 10 - 7 = 3$$

5. (d)

7. (b) We know C—C bond length = 1.54 Å

that C=C bond length = 1.34 Å

C≡C bond length = 1.20 Å

Since, propyne has triple bond, therefore, it has minimum bond length.

9. (a) $\text{CH}_3 - \text{CH}_2 - \text{C} \equiv \text{CH}$
 $\text{sp}^3 \quad \text{sp}^3 \quad \text{sp} \quad \text{sp}$

Electronegativity ∝ s -character

In sp -hybrid orbitals, s -character = 50%

and in sp^3 -hybrid orbitals, s -character = 33.3%

Thus, I is the most electronegative.

10. (d) Dehydrohalogenation of alkyl halide gives alkenes but not alkane.

11. (a) The greatest strain is involved in cyclopropane with bond angle 60°.

12. (b) $\text{CH}_3\text{—CH}_2\text{—CH}_2\text{—CH}_2\text{—CH}_2\text{—CH}_3$

13. (a) During catalytic hydrogenation, the hydrogens are transferred from the catalyst to the less substituted double bond. Thus, option (a) with two *R* groups on the same side of the molecule is correct.

14. (b) If the hydrocarbon C_3H_4 contains a triple bond it must be $\text{CH}_3\text{C}\equiv\text{CH}$. Since, being a terminal alkyne, it will react with ammoniacal AgNO_3 .

AgNO_3 solution, to give a white ppt of silver propynide or with ammoniacal CuCl solution to give a red ppt of copper propynide.

15. (d) When the groups with higher priority (i.e. with high atomic number) are present on same side of double bond, then the configuration is *Z* but when present on opposite side of double bond, the configuration is *E*.

Z
(Priority : $\text{Cl} > \text{H}$ and $\text{Br} > \text{F}$)

E

(Priority : $\text{Cl} > \text{H}$ and $\text{Br} > \text{F}$)

Z

(Priority : $\text{Br} > \text{Cl}$ and $\text{CH}_3 > \text{H}$)

Hence, compounds (i) and (iii) have (*Z*) configuration.

16. (d)

17. (a)

18. (a) two, one, one

19. (c)

Halogen Derivatives of Hydrocarbon

Haloalkane and Haloarene

The replacement of hydrogen atom(s) from a hydrocarbon (aliphatic or aromatic) by halogen atom(s) results in the formation of haloalkane or haloarene. These may be classified as mono, di or tri halo compounds depending upon the number of halogen atoms.

[If R = Alkyl; Haloarene
 R = Aryl; Haloarene
 X = Halogen]

Haloalkane

- (i) General formula : $C_nH_{2n+1}X$ (monohalides)
- (ii) sp^3 -hybrid C, geometry : tetrahedral
- (iii) Bond angle : $109^\circ 28'$

Classification of Haloalkane

1. Based on the number of halogen atoms

(a) Monohalides [CH_3Cl , $(CH_3)_3CCl$ etc]

(b) Dihalides $\left[\begin{array}{cc} \text{CH}_2=\text{C} \begin{array}{l} \nearrow \text{Cl} \\ \searrow \text{Cl} \end{array} & \begin{array}{cc} \text{CH}_2 & - & \text{CH}_2 \\ | & & | \\ \text{Cl} & & \text{Cl} \end{array} \end{array} \right]$
Gem dihalide Vicinal dihalide

(c) Trihalides $CHCl_3$ (chloroform)

(d) Tetrahalides CCl_4 (carbon tetrachloride)

2. Based on the type of C-atom to which halogen atom is attached

(a) $\text{CH}_3\text{—Cl} \longrightarrow$ primary

(b) $\begin{array}{c} \text{CH}_3 \\ \diagup \\ \text{CH—Cl} \\ \diagdown \\ \text{CH}_3 \end{array} \longrightarrow$ secondary

(c) $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3\text{—C—Cl} \\ | \\ \text{CH}_3 \end{array} \longrightarrow$ tertiary

Preparation of Haloalkane

1. From alkane (By halogenation)

2. From alkene (hydrohalogenation)

Unsymmetrical alkene gives major product by more stable carbocation according to Markownikoff's rule.

3. From alkyl halide (Halogen exchange reactions)

(a) Finkelstein reaction (In acetone solvent)

(b) Swart reaction (In polar aprotic solvent)

4. From alcohol

(a) Using dry HX

(b) Action of phosphorus halides and SOCl_2 on alcohols

5. Using Grignard reagent

6. From Ag-salt of carboxylic acid

Number of C-atoms decreases by one.

7. From alkyl amines

8. From ether

Physical Properties of Haloalkanes

General physical properties of haloalkanes are as follows:

- CH_3F , CH_3Cl , CH_3Br , $\text{C}_2\text{H}_5\text{F}$ and $\text{C}_2\text{H}_5\text{Cl}$ are found in gaseous state at room temperature.
- Alkyl halides are normally sweet-smelling gases and liquids, whereas odourless in solid state.
- All alkyl halides are insoluble in water.
- Boiling point of alkyl halides increases with increase in the size of halogen atom while decreases with increase in branching.

Chemical Properties of Haloalkanes

Haloalkanes are highly reactive compounds due to the presence of polar R—X bond.

The reactions of haloalkanes have been discussed below:

Nucleophilic Substitution Reactions

In haloalkanes, these reactions proceed either by $\text{S}_\text{N}1$ or by $\text{S}_\text{N}2$ type of mechanism.

1. Substitution nucleophilic unimolecular reaction (S_N1)

- Tertiary alkyl group and polar solvent favour S_N1 .
- It follows first order kinetics, rate = k [substrate].
- Carbocation is formed and gets rearranged, if possible, the carbocation must be stable.
- Reaction is completed in two steps.
- Nucleophile can attack from front or back side. Therefore, racemic mixture can be formed.

e.g.

Reactivity order of halides towards S_N1 mechanism is
 $3^\circ > 2^\circ > 1^\circ$

2. Substitution nucleophilic bimolecular reaction (S_N2)

- Primary alkyl group and non-polar solvent favour S_N2 .
- It follows second order kinetics, rate = k [substrate] [nucleophile]
- Carbocation is not formed.
- Reaction is completed in one step.
- It involves complete inversion in configuration as the attack of the nucleophile occurs from the back side of reactant.

e.g.

— (Solid bond) – towards the viewers
 (Wedge bond) – away from the viewers

Reactivity order of halides towards S_N2 mechanism is
 $1^\circ > 2^\circ > 3^\circ > \text{neo-pentyl halides}$

In S_N2 mechanism, rate of reactions does not depend upon the strength of attacking nucleophile.

The strength of different nucleophiles is

NOTE 3° halides usually proceed through S_N1 type, 1° halides proceed through S_N2 type and 2° halide may proceed either through S_N1 or S_N2 type.

Elimination Reactions [Synthesis of Alkenes]

Reaction of haloalkane with alcoholic KOH solution leads to an elimination of hydrogen atom from β -carbon atom and halogen atom from α -carbon atom. Thus, reaction termed as **dehydrohalogenation reaction**.

If dehydrohalogenation reactions produce two or more alkenes, the preferred or major product will be that alkene which possess larger number of alkyl groups linked to double bonded C-atoms. This is in accordance to **Saytzeff's rule**.

The reactivity order of alkyl halides for dehydrohalogenation reaction is given below

Reduction

Reducing agents

Formation of organo-metallic compounds

Reaction with NaPb alloy

[TEL $\rightarrow$ tetraethyl lead (antiknocking agent)]

Friedel-Crafts alkylation**Reaction with salts of carboxylic acid****Haloarenes****Preparation of Haloarenes**

General methods for the preparation of haloarenes are as follows:

Halogenation of Benzene/Toluene**Decomposition of Diazonium Salts****Sandmeyer reaction****Raschig Process****Physical Properties of Haloarenes**

- (i) Aryl halides (haloarenes) are heavier than water, though polar in nature but immiscible with water due to the absence of H-bonding with water molecules.

- (ii) For the same aryl group, boiling and melting points increase with an increase in the size of the halogen atom. Boiling and melting points of haloarenes increase with increase in the size of aryl group.

The *p*-isomers possess higher melting points than *ortho* and *meta*-isomers because *p*-isomers fit in the crystal lattice more efficiently than *ortho* and *meta*-isomers.

Chemical Properties of Haloarenes

Haloarenes give three types of reactions:

1. Nucleophilic Substitution Reactions

Haloarenes are less reactive than haloalkanes towards nucleophilic substitution reactions.

e.g.

This is known as Dow's process.

**2. Electrophilic Substitution Reactions**

Haloarenes undergo usual electrophilic substitution reactions of benzene nucleus such as halogenation, nitration, sulphonation and Friedel-Crafts alkylation and acylation.

e.g.
(i) **Halogenation**

(ii) **Nitration**

(iii) **Sulphonation**

(iv) **Friedel-Craft's alkylation**

(v) **Friedel-Craft's acylation**

Reactions with Metals

1. Wurtz-Fittig Reaction

A mixture of haloarene and haloalkane, when treated with Na in dry ether gives alkyl arene, e.g.

2. Fittig Reaction

Haloarenes on treatment with Na in dry ether give analogous compounds, e.g.

Polyhalogen Compounds

Carbon compounds which contain more than one halogen atom are called polyhalogen compounds.

Some important polyhalogen compounds along with uses and environmental effects are given as :

Trichloromethane (Chloroform), CHCl3

Chloroform oxidises by air slowly in the presence of light to yield phosgene, an extremely poisonous gas.

Therefore, it is stored under closed dark coloured bottles.

Uses

- It is used as a solvent for oils, fats, rubbers and resins.
- It is exclusively used in the production of freons.

Environmental Effects

Major effects of CHCl3 are as follows:

- The presence of CHCl3 in air can cause dizziness, fatigue and headache.
- It may lead to the damage of liver and kidneys when breathed with air.

Triiodomethane (Iodoform)

The chemical formula of iodoform is CHI3.

Uses It is used as an antiseptic for dressing the wounds, due to the liberation of free iodine by iodoform.

Freons

The chlorofluorocarbon compounds of methane and ethane containing no H-atom are called freons. These compounds are highly stable, non-toxic, unreactive and easily liquefiable gases.

Uses It is widely used in the production of aerosol propellants, refrigeration and air conditioning products.

Environmental effects These freons when released into air, diffuse into stratosphere where it initiates radical chain reactions for the depletion of ozone layer.

***p p'*-Dichlorodiphenyl Trichloroethane (DDT)**

The structure of DDT is

Uses DDT is cheap but powerful insecticide used for sugarcane and fodder crops in order to kill insects and mosquitoes.

Environmental Effects

Most of the species of insects developed resistance towards DDT and it is found to be highly toxic for animals.

It is deposited and stored in the fatty tissues because it is soluble in fat and chemically stable.

Dichloromethane

Uses It is widely used as

- (i) Solvent
- (ii) Paint remover
- (iii) Propellant in aerosols
- (iv) Metal cleaning and finishing solvent

Environmental effect

- (i) It harms human nervous system.
- (ii) It causes dizziness, nausea, tingling and numbness in the fingers.
- (iii) Direct human skin contact with CH_2Cl_2 causes intense burning sensation and mild redness of the skin. Also, it can burn the cornea if direct contact with eyes occurs.

Tetrachloro methane (Pyrene)

Uses

- (i) It is used in the manufacturing of refrigerants and propellants for aerosol units.
- (ii) It is used as a cleaning solvent, a degreasing solvent, a spot remover, a fire extinguisher.

Environmental effects

- (i) It causes dizziness, nausea, vomiting.
- (ii) Exposure to CCl_4 may cause irregular heart beat.
- (iii) It depletes the ozone layer which increases the level of UV-rays causing.

Practice Exercise

1. The true order of reactivity towards S_N1 reaction is

a. vinyl chloride > allyl chloride > isopropyl chloride
 b. allyl chloride > isopropyl chloride > vinyl chloride
 c. vinyl chloride > isopropyl chloride > allyl chloride
 d. isopropyl chloride > vinyl chloride > allyl chloride

2. Consider the following reaction,

The true statement about the above process is

a. the rate becomes four times of the halide becomes twice
 b. the rate does not change by reducing $[\text{OH}^-]$ to half
 c. the rate does not change by doubling $[\text{halide}]$
 d. the rate becomes twice on doubling the $[\text{OH}^-]$

3. Consider the following reaction,

The true statement about the above process is

a. the rate does not change on doubling $[\text{CH}_3\text{Br}]$ and making $[\text{OH}^-]$ to half
 b. the rate becomes half on doubling $[\text{CH}_3\text{Br}]$
 c. the rate becomes half on doubling $[\text{OH}^-]$
 d. All the above are correct

4. The product of reaction of alcoholic silver nitrite with ethyl bromide is

a. ethyl nitrite b. ethene
 c. nitroethane d. ethyl alcohol

5. Which does not give methyl bromide?

a. $\text{CH}_3\text{OH} + \text{HBr}$ b. $\text{CH}_3\text{OH} + \text{Br}_2$
 c. $\text{CH}_3\text{OH} + \text{PBr}_3$ d. $\text{CH}_3\text{COOAg} + \text{Br}_2$

6. Consider the following haloalkanes,

I. CH_3I II. CH_3F
 III. CH_3Cl IV. CH_3Br

The correct sequence of increasing order of dipole moment is

a. $\text{I} < \text{II} < \text{III} < \text{IV}$ b. $\text{IV} < \text{III} < \text{II} < \text{I}$
 c. $\text{I} < \text{IV} < \text{II} < \text{III}$ d. $\text{III} < \text{IV} < \text{I} < \text{II}$

7. Consider the following reaction,

The compound A is

a. $\text{C}_2\text{H}_5\text{Cl}$
 b. $\text{C}_2\text{H}_5\text{ONa}$
 c. CH_2N_2
 d. CH_3ONa

8. In alkaline hydrolysis of a tertiary halide by aqueous alkali, if concentration of alkali is doubled, then the reaction rate

a. will be doubled
 b. will be halved
 c. will remain constant
 d. Cannot say anything

9. Which of the following sequence of reagent is best suited for the reaction shown below?

a. (i) CH_3MgBr , H_3O^+ (ii) H^+ / Δ (iii) $\text{HBr} / \text{H}_2\text{O}_2$
 b. (i) CH_3MgBr , H_3O^+ (ii) H^+ / Δ (iii) HBr
 c. (i) CH_3MgBr , H_3O^+ (ii) HBr
 d. (i) HBr / ROOR (ii) CH_3MgBr , H_3O^+

10. The order of reactivities of the following alkyl halides for a S_N2 reaction is

a. $\text{RF} > \text{RCI} > \text{RBr} > \text{RI}$ b. $\text{RF} > \text{RBr} > \text{RCI} > \text{RI}$
 c. $\text{RCI} > \text{RBr} > \text{RF} > \text{RI}$ d. $\text{RI} > \text{RBr} > \text{RCI} > \text{RF}$

11. Choose the incorrect statement.

a. An S_N1 reaction proceeds with inversion of configuration
 b. An S_N2 reaction proceeds with stereochemical inversion
 c. An S_N2 reaction follows second order kinetics
 d. The reaction of *tert*-butyl bromide with OH^- follows first order kinetics

12. An organic compound $\text{C}_5\text{H}_9\text{Br}$ (A) which readily decolourises bromine water and cold alkaline KMnO_4 solution gives $\text{C}_5\text{H}_{11}\text{Br}$ (B) on catalytic hydrogenation. The reaction of A with alcoholic KOH first and then with NaNH_2 produces C with evolution of NH_3 . C reacts with Lindlar's catalyst to give D and on reaction with Na in liquid NH_3 produces E. D and E are isomers. The compound A is

a. $\text{CH}_3\text{CH}_2\text{CH}=\overset{\text{Br}}{\underset{|}{\text{C}}}-\text{CH}_3$
 b. $\text{CH}_3\text{CH}_2-\overset{\text{Br}}{\underset{|}{\text{C}}}=\text{CHCH}_3$
 c. Both (a) and (b)
 d. Neither (a) nor (b)

13. Consider the following reaction,

D and E respectively are

- Cl——CH₂OH and Cl——D
 - Cl———Cl and D———D
 - D———D and Cl———Cl
 - None of the above
14. The main product of the reaction of propane with chlorine at 25°C in the presence of sunlight is
- 1-chloropropane
 - 2-chloropropane
 - chloroethane
 - chloromethane
15. Hunsdiecker reaction is an example of
- decarboxylation
 - debromination
 - decarboxylation and bromination
 - bromination
16. When 3-phenyl propene is treated with HBr in the presence of peroxide, the major product formed is
- 1-bromo-3-phenyl propane
 - 1,2-dibromo-3-phenyl propane
 - 2-bromo-1-phenyl propane
 - 3-(*p*-bromo phenyl) propene
17. The alkyl halide that undergoes S_N1 reaction more readily is
- ethyl bromide
 - iso*-propyl bromide
 - vinyl bromide
 - t*-butyl bromide
18. Which alkyl halide from the following would you expect to react more rapidly by S_N2 mechanism?
- CH₃CHCH₂CH₂Br
|
CH₃
 - CH₃CH₂CHCH₂Br
|
CH₃
|
CH₃
 - CH₃CH₂C(CH₃)₂CH₂Br
 - CH₃CH₂CH₂CHBr
|
CH₃

19. Consider the following reaction,

The decreasing order of the rate of the above reaction with Nu[−] is

- PhO[−]
 - AcO[−]
 - HO[−]
 - CH₃O[−]
- IV > III > I > II
 - IV > III > II > I
 - I > II > III > IV
 - II > IV > III > I
20. The compound A in the following reaction sequence is
- $$\text{A} \xrightarrow{\text{PCl}_5} \text{B} \xrightarrow{\text{AlCl}_3, \text{KOH}} \text{C} \xrightarrow{\text{H}_2/\text{Ni}} \text{Propane}$$
- chloroethane
 - ethanol
 - 1,2-dichloroethane
 - None of these
21. Which of the following statements regarding S_N1 reaction shown by alkyl halide is incorrect?
- The added Nu[−] plays no kinetic role in S_N1 reaction
 - S_N1 reaction involves the inversion of configuration of optically active substance
 - S_N1 reaction on chiral starting material ends up with racemisation of the product
 - Polar protic solvent increases the rate of S_N1 reaction
22. The product of which of the following reactions is not a *vicinal* dihalide?
- Reaction of ethylene glycol with P + Br₂
 - Reaction of HCl with ethyne
 - Reaction of HBr with ethyne in the presence of peroxide
 - Reaction of Cl₂ with propene
23. The treatment of CH₃MgX with CH₃—C≡C—H produces
- CH₃—CH=CH₂
 - CH₃C≡C—CH₂
| |
H H
 - CH₃—C=C—CH₂
| |
H H
 - CH₄
24. Consider the following bromides,
- Me—CH₂—CH₂—CH₂—Br
 -
 - Me—CH₂—CH(Br)—CH₂—Me
- The correct order of S_N1 reactivity [AIEEE 2010]
- II > III > I
 - II > I > III
 - III > II > I
 - I > II > III

25. Which of the following reactions come within the framework of elimination?

a. $(\text{CH}_3)_2\text{CHCl} + \text{SH}^\oplus$
 b. $(\text{CH}_3)_3\text{C}-\text{Br} + \text{ethanolic KCN}$
 c. $\text{CH}_3\text{CH}_2\text{CH}_2\text{Cl} + \text{I}^-$
 d. $(\text{CH}_3)_2\text{CHBr} + \text{aq. KOH}$

26. 20% aqueous NaCl solution containing ethyl alcohol when subjected to electrolysis, produce

a. $\text{C}_2\text{H}_5\text{Cl}$
 b. CH_3CHO
 c. CHCl_3
 d. CCl_3CHO

27. Alkaline hydrolysis of which of the following compounds give methyl ketones?

I. Ethylene dichloride
 II. 2, 2-dichlorobutane
 III. Ethylidene chloride
 IV. Isopropylidene chloride

a. I, II and III
 b. II, III and IV
 c. I and III
 d. II and IV

28. When optically active halide is attacked by CN^- , the product obtained is a racemic mixture. Hence, the halide should be

a. primary
 b. secondary
 c. tertiary
 d. None of the above

29. Dipole moment of *cis*-2,3-dichloro-2-butene is than the dipole moment of *cis*-1, 2-dichloroethene.

a. more
 b. less
 c. neither more nor less
 d. None of the above

30. Aryl halides are less reactive towards nucleophilic substitution reaction as compared to alkyl halides due to

a. the formation of less stable carbonium ion
 b. resonance stabilisation
 c. longer carbon-halogen bond
 d. sp^2 -hybridised C attach to X

31. In the reaction $\text{PhCH}_3 \xrightarrow[\text{heat}]{\text{Cl}_2} \text{X} \xrightarrow{\text{aq. NaOH}} \text{Y}$,

the product Y is

a. *o*-cresol
 b. *p*-cresol
 c. 2, 4-dihydroxytoluene
 d. benzoic acid

32. The increasing order of reactivity of the following bromides in $\text{S}_\text{N}1$ reaction is

a. $\text{IV} < \text{III} < \text{I} < \text{II}$
 b. $\text{III} < \text{IV} < \text{I} < \text{II}$
 c. $\text{II} < \text{III} < \text{I} < \text{IV}$
 d. $\text{II} < \text{III} < \text{IV} < \text{I}$

33. The Wurtz-Fittig reaction involves condensation of

a. two molecules of aryl halides
 b. one molecule of each of aryl halide and alkyl halide
 c. one molecule of each aryl halide and phenol
 d. two molecules of an alkyl halide

34. Consider the following reaction,

The compound C is

a. *o*-bromotoluene
 b. *m*-bromotoluene
 c. *p*-bromotoluene
 d. 3-bromo-2,4,6-trichlorotoluene

35. *Trans*-2-phenyl-1-bromocyclopentane on reaction with alcoholic KOH produces

a. 4-phenylcyclopentene
 b. 2-phenylcyclopentene
 c. 1-phenylcyclopentene
 d. 3-phenylcyclopentene

36. **Assertion (A)** Exposure of ultraviolet rays to human causes the skin cancer, disorder and disrupt the immune system.

Reason (R) Carbon tetrachloride is released into air, it rises to atmosphere and depletes the ozone layer.

a. Both A and R are correct and R is correct explanation of A
 b. Both A and R are correct but R is not the correct explanation of A
 c. A is correct but R is incorrect
 d. R is correct but A is incorrect

37. IUPAC name of DDT is

a. 1,1-*bis* (4-chlorophenyl)-2,2,2-trichloroethane
 b. 1,2-*bis* (4-chlorophenyl)-1,1,1-trichloroethane
 c. 2,2-*bis* (4-chlorophenyl)-1,1,1-trichloroethane
 d. 2,1-*bis* (4-chlorophenyl)-1,1,1-trichloroethane

38. Which of the following statements is/are true for chloroform?

a. Chloroform exposure causes damage to heart
 b. People develop sores when skin is immersed in chloroform
 c. Chloroform has no effect on central nervous system
 d. All of the above

BITSAT Archives

1. Arrange the following compounds in increasing order of their boiling points: [2014]

- a. $\text{II} < \text{I} < \text{III}$
 b. $\text{I} < \text{II} < \text{III}$
 c. $\text{III} < \text{I} < \text{II}$
 d. $\text{III} < \text{II} < \text{I}$
2. Which of the following is less acidic among the given halogen compounds? [2013]
- a. CHF_3 b. CHI_3
 c. CHCl_3 d. CHBr_3
3. 2-bromopentane with alcoholic KOH yields a mixture of three alkenes. Which of the following alkene is predominant? [2012]
- a. 1-pentene
 b. *Cis*-2-pentene
 c. *Trans*-2-pentene
 d. *Cis*-1-pentene
4. Toluene on reaction with N-bromo-succinimide gives [2011]
- a. *p*-bromomethylbenzene
 b. *o*-bromomethylbenzene
 c. phenyl bromomethane
 d. *m*-bromomethylbenzene
5. Which of the following will yield a mixture of 2-chlorobutene and 3-chlorobutene on treatment with HCl? [2011]
- a. $\text{CH}_2=\text{C}=\text{CH}-\text{CH}_3$
 b. $\begin{array}{c} \text{H}_2\text{C}=\text{C}-\text{CH}=\text{CH}_2 \\ | \\ \text{CH}_3 \end{array}$
 c. $\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$
 d. $\text{HC}\equiv\text{C}-\text{CH}=\text{CH}_2$
6. 3-methyl-2-butanol on treatment with HCl gives (major product) [2010]
- a. 2-chloro-2-methylbutane
 b. 2-chloro-3-methylbutane
 c. 2, 2-dimethylpentane
 d. None of the above

7. The correct order of reactivity of hydrogen halides with ethyl alcohol is [2008]

8. Suitable reagents A and B for the following reactions respectively are [2005]

9. Following compound is treated with NBS: [2005]

Compound formed A is

10. Consider the following reaction,

A will have configuration

Answer with Solutions

Practice Exercise

1. (b) Vinyl chloride is relatively less reactive

While allyl chloride is very reactive due to stabilisation of allyl carbonium ion by resonance.

Isopropyl chloride in between them is reactivity towards $\text{S}_{\text{N}}1$.

2. (b) $\text{S}_{\text{N}}1$ reaction depends only upon concentration of substrate.
 3. (a) $\text{S}_{\text{N}}2$ reaction rate is directly proportional to concentration of substrate and nucleophile.
 4. (a) $\text{CH}_3\text{CH}_2\text{Br} + \text{AgNO}_2 \longrightarrow \text{CH}_3\text{CH}_2\text{NO}_2 + \text{AgBr}$

Alcoholic Major

5. (b) $\text{CH}_3\text{OH} + \text{HBr} \longrightarrow \text{CH}_3\text{Br} + \text{H}_2\text{O}$

6. (c) $\text{CH}_3\text{I} < \text{CH}_3\text{Br} < \text{CH}_3\text{F} < \text{CH}_3\text{Cl}$

1.6 D 1.79 D 1.84 D 1.94 D

7. (b) $\text{H}_3\text{C}-\text{CH}(\text{Cl})-\text{CH}_3 + \text{NaOC}_2\text{H}_5 \xrightarrow{\Delta}$

Isopropyl chloride

Sodium ethoxide

8. (c) Reaction of *t*-alkyl halides with aqueous alkali gives $\text{S}_{\text{N}}1$ reaction and rate of $\text{S}_{\text{N}}1$ reaction is not based on the concentration of nucleophile (alkali). Hence, reaction rate remains constant.

9. (a)

10. (d) The order of reactivities of the alkyl halides for $\text{S}_{\text{N}}2$ reaction is

11. (a) $\text{S}_{\text{N}}1$ reactions are accompanied by racemisation.

14. (b) $\text{CH}_3-\text{CH}_2-\text{CH}_3 \xrightarrow[25^\circ\text{C}]{\text{Cl}_2} \text{CH}_3-\text{CH}(\text{Cl})-\text{CH}_3 + \text{CH}_3-\text{CH}_2-\text{CH}_2\text{Cl}$
- 2° (Major) 1° (minor)

15. (c) $\text{R}-\text{C}(=\text{O})-\text{OH} \xrightarrow[\text{Br} + \text{CCl}_4/\Delta]{\text{aq. KOH}} \text{R}-\text{Br} + \text{CO}_2$

Clearly, it is decarboxylation with bromination.

16. (a)

17. (d) $\text{S}_{\text{N}}1$ mechanism involves formation of carbocation intermediate.

Out of the given compounds, three are primary halides. The presence of methyl group closer to halide group increases the steric hindrance and decreases rate of the reaction. Hence, compound (a) reacts rapidly.

19. (a) Nucleophilicity order is

Since, *C* gives propane ($\text{CH}_3\text{CH}_2\text{CH}_3$), it must be an alkene, $\text{CH}_3\text{CH}=\text{CH}_2$ (*C*). If *C* is formed from *B* through alc.KOH, then *B* must be an alkyl halide, $\text{CH}_3\text{CH}_2-\text{CH}_2\text{Cl}$ which is formed from *A* by PCl_5 . This suggests *A* would be alcohol, $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ (propanol).

21. (b)

23. (d)

24. (a)

25. (b) $(\text{CH}_3)_3\text{C}-\text{Br}$ undergoes dehydrobromination by ethanolic KCN and produces isobutylene.

26. (c) Electrolysis of aqueous NaCl solution gives NaOH and Cl_2 . These reactants on reaction give chloroform.

28. (c) Tertiary halide follows S_N1 mechanism which forms racemic mixture.

29. (a) [Hint : It is clear from the figure itself]

30. (b) All the aryl (aromatic) compounds are less reactive towards nucleophilic substitution because of the presence of π -electrons (resonance) due to which they repel the incoming nucleophile.

31. (d)

32. (a) II is most reactive as it produces an aromatic carbocation while IV is less reactive as it produces a non-resonance stabilised carbocation. III is least reactive than I as former involve an anti-aromatic carbocation.

33. (b)

34. (b)

35. (d)

Anti-elimination means —H and —Br both departing groups must be present at dihedral angle of 180° (anti).

36. (a) Carbon tetrachloride rises to atmosphere and deplete the ozone layer. This depletion of ozone layer increases exposure of UV rays to human being which lead to increase of skin cancer, eye disease and disorder with disruption of the immune system.
37. (c) IUPAC name of DDT is 2,2-bis (4-chlorophenyl) 1,1,1-trichloroethane.
38. (b) Chloroform exposure may cause damage to liver and to kidney and some people develop sores when skin is immersed in chloroform.

BITSAT Archives

1. (c) Boiling point decreases with increase in branching.
2. (a) Due to stronger $-I$ effect of F than that of Cl, CHF_3 should be more acidic than CHCl_3 . But actually reverse is true.

This is due to $:\text{CCl}_3^-$ left after the removal of a proton from CHCl_3 is stabilised due to presence of d -orbitals in Cl than $:\text{CF}_3^-$ left after the removal of a proton from CHF_3 which is not stabilised due to the absence of d -orbitals on F.

By Saytzeff's rule, substituted alkenes are more stable. Hence, out of *cis* and *trans* forms, *trans* product is more stable.

4. (c) NBS (N-bromosuccinimide) causes bromination at allylic position.

7. (d) Among hydrogen halides, as the size of halide ion increases, its reactivity towards ethyl alcohol also increases. Thus, the order of reactivity of hydrogen halides is

8. (d)

10. (b)

25

Alcohols, Phenols and Ethers

Alcohols

The compounds in which hydroxyl group is attached to C-atoms are called alcohols.

- (i) General formula: $C_nH_{2n+1}OH$ (ii) sp^3 -hybridised carbon, geometry: tetrahedral

Classification

Alcohols are divided into three types, i.e. monohydric, dihydric and trihydric alcohols.

Monohydric Alcohols

Monohydric alcohols may be divided into three types, i.e. 1° , 2° and 3° depending upon the carbon atom to which $—OH$ group is attached.

Preparation of Monohydric Alcohols

1. From alkane (Indirect conversion)

2. From alkene

(a) Hydration

(b) Oxo reaction

3. From alkyl halide

where, $R = 1^\circ, 2^\circ$ or 3° alkyl, aryl etc.

4. From carbonyl compounds

(a) Reduction

Reducing agents $Ni-H_2$, $LiAlH_4$ (in ether), $NaBH_4$, $Na-EtOH$, $Na-Hg$, H_2O can be used.

MPV (Meerwein-Ponndorf-Verley) reduction

5. From acid and its derivatives

6. From primary aliphatic amines

7. Industrial methods

(a) Preparation of methanol

(i) Destructive distillation of wood

(ii) From water gas

(iii) Oxidation of methane

(b) Preparation of ethanol

(i) Fermentation of molasses

(ii) From starch

Physical Properties of Monohydric Alcohols

Monohydric alcohols have many physical properties which are given below :

(i) **Physical state** Lower alcohols are colourless, toxic liquids with burning taste whereas, higher alcohols are colourless, odourless and wax like solids.

(ii) **Boiling point** The boiling point of alcohols is much higher than that of corresponding hydrocarbons due to the presence of intermolecular H-bonding in alcohols.

The boiling point for isomeric alcohols follows the order

(iii) **Solubility** Lower members of alcohols are soluble in water due to the presence of intermolecular hydrogen bonding.

Acidic Character of Monohydric Alcohols

Alcohols are weak acids due to the presence of alkyl groups (exerting +I-effect) linked to —OH group that increases the electron density on oxygen thereby, decreasing the polarity of O—H bond.

The increasing order of acidic character of alcohols is as follows

Alcohols are weaker acids than water because alkoxide ion is a strong conjugate base of alcohols as it readily accepts proton from a water molecule.

Chemical Properties of Monohydric Alcohols

The chemical reactions of alcohols are due to the presence of polar $\rightarrow C-OH$ bond.

Reactions Involving Cleavage of O—H bond

(i) Reaction with metals

(ii) Reaction with carboxylic acids (Esterification)

H_2SO_4 acts as a protonating as well as dehydrating agent.

(iii) Reaction with acid derivatives

Reactions Involving Cleavage of C—O Bond

The order of reactivity of alcohols towards these type of reactions is as follows:

(i) Reaction with halogen acids

The reactivity order for the halogen acids is as follows:

These reactions follow $\text{S}_{\text{N}}1$ mechanism.

(ii) Reaction with phosphorus halides and thionyl chloride (SOCl_2)

Reactions Due to —OH Group

The reactivity order would be

(i) Dehydration

Note The carbocation formed during dehydration undergoes rearrangement resulting in the formation of more than one alkene.

Reaction of ethanol (alcohol) with sulphuric acid at different temperatures

(ii) Oxidation of alcohols Oxidation of alcohols results in the formation of C=O bond.

NOTE $\text{CH}_3\text{CH}_2\text{OH} \xrightarrow[573 \text{ K}]{\text{Cu}} \text{CH}_3\text{CHO}$
1° alcohol Aldehyde

Identification of Primary, Secondary and Tertiary Alcohols

The primary, secondary and tertiary alcohols can be distinguished by

(i) **Victor Meyer's test** Alcohols when treated with P/I_2 and then with AgNO_2 and HNO_2 , a coloured product is produced with NaOH .

Primary alcohol $\longrightarrow$ Blood red product

Secondary alcohol $\longrightarrow$ Blue coloured product

Tertiary alcohol $\longrightarrow$ No colour

(ii) **Lucas test** The equimolar mixture of anhydrous ZnCl_2 and conc. HCl is called **Lucas reagent**. When alcohols are treated with it,

Primary alcohols $\longrightarrow$ No turbidity at room temperature

Secondary alcohols $\longrightarrow$ Turbidity after 5 min

Tertiary alcohols $\longrightarrow$ Immediate turbid solution

Dihydric Alcohols

They are the compounds containing two —OH groups either on same carbon atom or different C-atom.
e.g. Ethylene glycol

Methods of Preparation of Ethylene Glycol

1. From alkenes

2. From halides

Physical Properties of Ethylene Glycol

1. Colourless, syrupy liquid.
2. Soluble in water as well as in ethanol.
3. It is toxic as methanol.

Chemical Reactions of Ethylene Glycol

1. Reaction with metals

2. Reaction with HCl or phosphorus halides

3. Nitration

4. Reaction with HNO₃ (Oxidation)

Trihydric Alcohols

Preparation of Glycerol

Chemical Reactions of Glycerol

Glycerol has two primary —OH groups and one secondary —OH group, which is little less reactive than the primary —OH groups.

1. Reaction with metal

2. Reaction with HX

3. Reaction with acetic acid

4. Dehydration

Phenols

The organic compounds in which hydroxy group (—OH) is directly linked to a benzene ring are called phenols or carbolic acid.

Preparation of Phenols

Phenols are prepared by the following methods:

(i) Hydrolysis of aryl halides (Dow's process)

(ii) From diazonium salts

**Industrial Preparation of Phenols**

Phenols for industrial purposes can be manufactured in two ways:

(i) From cumene

(ii) From Raschig process through benzene

(iii) From coaltar Phenols can be obtained by the middle oil fraction of coaltar distillation.

Physical Properties of Phenols

Phenols are colourless crystalline solids or liquids with carbolic odour. The boiling point of phenols is higher than corresponding alcohols and arenes of compared masses due to the presence of intermolecular H-bonding. Phenols possess high dipole moments.

Acidic Character of Phenols

The acidic character of phenols is due to the conjugation between lone pair of electrons of oxygen and benzene nucleus.

**Effect of Substituents on Phenols**

The presence of electron withdrawing groups like $-\text{NO}_2$, $-\text{CN}$ etc., on the benzene ring stabilises the phenoxide ion by the dispersal of negative charge, thereby, increasing the acidic strength of phenol whereas presence

of electron donating groups, like $-\text{CH}_3$ etc., on the benzene ring destabilises the phenoxide ion by increasing the negative charge, thereby, decreasing the acidic strength of phenol.

Chemical Reactions of Phenol

The chemical reactions of phenol are classified into two categories:

Reactions due to the cleavage of O — H bond

(a) Reaction with metals

(b) Acylation

Phenolic esters when heated with AlCl_3 , *o* and *p*-acyl phenols are produced (Fries rearrangement).

(c) **Benzoylation** This reaction is known as Schotten-Baumann reaction.

(d) Reaction with Zn dust

**Reactions due to Benzene Ring**

Phenols undergo the following reactions due to the presence of benzene ring :

(a) Electrophilic substitution reaction

(b) Gattermann synthesis This reaction works as

(c) Ether formation

Special Reactions of Phenols

The special reactions of phenols can be summarised as:

(i) Reimer-Tiemann reaction This reaction looks like

NOTE When CCl_4 in place of CHCl_3 is used in the reaction, salicylic acid is produced in the reaction.

(ii) Kolbe's reaction

NOTE Salicylic acid is used for the production of aspirin (2-acetoxy benzoic acid), a well known analgesic.

Distinguish Tests for Phenols and Alcohols

Phenols can be distinguished from alcohols through the following tests:

- Neutral FeCl_3 test** Phenols react with neutral FeCl_3 to produce a blue violet or green coloured complex. Alcohols do not react with FeCl_3 .
- Liebermann's test** When sodium nitrite dissolved in conc. H_2SO_4 and it is added to phenol, red/brown colouration is produced which changes to blue-green on the addition of a base. Alcohols do not respond to this test.
- Bromine water test** When bromine water is added to phenol, a white precipitate of 2, 4, 6-tribromophenol is produced. Alcohols do not respond to this test.

Ether

Dialkyl derivative of water is called ether. It is anhydride of alcohol.

Preparation

1. From alkenes

2. From alkyl halides

(a) Williamson ether synthesis

(b) Heating alkyl halides with silver oxide

3. From alcohols

(a) Dehydration of alcohols

(b) Action of diazomethane on alcohols

Physical Properties of Ethers

Following are the main properties of ethers:

- (i) Dimethyl and ethyl methyl ethers are gases at ordinary temperature. Other lower members are colourless, pleasant smell, volatile liquids.
- (ii) Ethers have lower boiling points in comparison to corresponding alcohols due to the presence of weak dipole-dipole forces among intermolecular ethers.
- (iii) Ethers are soluble in water due to the formation of H-bonding with water molecules.

Solubility decreases with increase in the number of C-atoms.

Chemical Properties of Ethers

The chemical properties of ethers are classified into three categories:

Reactions Involving the Cleavage of C—O bond

(a) Reaction with halogen acids

The reactivity order of halogen acids for this reaction are

If one R group is phenyl and other is alkyl group, the cleavage of C—O bond produces phenol and alkyl halide.

Cyclic ethers cleaved by HI/HBr to form dihaloalkanes.

(b) Reaction with PCl_5

(c) Reaction with sulphuric acid

(d) Reaction with acid derivatives

Reactions due to Ethereal Oxygen

These reactions are due to the presence of two lone pairs on ethereal O-atom.

(a) Reaction with concentrated acids

These salts stabilises by the anion of acids.

(b) Formation of coordination complexes

Reactions Due to Alkyl Group

(a) Action of air and light

(b) Halogenation

Practice Exercise

- Appropriate test to make distinction between methanol and methyl carbinol is
 - test with acetic acid
 - test with salicylic acid and conc. H_2SO_4
 - test with sodium
 - None of the above
- Which of the following alcohols is unable to turn orange colour of chromic acid to green?
 - Primary alcohol
 - Secondary alcohol
 - Tertiary alcohol
 - Allyl alcohol
- Match List I with List II and choose the correct code.

List I	List II
A. $\text{CH}_3\text{CH}_2\text{OH} \xrightarrow{[\text{O}]}$ Product-1	1. $\begin{array}{c} \text{H}_2\text{C} - \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{O} \end{array}$ (Functional isomer)
B. $\text{CH}_3\text{COCH}_2\text{CH}_3 \xrightarrow{\text{Reduction}}$ Product-2	2. Optical isomer
C. $\text{CH}_3\text{CONH}_2 \xrightarrow{\text{Na/EtOH}}$ Product-3	3. Ethanol
D. $\text{CH}_2\text{O} \xrightarrow[\text{H}_2\text{O}]{(\text{i}) \text{CH}_3\text{MgI}}$ Product-4	4. Primary amine

Codes

	A	B	C	D
a.	1	2	4	3
b.	3	4	1	2
c.	1	2	3	4
d.	2	3	1	4

- Place the following alcohols in decreasing order of rate of dehydration with conc. H_2SO_4 :
 - $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_3$
 - $(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_3$
 - $(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}(\text{CH}_3)_2$
 - $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}(\text{CH}_3)_2$
 - $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$
 - $\text{III} > \text{II} > \text{IV} > \text{V} > \text{I}$
 - $\text{III} > \text{II} > \text{IV} > \text{I} > \text{V}$
 - $\text{III} > \text{II} > \text{I} > \text{IV} > \text{V}$
 - $\text{III} > \text{II} > \text{I} > \text{V} > \text{IV}$
- A compound with molecular formula $\text{C}_4\text{H}_{10}\text{O}_3$ is converted by the action of acetyl chloride to a compound of molecular mass 190. The original compound ($\text{C}_4\text{H}_{10}\text{O}_3$) has
 - one $-\text{OH}$ group
 - two $-\text{OH}$ groups
 - three $-\text{OH}$ groups
 - four $-\text{OH}$ groups
- Arrange the following compounds in increasing order of boiling point:

Propan-1-ol, butan-1-ol, butan-2-ol, pentan-1-ol

 - Propan-1-ol < butan-2-ol < butan-1-ol < pentan-1-ol
 - Propan-1-ol < butan-1-ol < butan-2-ol < pentan-1-ol
 - Pentan-1-ol < butan-2-ol < butan-1-ol < propan-1-ol
 - Pentan-1-ol < butan-1-ol < butan-2-ol < propan-1-ol
- An alcohol *A* when heated with copper gives a product *B* not having oxygen atom. *B* on ozonolysis gives two isomeric products *C* and *D*. *C* on oxidation gives a monobasic acid *E*, silver salt of which contains 59.6% Ag. The structure of *A* is
 - $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \underset{\text{OH}}{\text{CH}} - \text{CH}_2 - \text{CH}_3$
 - $\text{CH}_3 - \underset{\text{CH}_3}{\overset{\text{OH}}{\text{C}}} - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$
 - $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{CH}_2 - \text{CH}_2\text{OH}$
 - $\text{CH}_3 - \underset{\text{CH}_3}{\text{CH}} - \text{CH}_2 - \text{O} - \text{CH}_2 - \text{CH}_2\text{OH}$
- Rate of dehydration of alcohols follows the order
 - $2^\circ > 1^\circ > \text{CH}_3\text{OH} > 3^\circ$
 - $3^\circ > 2^\circ > 1^\circ > \text{CH}_3\text{OH}$
 - $2^\circ > 3^\circ > 1^\circ > \text{CH}_3\text{OH}$
 - $\text{CH}_3\text{OH} > 1^\circ > 2^\circ > 3^\circ$
- Consider the following reaction,

$$\text{A} \xrightarrow[\text{H}_2\text{SO}_4]{\text{K}_2\text{Cr}_2\text{O}_7} \text{Acetone} \xrightarrow{\text{Oxidation}} \text{Acetic acid}$$

Identify *A* in the above reaction.

 - 1-propanol
 - 2-propanol
 - 2-butanol
 - Ethanol
- The alcohols, 1-propanol and 2-propanol are distinguished by
 - oxidation with conc. H_2SO_4 followed by reaction with Fehling's solution
 - oxidation with alk. KMnO_4 followed by reaction with Fehling's solution
 - reaction with iodine and aq. NaOH
 - reaction with Grignard reagent

11. The order for the acidic strength of 1° , 2° , 3° alcohols, H_2O and $\text{RC}\equiv\text{CH}$ is

a. $\text{RC}\equiv\text{CH} > 3^\circ > 2^\circ > 1^\circ > \text{H}_2\text{O}$
 b. $1^\circ > 2^\circ > 3^\circ > \text{H}_2\text{O} > \text{RC}\equiv\text{CH}$
 c. $\text{H}_2\text{O} > 1^\circ > 2^\circ > 3^\circ > \text{RC}\equiv\text{CH}$
 d. $3^\circ > 2^\circ > 1^\circ > \text{H}_2\text{O} > \text{RC}\equiv\text{CH}$

12. Identify the reaction conditions for the following reaction to occur.

a. $\text{I} \rightarrow \text{H}_2\text{SO}_4, 443 \text{ K}$ $\text{II} \rightarrow \text{H}_2\text{SO}_4, 443 \text{ K}$
 b. $\text{I} \rightarrow \text{H}_2\text{SO}_4, 413 \text{ K}$ $\text{II} \rightarrow \text{H}_2\text{SO}_4, 413 \text{ K}$
 c. $\text{I} \rightarrow \text{H}_2\text{SO}_4, 443 \text{ K}$ $\text{II} \rightarrow \text{H}_2\text{SO}_4, 413 \text{ K}$
 d. $\text{I} \rightarrow \text{H}_2\text{SO}_4, 413 \text{ K}$ $\text{II} \rightarrow \text{H}_2\text{SO}_4, 443 \text{ K}$

13. Which of the following reagents cannot be used to distinguish between phenol and benzyl alcohol?

a. $\text{Br}_2 / \text{CCl}_4$ b. NaOH
 c. NaHCO_3 d. FeCl_3 (neutral)

14. For the reaction, Phenol $\longrightarrow$ Cyclohexanol, the $s : p$ ratio of the carbon attached to $-\text{OH}$ group changes from ... to ...

a. $\left(\frac{1}{3} : \frac{2}{3}\right) \left(\frac{1}{4} : \frac{3}{4}\right)$ b. $\left(\frac{1}{3} : \frac{2}{3}\right) \left(\frac{1}{2} : \frac{1}{2}\right)$
 c. $\left(\frac{1}{2} : \frac{1}{2}\right) \left(\frac{1}{3} : \frac{2}{3}\right)$ d. None of these

15. In which of the following reactions, phenol is not obtained?

16. Sodium phenoxide reacts with CO_2 at 400 K and 4.7 atm pressure to give

a. catechol b. salicylaldehyde
 c. sodium salicylate d. benzoic acid

In this reaction, the end product C is

a. salicylaldehyde b. salicylic acid
 c. phenyl acetate d. aspirin

18. Phenol on heating with CHCl_3 and NaOH gives salicylaldehyde. This reaction is called

a. Reimer-Tiemann reaction
 b. Claisen reaction
 c. Cannizzaro reaction
 d. Hell-Volhard-Zelinsky reaction

19. Identify Y + Z in the following reaction,

20. Consider the following reaction,

The electrophile involved in the above reaction is

a. dichloromethyl cation, CHCl_2^+
 b. formyl cation, CHO^+
 c. trichloromethyl anion, CCl_3^-
 d. dichlorocarbene, $:\text{CCl}_2$

21. Consider the following compounds.

Among the compounds *A* and *B*, the vapour pressure of *B* at a particular temperature is

- higher than that of *A*
- lower than that of *A*
- same as that of *A*
- None of the above

22. Consider the following reaction,

The major product formed in the above reaction is

-
-
-
-

23. Which is/are the correct method(s) to synthesise phenol?

-
-
-
- All of the above

Select the product(s) formed in the above reaction.

-
-
-
- Both (a) and (c)

What will be the product formed in the above reaction?

-
-
-
-

In the given reaction, the product is

-
-
-
-

The formula of the complex formed in the above reaction, is

- a. $[\text{Fe}(\text{OC}_6\text{H}_5)_3]^{3-}$ b. $[\text{Fe}(\text{OC}_6\text{H}_5)_3]^{3+}$
 c. $[\text{Fe}(\text{OC}_6\text{H}_5)_6]^{3-}$ d. $[\text{Fe}(\text{OC}_6\text{H}_5)_6]^{3+}$

28. The main product of the following reaction is

- a. 
 b. 
 c. 
 d. 

29. Glycerol on treatment with excess HI gives

- a. 1, 2, 3-triiodopropane b. 1, 3-diiodopropane
 c. 2-iodopropane d. 3-iodopropane

30. Etherates are

- a. ethers
 b. solution in ethers
 c. complexes of ethers with Lewis acid
 d. complexes of ethers with Lewis base

31. Compound $\text{Ph}-\text{O}-\overset{\text{O}}{\parallel}{\text{C}}-\text{Ph}$ can be prepared by the reaction of

- a. phenol and benzoic acid in the presence of NaOH
 b. phenol and benzoyl chloride in the presence of pyridine
 c. phenol and benzoyl chloride in the presence of ZnCl_2
 d. phenol and benzaldehyde in the presence of palladium

32. Consider the following reaction,

The products formed in the above reaction are

- a. -OH and CH_3Br b. -Br and CH_3Br
 c. -OCH₃ and H_2 d. -Br and CH_3OH

33. Anisole on reaction with HI forms

- a. benzene and methyl iodide
 b. phenol and methanol
 c. iodobenzene and methanol
 d. phenol and methyl iodide

34. The reaction of $\text{H}_2\text{C}-\underset{\text{O}}{\text{CH}_2}$ with $\text{H}_2\text{O}/\text{R}-\text{MgX}$

produces

- a. RCHOHR
 b. RCHOHCH_3
 c. $\text{R}_2\text{CHCH}_2\text{OH}$
 d. $\text{RCH}_2\text{CH}_2\text{OH}$

35. **Assertion (A)** The cleavage of C—O bond in ethers takes place under drastic condition with excess of hydrogen halides.

Reason (R) Ethers are the most reactive among all the functional groups.

- a. Both A and R are correct and R is the correct explanation of A
 b. Both A and R are correct but R is not the correct explanation of A
 c. A is correct but R is incorrect
 d. R is correct but A is incorrect

36.

In the above reaction, the products are

- a.  + RX b.  + RX
 c.  + ROH d.  + ROX

BITSAT Archives

1. What will be the product of the following reaction? [2014]

- a. $\text{CH}_3-\underset{\text{CH}_3}{\text{C}}=\text{CH}_2$ b. $\text{CH}_3-\text{O}-\underset{\text{CH}_3}{\overset{\text{CH}_3}{\text{C}}}-\text{CH}_3$
 c. $\text{CH}_3-\text{CH}_2-\text{CH}_2-\text{CH}_3$ d. $\text{CH}_3-\underset{\text{CH}_3}{\text{CH}}-\text{CH}_3$

2. Identify the correct product formed during the following reaction: [2014]

3. When 2-methyl propan-2-ol is treated with a mixture of conc. HCl and ZnCl_2 , turbidity appears immediately due to the formation of [2013]

- a. 2-methyl propane
 b. 2-methyl propene
 c. 2-methyl-2-chloropropane
 d. 2-chlorobutane

4. What will be the correct relation between products when 2-methyl cyclohexene is treated with (i) B_2H_6 in the presence of $\text{H}_2\text{O}_2/\text{OH}^-$ and (ii) $\text{H}_2\text{O}/\text{H}_2\text{SO}_4$?

(Also consider stereochemistry of product) [2013]

- a. They are metamers
 b. They are tautomers
 c. They are functional isomers
 d. They are positional isomers

5. The following reaction is known as [2012]

- a. Friedel-Crafts reaction
 b. Kolbe reaction
 c. Reimer-Tiemann reaction
 d. Wittig reaction

[2011]

This reaction is called

- a. Reimer-Tiemann reaction
 b. Liebermann's nitroso reaction
 c. Dakin reaction
 d. Lederer-Manasse reaction

7. 3-methyl-2-butanol on treatment with HCl gives (major product) [2010]

- a. 2-chloro-2-methyl butane
 b. 2-chloro-3-methyl butane
 c. 2, 2-dimethyl pentane
 d. None of the above

8. Phenol can be tested by [2010]

- a. Liebermann's nitroso test
 b. FeCl_3 solution
 c. bromine water
 d. All of the above

9. Phenol reacts with PCl_5 to give mainly [2009]

- a. *p*-chlorophenol
 b. chlorobenzene
 c. *o* and *p*-chlorophenol
 d. triphenyl phosphate

10. The IUPAC name of $\text{C}_2\text{H}_5-\text{O}-\text{CH}(\text{CH}_3)_2$ is

- a. ethoxy propane
 b. 1,1-dimethyl ether
 c. 2-ethoxy isopropane
 d. 2-ethoxy propane [2008]

11. The compound which gives the most stable carbonium ion on dehydration is [2007]

- a. $\text{CH}_3\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$
 b. $(\text{CH}_3)_3\text{COH}$
 c. $\text{CH}_2=\text{CHCH}_2\text{CH}_2\text{OH}$
 d. $\text{CH}_3\text{CHOHCH}_2-\text{CH}_3$

12. Pinacol is [2006]

- a. 3-methylbutan-2-ol
 b. 2, 3-dimethyl-2, 3-butanediol
 c. 2, 3-dimethyl-2-propanone
 d. None of the above

13. Grignard reagent reacts with HCHO to produce a/an [2005]

- a. secondary alcohol
 b. anhydride
 c. acid
 d. primary alcohol

14. The product obtained by heating diethyl ether with HI is [2005]

- a. $\text{C}_2\text{H}_5\text{I}$ b. $\text{C}_2\text{H}_5\text{OH}$
 c. $\text{C}_2\text{H}_5\text{OH} + \text{C}_2\text{H}_5\text{I}$ d. $\text{C}_2\text{H}_5-\text{C}_2\text{H}_5$

Answer with Solutions

Practice Exercise

1. (b)

2. (c) Tertiary alcohol offers resistance to oxidation. Hence, Cr^{3+} ions are not formed and the solution does not turn green.
3. (a) Product-1: acetaldehyde (functional isomer of epoxide),
Product-2: *s*-butyl alcohol,
Product-3: ethylamine and
Product-4: ethyl alcohol.
4. (b) The alcohols (II) and (III) both are 3° , but alcohol (III) gives a more substituted alkene. Alcohol (IV) and (I) both are 2° , but alcohol (IV) can give a more substituted alkene and alcohol (V) is 1° . Rate of dehydration of alcohols with conc. H_2SO_4 follows the order

$$3^\circ > 2^\circ > 1^\circ$$

5. (b) In acetylation, replacement of H of O—H occurs by CH_3CO — group.

i.e. H-atom of mass 1 amu is lost and an acetyl group of mass 43 amu is added. Thus, there is a net gain of $43 - 1 = 42$ amu for every acetyl group introduced. Mass of difference of final product and original compound is $190 - 106 = 84$. Hence, number of —OH groups

$$= \frac{84}{42} = 2$$

6. (a) With the increase in molecular mass, the boiling points also increase. Amongst isomeric alcohols, the boiling point decreases with branching due to decrease in surface area.
7. (b) Molecular mass of silver salt of *E* = $\frac{108}{59.6} \times 100 = 181$

$$\text{RCOOAg} = 181$$

$$R = 181 - (108 + 12 + 32) = 181 - 152 = 29$$

Hence, acid salt is $\text{CH}_3\text{—CH}_2\text{—COOAg}$.

Corresponding to this salt, acid is $\text{CH}_3\text{—CH}_2\text{—COOH}$, which is obtained by oxidation of (C), an ozonolysis product. Thus, (C) is $\text{CH}_3\text{—CH}_2\text{—CH=O}$.

Since, (C) and (D) are isomers, D is $\text{CH}_3\text{—}\overset{\text{CH}_3}{\underset{\text{O}}{\text{C}}}=\text{O}$. On the basis of C and D, we can get product B and finally A.

8. (b) The order of dehydration of alcohols is

$$3^\circ > 2^\circ > 1^\circ > \text{CH}_3\text{OH}$$

9. (b) The given reaction can be completed as

10. (c) $\text{CH}_3\text{—CH}_2\text{—CH}_2\text{OH} + \text{I}_2 + \text{NaOH} \xrightarrow{\Delta}$ No reaction
Propanol

11. (c) $\text{H}_2\text{O} > 1^\circ > 2^\circ > 3^\circ > \text{R—C}\equiv\text{CH}$

13. (c)

(a) (b) and (d) all react with phenol and none of them reacts with benzyl alcohol. But (c) does not react with either phenol or benzyl alcohol.

14. (a) Carbon changes its hybridisation state from sp^2 to sp^3 ,
i.e. $\left(\frac{1}{3} : \frac{2}{3}\right)$ to $\left(\frac{1}{4} : \frac{3}{4}\right)$.

15. (b) $\text{C}_6\text{H}_5\text{MgBr} \xrightarrow{\text{H}_3\text{O}^+} \text{C}_6\text{H}_6$

This reaction is called Reimer-Tiemann reaction.

21. (a) In *o*-nitrophenol, intramolecular H-bonding is present between $-\text{OH}$ and $-\text{NO}_2$ groups, whereas *p*-nitrophenol forms intermolecular H-bonding. Thus, vapour pressure of *B* is higher than that of *A*.

23. (d) All the given methods are correct.

24. (d) Nitration of phenol with dilute nitric acid at low temperature (298 K), phenol yields a mixture of *ortho* and *para*-nitrophenol.

27. (c) $[\text{Fe}(\text{OC}_6\text{H}_5)_6]^{3-}$

30. (c) Etherates are the complexes of ethers with Lewis acid.

31. (b)

32. (a) The complete reaction is as follows

33. (d)

34. (d) $H_2C-CH_2 \xrightarrow[H_2O]{R-MgX} R-CH_2CH_2-OH + MgX(OH)$

35. (c) Ethers are the least reactive among all the functional groups. The cleavage of C—O bond in ethers takes place under drastic conditions with excess of hydrogen halides.

36. (a)

BITSAT Archives

1. (a) When tertiary alkyl halide is treated with sodium alkoxide then elimination reaction completes over substitution reaction because alkoxides are not only nucleophiles but strong base as well. Therefore, alkenes are formed instead of ethers.

2. (d)

Basis of carbocationic rearrangement is due to relief from angle strain.

3. (c) When 2-methyl propan-1-ol is treated with a mixture of conc. HCl and $ZnCl_2$ (Lucas reagent) then *tert*-alkyl halide is formed and produced turbidity due to its less solubility.

4. (d)

A and B have difference in position of OH only so, A and B are positional isomers.

5. (b) At 120-140°C temperature and 1.5 atm pressure, sodium phenoxide reacts with CO_2 to yield sodium salicylate which on further hydrolysis give to salicylic acid. This reaction is known as Kolbe's reaction.

6. (c) The reduction of —CHO group to —OH by H_2O_2/OH^- is called Dakin reaction.

7. (a) $CH_3-CH(CH_3)-CH(OH)-CH_3 + HCl \longrightarrow$

8. (d) Phenol can be tested by all the given reagents.

9. (d) $3C_6H_5OH + PCl_5 \xrightarrow[\text{Nucleophilic attack}]{-3HCl} (C_6H_5O)_3PCl_2 \xrightarrow[-2HCl]{H_2O} (C_6H_5O)_3PO$ Triphenyl phosphate

10. (d) $C_2H_5-O-\overset{1}{\underset{3}{\overset{2}{CH}}}(CH_3)_2$
2-ethoxy propane

11. (b) $(CH_3)_3C-OH \xrightarrow[-H_2O]{+H^+} (CH_3)_3C^+$
Tertiary alcohol $\rightarrow$ 3° carbocation (more stable)

12. (b)

13. (d) $HCHO + R-MgX \xrightarrow{H_3O^+} R-CH_2OH$
(1° alcohol)

14. (c) $C_2H_5-O-C_2H_5 \xrightarrow[100^\circ C]{HI} C_2H_5-OH + C_2H_5-I$

26

Aldehydes and Ketones

Carbonyl Compounds

Carbonyl compounds contain carbon-oxygen double bond, >C=O .

These are divided into three classes:

Nature of >C=O Group

The >C=O group is highly polar in nature due to the high electronegativity of oxygen atom, so that, C-atom acquires partially positive charge and O-atom acquires partially negative charge.

The two canonical forms of carbonyl group are:

Preparation of Aliphatic and Aromatic Aldehydes and Ketones

The general methods for the preparation for aldehydes and ketones are as follows:

Aldehydes and Ketones

These methods are as follows :

- (i) **From alcohols** The controlled oxidation of primary alcohols, RCH_2OH yields aldehydes while secondary alcohols yield ketones.

- (ii) **From carboxylic acids**

- (a) **Dry distillation of calcium salts of fatty acids** Dry distillation of calcium formate yields formaldehyde only.

Dry distillation of calcium formate with calcium salts of fatty acids yields other aldehydes.

Pyrolysis of a mixture of calcium salt of different fatty acids yields mixed ketones.

- (b) **Catalytic decomposition of acids** Reaction of acids with formic acid yields aldehyde.

Reaction of two molecules of acid yields ketones.

- (iii) **From hydrocarbons** Aldehydes and ketones can be prepared from alkenes and alkynes.

- (a) **Alkenes**

Carbonyl compounds can be prepared from alkenes in the following ways:

Reductive ozonolysis of alkenes

Wacker's process [Oxidation of alkenes with $\text{PdCl}_2/\text{CuCl}_2$]

The reaction is as follows:

- (b) **Alkynes**

Carbonyl compounds can be prepared from alkynes in the following ways:

Hydration of alkynes The reaction works as

- (iv) **From Grignard's reagents**

- (a) **Cyanides** Addition of RMgX on HCN yields aldehydes.

Addition of $\text{R}'\text{MgX}$ on RCN gives ketones.

Preparation of Aldehydes Only

- (i) **From acyl chloride**

This reaction is called **Rosenmund reduction**.

- (ii) **Stephen reaction**

- (iii) **By side chain chlorination followed by hydrolysis**

(iv) Etard reaction

(v) By oxidation of methyl benzene

(vi) By Gattermann-Koch reaction

(vii) From diazonium salts

Preparation of Ketones Only

(i) From acid chlorides

(ii) By Friedel-Crafts acylation

Physical Properties of Aldehydes and Ketones

(i) **Boiling points** Boiling points of aldehydes and ketones are higher than that of hydrocarbons and ethers but lower than alcohols of comparable molecular masses. This is because of weak intermolecular interactions due to dipole-dipole interactions and absence of H-bonding.

(ii) **Solubility** Solubility decreases with increase in molecular mass or size of alkyl group. Aldehydes and ketones containing upto 4C-atoms are soluble in water.

Chemical Reactions of Aldehydes and Ketones

Due to the presence of polar >C=O group, aldehydes and ketones exhibits the following reactions:

Nucleophilic Addition Reactions

Carbonyl compounds undergo nucleophilic addition reactions in which nucleophile attack electrophilic C-atom of >C=O group.

In general, ketones are less reactive in nucleophilic addition reactions as compared to aldehydes. *This is because*

- (i) Aldehydes have only one electron pair releasing group while ketones have two.
- (ii) Steric hindrance is less in aldehydes compared to ketones.

(a) **Addition of HCN** The reaction looks like

(b) **Addition of NaHSO₃** The reaction looks like

Nucleophilic Addition-Elimination Reaction

In these reactions, additions of nucleophile on electrophilic C-atom of carbonyl group leads to the elimination of O-atom in the form of water, H_2O .

(i) **Addition of alcohols** Acetals and ketals are formed.

(ii) **Addition of PCl_5** Geminal dihalides are produced.

(iii) **Addition of NH_3 and its derivatives $[H_2N-Z]$**

Here, Z may be

Some N-Substituted Derivatives of Aldehydes and Ketones ($>C=N-Z$)

Z	Reagent name	Carbonyl derivative	Product name
-H	Ammonia	$\begin{array}{c} >C=NH \\ >C=NH \end{array}$	Imine
-R	Amine	$\begin{array}{c} >C=NR \\ >C=NR \end{array}$	Substituted imine (Schiff's base)
-OH	Hydroxyl amine	$\begin{array}{c} >C=N-OH \\ >C=N-OH \end{array}$	Oxime
$-NH_2$	Hydrazine	$\begin{array}{c} >C=N-NH_2 \\ >C=N-NH_2 \end{array}$	Hydrazone
$-HN-\text{C}_6\text{H}_5$	Phenyl hydrazine	$\begin{array}{c} >C=N-NH-\text{C}_6\text{H}_5 \\ >C=N-NH-\text{C}_6\text{H}_5 \end{array}$	Phenyl hydrazone
$-HN-\text{C}_6\text{H}_3(\text{NO}_2)_2$	2,4-dinitrophenyl hydrazine	$\begin{array}{c} >C=N-NH-\text{C}_6\text{H}_3(\text{NO}_2)_2 \\ >C=N-NH-\text{C}_6\text{H}_3(\text{NO}_2)_2 \end{array}$	2,4-dinitrophenyl hydrazone
$-NH-\overset{O}{\parallel}C-NH_2$	Semicarbazide	$\begin{array}{c} >C=N-NH-\overset{O}{\parallel}C-NH_2 \\ >C=N-NH-\overset{O}{\parallel}C-NH_2 \end{array}$	Semicarbazone

Reduction

Aldehydes and ketones can be reduced to alcohols and alkanes.

(i) Reduction to alcohols

Note Reduction of ketones by aluminium isopropoxide [Meerwein-Ponndorf-Verley's (MPV) reduction]

(ii) Reduction to alkanes

The reducing agents may be

(a) Zn-Hg/HCl (Clemmensen's reduction)

(b) NH_2-NH_2 / KOH (Wolff-Kishner reduction)

Oxidation

(i) Oxidation of aldehydes

The above reaction is called **Silver mirror test** and used as a distinguish test for aldehydes and ketones.

(ii) Oxidation of ketones

By the help of strong oxidising agents like conc. HNO_3 / $KMnO_4$ / H_2SO_4 / $K_2Cr_2O_7$ / H_2SO_4 , their oxidation involves carbon-carbon bond cleavage.

For unsymmetrical ketones, the cleavage takes place in such a way that keto group remains with smaller alkyl group (**popoff's rule**).

(iii) Oxidation with sodium hypohalite (NaOX) or haloform test

This reaction is given by carbonyl

compounds containing $-\overset{\overset{O}{||}}{C}-CH_3$ group that is acetaldehyde or methyl ketone only.

[X = Cl, Br, I]

Reactions Due to α -H-atom

α -H-atom of aldehydes and ketones is highly acidic in nature due to the presence of electron withdrawing effect of carbonyl group.

(i) **Aldol condensation** Aldehydes and ketones possessing atleast one α -H-atom reacts in the presence of dilute alkali [like NaOH as catalyst] to form β -hydroxy aldehydes (aldol)/ β -hydroxyketones (ketol) respectively. Further, aldol and ketol condenses to give α, β -unsaturated carbonyl compounds. This reaction is called aldol condensation.

The above reaction is called **Self aldol condensation**.

(ii) **Cross aldol condensation** When aldol condensation is carried out between two different aldehydes/ketones, it is called cross aldol condensation.

Chemical Reactions of Aldehydes only

- (i) **Cannizzaro reaction** This reaction is shown by those aldehydes which lack α -H-atom and undergo self oxidation-reduction reaction (disproportionation).

Cross-Cannizzaro reaction

HCHO lacks steric hindrance. Hence, it readily oxidises acid to salt.

- (ii) **Tischenko reaction** The reaction looks like

Electrophilic Substitution Reaction

- (i) **Electrophilic substitution reaction due to benzene ring** Aromatic aldehydes undergo electrophilic substitution reactions rarely due to the presence of deactivating carbonyl group. This is *m*-directing group as substituent directed to *m*-position.

- (ii) **Claisen-Schmidt reaction** The reaction looks like

- (iii) **Perkin condensation** [For aromatic aldehydes only]

- (iv) **Benzylic acid rearrangement** [For aromatic ketones] The reaction is given by only diketones.

Practice Exercise

1. Ozonide of $\text{CH}_2=\text{CH}-\text{CH}_2\text{OH}$ on hydrolysis gives

- HCHO , $\text{OHC}-\text{CHO}$
- HCHO , HOCH_2-CHO
- HCHO , $\text{HOC}-\text{CH}_2\text{OH}$
- None of the above

2. Dry distillation of calcium acetate and calcium formate leads to the formation of aldehydes and ... ketones

- 2, 1
- 1, 2
- 2, 2
- 1, 1

3. In the following sequence of reactions, the final product is

- p*-chlorobenzaldehyde
- p*-chlorobenzylalcohol
- p*-chlorobenzoic acid
- p*-salicylaldehyde

4. Identify the product (Y) in the following reaction sequence:

- $\text{MeO}-\text{C}_6\text{H}_4-(\text{CH}_2)_3\text{COOH}$
- $\text{MeO}-\text{C}_6\text{H}_4-(\text{CH}_2)_2\text{COOH}$
- $\text{MeO}-\text{C}_6\text{H}_4-\text{CH}_2\text{COOH}$
- $\text{MeO}-\text{C}_6\text{H}_4-\text{COOH}$

5. Consider the following reaction,

The compounds X is

-
-
-
-

6. The compound formed as a result of oxidation of ethyl benzene by KMnO_4 is

- benzophenone
- acetophenone
- benzoic acid
- benzyl alcohol

7. Choose the Gattermann-Koch reaction.

Structure of A and type of isomerism in the above reaction respectively are

- prop-1-en-2-ol, metamerism
- prop-1-en-1-ol, tautomerism
- prop-2-en-2-ol, geometrical isomerism
- prop-1-en-2-ol, tautomerism

9. Consider the following reaction,

A is

-
-
-
-

10. Which of the substrate give the same product on the reduction with DIBAL-H?

a. $\text{CH}_3 - (\text{CH}_2)_9 - \text{CN}$ and $\text{CH}_3(\text{CH}_2)_9 - \text{COOH}$
 b. $\text{CH}_3 - (\text{CH}_2)_9 - \text{CN}$ and $\text{CH}_3(\text{CH}_2)_9 - \text{COOC}_2\text{H}_5$
 c. $\text{CH}_3 - (\text{CH}_2)_9 - \text{COOH}$ and $\text{CH}_3(\text{CH}_2)_9 - \text{CHO}$
 d. $\text{CH}_3(\text{CH}_2)_9 - \text{COOH}$ and $\text{CH}_3(\text{CH}_2)_9 \text{COOC}_2\text{H}_5$

11. Identify the starting material from which the products
 $\text{H}_3\text{CCH}=\text{C}-\text{CHO}$ and

$\text{H}_3\text{C}-\text{CH}_2\text{CH}=\text{CH}-\text{CHO}$ are formed?

- a. Two molecules of ethanal
 b. Two molecules of propanal
 c. One molecule of ethanal and two molecules of propanal
 d. One molecule of propanal and one molecule of ethanal
12. Both HCHO and CH_3CHO give similar reactions with all the reagents except
- a. Schiff's reagent b. ammoniacal AgNO_3
 c. Fehling solution d. ammonia
13. Which of the following carbonyl compounds gives lactic acid as the end product in the following sequence?

- a. HCHO b. CH_3CHO
 c. $\text{C}_6\text{H}_5\text{CHO}$ d. CH_3COCH_3
14. Oximino acetone is formed in the reaction
- a. acetone + hydroxylamine b. acetone + ammonia
 c. acetone + nitrous acid d. None of the above
15. Which of the following is used to prepare a medicine, which is used in making an important explosive, RDX ?
- a. Acetaldehyde b. Acetone
 c. Formaldehyde d. None of these
16. Which of the following reactions gives pentaerythritol?

17. Consider the following reaction,

The above reaction is completed by the reagent

a. alkaline KMnO_4 b. Tollen's reagent
 c. selenium dioxide d. osmium tetroxide

18. Consider the following reaction,

A is

- a. CH_3COOH
 b. $\text{CH}_3\text{CH}_2\text{COOH}$
 c. $\text{CH}_3\text{CH}=\text{CHCOOH}$
 d. $\text{HOOC}-\text{CH}=\text{CH}-\text{COOH}$
19. In the aldol condensation of acetaldehyde and acetone in dilute alkali, the carbanion source will be
- a. acetaldehyde
 b. acetone
 c. Both (a) and (b)
 d. None of the above
20. For distinct between CH_3CHO and $\text{C}_6\text{H}_5\text{CHO}$, the used reagent is
- a. KCN b. HCN c. NH_2OH d. PCl_5
21. Oxidation of ketones with H_2O_2 or with a peroxy acid is called Baeyer-Villiger oxidation. This oxidation reaction forms
- a. carboxylic acid with the fewer number of carbons
 b. an alcohol with the same number of carbons as in the ketone
 c. an ester
 d. carboxylic acid with the same number of carbons as in the parent ketone
22. The order of reactivity of phenyl magnesium bromide with the following compounds is

- a. $\text{II} > \text{III} > \text{I}$
 b. $\text{I} > \text{III} > \text{II}$
 c. $\text{II} > \text{I} > \text{III}$
 d. All react with the same rate
23. The product of acid hydrolysis of P and Q can be distinguished by

- a. Lucas reagent b. 2, 4-DNP
 c. Fehling's solution d. NaHSO_3
24. Consider the following Rosenmund reaction,

Here, BaSO_4

- a. promotes catalytic activity of Pd
 b. removes the HCl formed in the reaction
 c. deactivates palladium
 d. activates palladium

25. Addition of water to alkynes occurs in acidic medium and in the presence of Hg^{2+} ions as a catalyst. Which of the following products will be formed on addition of water to but-1-yne under these conditions?

26. An organic compound containing C, H and O gives red colouration with sodium nitroprusside solution but does not reduce Tollen's reagent and yields chloroform on treating with NaOH and Cl_2 . The compound is

27. Maximum dehydration takes place in that of

28. With reference to the scheme given, which of the given statements about T, U, V and W is incorrect?

- a. T is soluble in hot aqueous NaOH
 b. V is optically active
 c. Molecular formula of W is $\text{C}_{10}\text{H}_{18}\text{O}_4$
 d. V gives effervescence on treatment with aqueous NaHCO_3

29. Which of the following is the product of aldol condensation?

30. Iodoform can be prepared from all, except

- a. ethyl methyl ketone
 b. isopropyl alcohol
 c. 3-methyl-2-butanone
 d. isobutyl alcohol

31. The Clemmensen reduction of ketones is carried out in the presence of

- a. Zn-Hg with HCl
 b. LiAlH_4
 c. H_2 and Pt as a catalyst
 d. glycol with KOH

32. Which one of the following aldehydes does not give Cannizzaro's reaction?

- a. Formaldehyde b. Acetaldehyde
 c. Trimethyl acetaldehyde d. Benzaldehyde

33. When α , β -unsaturated carbonyl compounds undergo a ring closure reaction with conjugated dienes, the reaction is called

- a. Claisen rearrangement
 b. Diels Alder reaction
 c. Cannizzaro reaction
 d. Perkin reaction

34. The most acidic H-atom in the following ester is

The above reaction is known as

- a. Wolff-Kishner reduction
 b. Clemmensen's reduction
 c. Both (a) and (b)
 d. None of the above

36. Identify the product formed in the following reaction:

37. Consider the following reaction,

Identify X and Y in the given reaction.

38. Cannizzaro's reaction is not given by

39. The product formed in the following reaction is

40. The compounds, benzaldehyde and acetone are distinguished by

a. Fehling's solution

b. 2, 4-DNP

c. Tollen's reagent

d. sodium hydroxide solution

41. Consider the following Cannizzaro reaction,

In the above reaction, the slowest step of the reaction is

a. the transfer of hydride ion to the carbonyl group

b. the deprotonation of $\text{Ph}-\text{CH}_2\text{OH}$

c. the attack of OH^- at the carbonyl group

d. the abstraction of proton from the carboxylic acid

42. An aromatic compound, A [$\text{C}_5\text{H}_{10}\text{O}$] undergoes

Cannizzaro reaction, forms 2, 4-DNP derivative, reduces Tollen's reagent and produces 1, 2-benzenedicarboxylic acid on vigorous oxidation. The compound A would be

43. Consider the following series of reaction,

The end product of the above series of reaction is

44. The increasing order of the rate of HCN addition to compounds *a-d* is

(i) HCHO
 (ii) CH_3COCH_3
 (iii) PhCOCH_3
 (iv) PhCOPh
a. (i) < (ii) < (iii) < (iv)
b. (iv) < (ii) < (iii) < (i)
c. (iv) < (iii) < (ii) < (i)
d. (iii) < (iv) < (ii) < (i)

45. Select the structure of chromium complex formed when the toluene reacts with chromyl chloride to give benzaldehyde on hydrolysis.

Predict the product (s) formed in the given reaction.

47. An organic compound (*x*) with molecular formula $\text{C}_8\text{H}_8\text{O}$ forms an orange-red precipitate with 2,4-DNP reagent and gives yellow precipitate on heating with iodine in the presence of sodium hydroxide.

It neither reduces Tollen's or Fehling's reagent, nor does it decolourise bromine water or Baeyer's reagent.

On drastic oxidation with chromic acid, it gives a carboxylic acid (*Y*) having molecular formula $\text{C}_7\text{H}_6\text{O}_2$. Identify the compounds *X* and *Y*.

48. An aromatic compound *X* with molecular formula $\text{C}_9\text{H}_{10}\text{O}$ gives the following chemical tests:

I. Forms 2, 4-DNP derivative
 II. Reduces Tollen's reagent
 III. Undergoes Cannizzaro reaction
 IV. On vigorous oxidation, 1,2-benzene dicarboxylic acid is obtained. *X* is

49. Predict the product(s) formed in the following reaction:

50. Name the reaction which involves the conversion of benzaldehyde to cinnamic acid in the presence of acetic anhydride.

a. Benzoin condensation **b.** Reformatsky reaction
c. Knoevenagel reaction **d.** Perkin's reaction

BITSAT Archives

1. How many chiral centres are possible for the product of following reaction? [2014]

- a. 1
b. 0
c. 3
d. 2

2. Arrange the following compounds in the increasing order of nucleophilic addition reaction: [2014]

- I. HCHO
II. CH_3COCH_3
III. $\text{C}_6\text{H}_5\text{COCH}_3$
IV. $\text{C}_6\text{H}_5\text{COC}_6\text{H}_5$

- a. $\text{I} < \text{II} < \text{III} < \text{IV}$
b. $\text{IV} < \text{III} < \text{II} < \text{I}$
c. $\text{IV} < \text{II} < \text{III} < \text{I}$
d. $\text{III} < \text{IV} < \text{II} < \text{I}$

3. Which of the following compounds will give positive iodoform test with I_2 and NaOH ? [2013]

- a. $\text{C}_6\text{H}_5\text{COC}_6\text{H}_5$
b. $\text{CH}_3\text{CH}_2\text{CHO}$
c. $\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_3$
d. $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CH}_3$

4. What will be the final product of the reaction? [2014]

5. The compound formed as a result of oxidation of propyl benzene by KMnO_4 is [2013]

- a. benzaldehyde
b. benzyl alcohol
c. benzoic acid
d. acetophenone

6. What will be the correct structural formula of product for the following reaction? [2013]

7. Which of the following is process used for the preparation of acetone? [2012]

- a. Waber process
b. Wacker process
c. Wolff-Kishner reduction
d. Gattermann-Koch synthesis

8. What will be the main product when acetylene reacts with hypochlorous acid? [2012]

- a. Trichloro acetaldehyde
b. Acetaldehyde
c. Dichloro acetaldehyde
d. Chloro acetaldehyde

9. Which of the following reagents can be used to prepare benzaldehyde from toluene? [2009]

- a. CrO_3 in $(\text{CH}_3\text{CO})_2\text{O}$
b. $\text{K}_2\text{Cr}_2\text{O}_7$ + conc. H_2SO_4
c. Hot alkaline KMnO_4
d. Conc. HNO_3

10. Acetone on addition to methyl magnesium bromide forms a complex, which on decomposition with acid gives X and $\text{Mg}(\text{OH})\text{Br}$. Which one of the following is X? [2008]

- a. CH_3OH
b. $(\text{CH}_3)_3\text{COH}$
c. $(\text{CH}_3)_2\text{CHOH}$
d. $\text{CH}_3\text{CH}_2\text{OH}$

11. $\text{CH}_3 - \text{C} \equiv \text{CH}_3 - \text{CH}_3 \xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) X}}$

In the above reaction, X is [2008]

- a. HNO_3
b. O_2
c. O_3
d. KMnO_4

12. Which of the following ketones will not respond to iodoform test? [2007]

- a. Methyl isopropyl ketone
b. Ethyl isopropyl ketone
c. Dimethyl ketone
d. 2-hexanone

13. Acetone and acetaldehyde can be distinguished by

- a. Molisch test
b. Tollen's test
c. Schiff's test
d. iodoform test

14. Cyanohydrin of which of the following forms lactic acid [2005]

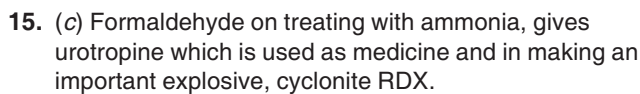

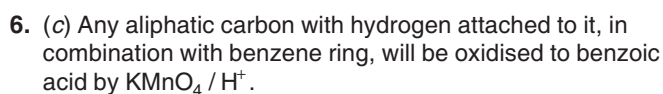

- a. HCHO
b. CH_3CHO
c. $\text{CH}_3\text{CH}_2\text{CHO}$
d. CH_3COCH_3

Answer with Solutions

Practice Exercise

Calcium formate + calcium acetate $\xrightarrow{\Delta}$ Acetaldehyde
i.e. two aldehydes and one ketone are obtained.

16. (a) It is the product of reaction (a).

17. (b) Tollen's reagent converts only —CHO to —COOH .

19. (b) Acetone generates carbanion because carbonyl group of acetaldehyde acts as a better nucleophile acceptor than acetone.

In other reactions, the products are similar.

21. (c) $\text{R}_2\text{C}=\text{O} \xrightarrow{\text{H}_2\text{O}_2} \text{R—C(=O)—OR}$
- Cyclic ketones are converted into cyclic esters (lactones).

22. (c) From phenyl magnesium bromide, phenyl is attached with that C-atom of carbonyl group which has low electron density (higher electropositive charge). In carbonyl compounds, aldehydes are more reactive towards nucleophile. In nucleophilic addition reactions because in ketones alkyl groups (due to +I effect) decrease the electropositive charge of carbon of carbonyl group. Hence, attraction of nucleophile decreases. Moreover in the tetrahedral intermediate, aldehydes have less steric repulsion than ketones and also the aldehyde increases the negative charge on oxygen less in comparison of ketones. Therefore, on the basis of above reason, the order of reactivity of acetone (I), acetaldehyde (II) and benzophenone (III) with PhMgBr is $\text{II} > \text{I} > \text{III}$

Fehling's solution is not reduced with acetone.

Fehling solution is reduced with aldehyde, i.e. $\text{CH}_3\text{CH}_2\text{CHO}$. Hence, the product of acid hydrolysis of *P* (ketone) and *Q* (aldehyde) can be distinguished by Fehling solution.

24. (c) BaSO_4 decreases the activity of Pd .

25. (b) But-1-yne on reaction with water in presence of Hg^{2+} ions as a catalyst produces butan-2-one.

26. (c) CH_3COCH_3 gives red colour with sodium nitroprusside solution but does not reduce Tollen's reagent. Acetone yields chloroform with NaOH/Cl_2 .

27. (b) Dehydrated product will be conjugated with >C=O

28. (b) (a) *T* is an ester, so get hydrolysed.

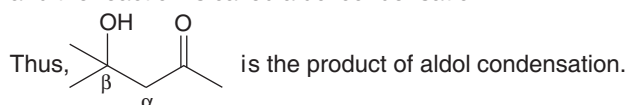

U on treatment with excess $(\text{CH}_3\text{CO})_2\text{O}$, forms a diester (W).

29. (b) When two aldehydes or ketones (or carbonyl compounds) having α -hydrogen atoms react in the presence of a base, they result in the formation of β -hydroxy aldehyde or ketone, called the aldol or ketol and the reaction is called aldol condensation.

30. (d) All carbonyl compounds of the type $R-\overset{\text{O}}{\parallel}{\text{C}}-\text{CH}_3$ formed iodoform but isobutyl alcohol do not have $R-\overset{\text{O}}{\parallel}{\text{C}}-\text{CH}_3$ group.
31. (a) The reagents used to carry out Clemmensen reduction of ketones are $\text{Zn} - \text{Hg}$ with conc. HCl .
32. (b) Cannizzaro reaction is given by the aldehydes that do not contain α -H-atom. The aldehydes like acetaldehyde, CH_3CHO possess α -H-atom and hence, does not undergo Cannizzaro reaction.
33. (b) The reaction between α, β -unsaturated carbonyl compound and conjugated diene to undergo ring closure is called Diel's Alder reaction.

34. (c) The H-atoms linked to C-3 atom are most acidic in nature as these are attached to two electron withdrawing carbonyl groups.

35. (a)

This oxidation does not affect a carbon double bond, if present in the molecule.

38. (c) Only those aldehydes undergo Cannizzaro reaction in the presence of concentrated base, which have lack of α -H atom. CH_3CHO contains three α -H atoms, that's why it does not undergo Cannizzaro's reaction, rather it undergoes aldol condensation.

39. (c)

40. (a) Tollen's reagent is used to distinguish between aldehydes and ketones. Aromatic aldehydes do not reduce Fehling solution and Benedict solution because they are weak reagents.
41. (a) The transfer of hydride ion to the carbonyl group is the slowest step of Cannizzaro reaction.

(i) Attack of OH^- on carbonyl carbon

(ii) Transfer of hydride ion

42. (a) The compound A undergoes Cannizzaro reaction shows that it may be an aldehydic compound with no α -H-atom. The formation of 2, 4-DNP suggests the presence of $C=O$ group and reduction of Tollen's reagent confirms aldehydic group in the compound. The production of 1,2-benzene dicarboxylic acid on vigorous oxidation of A shows that aldehydic and ethyl group present at 1, 2-position of benzene ring. Thus, the compound A is

43. (c)

44. (c) Addition of HCN is a nucleophilic addition reaction. Greater the electron deficiency of carbonyl group, higher the rate of reaction.

45. (c)

It is the Fries rearrangement.

47. (a) X forms 2, 4-DNP derivative so it is an aldehyde or ketone. X must be ketone as it does not reduce Tollen's or Fehling reagent. X must be methyl ketone as it responds to iodoform test.

X do not decolourise bromine water which suggests the presence of unsaturation due to an aromatic ring.

Compound Y should be benzoic acid according to the molecular formula of Y. The compound X must be monosubstituted aromatic methyl ketone.

Compound X is phenylmethyl ketone.

48. (a) I. X forms 2, 4-DNP derivatives, it shows that it has a carbonyl compound.
 II. It reduces Tollen's reagent, it shows that it has an aldehyde group.
 III. It undergoes Cannizzaro reaction, that shows the presence of an aldehyde having no α -hydrogen.
 IV. It produces 1, 2-benzenedicarboxylic. It shows that groups are present at 1, 2-position on benzene ring.

49. (c) OH^- can attack any of the three CHO groups, but nucleophilic addition of OH^- ion occurs on that CHO group which is located at *para*-positions with respect to the other. This is because electron withdrawing groups facilitate the release of hydride ion from the intermediate. The *p*-CHO group is oxidised while the *m*-CHO group is reduced.

50. (d)

BITSAT Archives

1. (a)

2. (b) Steric hindrance decreases the rate of reaction. This steric hindrance is minimum in methanal and maximum in benzophenone.

3. (d)

4. (d)

Now, this bicarbonyl compound undergoes intramolecular aldol condensation as follows:

5. (c)

6. (a)

7. (b) In Wacker process, when mixture of propene and air is passed through mixture of Pd and CuCl₂ at high pressure, acetone is formed.

8. (c)

9. (a) K₂Cr₂O₇ + conc. H₂SO₄, hot alkaline KMnO₄ and conc. HNO₃ will all oxidise toluene to benzoic acid while CrO₃ in CH₃(CO₂O) (mild reagent) will oxidise toluene to benzaldehyde.

or (CH₃)₃COH 2-methyl propan-2-ol

11. (c) $\text{CH}_3-\text{C}\equiv\text{C}-\text{CH}_3 \xrightarrow[\text{Zn/H}_2\text{O}-\text{H}_2\text{O}_2]{\text{O}_3}$

12. (b)

Carboxylic Acid and Its Derivatives

Introduction

Carboxylic acids are a large family of organic compounds that contain the functional group called the carboxyl group. Any aliphatic or aromatic compound can have a carboxyl group attached to it and represented by

carboxylic acids form numerous important derivatives including esters, amides, anhydrides and acid halides. Carboxylic acids have general formula: $\text{C}_n\text{H}_{2n+1}\text{COOH}$

Methods of Preparation

1. From Alkenes

(a) By oxidation

(b) Carboxylation

2. From Grignards Reagent

3. From Trihalogen Derivatives

4. By Oxidation of Aldehyde, Ketones and Alcohols

Strong oxidising agents

Mild oxidising agents

MnO, CuO (Fehling's solution), Ag₂O (Tollen's reagent), FeSO₄ + H₂O₂ (Fenton's reagent)

5. Carboxylation of Sodium Alkoxide

6. By Hydrolysis of Nitriles

Physical Properties of Carboxylic Acids

1. Physical State and Odour

Lower members of aliphatic acids with C₁—C₃ atoms are colourless and pungent smelling liquids. Higher carboxylic acids are colourless oily liquids. Unbranched chain of C₁₂—C₂₄ atoms are called fatty acids.

2. Solubility

Lower members of aliphatic acids with C₁—C₃ atoms are highly soluble in water due to H-bonding. Solubility of carboxylic acids decreases with increases in the number of carbon atoms due to an increase in hydrophobic interactions of the hydrocarbon part.

3. Boiling Points

Boiling points of carboxylic acids is much higher than those of hydrocarbons, aldehydes, ketones and alcohols of comparable masses due to the formation of strong intramolecular H-bonds.

4. Melting Points

The first ten members of carboxylic acids show oscillation or alternation effect in their melting points. The melting point of an acid with even number of C-atoms is higher than that of acids with odd number of C-atoms.

Acidic Strength of Carboxylic Acids

Carboxylic acids are weaker than mineral acids but stronger than phenols because of conjugate base, carboxylate ion is more stabilised than phenoxide ion.

Effect of Substituents on Acidic Strength

The strength of carboxylic acids depends on the substituents bonded to carboxyl group. Electron withdrawing groups like NO₂, CN, F, Cl, Br, OH exerting *-I*-effect decreases the concentration of negative charge from carboxylate ion, thereby making the O—H bond weaker and hence, release of proton easier.

Larger the number of electron withdrawing groups bonded the carboxyl group, greater is the acidic strength of acid.

Electron donating groups like —R, —OR exerting *+I*-effect decreases the acidic strength of acids. The *+I*-effect of alkyl groups decreases in the following order

Thus, the relative strength of acids follows the following order

o-substituted benzoic acids are stronger than *para* and *meta*-benzoic acids.

**Some Special Reactions of HCOOH**(a) It contains $-\text{CHO}$ group, hence reduces Tollen's reagent.

The above reactions can be used to differentiate between formic acid and other acids.

Effect of Carbonyl Group in Acid Derivatives(a) It provides a site for a Nu^- attack.**Reactivity** $\text{RCOX} > \text{RCOOCOR} > \text{RCOOR} > \text{RCONH}_2$ (b) Acidic character of α -hydrogen.Carbonyl group makes α -H active hence, acid derivatives give reactions such as Claisen condensation.**Uses**(a) **Formic acid** Used as reducing agent, for removing hair from skin, formation of resin, insecticide, antiseptic etc.(b) **Acetic acid** Used in synthesis of other organic compounds, as a solvent, in coagulation of rubber latex, for making vinegar, cellulose acetate etc.**Aromatic Acids**

Preparation

1. By Oxidation of Toluene

2. By Friedel-Crafts Reaction

3. By Sandmeyer Reaction

Chemical Properties

Acidity in Benzoic Acid

Acidity of benzoic acid increases, when any group is introduced at the *ortho* position, due to *ortho*-effect. Hence, *o*-nitrobenzoic acid is the strongest among nitrobenzoic acids.

Aromatic acids are stronger acid than aliphatic acids.

Practice Exercise

1. Highest bp would be of

- formic acid
- water
- acetic acid
- ethanol

2. Acidic hydrolysis of, which of the following ester will be slowest?

- $\text{CH}_3\text{COOCH}_3$
- $\text{CH}_3\text{COOCH}_2\text{CH}_3$
- $\text{CH}_3\text{COO}-\underset{\text{CH}_3}{\text{CH}}-\text{CH}_3$
- $\text{CH}_3\text{COOC}(\text{CH}_3)_3$

3. $\text{HCN} \xrightarrow{\text{Hydrolysis}}$ acid-1

The heat of ionisation of HCN and acid-2 respectively are x kcal and y kcal [$x < y$]. The order of their $\text{p}K_a$ values will be

- $(\text{p}K_a)_{\text{HCN}} > (\text{p}K_a)_{\text{acid-2}}$
- $(\text{p}K_a)_{\text{HCN}} = (\text{p}K_a)_{\text{acid-2}}$
- $(\text{p}K_a)_{\text{HCN}} < (\text{p}K_a)_{\text{acid-2}}$
- All of the above

4. A compound with molecular formula $\text{C}_4\text{H}_{10}\text{O}_4$ on acylation with acetic anhydride gives a compound with molecular formula $\text{C}_{12}\text{H}_{18}\text{O}_8$. How many hydroxyl groups are present in the compound?

- One
- Two
- Three
- Four

5. In the reaction,

product A is

- acetaldehyde
- cinnamic acid
- β -naphthol
- phenol

6. Phenol $\xrightarrow[\text{(ii) CO}_2/140^\circ\text{C}]{\text{(i) NaOH}}$ A $\xrightarrow{\text{H}^+/\text{H}_2\text{O}}$ B $\xrightarrow{\text{Ac}_2\text{O}}$ C

In this reaction, the end product C is

- salicylaldehyde
- salicylic acid
- phenyl acetate
- aspirin

7. $\text{C}_8\text{H}_6\text{O}_4 \xrightarrow{\Delta} \text{X} \xrightarrow{\text{NH}_3} \text{Y}$

The compound X is

- o*-xylene
- phthalic acid
- phthalic anhydride
- salicylic acid

8. The correct order of increasing acidic strength is

- phenol < ethanol < chloroacetic acid < acetic acid
- ethanol < phenol < chloroacetic acid < acetic acid
- ethanol < phenol < acetic acid < chloroacetic acid
- chloroacetic acid < acetic acid < phenol < ethanol

9. The correct order for the acidic strength of the following compounds is

I. CH_3COOH II. $\text{MeOCH}_2\text{COOH}$
 III. CF_3COOH IV. Me_2CHCOOH

- a. $\text{II} < \text{IV} < \text{I} < \text{III}$
 b. $\text{IV} < \text{I} < \text{III} < \text{II}$
 c. $\text{IV} < \text{I} < \text{II} < \text{III}$
 d. $\text{I} < \text{IV} < \text{III} < \text{II}$

10. Consider the following reaction,

The compound X is

- a. $\text{CH}_2=\text{CHCH}_2\text{COOH}$
 b. $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}$
 c. $\text{CH}_3\text{CH}=\text{CH}-\text{COOH}$
 d. $\text{CH}_2=\text{CHCOOH}$

11. Arrange the following derivative of carboxylic acid in their increasing order of their acidity.

12. Select the missing compounds for the given reaction.

Identify A, B and C for the above reaction and choose the correct option.

13. Which of the following represents the correct order of the acidic strength in the given compounds?

- a. $\text{CH}_3\text{COOH} > \text{BrCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{FCH}_2\text{COOH}$
 b. $\text{FCH}_2\text{COOH} > \text{CH}_3\text{COOH} > \text{BrCH}_2\text{COOH} > \text{ClCH}_2\text{COOH}$
 c. $\text{BrCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{FCH}_2\text{COOH} > \text{CH}_3\text{COOH}$
 d. $\text{FCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{BrCH}_2\text{COOH} > \text{CH}_3\text{COOH}$

Major product of the above reaction is

15. To distinguish between formic acid and acetic acid, the suitable reagent is

1. acidified KMnO_4
2. Tollen's reagent
3. ethyl alcohol
4. sodium bicarbonate

The correct answer is

a. 1, 2, 3, 4 b. 1, 2, 3
c. 2, 3, 4 d. 1, 2

16. When salicylic acid is heated with acetic anhydride, we get

a. aspirin b. salol
c. paracetamol d. None of these

17. The general formula of the compound obtained as a result of reaction between formic acid and hydroiodic acid is

a. $\text{C}_n\text{H}_{2n+1}\text{OH}$ b. $\text{C}_n\text{H}_{2n+2}$
c. $\text{C}_n\text{H}_{2n}\text{O}$ d. C_nH_{2n}

18. Pyruvic acid as

a. α -keto acid
b. β -keto acid
c. γ -keto acid
d. δ -keto acid

19. The product of which of the following reaction is capable of changing orange colour of $\text{Cr}_2\text{O}_7^{2-}$ to green colour of Cr^{3+} .

a. $\text{CH}_2(\text{COOH})_2 \xrightarrow{\Delta}$
b. $\text{CH}_3\text{CN} \xrightarrow{\text{H}_3\text{O}^+}$
c. $\text{HCN} \xrightarrow{\text{H}_3\text{O}^+}$
d. $\text{CH}_3\text{CONH}_2 \xrightarrow{\text{H}_2\text{O}}$

20. The compound that undergoes decarboxylation most readily under mild condition is

21. The acids, HCOOH and CH_3COOH are distinguished by

a. reaction with Na metal
b. reaction with NaOH
c. reaction with Tollen's reagent
d. reaction with Schiff's reagent

22. The reaction given below is called

a. Cannizzaro reaction
b. Hell-Volhard-Zelinsky reaction
c. Schrodinger reaction
d. Perkin's reaction

23. Carboxylic acids dissociate to give resonance stabilised carboxylate anion

The above statement is

a. true b. false
c. sometimes true d. sometimes false

24. In the given reaction,

Identify I and II for the above reaction and choose the correct option.

25. The product formed during Hell-Volhard-Zelinsky reaction is

- a. $R-\underset{\substack{| \\ X}}{\text{CH}}-\text{COOH}$
 b. $R-\text{CH}_2-\text{COX}$
 c. $R-\underset{\substack{| \\ X}}{\overset{\substack{| \\ X}}{\text{C}}}-\text{COOH}$
 d. $R-\underset{\substack{| \\ X}}{\text{CH}}-\text{CH}_2-\text{COOH}$

26. In the given reactions:

Identify X and Y for the above reaction.

28. In a set of the given reactions, acetic acid yields a product C.

Product C would be

- a. $\text{CH}_3\text{CH}(\text{OH})\text{C}_6\text{H}_5$
 b. $\text{CH}_3-\underset{\substack{| \\ \text{C}_2\text{H}_5}}{\text{C}}(\text{OH})\text{C}_6\text{H}_5$
 c. $\text{CH}_3\text{CH}(\text{OH})\text{C}_2\text{H}_5$
 d. $\text{CH}_3\text{COC}_6\text{H}_5$

29. Complete the synthesis by giving the missing product.

30. Role of 2,4-dichlorophenoxy acetic acid is used as

- a. moth repellent b. insecticide c. fungicide d. herbicide

BITSAT Archives

- Acetic acid on warming with hydrazoic acid in presence of conc. H_2SO_4 gives [2010]
 - CH_3NH_2
 - $\text{CH}_3\text{CH}_2\text{NH}_2$

 - $\text{CH}_3\text{COONH}_4$
- Which of the following on heating does not form an anhydride? [2009]
 - Oxalic acid
 - Succinic acid
 - Glutaric acid
 - Maleic acid
- Acetic acid reacts separately with the following alcohols. The rate of esterification is highest for [2009]
 - CH_3OH
 - $\text{C}_2\text{H}_5\text{OH}$
 - $(\text{CH}_3)_2\text{CHOH}$
 - $(\text{CH}_3)_3\text{COH}$
- Identify A and B in the following reaction. [2008]

$$\text{CH}_3 - \text{CH}_3 \xleftarrow{B} \text{CH}_3\text{COOH} \xrightarrow{A} \text{CH}_3\text{CH}_2\text{OH}$$

A	B
a. $\text{HI} + \text{red P}$	LiAlH_4
b. Ni/Δ	LiAlH_4
c. LiAlH_4	$\text{HI} + \text{red P}$
d. Pd-BaSO_4	$\text{Zn} + \text{HCl}$
- In aqueous solution amino acids mostly exist as [2007]

a. $\text{NH}_2 - \text{CHR} - \text{COOH}$	b. $\text{NH}_2 - \text{CHR} - \text{COO}^-$
c. $\text{NH}_3 - \text{CHR} - \text{COOH}$	d. $\text{H}_3\text{N}^+ \text{CHR} - \text{COO}^-$
- On heating with oxalic acid at 110°C , glycerine gives [2006]

a. glyceryl trioxalate	b. formic acid
c. glyceryl dioxalate	d. None of the above
- Glycerol is oxidised by bismuth nitrate to produce [2005]

a. oxalic acid	b. mesoxalic acid
c. glyceric acid	d. glyoxalic acid

Answer with Solutions

Practice Exercise

- (c) High molecular weight of acetic acid coupled with polar nature due to resonance as well as presence of H-bonding accounts for its high boiling point.
- (d) Alcoholic part of this ester offers maximum steric hinderance. Hence, is hydrolysis will be slowest.
- (a) Acid-2 is acetic acid. HCN is a weaker acid as its heat of ionisation is less than acetic acid. Hence,

$$(pK_a)_{\text{HCN}} > (pK_a)_{\text{acid-2}}$$

- (d) $R-OH \longrightarrow R-OCOCH_3$

Acylation of one hydroxyl group results in increament of $-COCH_2$ (or C_2H_2O). In the question there is an increament of $(C_8H_8O_4)$, hence there should be present four $-OH$ groups.

- (a) The presence of electron withdrawing group on the phenyl of aromatic carboxylic acid increases their acidity while electron donating groups decrease their acidity.

13. (d) The acidity of halogenated acid increases with increase in electronegativity of the halogen present. The correct order is
 $\text{FCH}_2\text{COOH} > \text{ClCH}_2\text{COOH} > \text{BrCH}_2\text{COOH} > \text{CH}_3\text{COOH}$
14. (d) Cannizzaro reaction occurs in the absence of α -hydrogen atom.

15. (d) Formic acid decolourises acidified KMnO_4 solution as well as gives silver mirror with Tollen's reagent.
16. (a) Acetyl salicylic acid is known as aspirin.

17. (b) The product of the reaction is CH_4 and hence, the general formula is $\text{C}_n\text{H}_{2n+2}$.
18. (a) Pyruvic acid is 2-oxo-propanoic acid.

19. (c) Product of 1, 2 and 4 is CH_3COOH , whereas product of 3 is HCOOH which is a reducing agent and will be oxidised by $\text{Cr}_2\text{O}_7^{2-}$.

20. (b) It is a β -keto acid which undergoes decarboxylation in very mild conditions, i.e. on simple heating. Ordinary carboxylic acid requires soda lime catalyst for decarboxylation (β -keto acid must contain an α -H atom).

Thus, readily undergoes decarboxylation.

21. (c) HCOOH gives positive Tollen's test while CH_3COOH does not respond to this test.
22. (b) The α -bromination of carboxylic acids is called Hell-Volhard-Zelinsky reaction.
23. (b) Carboxylic acids dissociate in water to give resonance stabilised carboxylate anions and hydronium ions.

24. (d) Carboxylic acids react with ammonia to give ammonium salt, which on further heating at high temperature gives amides.

25. (a) Carboxylic acids having an α -hydrogen are halogenated at the α -position on treatment with chlorine or bromine in the presence of a small amount of red phosphorus to give α -halocarboxylic acids. The reaction is known as Hell-Volhard-Zelinsky reaction.

**BITSAT Archives**

1. (a) $\text{CH}_3\text{COOH} \xrightarrow[\text{H}_2\text{SO}_4]{\text{N}_3\text{H}} \text{CH}_3\text{NH}_2 + \text{CO}_2 + \text{N}_2$
2. (a) Therefore, oxalic acid on heating does not form an anhydride. Instead it decomposes to give $\text{CO}_2 + \text{CO} + \text{H}_2\text{O}$.
- $$\begin{array}{c} \text{COOH} \\ | \\ \text{COOH} \end{array} \xrightarrow{\Delta} \text{CO}_2 + [\text{HCOOH}] \xrightarrow{\Delta} \text{CO} + \text{H}_2\text{O}$$
3. (a) As the hydrocarbon part (R) of the alcohol increases, the tetrahedral intermediate (I) formed during esterification becomes more and more crowded and hence, the rate of esterification decreases accordingly. Thus, the smallest alcohol, i.e. CH_3OH reacts at the fastest rate.

4. (c) Acetic acid on reduction with lithium aluminiumhydride (LiAlH_4) gives ethyl alcohol while on reduction with HI and red P gives ethane.

Hence, reagent A and B are respectively LiAlH_4 and HI/red P .

5. (d) In aqueous solutions, amino acids mostly exist as zwitter ions.

6. (b)

28

Nitrogen Containing Compounds

Amines

These are the derivatives of ammonia in which one, two or all the three hydrogen atoms are replaced by alkyl or aryl groups. Amines are classified as primary, secondary or tertiary according to the replacement of one, two or three hydrogen atoms from ammonia respectively.

Structure of Amines

Nitrogen in amines, is sp^3 -hybridised. The sp^3 -hybridised orbitals of nitrogen overlap with orbitals of hydrogen or carbon depending upon the composition of amines. The fourth hybridised orbital of nitrogen in all amines has an unshared pair of electrons. Due to the presence of lone pair of electrons, the bond angle C–N–E (where, E is C or H) is less than 109.5° and shape is pyramidal.

Preparation of Amines

Several methods can be used to prepare aliphatic amines, out of which some are specific for 1°, 2° and 3° amines in which some gives mixtures of all the three.

1. By the Reduction of Nitro Compounds, Nitriles and Amides

Alkyl nitriles, nitroalkanes, oximes and amides, all on reduction give primary amines. Reduction of nitriles to primary amines by using Na and alcohol is called mendius reaction.

All the above reactions are used in the preparation of primary amines.

2. By Ammonolysis of Alkyl Halides (Hofmann's Method)

When alkyl halide is heated with alcoholic solution of ammonia in a sealed tube at about 393 K, a mixture of amines is obtained. This reaction is called Hofmann's ammonolysis method.

NOTE Ammonolysis of alkyl halides produces a mixture of 1°, 2° and 3° amines alongwith quaternary ammonium salt.

The free amine can be obtained from ammonium salt by the treatment with a strong base.

3. Gabriel Phthalimide Synthesis

This reaction is used for the preparation of 1° amine (aliphatic as well as aromatic amines having electron withdrawing group at *o*- and *p*-positions, e.g. —NO₂ group).

Aromatic primary amines cannot be prepared by this method because aryl halides do not undergo nucleophilic substitution with the anion formed by phthalimide.

4. Hofmann Bromamide Degradation Reaction

Amides on reaction with Br₂ in an aqueous or ethanolic solution of NaOH give 1° amine with one C-atom less than that present in the amide.

5. Schmidt Reaction

Instead of N₃H and conc. H₂SO₄, a mixture of NaN₃ and conc. H₂SO₄ can also be used.

Physical Properties of Amines

General physical properties of amines are as follows :

- Lower aliphatic amines are gases while lower aromatic amines are liquids.
- Boiling point of amines is higher than hydrocarbons of comparable molecular masses due to the presence of intermolecular H-bonding. However, H-bonding is absent in tertiary amines.
- Aliphatic amines are miscible with water due to intermolecular H-bonding with H₂O molecules.
- The lower aliphatic amines are gases with fishy odour. Aniline and other aryl amines are usually colourless but get coloured on storage due to atmospheric oxidation.
- Boiling points and solubility of isomeric amines decrease with branching, i.e.

- Amines have lower boiling point than corresponding alcohols.

Chemical Properties of Amines

Amines are reactive and behave as nucleophiles due to the presence of one unshared pair of electrons.

This reaction is used to distinguish 1°, 2° and 3° amines.

Electrophilic Substitution Reaction

This is an organic reaction in which an atom that is attached to an aromatic system is replaced by an electrophile. *Some of the most important electrophile aromatic substitution, i.e. bromination, nitration, sulphonation etc, are given below :*

1. Bromination

The main problem encountered during electrophilic substitution reactions of aromatic amines is that these have very high reactivity.

2. Selective Bromination**3. Nitration** Aniline can be treated with a nitric acid to give nitrobenzene.

The overall reaction is given below :

This is due to the fact that aniline gets protonated to form anilinium ion which is *meta* directing.

However, by protecting the —NH_2 group through acetylation with acetic anhydride, the nitration can be controlled and *p*-nitro aniline is obtained as a major product.

**4. Sulphonation** Benzene can be treated with a very concentrated sulphuric acid to give sulphanilic acid in a reversible reaction. The overall reaction is given below.**Hinsberg's Test**

Distinction between primary, secondary and tertiary amines is made by $\text{C}_6\text{H}_5\text{SO}_2\text{Cl}$, which is known as Hinsberg's reagent.

$$\begin{array}{ccc}
 \text{R}-\text{N}-\text{H} + \text{C}_6\text{H}_5-\text{SO}_2-\text{Cl} & \xrightarrow{-\text{HCl}} & \text{C}_6\text{H}_5-\text{SO}_2-\text{N}-\text{R} \\
 | & & | \\
 \text{H} & & \text{H} \\
 \text{(Insoluble mass)} & & \\
 \downarrow \text{NaOH (aq)} & & \\
 \text{C}_6\text{H}_5-\text{SO}_2-\text{N}^--\text{R} & & \text{Na}^+ \\
 \text{Soluble} & &
 \end{array}$$
$$\begin{array}{c}
 \text{O} \\
 \parallel \\
 \text{R}-\text{N}-\text{H} + \text{C}_6\text{H}_5-\text{S}-\text{Cl} \xrightarrow{\quad} \text{HCl} \\
 | \\
 \text{R}
 \end{array}$$

$$\begin{array}{c}
 \text{O} \\
 \parallel \\
 \text{C}_6\text{H}_5-\text{S}-\text{N}-\text{R} \xrightarrow{\text{NaOH (aq)}} \text{Insoluble} \\
 \parallel \quad | \\
 \text{O} \quad \text{R} \\
 \text{Insoluble}
 \end{array}$$

due to the absence of H-atoms

$$\begin{array}{c} \text{H} \qquad \qquad \qquad \text{H} \quad \text{S} \\ | \qquad \qquad \qquad | \quad || \\ \text{C}_2\text{H}_5-\text{N}-\text{H} + \text{S} = \text{C} = \text{S} \longrightarrow \text{C}_2\text{H}_5-\text{N}-\text{C}-\text{SH} \\ \\ \xrightarrow{\text{HgCl}_2} \text{C}_2\text{H}_5-\text{N} = \text{C} = \text{S} + \text{HgS} + 2\text{HCl} \\ \text{Ethyl isothiocyanate} \end{array}$$

Quaternary ammonium salts of long chain aliphatic tertiary amines are used as detergents.

8.

Reactions Involving Retention of Diazo Group

Coupling reactions are the examples of electrophilic substitution reaction.

Coupling with phenols is carried out in weakly alkaline medium (pH 9 to 10) because phenate ion produced is coupled with diazonium salt more readily. Above pH 10, diazonium salt reacts with hydroxide ion to form diazotate ion which does not take part in coupling reaction.

Uses of Diazonium Salts

Diazonium salts are used for the preparation of a large number of aromatic compounds viz substitution and coupling compounds.

Nitroalkane

The nitro derivatives of alkanes are called nitroalkanes.

Isomerism

They also show chain, positional and optical isomerism.

Methods of Preparation

1. Nitration of alkane

2. Action of AgNO₂ on alkyl halide

Physical Properties

Colourless, pleasant smelling compounds with low solubility in H₂O and have very high boiling point.

Chemical Reactions

1. Action of heat

2. Halogenation

3. Reduction

4. Reaction with HNO₂

5. Condensation with carbonyl compounds

Nitrobenzene

Methods of Preparation

Physical Properties

It has bitter almond odour and is also known as oil of mirbane.

Chemical Properties

Substitution Reactions

(a) Nucleophilic substitution (*o* and *p* - direction)(b) Electrophilic substitution (*m* - direction)

Test for Nitrobenzene

(Mulliken and Barker's Method)

Uses of Nitrobenzene

It is mainly used in

1. Manufacture of aniline.
2. As solvent in Friedel-Crafts reaction.
3. As an oxidant in the synthesis of quinoline.

Practice Exercise

1. Gabriel phthalimide synthesis can be used for the preparation of amine from

a. $\text{CH}_3\text{CH}_2\text{Br}$ b. $(\text{CH}_3)_3\text{CBr}$
c. $p\text{-CH}_3\text{OC}_6\text{H}_4\text{Br}$ d. $p\text{-CH}_3\text{C}_6\text{H}_4\text{Br}$

2. Hofmann's bromamide degradation reaction is shown by

a. ArNH_2
b. ArCONH_2
c. ArNO_2
d. ArCH_2NH_2

3. The positive carbylamine test is shown by

a. $p\text{-methylbenzylamine}$
b. $N,N\text{-dimethylaniline}$
c. $2,4\text{-dimethylaniline}$
d. $N\text{-methyl-}o\text{-methyl aniline}$

4. What are the constituent amines formed when the mixture of I and II undergoes Hofmann's bromamide degradation?

- a.  , 
 , 
b.  , 
c.  , 
d.  , 

5. The primary, secondary and tertiary amines can be best distinguished by

a. mustard oil reaction
b. carbylamine reaction
c. exhaustive alkylation
d. HNO_2 treatment

Product of this reaction is

7. Which of the following compounds does not liberate nitrogen with HNO_2 ?

a. Carbamide b. Primary amine
c. Secondary amine d. Alkanamide

8. The compound that is most reactive towards electrophilic nitration is

a. toluene b. benzene
c. benzoic acid d. nitrobenzene

9. Towards electrophilic substitution, the most reactive species will be

10. When aniline is treated with fuming sulphuric acid at 475 K, it gives

a. sulphanilic acid
b. aniline sulphate
c. $o\text{-aminobenzene sulphonc acid}$
d. $m\text{-aminobenzene sulphonc acid}$

11. The correct increasing order of basic strength for the following compounds is [NCERT Exemplar]

a. $\text{II} < \text{III} < \text{I}$ b. $\text{III} < \text{I} < \text{II}$
c. $\text{III} < \text{II} < \text{I}$ d. $\text{II} < \text{I} < \text{III}$

12. Amino group, —NH_2 is *ortho*, *para*-directing group in case of aromatic electrophilic substitution but nitration of aniline produce a good amount of *m*-nitroaniline. This is because

a. —NH_2 gets converted into $\text{—NH}^+\text{NO}_2^-$ which is *m*-directing
 b. NH_2 gets converted into NH_3^+ which is *m*-directing
 c. —NH_2 gets converted into $\text{—NH}^+\text{SO}_4^-$ which is *m*-directing
 d. *ortho*, *para* activity of —NH_2 group is completely destroyed during nitration

13. Reduction of aromatic nitro compounds using Fe and HCl gives

a. aromatic oxime
 b. aromatic hydrocarbon
 c. aromatic primary amine
 d. aromatic amide

14. The relative order of basic character of the following compounds is

a. $\text{II} > \text{I} > \text{III} > \text{IV} > \text{V}$ b. $\text{II} > \text{III} > \text{IV} > \text{V} > \text{I}$
 c. $\text{II} > \text{V} > \text{IV} > \text{I} > \text{III}$ d. $\text{II} > \text{IV} > \text{V} > \text{III} > \text{I}$

15. Which of the following amine does not react with Hinsberg reagent?

a. Neopentyl amine b. Isopropyl amine
 c. Triethyl amine d. Ethyl methyl amine

16. When a primary amine reacts with chloroform in ethanolic KOH, the product is

a. an isocyanide b. an aldehyde
 c. a cyanide d. an alcohol

17. Tertiary nitro compounds do not tautomerise because

a. there is no double bond
 b. there is no α -hydrogen
 c. oxygen is more electronegative than H
 d. All of the above

18. When *p*-toluidine reacts with sodium nitrite and hydrochloric acid at 273 K, a crystalline precipitate is formed, which is boiled with water. The resulting compound obtained is

a. *p*-cresol b. *p*-nitro toluene
 c. phenol d. toluic acid

19. The reagent used to distinguish *p*-methylaniline from N-methylaniline is

a. benzenesulphonyl chloride
 b. iodoform in alc. KOH
 c. AgCl
 d. AgNO_3

20. The best reagent for converting 2-phenylpropanamide into 2-phenylpropanamine is

a. excess H_2
 b. Br_2 in (aq) NaOH
 c. iodine in the presence of phosphorus
 d. LiAlH_4 in ether

21. Consider the following reaction sequence. The final product of this reaction sequence is

22. Consider the following series of reactions

The compound Y is

23. Compound A (C_3H_9N) reacts with benzene sulphonyl chloride to form a solid insoluble in alkali. The structure of compound A is

- a. $CH_3-N(CH_3)-CH_3$
 b. $CH_3-CH_2-NH-CH_3$
 c. $CH_3-CH_2-CH_2-NH_2$
 d. All of the above

24. Aniline yields a coloured product Y through the following series of reactions:

The structure of Y is

- a. 
 b. 
 c. 
 d. 

25. Consider the following statements:

Phenyl diazonium salts form azo dye with

- I. aniline
 II. phenol
 III. N,N-dimethyl aniline
 IV. anisole (methoxybenzene)

The correct statements is

- a. II, III and IV are correct b. I, III and IV are correct
 c. I, II and IV are correct d. I, II and III are correct

26. Benzylamine may be alkylated as shown in the following equation

Which of the following alkyl halides is best suited for this reaction through S_N1 mechanism?

- a. CH_3Br
 b. C_6H_5Br
 c. $C_6H_5CH_2Br$
 d. C_2H_5Br

27. Consider the following reaction :

The above reaction is called

- a. carbylamine reaction
 b. Gattermann synthesis
 c. Sandmeyer's reaction
 d. Balz-Schiemann reaction

28. Identify the final product (Z) in the following sequence of reactions

- a. $C_6H_5CH_2NH_2$
 b. $C_6H_5CH_2CH_2NH_2$
 c. $C_6H_5CH_2CH_2NH_2$
 d. $C_6H_5-CH(CH_3)-NH_2$

29. Hydrolysis of phenyl isocyanide forms

- a. benzoic acid
 b. formic acid
 c. acetanilide
 d. acetic acid

30. Which of the following on reaction with nitrous acid followed by treatment with NaOH produces a blood red colouration?

- a. RCH_2NO_2 b. R_3CNO_2
 c. R_2CHNO_2 d. $PhNO_2$

- a. 
 b. 
 c. 
 d. 

BITSAT Archives

1. Arrange the following in correct order of basicity [2014]

- a. I > II > III
b. III > II > I
c. II > I > III
d. I > III > II

[2014]

The true statement about the product is

- a. it does not exist as Zwitter ion
b. it does not act as inner salt
c. $-\text{SO}_3$ diminishes the basic character of $-\text{NH}_2$
d. $-\text{NH}_2$ displays a powerful basic character

3. Identify C in the following reaction: [2012]

- a. benzamide
b. benzoic acid
c. chlorobenzene
d. aniline

4. The structure of the compound formed, when nitrobenzene is reduced by lithium aluminium hydride (LiAlH_4) is [2008]

5. The IUPAC name of the compound, [2007]

- a. 2-amino-3-hydroxy propanoic acid
b. 1-hydroxy-2-aminopropan-3-oic acid
c. 1-amino-2-hydroxypropanoic acid
d. 3-hydroxy-2-amino propanoic acid

- 6.

[2007]

7. Aniline reacts with conc. HNO_3 to give [2007]

Answer with Solutions

Practice Exercise

- (a) By the use of Gabriel phthalimide synthesis, 1° alkyl halides can be converted into corresponding 1° amines.
- (b) Hofmann's bromamide degradation reaction is shown by amides, i.e. ArCONH_2 .
- (a) Carbylamine test is given by only primary amines. Therefore, *p*-methylbenzylamine gives response to carbylamine test.

- (d) Primary, secondary and tertiary amines on reaction with HNO_2 produces different products.

- (a) Toluene has electron donating methyl group and hence, reacts fastest.

- (b) $+I$ -effect groups increase electron density on *o* and *p*-positions in benzene ring, hence they favour the electrophilic substitution.

- (a) This is the reason why aniline is most reactive among given compounds.

- (d) Electron releasing ($+I$ -effect) groups increase the basicity of amines while electron attracting ($-I$ -effect) groups decrease the basicity of amines.

Hence, the order is $\text{II} < \text{I} < \text{III}$

- (b) Protonation of $-\text{NH}_2$ leads to the formation of NH_3^+ which is *m*-directing group.

- (c)

- (c) Triethyl amine is tertiary amine. It does not react with Hinsberg reagent.

- (b) Tertiary nitro compounds do not tautomerise, since there is no α -hydrogen.

- (a)

- (a) *p*-methylaniline is a primary amine while *N*-methylaniline is a secondary amine. Primary amines can be distinguished from secondary amines by benzenesulphonyl chloride.

25. (d) $\text{Ph-N}^+\equiv\text{N}$ is a weak electrophile that undergoes diazocoupling only with rings activated by $-\text{OH}$, $-\text{NH}_2$, $-\text{NHR}$ or $-\text{NR}_2$. The ring is not sufficiently activated by $-\text{OCH}_3$ and hence, anisole does not form azodye.

26. (c) The species $\text{C}_6\text{H}_5\text{CH}_2^+$ on ionisation produces, $\text{C}_6\text{H}_5\text{CH}_2$ (benzyl carbocation), therefore, $\text{C}_6\text{H}_5\text{CH}_2\text{Br}$ is best suited for $\text{S}_{\text{N}}1$ reaction.

The above reaction is called Gattermann reaction.

NOTE Isocyanides are hydrolysed only by acids, and not by alkalis. It is because negative charge present on the carbon atom in isocyanides initially attracts electrophile. (i.e. H^+)

Nitrolic acid dissolve in NaOH to give blood red colouration.

BITSAT Archives

1. (c) Hybridisation of N-atom in the compounds given below are sp^2 , sp^3 and sp^2 respectively.

Greater the s -character, more will be electronegativity of N-atom and lesser will be its basicity on this basis, I is less basic than II.

Conjugation If lone pairs of electrons of N are involved in conjugation causes decrease in basicity of compound due to lesser availability of lone pair for donation to show basic nature.

Lone pair involved in formation of aromatic sextet of 6π -electron (least basic).

Sulphanilic acid exists as a dipolar ion which has acidic, as well as basic groups in the same molecules. Such ions are called Zwitter ions or inner salts.

31. (a)

3. (d)

4. (c) Nitrobenzene on reduction with lithium aluminium hydride ($LiAlH_4$) gives azobenzene.

2-amino-3-hydroxy propanoic acid

6. (b) $-NH-$ is stronger electron releasing group than $-CH_3$ group, therefore bromination will take place at p -position with respect to $-NH-$ group.

29

Polymers, Biomolecules and Chemistry in Action

Polymers

These are defined as very large molecules having high molecular mass ($10^3 - 10^7$ u). These are formed by joining of repeating structural units, called **monomers**, on a large scale. The monomers units are linked to each other by covalent bonds. The process of formation of polymer from respective monomers is called **polymerisation**.

where, $n = 1000$

Classification

Based on Structure

- (i) **Linear polymer** Long straight chain, joining of monomers. They have high melting point, density and tensile strength, e.g. polythene $\text{-(CH}_2\text{—CH}_2\text{)}_n$.
- (ii) **Branched chain polymer** Made up of a main chain and its branches. They have low melting point, density and tensile strength, e.g. low density polythene, PMMA, neoprene etc.
- (iii) **Cross-linked polymer** Joining of linear chains to form a 3-D network. They are hard and brittle in nature, e.g. bakelite.

Based on Synthesis

- (i) **Addition polymers** In this case during linking of monomers, there is no elimination of smaller molecules. Polymerisation takes place usually in the presence of peroxide and follows free radical mechanism.

Molecular weight of polymer = $n \times$ Molecular weight of monomers

e.g. Formation of PVC (polyvinyl chloride)

- (ii) **Condensation polymers** This is a step-growth polymerisation in which polymer is formed by linking of monomer units along with elimination of smaller molecules, such as H_2O , NH_3 , HCl etc.

Based on Source

- (i) **Natural polymers** These are obtained from animals and plants, e.g. starch, protein, natural rubber, nucleic acid, cellulose etc.
- (ii) **Synthetic polymers** Man-made, synthesised in lab, from low weight compounds, e.g. synthetic rubber, nylon, bakelite etc.

Based on Interparticle forces

- (i) **Elastomers** Weakest intermolecular forces. These have elastic character and can be stretched with retainment of structure, e.g. natural rubber.
- (ii) **Fibres** Quite strong interparticle forces such as H-bonds, e.g. nylon, dacron.
- (iii) **Thermoplastics** Polymers which can easily be moulded by heating and subsequent cooling. Intermolecular forces are intermediate to those of elastomers and fibres, e.g. polythene and polystyrene.
- (iv) **Thermosetting polymers** These become hard and infusible on heating due to excessive cross-linking. e.g. bakelite, malamine.

General Methods of Polymerisation

These are the following methods through which monomers combine to give polymers :

Addition Polymerisation

It is the process in which molecules of same or different monomers combine together to give a polymer without the elimination of small molecules. Since, there is an increase in the length of chain (i.e. chain grows) by this mode of polymerisation, it is also known as **chain growth polymerisation**. This mode of polymerisation is observed in molecules having multiple bonds, mainly in $\text{CH}_2=\text{CHy}$ type molecules (where, y may be $-\text{H}$, $-\text{X}$, $-\text{CO}_2\text{R}$, $-\text{CN}$ etc)

The addition or chain growth polymerisation can proceed by the following two mechanisms (i) By the formation of free radicals, i.e. free radical polymerisation and (ii) By the formation of ionic species, i.e. ionic polymerisation.

Condensation Polymerisation

In this mode of polymerisation, there is combination of molecules of same or different monomers in a controlled stepwise manner with the elimination of small molecules such as water, ammonia, alcohol etc., as by-product. These monomers have functional groups such as alcohol, amine or carboxylic acid groups, instead of double bonds. Since, there is a repetitive condensation reaction between bifunctional monomers, the process is also known as step growth polymerisation.

Copolymerisation

When two or more different monomer units are allowed to polymerise, a copolymer is formed which contains multiple units of each monomer, used in the same polymeric chain. The process by which copolymers are formed, is referred to as copolymerisation.

Molecular Weight of Polymers

(a) Number average molecular weight ($\overline{M}_n$)

$$\overline{M}_n = \frac{\text{Total weight of molecules}}{\text{Total number of molecules}} = \frac{n_1M_1 + n_2M_2 + \dots}{n_1 + n_2 + \dots}$$

$$\therefore \overline{M}_n = \frac{\sum M_i n_i}{\sum N_i}$$

(b) Weight average molecular weight ($\overline{M}_w$)

$$\overline{M}_w = \frac{w_1M_1 + w_2M_2 + \dots}{w_1 + w_2 + \dots}$$

$$\therefore \overline{M}_w > \overline{M}_n$$

Homo and Copolymers

Homopolymers are formed from the same monomers.

e.g. Polythene, PVC etc.

Copolymers are formed from more than one type of monomers.

Atactic, Syndiotactic and Isotactic Polymers

When substituents are arranged in a random fashion, it is called an atactic polymer, e.g. polypropylene. When substituents are arranged in a regular fashion, it is called syndiotactic polymer, e.g. polystyrene. Isotactic polymers are those in which all substituents are on the same side of the chain, e.g. PVC

Some Important Polymers

1. Natural rubber

It is a natural polymer obtained from rubber latex (contains 35% rubber). It is a colloidal dispersion of rubber in water and is obtained from rubber trees (*Hevea brasiliensis*).

It is a polymer of isoprene (2-methyl-1,3-butadiene) and is also known as **cis-1, 4-polyisoprene**.

NOTE The average molecular weight ($\bar{M}_w$) of rubber is in the range 1,30,000 - 3,40,000. Its *trans*-form is known as gutta percha.

Natural rubber $\longrightarrow$ *cis*-polyisoprene

Gutta percha $\longrightarrow$ *trans*-polyisoprene.

2. Neoprene (Synthetic rubber)

Uses In household and mechanical rubber articles.

3. Buna-S

Uses In rubber soles, water proof shoes, tyres, etc.

4. Nylon-66

Uses In carpets, textile fibres, brushes, hosiery, etc.

5. Terylene (Dacron)

Properties and Uses

Terylene is highly resistant to the action of chemical and biological agents. Its fibres are quite strong and durable. It can also be blended with wool or cotton to obtain fabrics of desired composition. Terylene is used in the manufacturing of a variety of clothes such as terycot, terywool and terysilk as a result of blending with other yarns. It is also used for preparing magnetic recording tapes, conveyor belts, aprons for industrial workers etc.

6. Bakelite

Uses In electrical switches, fuse holders etc.

7. Nylon-6 or Perlon

It is obtained by heating caprolactum with water at a high temperature.

8. Glyptal

Uses In paints and lacquers.

9. Melamine (Formaldehyde resin)

Vulcanisation of Rubber

Natural rubber becomes soft at high temperature (>335 K) and brittle at low temperature (<283 K). It has high water absorbing capacity. It is easily attacked by oxidising agents and soluble in non-polar solvents. To improve these properties, vulcanisation of rubber is carried out.

The process involves the heating of raw rubber with sulphur and appropriate additive at a temperature 373 – 415 K.

Sulphur forms cross links at reactive sites of double bonds and makes the rubber stiffened. Rubber made with 1-3% sulphur is soft and stretchy and rubber made with 3-10% S, is more rigid (used in making tyre).

Biomolecules

Biomolecules are the complex organic compounds which form the basis of life for growth and maintenance of living organism. e.g. carbohydrates, proteins, vitamin, hormones, etc.

The branch of science which deals with the study of biomolecules and their role in living systems is called biochemistry.

Carbohydrates

These are polyhydric aldehydes and ketones which can be represented by general formula $\text{C}_x(\text{H}_2\text{O})_y$ [where $x, y > 4$].

Classification

Monosaccharides

A carbohydrate that cannot be hydrolysed further to give simpler units is called monosaccharide, e.g. glucose, fructose, galactose are hexose while ribose and arabinose are pentose. All monosaccharides are reducing sugars, commonly known as **glucose**.

Preparation of Glucose

Properties of Glucose

(i) Glucose is an aldohexose and is also known as **dextrose** (Grape sugar).

NOTE Glycolysis is the anaerobic degradation of glucose into two molecules of pyruvic acid.

Structure of Glucose

(i) Fisher Projections

(ii) Haworth Structures

- α and β -D-glucose have different configuration at anomeric (C-1) carbon atom, hence are called **anomers**.
- While the pair of diastereomeric aldoses, e.g. glucose and mannose that differ only in configuration about C-2 are called **epimers**. Glucose and galactose differ in configuration at C4 and are called C4 - epimers.

Structure of Fructose (Laevulose; Fruit Sugar)

It is a functional isomer of glucose and has ketone group.

**2. Oligosaccharides**

These are the carbohydrates that yield two to ten monosaccharides units on hydrolysis.

e.g. Disaccharides: sucrose, maltose, lactose etc.

Trisaccharides : raffinose; tetrasaccharides : stachyrose.

- Except sucrose, all other disaccharides are reducing in nature and hence, are called **reducing sugars**.

**(a) Sucrose**

It is a non-reducing due to absence of free aldehyde or ketone group. It is cane sugar or table sugar.

- Sucrose is also known as **invert sugar**. It is due to the fact that on hydrolysis (+) sucrose gets inverted to give a mixture of D-(+) -glucose and D-(-) -fructose.
- In sucrose, free aldehyde or ketone group is absent. It is shown by the facts that it does not form osazone, does not exist in anomeric forms and also does not show mutarotation.

Structure of Sucrose**Maltose (C₁₂H₂₂O₁₁)**

It is obtained by partial hydrolysis of starch by diastase enzyme present in malt, i.e. sprouted barley seeds (hence named as **maltose** or **malt sugar**).

- It is a white crystalline solid (with m.p. 160-165°C), soluble in water and dextrorotatory. When it is hydrolysed with dilute acid or by enzyme maltase, maltose yields two molecules of D-(+)-glucose. Hence, maltose is a condensation product of two α -D-glucose units.

- It is a reducing sugar. It reduces Fehling's solution, Tollen's reagent, it forms an oxime and an osazone and undergoes mutarotation. This indicates that at least one aldehyde group is free in maltose.

Lactose (C₁₂H₂₂O₁₁)

It occurs in the milk of all animals (milk-sugar). It is a white crystalline solid (with m.p. 203°C), soluble in water and is dextrorotatory.

It is hydrolysed by dilute acid or enzyme lactase, to an equimolar mixture of D-(+)-glucose and D-(+)-galactose. It is a reducing sugar, forms an oxime and osazone and also undergoes mutarotation.

It gets hydrolysed by emulsion also, an enzyme which specifically hydrolyses β -glycosidic linkage.

Polysaccharides

Carbohydrates which yield a large number of monosaccharides units on hydrolysis, are called polysaccharides, e.g. starch, cellulose, glycogen, gums arabic etc. Polysaccharides are not sweet in taste, hence they are also called **non-sugars**.

Moreover, all polysaccharides are non-reducing due to the absence of free —CHO or >CO group.

Starch is the main storage polysaccharides of plants. It is a polymer of α -D-glucose units and consists of two components—amylose and amylopectin.

Cellulose is a predominant constituent of cell wall of plant cells. It is a straight chain polysaccharide composed only of β -D-glucose units which are joined together by β -1,4-glycosidic linkage, i.e. the β -glycosidic linkages between C-1 of one glucose and C-4 of the next glucose unit.

Glycogen is the carbohydrate (a condensation polymer of α -D-glucose) which is stored in animal body. When the body needs glucose, enzymes break the glycogen down to glucose.

- Wood contains 50% cellulose, rest being lignin and resins. In cotton, cellulose is 90%, the rest being fats and waxes. Cellulose is not digestible by humans due to the absence of enzyme cellulase in digestive system.
- Starch and cellulose are homopolysaccharides while gums and pectins are heteropolysaccharides. Starch consists of two compounds : amylose (20%) and amylopectin (80%).
- Gums arabic are acidic polysaccharides.

Proteins

These are the polymers of amino acids (the compounds which have both the acid and amino group). The total number of amino acids that have been found in proteins are twenty.

On the basis of their synthesis, amino acids are divided into two classes

1. **Essential amino acids** are the amino acids which cannot be synthesised in the body and must be obtained through diet, e.g. valine, leucine, lysine, isoleucine, arginine etc.

2. **Non-essential amino acids** are the amino acids which can be synthesised in the body, e.g. glycine, alanine, glutamic acid, aspartic acid etc. Amino acids behave like salts rather than simple amines or carboxylic acids. This is due to the presence of both acidic and basic groups in the same molecule.

At a certain pH of the medium, called the **isoelectric point** of an amino acid, the structure behaves as a dipolar ion and does not migrate to any electrode on passing current.

Proteins give biuret test, Millon's test, Ninhydrin test. Those proteins give Mollisch's test, which contain a carbohydrate group. Carbohydrates also give Mollisch's test.

Classification of Proteins

Proteins can be classified into two types on the basis of their molecular shape :

- (i) **Fibrous proteins** Polypeptide chains form fibre like structure, e.g. keratin and myosin etc.
- (ii) **Globular proteins** This structure results when the chains of polypeptides coil around to give a spherical shape. These are usually soluble in water, e.g. insulin and albumins.

Structure of Proteins

N-terminal of one amino acid combines with C-terminal of other amino acid and forms peptide bond (—NHCO—).

In the same way, many amino acids combine to each other and form polypeptide bonds. Polypeptides with fewer amino acids are likely to be called proteins.

Structure and shape of proteins may be discussed at four different levels:

1. Primary Structure

Proteins may have one or more polypeptide chains. Specific sequence of amino acids in a chain gives the primary structure of that protein. Any change in this structure gives a different protein.

2. Secondary Structure

The polypeptide chains are linked by hydrogen bonds. They are found to exist in two different types of structures viz α -helix and β -pleated sheet structure.

3. Tertiary Structure

It has polypeptide bonds, hydrogen bonds, disulphide linkages, van der Waals' forces and electrostatic forces of attraction. It gives rise to two major molecular shapes *viz* fibrous and globular.

4. Quaternary Structure

Some of the proteins are composed of two or more polypeptide chains referred to as subunits. The spatial arrangement of these subunits with respect to each other is known as quaternary structure.

Denaturation of Proteins

Disturbance of hydrogen bonds either by acids or alcohols or heat, results in unfolding of globules. Thus, helix get uncoiled and protein loses its biological activity due to the change in temperature or pH. This is called denaturation of proteins. During denaturation, secondary and tertiary structures of proteins are destroyed while primary structures remain intact.

Enzymes

Enzymes are globular protein bodies, which are biological catalysts. Enzyme inhibitors reduce the activity of a particular enzyme. These are mostly inorganic ions or complex organic molecules.

NOTE Congenital and albinism diseases are caused by the deficiency of the enzymes, phenyl ketone urea and tryosinase respectively.

Vitamins

Organic compounds required in the diet in the small amounts to perform specific biological functions for normal maintenance of optimum growth and health of the organism, are termed as vitamins.

Types of Vitamins

- Fat or oil soluble vitamins, e.g. A, D, E and K.
- Water soluble vitamins, e.g. B group vitamins and vitamin C.

Some Important Vitamins, their Sources and their Deficiency Diseases

Name of Vitamin	Sources	Deficiency Diseases
Vitamin-A (Retinol)	Fish liver oil, carrots, butter and milk	Xerophthalmia (hardening of cornea of eye) night blindness,
Vitamin-B ₁ (Thiamine)	Yeast, milk, green vegetables	Beri-beri (loss of appetite)
Vitamin-B ₂ (Riboflavin)	Milk, egg white, liver, kidney	Cheilosis (fissuring at corners of mouth and lips)
Vitamin-B ₆ (Pyridoxine)	Yeast, milk, egg yolk, cereals	Convulsions, nervousness
Vitamin-B ₁₂ (Cyanocobalamin)	Meat, fish, egg and curd	Pernicious anaemia (RBC deficient in haemoglobin)
Vitamin-C (Ascorbic acid)	Citrus fruit, amla and green leafy vegetables	Scurvy (bleeding gums)
Vitamin-D	Exposure to sunlight, fish and egg yolk	Rickets and osteomalacia
Vitamin-E	Wheat, germ oil, sunflower oil	Increased fragility of RBC and muscular weakness
Vitamin-K	Green leafy vegetables	Increased blood clotting time.

Nucleic Acids

These are the biological polymers. They function as the chemical carriers of cell's genetic information.

DNA (Deoxyribose Nucleic Acid)

- It is the polymer of nucleotide.
- It is a genetic material.
- It has double helical structure.
- **Nucleotide** has deoxyribose sugar, phosphate and nitrogenous base.

- **Nucleoside** has deoxyribose sugar and nitrogenous base. A unit formed by the attachment of a base to 1' position of sugar is known as **nucleoside**.
- In nucleosides, the sugar carbons are numbered as 1', 2', 3' etc., in order to distinguish these from the bases. When nucleoside is linked to phosphoric acid at 5'-position of sugar moiety, we get a nucleotide.
- Nucleotides are joined together by phosphodiester linkage between 5' and 3' carbon.

- DNA has A = T, C ≡ G

RNA (Ribose Nucleic Acid)

- It is also a polymer of nucleotide units but in it, the nucleotide unit contains ribose sugar instead of deoxyribose sugar.
- RNA has uracil (U) instead of thymine (T).
- RNA molecules are of three types. These are messenger RNA (*mRNA*), ribosomal RNA (*rRNA*) and transfer RNA (*tRNA*). They perform different functions.

Biological Functions of Nucleic Acids

- DNA has an ability of self duplication during cell division and identical DNA strand are transferred to daughter cell. In this way, DNA is responsible for maintaining the identity of different species of organisms over million of years.
- RNA molecules synthesised various types of proteins in the cell but the message for the synthesis of a particular type of protein is present in DNA.

Chemicals in Medicines

Drugs are chemicals of low molecular masses, which interact with macromolecular targets (carbohydrates, proteins and nucleic acids) to produce a biological response. When the biological response is therapeutic and useful, these chemicals are called medicines.

Different Classes of Drugs

Some important classes of drugs are given below:

Antacids

Treatment for acidity was administration of antacids. Antacids raise the pH of stomach to some appropriate level. Sodium hydrogen carbonate, a mixture of aluminium and magnesium hydroxide etc., are the commonly used antacids.

Antihistamines

Antihistamines or antiallergic drugs are used as treatment for allergies. Some synthetic drugs, brompheniramine (dimetapp) and terfenadine (seldane), also act as antihistamines. Histamine also stimulate the secretion of gastric juice (in stomach) but antihistamines do not affect this secretion because antiallergic and antacid drugs work on different receptors.

Neurologically Active Drugs

- Tranquiliser** It is a class of chemical compounds used for the treatment of stress, mild and severe mental diseases. These are commonly called **psychotherapeutic** drugs. These are the essential component of sleeping pills.

Some examples according to the action of drugs are

- Antidepressant drugs, e.g. iproniazid, phenelzine etc., are used to reduce depression.

- Chlorodiazepoxide and meprobamate, are relatively mild tranquilisers, suitable for relieving tension. Equanil is used in controlling depression and hypertension.

- Barbiturates such as seconal, luminal, veronal are hypnotic (sleep producing) drugs while valium and serotonin, are non-hypnotic drugs.

- Analgesics** These reduce or abolish pain.

These are classified as follows:

- Non-narcotic (non-addictive) analgesics, e.g. aspirin and paracetamol are analgesics as well as antipyretics (fever reducing).

NOTE Aspirin (acetyl salicylic acid) and paracetamol (N-acetyl-p-amino phenol) are non-narcotic (non-addictive) analgesics. Aspirin inhibits the synthesis of chemicals, known as prostaglandins which stimulate inflammation in the tissue and cause pain. Because of its anti blood clotting action, aspirin is also used in the prevention of heart attacks.

- Narcotic analgesics, e.g. morphine, heroin (morphine diacetate), codeine etc.

Antimicrobials

- Antibiotics** These are the chemicals synthesised from microbes and have either cidal (killing) effect or a static (inhibitory) effect on microbes.

A few examples of the two types of antibiotics are as follows:

- Bactericidal, e.g. penicillin (a narrow spectrum antibiotic), ampicillin and amoxicillin (semisynthetic modification of penicillin), ofloxacin (broad spectrum), aminoglycosides (streptomycin) (broad spectrum) etc.

- Bacteriostatic, e.g. erythromycin, tetracycline, chloramphenicol (a broad spectrum antibiotic) etc.

- Antiseptics** These are applied to the living tissues such as wounds, cuts, ulcers and diseased skin surfaces, e.g. furacine, soframycin, dettol (a mixture of chloroxylenol and α -terpinol), 0.2 per cent solution of phenol. Bithionol (also called bithional) is added to soaps, iodine, iodoform etc.

- Disinfectants** These are applied to inanimate objects such as floors, drainage system, e.g. one per cent solution of phenol, chlorine and SO_2 (in very low concentrations), are disinfectants.

Antifertility Drugs

These have lead to the concept of family planning. Birth control pills essentially contain a mixture of synthetic estrogen and progesterone derivatives.

e.g. Norethindrone (synthetic progesterone) and the estrogen derivative in combination with progesterone derivative, (ethinylestradiol) (novestrol) etc.

Chemicals in Food

Substances which are added to food either to improve its taste and flavour or to preserve it, are called **food additives**.

Main categories of food additives are as follows:

Artificial Sweetening Agents

Some examples of artificial sweetening agents are saccharin (*ortho*-sulphobenzimide), aspartame (nutra sweet), sucralose, alitame etc.

Alitame is high potency sweetener, although it is more stable than aspartame. Sucralose is trichloro derivative of sucrose. Its appearance and taste are sugar like.

It is stable at cooking temperature. Hence, its use is of great value to diabetic persons who need to control in take of calories.

Food Preservatives

Food preservatives prevent spoilage of food due to microbial growth, e.g. sodium benzoate, salts of sorbic acid and propanoic acid etc.

Cleansing Agents

These are also known as surfactants or surface active agents. In fact, those chemicals which concentrate at the surface of the solution or interfaces or surface films, reduce surface tension of the solution and help in removing dirt and dust by emulsifying grease are known as **surfactants**. Soaps and detergents belong to this class.

Soaps

These are the sodium or potassium salts of higher fatty acids and are prepared by alkaline hydrolysis of fats or oils. Fats or oils are esters of higher fatty acids.

The reaction is known as **saponification**.

Cleansing Action of Soap

On applying soap to a dirty wet cloth, the hydrocarbon part (non-polar part) of soap dissolves in grease or dust while the polar carboxylate part is directed towards water.

Thus, an emulsion is formed between grease particles and water molecules, which appears in the form of foam.

On washing the cloth with excessive water, these dirt or dust or grease particles are washed away from the surface of cloth along with soap and the cloth becomes clean.

- **Advantages** Soaps are biodegradable cleansing agents, therefore they do not cause pollution.
- **Disadvantages** Soaps do not work in hard water because hard water contains calcium and magnesium ions.
- These ions form insoluble calcium and magnesium soaps respectively.

Synthetic detergents

Alkyl benzene sulphonates are the synthetic detergents. These are also called **syndets**.

The detergents are classified into following three types on the basis of ionic charge present at the soluble end of their chain:

Anionic detergents

e.g. Sodium dobecyl benzene sulphonate

Anionic detergents are also used in toothpaste.

Cationic detergents

These are used in hair conditioners and are expensive, therefore these are of limited use.

Non-ionic detergents

e.g. $\text{CH}_3(\text{CH}_2)_{16}\text{COO}(\text{CH}_2\text{CH}_2\text{O})_n\text{CH}_2\text{CH}_2\text{OH}$

They are used in liquid dishwashing detergents.

Advantages Detergents can be used both in soft and hard water as they give foam even in hard water.

Disadvantages In detergents, hydrocarbon chain is highly branched, so bacteria cannot degrade this easily. In other words, we can say that these are non-biodegradable.

Practice Exercise

- Polymers are also referred to as
 - micromolecules
 - small molecules
 - macromolecules
 - huge molecules
- On the basis of structure of polymers, they can be classified as
 - linear, branched and network polymers
 - natural, synthetic and network polymers
 - natural, synthetic and semi synthetic polymers
 - natural, synthetic and linear polymers
- The correct classification of polymers based on molecular forces is
 - elastomers, fibres and thermosetting polymers
 - elastomers, fibres, thermoplastic and thermosetting polymers
 - homopolymers and copolymers
 - None of the above
- Repeating unit of polystyrene is
 - $\text{—CH}_2\text{—CH—}$
|
Cl
 - $\text{—CH}_2\text{—CH—}$
|
C₆H₅
 - $\text{—CH}_2\text{—CH—}$
|
CN
 - $\text{—CF}_2\text{—CF}_2\text{—}$
- Consider the following polymers,
A = Nylon-66, B = Buna-S, C = Polyethene
Arrange these in the increasing order of their intermolecular forces (lower to higher).
 - $A < B < C$
 - $B < C < A$
 - $B < A < C$
 - $C < A < B$
- Synthetic polymer prepared by using caprolactam is known as
 - terylene
 - teflon
 - nylon-6
 - neoprene
- Relation between number of average molecular mass ($\overline{M}_n$) and weight of average molecular mass ($\overline{M}_w$) of synthetic polymers is
 - $\overline{M}_n < \overline{M}_w$
 - $\overline{M}_n > \overline{M}_w$
 - $\overline{M}_n = \overline{M}_w$
 - $\overline{M}_n > \overline{M}_w$
- Bakelite is obtained from phenol by reacting it with
 - acetaldehyde
 - acetal
 - formaldehyde
 - chlorobenzene
- The structural formula of monomer of poly methyl methacrylate (PMMA) is
 - $\text{CH}_2 = \text{CHCOOCH}_3$
 - $\text{CH}_2 = \text{C}(\text{CH}_3)\text{—COOCH}_3$
 - $\text{CH}_3\text{COOCH}=\text{CH}_2$
 - $\text{CH}_3\text{COOC}(\text{CH}_3)=\text{CH}_2$
- The element present in teflon is
 - fluorine
 - chlorine
 - nitrogen
 - oxygen
- Glyptal is classified as a
 - polyolefin
 - polyester
 - polyamide
 - polyether
- Bakelite is made from phenol and formaldehyde. The initial reaction between them is the example of
 - electrophilic aromatic addition
 - nucleophilic aromatic substitution
 - free radical reaction
 - aldol reaction
- Artificial silk is a
 - polypeptide
 - polysaccharide
 - polythene
 - polyvinyl chloride
- Which one of the following pairs is not correctly matched?
 - Terylene** Condensation polymer of terephthalic acid and ethylene glycol
 - Perspex** A homopolymer of methyl methacrylate
 - Teflon** Thermally stable cross - linked polymer of phenol and formaldehyde
 - Synthetic rubber** A co-polymer of butadiene and styrene
- Identify the following polymer :
 
 - Gutta percha
 - Neoprene
 - Polypropylene
 - Natural rubber
- Orlon is a polymer of
 - styrene
 - tetrafluoro ethylene
 - vinyl chloride
 - acrylonitrile
- Melamine formaldehyde resin is
 - an addition polymer
 - a copolymer
 - a fibre type polymer
 - dimer of melamine and formaldehyde
- Which one of the following compounds is different from the rest?
 - Sucrose
 - Maltose
 - Lactose
 - Glucose
- A carbohydrate which cannot be hydrolysed to simpler compounds, is called
 - monosaccharide
 - disaccharide
 - trisaccharide
 - polysaccharide

- a.** 1–10 **b.** 2–10
c. 4–10 **d.** 5–10

- a.**
- $$\begin{array}{c} \text{CHO} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{CH}_2\text{OH} \end{array}$$
- b.**
- $$\begin{array}{c} \text{CHO} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{CH}_2\text{OH} \end{array}$$
- c.**
- $$\begin{array}{c} \text{CHO} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{CH}_2\text{OH} \end{array}$$
- d.**
- $$\begin{array}{c} \text{CHO} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{HO} - \text{C} - \text{H} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{CH}_2\text{OH} \end{array}$$

- a.** primary structure of proteins
- b.** secondary structure of proteins
- c.** tertiary structure of proteins
- d.** quaternary structure of proteins

- a.** Glucose and fructose **b.** Glucose and galactose
c. Glucose and arabinose **d.** Lactose and maltose

- a.** nucleotide **b.** nucleoside
c. purine base **d.** pyrimidine base

- a.** DNA only **b.** RNA only
c. Both DNA and RNA **d.** protein

- a.** proteins into α -amino acids
- b.** starch into sugar
- c.** glucose into glycogen
- d.** α -amino acids into proteins

- a.** uracil and adenine, cytosine and guanine
b. adenine and guanine, thymine and cytosine
c. adenine and guanine, guanine and uracil
d. adenine and thymine, guanine and cytosine

- $$\text{a. } \begin{array}{ccccccccccccccc} & & \text{H} & & & \text{O} & & & \text{H} & & & & & \\ & & | & & & || & & & | & & & & & \\ \text{a. } & -\text{C} & -\text{N} & -\text{C} & -\text{C} & -\text{C} & -\text{N} & -\text{C} & -\text{C} & -\text{N} & -\text{C} & -\text{C} & -\text{C} & - \\ & | & & | & | & & | & | & | & || & | & | & | & \\ & & & & & & \text{H} & & & \text{O} & & & & \end{array}$$

- | Column I | Column II |
|---------------------------|---|
| A. Asparagine (Asn, N) | 1.  |

- a.** Vitamin B₂ **b.** Vitamin B₆
c. Vitamin B₁₂ **d.** Vitamin B₁

- a.** aspartame
c. fructose
- b.** cellulose
d. glucose

- a.** uracil **b.** thiamine
c. adenine **d.** guanine

- They are designated by A, B, C and D.
- They are further named as B₁, B₂, B₆ and B₁₂
- Vitamin pills should not be taken without the advice of doctor
- All of the above

34. Following amino acid has been found in protein prothrombin, but remains undetected due to the formation of another common acid (A)

Identify A.

- a. $\text{H}_3\text{N}^+-\text{CH}-\text{COO}^-$
|
 $\text{CH}_2-\text{CH}_2-\text{COO}^-$
- b. $\text{H}_3\text{N}^+-\text{CH}-\text{COO}^-$

- c. $\text{H}_2\text{N}-\text{CH}-\text{COO}^-$
|
 CH_2COOH
- d. $\text{H}_2\text{N}-\text{CH}-\text{COOH}$
|
 $\text{CH}-\text{COO}^-$
|
 COO^-
35. Which of the following hormones is responsible for the growth of animals?
a. Auxin
b. Insulin
c. Adrenaline
d. Somatotropin
36. Which of the following is present in DNA?
a. Deoxyribose
b. Starch
c. Riboflavin
d. None of these
37. Which of the following biomolecules contain a non-transition metal ion?
a. Haemoglobin
b. Chlorophyll
c. Insulin
d. Vitamin B₁₂
38. Molecular masses of drugs lie in the range of
a. ~ 5 u – 10 u
b. ~ 50 u – 60 u
c. ~ 100 u – 500 u
d. Above 2000 u
39. Difference in the antiseptics and disinfectants is
a. Antiseptics are used against micro-organisms while disinfectants are used against insects
b. antiseptics are used only over skin while disinfectants can be taken orally also
c. antiseptics merely inhibit the growth and disinfectant kill the micro-organisms
d. antiseptics are used over living tissues while disinfectants cannot be used over living tissues
40. Chloramine -T is a/an
a. antiseptic
b. disinfectant
c. analgesic
d. antipyretic
41. The chemical name of aspirin is
a. methyl salicylate
b. acetylsalicylic acid
c. sodium salicylate
d. salicylic acid
42. Which statement about aspirin is not true?
a. Aspirin belongs to narcotic analgesics
b. It is effective in relieving pain
c. It has antiblood clotting action
d. It is a neurologically active drug

43. Consider the following structure,

It is the structure of

- a. penicillin K
b. penicillin V
c. penicillin G
d. chloramphenicol
44. A drug that is antipyretic as well as analgesic is
a. chlorpromazine hydrochloride
b. *para*-acetamidophenol
c. chloroquine
d. penicillin
45. Consider the following reaction,

The end product Y formed in the above reaction is a well known medicine. Which of the following is incorrect regarding Y?

- a. It has analgesic as well as antipyretic properties
b. It helps to prevent heart attack
c. It has anti-blood clotting property
d. It suppresses the gastric ananoties
46. Tranquillisers are the substances used for the treatment of
a. cancer
b. AIDS
c. mental diseases
d. physical disorders
47. Match the medicines given in Column I with their use given in Column II.

Select the correct option from the codes given below:

Column I	Column II
A. Ranitidine	1. Tranquiliser
B. Furacine	2. Antibiotic
C. Phenelzine	3. Antihistamine
D. Chloramphenicol	4. Antiseptic

Codes

	A	B	C	D
a.	3	4	1	2
b.	4	1	2	3
c.	1	2	3	4
d.	2	3	4	1

48. Chloramphenicol is used in the treatment of
a. typhoid
b. malaria
c. acidity
d. tuberculosis

49. Arsenic drugs are mainly used in the treatment of
 a. jaundice b. typhoid
 c. syphilis d. cholera
50. Compound which is added to soap to impart antiseptic properties is
 a. sodium lauryl sulphate
 b. sodium dodecylbenzene sulphonate
 c. rosin
 d. bithional
51. The pH value of gastric juice in human stomach is about 1.8 and in the small intestine, it is about 7.8. The pK_a value of aspirin is 3.5. Aspirin will be
 a. ionised in the small intestine and almost unionised in the stomach
 b. unionised in the small intestine and in the stomach
 c. completely ionised in the small intestine and in the stomach
 d. ionised in the stomach and almost unionised in the small intestine

52. Which of the following is the structure of equanil?

BITSAT Archives

1. The catalyst used for olefin polymerisation is [2014]
 a. Ziegler-Natta catalyst
 b. Raney-nickel catalyst
 c. Wilkinson catalyst
 d. Merrified resin
2. A copolymer of ethene and vinyl chloride contains alternate monomers of each type. What is the mass percentage of vinyl chloride in this copolymer? [2014]
 a. 38% b. 69%
 c. 72% d. 82%
3. The number of disulphide linkages present in insulin are [2014]
 a. 1 b. 2 c. 3 d. 4
4. Which of the following statements is not true about the drug barbitol? [2014]
 a. It is used in sleeping pills
 b. It is a non-hypnotic drug
 c. It is tranquilliser
 d. It causes addiction
5. The monosaccharide having anomeric carbon atoms are [2013]
 a. geometrical isomers
 b. α and β -optical isomers
 c. having symmetrical carbon atoms
 d. None of the above
6. In vulcanisation of rubber, [2013]
 a. sulphur reacts to form a new compound
 b. sulphur cross-links are introduced
 c. sulphur forms a very thin protective layer on rubber
 d. All of the above
7. Which of the following antibiotics contain nitro group attached to aromatic nucleus in its structure? [2013]
 a. Tetracyclin b. Penicillin
 c. Streptomycin d. Chloramphenicol
8. Alizarin is an example of [2012]
 a. triaryl dye b. azo dye
 c. vat dye d. anthraquinone dye
9. Which of the following hormones, is responsible for the growth of animals? [2012]
 a. Auxin b. Insulin
 c. Adrenaline d. Somatotropin
10. The polymer polyurethanes are formed by treating diisocyanate with [2012]
 a. butadiene b. isoprene
 c. glycol d. acrylonitrile
11. A synthetic rubber which is resistant to the action of oils, gasoline and other solvents is [2011]
 a. buna-S b. polyisoprene
 c. neoprene d. polystyrene
12. The number of polypeptide chains present in a molecule of haemoglobin is/are [2011]
 a. four b. one c. two d. three
13. The pentose sugar in DNA and RNA has the [2011]
 a. open chain structure b. pyranose structure
 c. furanose structure d. All of these
14. Which of the following is an artificial edible colour? [2011]
 a. Saffron b. Carotene
 c. Tetrazine d. Melamine

15. The well known urinary antiseptic urotropine is formed when formaldehyde reacts with [2011]

a. NH_2OH b. NH_3
c. $\text{NH}_2 \cdot \text{NH}_2$ d. $\text{C}_6\text{H}_5\text{NH} \cdot \text{NH}_2$

16. Correct statement is [2010]

a. keratin is fibrous protein
b. androsterone is male sex hormone
c. vitamin B_1 is antineutritic factor
d. All of the above

17. A certain compound gives negative test with ninhydrin and positive test with Benedict's solution. The compound is [2009]

a. a protein b. a monosaccharide
c. a lipid d. an amino acid

18. Natural rubber and *gutta-percha* respectively are [2009]

a. *cis*-polyisoprene and *trans*-polyisoprene
b. both are *cis*-polyisoprene
c. both are *trans*-polyisoprene
d. *trans*-polychloroprene and *cis*-polychloroprene

19. Match the following. [2008]

List I		List II	
A.	Oxyhaemoglobin	1.	Analgesic
B.	Aspirin	2.	Oxygen carrier
C.	Haemoglobin	3.	Photosynthesis
D.	Chlorophyll	4.	Oil of winter green
		5.	Fe^{2+} paramagnetic

The correct match is

Codes

A	B	C	D	A	B	C	D		
a.	5	1	2	3	b.	4	2	1	3
c.	3	1	2	4	d.	5	2	3	1

20. If $\bar{M}_w$ is the weight average molecular weight and $\bar{M}_n$ is the number average molecular weight of a polymer, the poly dispersity index (PDI) of the polymer is given by [2008]

a. $\frac{\bar{M}_n}{\bar{M}_w}$ b. $\frac{\bar{M}_w}{\bar{M}_n}$ c. $\bar{M}_w \times \bar{M}_n$ d. $\frac{1}{\bar{M}_w \times \bar{M}_n}$

21. Hydrolysis of sucrose with dilute aqueous sulphuric acid yields [2008]

a. 1:1 D- (+)-glucose, D-(-)-fructose
b. 1:2 D- (+)-glucose, D-(-)-fructose
c. 1:1 D- (-)-glucose, D-(+)-fructose
d. 1:2 D- (-)-glucose, D-(+)-fructose

22. Alizarin belongs to the class of [2007]

a. vat dyes b. mordant dyes
c. basic dyes d. reactive dyes

23. 2,4-dichlorophenoxyacetic acid is used as [2007]

a. fungicide b. insecticide
c. herbicide d. moth repellent

24. Bakelite is a product of the reaction between [2007]

a. formaldehyde and NaOH
b. aniline and urea
c. phenol and methanal
d. phenol and chloroform

25. Cellulose is a polymer of [2007]

a. glucose b. fructose
c. ribose d. sucrose

26. Raffinose is [2005]

a. trisaccharide b. monosaccharide
c. disaccharide d. None of these

27. How many hydrogen bonds is/are present between pair of thymine and adenine in DNA? [2005]

a. 1 b. 2
c. 3 d. No bond occurs

28. Dacron is polymer of [2005]

a. glycol and formaldehyde
b. glycol and phenol
c. glycol and phthalic acid
d. glycol and terephthalic acid

29. Natural rubber is a polymer of [2005]

a. styrene b. isoprene
c. ethylene d. butadiene

30. Milk of magnesia is used as [2005]

a. antichlor b. antacid
c. antiseptic d. food preservative

31. Which destroy antigens? [2006]

a. Insulin b. Antibodies
c. Chromoprotein d. Phosphoprotein

32. Nylon-66 is an example of [2006]

a. poly propylene b. polyester
c. polyamide d. polystyrene

33. The purine base present in RNA is [2006]

a. guanine b. thymine c. cytosine d. uracil

34. Glyptal polymer is obtained by the reaction of glycerol with [2006]

a. malonic acid
b. acetic acid
c. phthalic acid
d. maleic acid

Answer with Solutions

Practice Exercise

- (c) Macromolecules is another term used to define polymers.
- (a)
- (b) Polymers can be classified on the basis of molecular forces as elastomers, fibres, thermoplastic and thermosetting polymers.
- (b)
- (b) Nylon-6,6 is a fibre, thus it has strong intermolecular forces like H-bonding. Buna-S is an elastomer, thus it has weakest intermolecular forces. Polythene is a thermoplastic polymer, thus the intermolecular forces present in polythene are in between elastomers and fibres. Thus, the order of intermolecular forces is

$$B < C < A$$

- (c) Caprolactam is the monomer unit of nylon-6.

- (a) Polydispersity index (PDI) of polymer = $\frac{\bar{M}_w}{\bar{M}_n}$

For natural polymers, PDI = 1, i.e. $\bar{M}_w = \bar{M}_n$

For synthetic polymers PDI = 1, i.e. $\bar{M}_w > \bar{M}_n$

- (c)
- (b) PMMA is the polymer of methyl methacrylate. PMMA is also known as fixiglass or perspex. It is used in making lenses, transparent domes etc.

- (a)
- (b)
- (a) The reaction of phenol and formaldehyde, is called Lederer Mannase reaction. It follows electrophilic addition and rearrangement mechanism.
- (b) Chemically treated cellulose (polysaccharide) is called silk.
- (c) Teflon is thermally stable polymer of tetrafluoroethylene ($\text{F}_2\text{C} = \text{CF}_2$).
- (d) Natural rubber is *cis*-polymer.
- (d) Orlon or PAN is the polymer of acrylonitrile (or vinyl cyanide). It is used in making carpets etc.

- (b) Melamine-formaldehyde resin is a copolymer.
- (d) Glucose is a monosaccharide while the others are disaccharides. Sucrose is a combination of glucose and fructose. Maltose is a combination of two glucose units. Lactose (or milk sugar) is a combination of glucose and galactose (a hexose sugar).
- (a) Monosaccharide is the simplest carbohydrate which cannot be hydrolyse to simpler compounds.
- (b) Carbohydrates that yield 2-10 monosaccharides units on hydrolysis are called oligosaccharides.
- (b) L-glucose is the mirror image of D-glucose.
- (a) Sequence of amino acids is called primary structure of proteins.
- (a) All monosaccharides which differ in configuration at C_1 and C_2 give the same osazone. Since, glucose and fructose differ from each other only in configuration at C_1 and C_2 therefore, they give the same osazone. All other options given in the questions do not satisfy this condition and hence, do not form the same osazone.
- (b) Adenosine is a nucleoside while adenosine triphosphate is a nucleotide.
- (c) Adenine is a purine base which is common in DNA and RNA.
- (a) Trypsin converts proteins into α -amino acids.
- (d) In DNA, the complementary bases are adenine and thymine, guanina and cytosine.
- (d) The peptide linkage ($-\text{NH}-\text{CO}-$) is formed by the condensation of amino acid molecules.

Hence, following structure represents the peptide chain

- (a) $A \rightarrow 4$, $B \rightarrow 1$, $C \rightarrow 2$, $D \rightarrow 3$
- (b) Pyridoxin is also known as vitamin B_6 .
- (a) Aspartame is the safest and most popular alternative of sugar. Its chemical formula is

- (a)

33. (d) Vitamins are designated by alphabets A, B, C, D. Some of them are further named as sub-groups, e.g. B₁, B₂, B₆, and B₁₂ etc. Excess of vitamins is also harmful and vitamin pills should not be taken without the advice of doctor.

34. (a)

35. (d) Somatotropin is the hormone, secreted by anterior lobe of pituitary gland. It is also called growth hormone as it stimulates protein-synthesis, glycogenesis and some other biological activities. Its deficiency causes midgets or dwarfism.
36. (a) The sugar present in DNA is 2-deoxyribose while that present in RNA is a base.
37. (b) Chlorophyll contains Mg.
38. (c) Molecular masses of drugs lie in the range of $\sim 100 \text{ u} = 500 \text{ u}$.
39. (d) Antiseptics are used over living tissues while disinfectants used for inanimate objects such as floors, toilets, instruments etc.
40. (a) Antiseptic drugs cause destruction of micro-organisms, which produce septic diseases, e.g. dettol, savlon, aeriflavin, iodoform and some dyes such as chloramine-T, methylene blue.
41. (b)
42. (a) Aspirin is a non-narcotic drug.
43. (c) The given structure is of penicillin G.

44. (b) Para-acetamidophenol is used as an antipyretic as well as analgesic.

Aspirin increases the gastric anomalies, hence it is banned in various countries.

46. (c) Tranquilisers reduce anxiety and are employed for treatment of mental disease.
47. (a) A $\rightarrow$ 3, B $\rightarrow$ 4, C $\rightarrow$ 1, D $\rightarrow$ 2
48. (a) It is effective in treatment of typhoid.
49. (c) Arsenic drugs, also called arsenical (like atoxyl, salvarsan, neoarsphenamine etc) are mainly used in sleeping sickness, syphilis etc.
50. (d) Bithional impart antiseptic property to soap.
51. (a) Aspirin is a moderate acid ($\text{p}K_a = 3.5$), hence it is almost unionised in stomach due to its strong acidic medium because of HCl. It is due to common ion effect. While in small intestine, the medium is alkaline, hence aspirin will be sufficiently ionised in small intestine.

BITSAT Archives

1. (a) Ziegler-Natta catalyst $[\text{TiCl}_4 + \text{Al}(\text{C}_2\text{H}_5)_3]$ is used as a catalyst in the polymerisation of olefins.
2. (b) The structure of copolymer of ethene and vinyl chloride is shown below

Molecular weight of ethene (CH_2CH_2) = 28

Molecular weight of vinyl chloride (CH_2CHCl) = 62.5

Empirical formula weight of copolymer = $28 + 62.5 = 90.5$

Mass% of vinyl chloride in the copolymer

$$= \frac{62.5 \times 100}{90.5} = 69.06 \approx 69\%$$

3. (b) Insulin is composed of two peptide chains referred to chains A and B. Chain A of 21 residues and chain B of 30 residues are cross-linked by two disulphide bridges.
4. (b) Barbitol is a sleep-producing drug, i.e. hypnotic tranquiliser. It causes addiction.
5. (b) C₁ carbon of monosaccharides is called anomeric carbon. When —OH group is attached with C₁ carbon towards right, it is called α -form and when —OH group is towards left, it is called β -form, such pair of optical isomers which differ in the configuration only around anomeric carbon are called anomers.
6. (b) In vulcanisation of rubber, sulphur cross-links are introduced at the reactive sites of double bonds.

7. (d)

8. (d) Alizarin is an anthraquinone dye. It gives a bright red colour with aluminium and a blue colour with barium.

9. (d) Somatotropin is the hormone, secreted by anterior lobe of pituitary gland. It is also called growth hormone as it stimulates protein synthesis, glycogenesis and some other biological activities. Its deficiency causes midgets or dwarfism.

10. (c) $\text{O}=\text{C}=\text{N}-\text{R}-\text{N}=\text{C}=\text{O}$

Diisocyanate

11. (c) Neoprene is synthetic rubber. It is a polymer of chloroprene and is resistant to the action of oils, gasoline and other solvents.

12. (a) Haemoglobin molecule contains four polypeptide chains.

13. (c) The structures of sugar of DNA (i.e. deoxyribose) and that of RNA (i.e. ribose) are as

Thus, it is clear that these have furanose structure.

14. (c) Tetrazine is an artificial edible colour.

15. (b) When formaldehyde reacts with ammonia, a well known urinary antiseptic urotropine (also called hexamethylene tetramine) is obtained.

16. (d)

17. (b) Since, it gives a negative test with ninhydrin, it cannot be a protein or an amino acid. Since, it gives a positive test with Benedict's solution, it must be a monosaccharide but not a lipid.

18. (a) Natural rubber is *cis*-polyisoprene while *gutta-percha* is *trans*-polyisoprene.19. (a) Aspirin is used as analgesics as well as antipyretics, i.e. it serve a dual purpose. Chlorophyll is used in photosynthesis. Oxyhaemoglobin contains Fe^{2+} ion, so it is paramagnetic and haemoglobin works as oxygen carrier. Hence $A \rightarrow 5$, $B \rightarrow 1$, $C \rightarrow 2$, $D \rightarrow 3$

20. (b)

21. (a) On hydrolysis with dilute aqueous sulphuric acid, sucrose gives a equimolar mixture of D-(+)-glucose and D-(-)-fructose.

Sucrose is dextrorotatory but after hydrolysis, it gives dextrorotatory glucose and laevorotatory fructose. Laevorotatory fructose is more, so the mixture is laevorotatory.

22. (b) Alizarin is mordant dye. Alizarin gives a bright red colour with aluminium and a blue colour with barium.

23. (c) 2, 4-D or 2, 4-dichlorophenoxyacetic acid is used as a herbicides.

24. (c)

25. (a) Cellulose is a polymer of glucose. β -D-(+)-glucose units are attached to each other by C_1 to C_4 bonds through β -glycosidic linkage in structure of cellulose.

26. (a) Carbohydrates that yield 2 to 0 monosaccharide units on hydrolysis. They are further classified as disaccharides, trisaccharides, etc. Riffinose is trisaccharide.

27. (b) Between pair of thymine and adenine in DNA, two-hydrogen bonds are present.

28. (d) Dacron is polymer of glycol and terephthalic acid.

29. (b) Natural rubber is considered as a linear polymer of isoprene (2-methyl-1, 3-butadiene). It is also called as *cis*-1, 4-polyisoprene.

30. (b) It is a used as an antacid.

31. (c) A chromoprotein is a conjugated protein that contains a pigmented prosthetic group which destroy antigens.

32. (c) It is an example of polyamide. It is prepared by condensation polymerisation of hexamethylene diamine with adipic acid under high pressure and temperature.

33. (d) The purine base present in RNA is uracil

34. (c) Phthalic acid

30

Qualitative Analysis

In inorganic qualitative analysis, an inorganic ionic compound or mixture of compounds, is analysed for its cations and anions (i.e. basic radicals and acid radicals). There are various methods of qualitative analysis like borax bead test, flame test, cobalt nitrate test etc., but the most important method is wet test.

Qualitative Analysis for Acid Radicals

Acids radicals have been grouped in two groups on the basis of decomposing acid (group reagent) :

Group I

On heating the mixture with dil. HCl or dil. H₂SO₄, a gas is evolved which is identified by its properties.

Acid radicals	Evolved gas
(i) Carbonate (CO ₃ ²⁻)	Gas (CO ₂) evolves with brisk effervescence which turns lime water to milky.
(ii) Sulphite (SO ₃ ²⁻)	Gas (SO ₂) with smell of burning sulphur, turns acidic dichromate paper to green [Cr(SO ₄) ₃].
(iii) Sulphide (S ²⁻)	Gas (H ₂ S) with smell of rotten eggs, turns lead acetate paper to black (PbS).
(iv) Nitrite (NO ₂ ⁻)	Brown gas (NO ₂) with pungent odour, turns KI-starch paper to blue.
(v) Acetate (CH ₃ COO ⁻)	Smell of vinegar, aqueous salt + FeCl ₃ → red colour

Group II

Mixture is heated with conc. H₂SO₄, when a gas is evolved which is identified by its properties.

Acid radicals	Gas evolved
(i) Chloride (Cl ⁻)	Colourless, pungent gas (HCl), gives white fumes on bringing glass rod moistened with NH ₄ OH.
(ii) Bromide (Br ⁻)	Colourless, pungent gas (HBr) Mixture + MnO ₂ + conc. H ₂ SO ₄ $\xrightarrow{\Delta}$ red vapours (Br ₂)
(iii) Iodide (I ⁻)	Violet vapours (I ₂), turns starch paper to blue.
(iv) Nitrate (NO ₃ ⁻)	Brown, pungent gas (NO ₂).
(v) Oxalate (C ₂ O ₄ ²⁻)	Colourless, odourless gas (CO) evolves, which burns with blue flame.

Some specific tests**Chromyl Chloride Test**

Chloride on heating with solid $K_2Cr_2O_7$ and conc. H_2SO_4 gives orange-yellow vapours of chromyl chloride (CrO_2Cl_2) which on passing over NaOH and then on treating with lead acetate forms yellow precipitate of lead chromate.

Chromyl chloride test is not given by chlorides of Hg, Sn, Ag, Pb and Sb. Bromides and iodides do not give chromyl chloride test.

Ring Test

This test is for the identification of nitrate ion (NO_3^-). To the mixture, freshly prepared $FeSO_4$ solution is added shaken. Now a drop of conc. H_2SO_4 is added by the side of the test tube, a brown ring is formed at the junction of two liquids due to the formation of nitroso ferrous sulphate.

**Test for Some Other Acid Radicals**

- (a) **Sulphate** (SO_4^{2-}) Solution of mixture in dil. HCl + $BaCl_2 \longrightarrow$ white ppt ($BaSO_4$) is insoluble in mineral acids.
- (b) **Phosphate** (PO_4^{3-}) Mixture is boiled with conc. HNO_3 and then ammonium molybdate solution is added when a canary yellow precipitate is obtained.

Interfering Acid Radicals

Borate, oxalate, fluoride and phosphate are called interfering radicals as they interfere in the usual test of basic radicals.

Qualitative Analysis for Basic Radicals

Basic radicals have been grouped in 6 groups on the basis of solubility products of their salts with group reagent.

Group	Basic radical	Group reagent	Precipitate
I	Ag^+, Pb^{2+}, Hg_2^{2+}	dil. HCl	$AgCl, PbCl_2, Hg_2Cl_2$ (All white)
II	Hg^{2+}, Pb^{2+}	H_2S (in acidic medium of dil. HCl)	HgS, PbS, CuS (all black), Bi_2S_3 (brown), CdS (yellow)
II A	$Bi^{3+}, Cu^{2+}, Cd^{2+}$ (insoluble in yellow ammonium sulphide)		
II B	$As^{3+}, Sb^{3+}, Sn^{2+}, Sn^{4+}$ (soluble in YAS)		SnS (black), As_2S_3 (yellow), Sb_2S_3 (orange)
III	$Fe^{3+}, Al^{3+}, Cr^{3+}$	NH_4OH (in presence of excess NH_4Cl)	$Fe(OH)_3$ (brown), $Cr(OH)_3$ (green), $Al(OH)_3$ (white gelatinous)
IV	$Co^{2+}, Ni^{2+}, Zn^{2+}$	H_2S (in alkaline medium of NH_4OH)	NiS, CoS (black), ZnS (white)
V	$Ba^{2+}, Ca^{2+}, Sr^{2+}$	$(NH_4)_2CO_3$ (in presence of NH_4OH)	$BaCO_3, CaCO_3, SrCO_3$ (all white)
VI	Mg^{2+}	Na_2HPO_4	$Mg(NH_4)PO_4$ (white)

Test for ammonium (NH_4^+)

Ammonium ion on heating with NaOH gives NH_3 gas which is recognised by taking a glass rod dipped in HCl above the mouth of test tube.

It gives yellowish-brown precipitate with Nessler's reagent.

**Some Important Points**

- Before the test of group III, the filtrate of group II is boiled to evolve out H_2S gas so that sulphide of higher group radicals could not precipitate in group III.
- In group III analysis, NH_4Cl is added before NH_4OH to decrease the ionisation of NH_4OH by common ion effect so that only group III radicals could precipitate.

Borax Bead Test

In this test, a platinum wire loop is made and heated. Now it is dipped into borax powder.

It is heated again when borax loses water and decomposes to give a transparent glassy bead of sodium metaborate.

Now mixture is taken over bead and it is again heated in oxidising (non-luminous) flame and then in reducing (luminous flame) and colour is observed in each case.

Different basic radicals give different colours, thus they can be identified.

Basic Radical	Colour (in oxidising flame)	Colour (in reducing flame)
Co^{2+}	Blue	Blue
Cu^{2+}	Light blue or green	Colourless or red
Fe^{3+}	Yellow brown	Bottle green
Cr^{3+}	Green	Green

Practice Exercise

- A substance on treatment with dil. H_2SO_4 liberates a colourless gas which produces (i) turbidity with baryta water and (ii) turns acidified dichromate solution green. The reaction indicates the presence of
 a. CO_3^{2-} b. S^{2-} c. SO_3^{2-} d. NO_2^-
- In qualitative analysis when H_2S is passed through an aqueous solution of salt acidified with dilute HCl a black precipitate is obtained. On boiling the precipitate with dil. HNO_3 , it forms a solution of blue colour. Addition of excess of aqueous solution of NH_3 to this solution gives
 a. deep blue precipitate of $\text{Cu}(\text{OH})_2$
 b. deep blue solution of $[\text{Cu}(\text{NH}_3)_4]^{2+}$
 c. deep blue solution of $\text{Cu}(\text{NO}_3)_2$
 d. deep blue solution of $\text{Cu}(\text{OH})_2 \cdot \text{Cu}(\text{NO}_3)_2$
- The aqueous solution of which of the following salt will be coloured?
 a. $\text{Zn}(\text{NO}_3)_2$ b. LiNO_3
 c. CrCl_3 d. Potash alum
- Which does not give borax bead test?
 a. Fe b. Cu
 c. Cr d. Pb
- A brown ring is formed in the ring test for NO_3^- ion. It is due to the formation of
 a. $[\text{Fe}(\text{H}_2\text{O})_5(\text{NO})]^{2+}$ b. $\text{FeSO}_4 \cdot \text{NO}_2$
 c. $[\text{Fe}(\text{H}_2\text{O})_4(\text{NO}_2)]^{2+}$ d. $\text{FeSO}_4 \cdot \text{HNO}_3$
- Among the following pairs, the pair of salts that gives yellow precipitate separately with aqueous solution of BaBr_2 , is
 a. Na_2CO_3 , AgNO_3 b. K_2SO_4 , K_2CrO_4
 c. K_2SO_4 , AgNO_3 d. AgNO_3 , K_2CrO_4
- Formation of purple colour on the addition of sodium nitroprusside to sodium carbonate extract indicates the presence of
 a. PO_4^{3-} b. SO_3^{2-}
 c. S^{2-} d. $\text{S}_2\text{O}_3^{2-}$
- Which chloride turns black with NH_4OH ?
 a. Lead chloride b. Mercurous chloride
 c. Mercuric chloride d. Silver chloride
- Which among the following is an interfering radical?
 a. Sulphide b. Sulphate
 c. Phosphate d. Nitrite
- Which compound does not dissolve in hot dilute HNO_3 ?
 a. HgS b. CuS c. PbS d. CdS
- A metal nitrate reacts with KI to give a black precipitate which on addition of excess of KI convert into orange colour solution. The cation of metal nitrate is
 a. Hg^{2+} b. Bi^{3+} c. Pb^{2+} d. Cu^+
- A brown precipitate obtained by reaction of alkaline solution of Nessler's reagent and NH_3 are due to the formation of
 a. mercuric hydroxide b. HgI_4^{2-}
 c. $\text{Hg} + \text{Hg}(\text{NH}_2)\text{I}$ d. iodide of Millon's base
- Which of the following on reaction with NaOH and Na_2O_2 gives yellow colour?
 a. $\text{Cr}(\text{OH})_3$ b. $\text{Al}(\text{OH})_3$
 c. $\text{Zn}(\text{OH})_3$ d. None of these
- Consider the following reactions,

$$[\text{A}] + \text{H}_2\text{SO}_4 \longrightarrow [\text{B}]$$
 a colourless gas having irritating smell

$$[\text{B}] + \text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4 \longrightarrow \text{Green solution}$$
 A and B respectively are
 a. Cl^- and HCl b. CO_3^{2-} and CO_2
 c. SO_3^{2-} and SO_2 d. S^{2-} and H_2S
- A solution of metal ion when treated with KI gives a red precipitate which dissolves in excess KI to give a colourless solution. Moreover the solution of metal ion on treatment with a solution of cobalt (II) thiocyanate gives rise to a deep blue crystalline precipitate. The metal ion is
 a. Pb^{2+} b. Hg^{2+} c. Cu^{2+} d. Co^{2+}

16. An aqueous solution contains the ions Hg_2^{2+} , Hg^{2+} , Pb^{2+} and Cd^{2+} . Which of these will precipitate by the addition of dil. HCl ?
 a. Hg_2Cl_2 and PbCl_2 b. Only Hg_2Cl_2
 c. Only PbCl_2 d. PbCl_2 and Hg_2Cl_2
17. Which one of the following does not impart colour to the flame?
 a. LiCl b. KI
 c. MgCl_2 d. CaCl_2
18. Identify the incorrect statement about $\text{Al}_2(\text{SO}_4)_3$.
 a. It is a white salt
 b. On adding NaOH solution to its aqueous solution, a precipitate is formed which get dissolve in excess of NaOH solution
 c. With lead acetate solution also, it gives a precipitate
 d. With silver nitrate, its aqueous solution gives a precipitate
19. On addition of conc. H_2SO_4 to a chloride salt, colourless fumes are evolved but in case of iodide salt, violet fumes come out. This is because
 a. H_2SO_4 reduces HI to I_2 b. HI is of violet colour
 c. HI gets oxidised to I_2 d. HI changes to HIO_3
20. When bismuth chloride is poured into a large excess of water, then white precipitate produced is due to
 a. $\text{Bi}(\text{OH})_3$ b. Bi_2O_3
 c. BiOCl d. Bi_2OCl_2
21. A purple coloured compound is obtained, on treating sodium sulphide with sodium nitroprusside. In this reaction, the oxidation state of Fe
 a. changes from + 3 to + 2
 b. changes from + 2 to + 4
 c. changes from + 2 to + 3
 d. No change in oxidation state
22. Which one of the following statements is correct?
 a. Manganese salts give a violet borax bead test in the reducing flame
 b. From a mixed precipitate of AgCl and AgI , ammonia solution dissolves only AgCl
 c. Ferric ions give a deep green precipitate on adding potassium ferrocyanide solution
 d. On boiling a solution having K^+ , Ca^{2+} and HCO_3^- ions, we get a precipitate of $\text{K}_2\text{Ca}(\text{CO}_3)_2$
23. Which is soluble in NH_4OH ?
 a. PbCl_2 b. AgCl c. PbSO_4 d. CuCO_3
24. Which of the following will not give positive chromyl chloride test?
 a. CuCl_2 b. HgCl_2
 c. ZnCl_2 d. $\text{C}_6\text{H}_5\text{NH}_3\text{Cl}^+$
25. Which of the following does not give flame test?
 a. Ba^{2+} b. Mg^{2+} c. Sr^{2+} d. Ca^{2+}
26. Which of the following will give blood red colour with FeCl_3 in sodium extract?
 a. NH_2CONH_2 b. NH_2CSNH_2
 c. $\text{C}_2\text{H}_5\text{NHNH}_2$ d. $\text{CH}_3\text{C}\equiv\text{N}$
27. Which of the following gives blood red colour with KCNS ?
 a. Cu^{2+} b. Fe^{3+}
 c. Al^{3+} d. Zn^{2+}
28. Which pair of ions gives precipitate when their dilute aqueous solutions are mixed?
 a. CO_3^{2-} , NH_4^+ b. SO_3^{2-} , Na^+
 c. PO_4^{3-} , Fe^{3+} d. Na^+ , S^{2-}
29. The ion that cannot be precipitated by both HCl and H_2S , is
 a. Pb^{2+} b. Cu^+ c. Ag^+ d. Sn^{2+}

BITSAT Archives

1. In Nessler's reagent for the detection of ammonia, the active species is [2007]
 a. Hg_2Cl_2 b. Mg^{2+}
 c. HgI_2 d. HgI_4^{2-}
2. Which of the following silver salts is insoluble in water? [2005]
 a. AgClO_4 b. Ag_2SO_4
 c. AgF d. AgNO_3

Answer with Solutions

Practice Exercise

- (c) SO_3^{2-} gives SO_2 with dil. H_2SO_4 which gives turbidity with $\text{Ba}(\text{OH})_2$ and turns acidified dichromate solution green due to its reduction to Cr^{3+} ions.
- (b) $3\text{CuS} + 8\text{HNO}_2 \longrightarrow 3\text{Cu}(\text{NO}_3)_2 + 2\text{NO} + 3\text{S} + 4\text{H}_2\text{O}$
 $\text{Cu}^{2+} + 4\text{NH}_4\text{OH} \longrightarrow [\text{Cu}(\text{NH}_3)_4]^{2+} + 4\text{H}_2\text{O}$
Deep blue complex
- (c) Cr^{3+} is a green coloured ion.
- (d) Borax bead test is given only by coloured salts or ions. Hence, Pb does not give borax bead test.
- (a)
- (d) $\text{Ba}^{2+} + \text{K}_2\text{CrO}_4 \longrightarrow \text{BaCrO}_4 \downarrow + 2\text{K}^+$
Yellow
 $\text{Br}^- + \text{AgNO}_3 \longrightarrow \text{AgBr} \downarrow + \text{NO}_3^-$
Yellow
- (c) $\text{Na}_2\text{S} + \text{Na}_2[\text{Fe}(\text{CN})_5(\text{NO})] \longrightarrow \text{Na}_4[\text{Fe}(\text{NOS})\text{CN}]_5$
Sodium nitroprusside Violet (purple)
- (b) It form black precipitate of mercury with NH_4OH
 $\text{Hg}_2\text{Cl}_2 + 2\text{NH}_4\text{OH} \longrightarrow [\text{NH}_2\text{—Hg—Hg—Cl}] + \text{NH}_4\text{Cl} + \text{H}_2\text{O}$
Unstable
 $\downarrow$
 $\text{NH}_2\text{HgCl} \downarrow + \text{Hg} \downarrow$
White Black
- (c) Phosphate causes the precipitation of group IV, V and Mg^{2+} cation in group III as PO_4^{3-} and hence, creates interference.
- (a) HgS is soluble only in aqua-regia (i.e. $3\text{HCl} + \text{HNO}_3$).
- (b) $\text{Bi}(\text{NO}_3)_3(\text{aq}) + 3\text{KI}(\text{aq}) \longrightarrow \text{BiI}_3(\text{s}) \downarrow + 3\text{KNO}_3(\text{aq})$
Black ppt
 $\text{BiI}_3(\text{s}) + \text{KI}(\text{aq}) \longrightarrow \text{K}[\text{BiI}_4]$
Orange
- (d) NH_3 form Millon's iodide base $[\text{I—HgOHg—NH}_2]$ with Nessler's reagent.
- (a) $2\text{Cr}(\text{OH})_3 + 4\text{NaOH} + 3[\text{O}] \longrightarrow 2\text{Na}_2\text{CrO}_4 + 5\text{H}_2\text{O}$
Yellow
- (c) Since, SO_3 has a smell of burning which is irritating, thus, [A] is SO_3^{2-} and [B] is SO_2 , which turns acidified $\text{K}_2\text{Cr}_2\text{O}_7$ solution green, as it get reduced to Cr^{3+} ions.

- (b) $\text{Hg}^{2+} + 2\text{I}^- \longrightarrow \text{HgI}_2$
 $\text{HgI}_2 + 2\text{I}^- \xrightarrow{\text{Excess}} [\text{HgI}_4]^{2-}$
 $\text{Hg}^{2+} + \text{Co}(\text{SCN})_2 \longrightarrow \text{Hg}(\text{SCN})_2 \downarrow$
Blue crystalline ppt
- (a) Hg_2^{2+} and Pb^{2+} are present in I group, hence only these will be precipitated. The solubility product of MgCl_2 and CdCl_2 are higher, hence they will not precipitate.
- (b)
- (d) Aqueous solution of $\text{Al}_2(\text{SO}_4)_3$ does not give precipitate with silver nitrate (AgNO_3) solution.
- (c)
- (c) Bismuth and antimony chloride give white precipitate of oxychloride in water.
 $\text{BiCl}_3 + \text{H}_2\text{O} \longrightarrow \text{BiOCl} + 2\text{HCl}$
Milky
- (d) $\text{Na}_2[\text{Fe}(\text{CN})_5\text{NO}] + \text{Na}_2\text{S} \longrightarrow \text{Na}_4[\text{Fe}(\text{CN})_5\text{NOS}]$
+3
- (b) NH_3 is an inorganic solvent. AgI has much higher covalent character in comparison to AgCl. Thus, AgCl dissolves readily in NH_3 .
- (b) AgCl is completely soluble in NH_4OH while AgBr is sparingly soluble in it. AgI is insoluble in NH_4OH .
- (b) HgCl_2 does not give positive chromyl chloride test due to its covalent nature.
- (b) Mg^{2+} and Be^{2+} do not impart colour to the flame in the flame test.
- (b) Compound (b) contains both N and S, therefore it will form NaSCN which reacts with FeCl_3 to give ferric thiocyanate which is blood red in colour.
- (b) $\text{Fe}^{3+} + 3\text{KCNS} \longrightarrow \text{Fe}(\text{CNS})_3 + 3\text{K}^+$
Ferric thiocyanate (blood red)
- (c) $\text{Fe}^{3+}(\text{aq}) + \text{PO}_4^{3-}(\text{aq}) \longrightarrow \text{FePO}_4 \downarrow$
ppt
- (d) Sn^{2+} can be precipitated only by H_2S and not by HCl. Rest can be precipitated by both reagents.

BITSAT Archives

- (d) Nessler's reagent gives brown ppt of iodide of Millon's base with ammonium salt.
 $[\text{HgI}_4]^{2-} + \text{NH}_4\text{Cl} + 4\text{OH}^- \longrightarrow \text{NH}_2\text{HgOHgI} + \text{I}^- + \text{Cl}^- + 3\text{H}_2\text{O}$
Iodide of Millon's base (brown ppt)
- (b) Ag_2SO_4 is insoluble in water.

31

Stereochemistry

Isomerism

Compounds having the same molecular formula but differ in structural formulae, properties and spatial arrangement, are called **isomers** and the phenomenon is called isomerism.

Types of Isomerism

Isomerism can be of the following two types:

- (i) Structural isomerism
- (ii) Stereo isomerism

Structural Isomerism

When the isomerism is due to difference in the sequence (connectivity) of atoms within the molecules (without any reference to space), the phenomenon is called structural isomerism. In other words, the structural isomers are the compounds which have the same molecular formula but different structural formulae, hence different properties. The structural isomerism is also called **constitutional isomerism** and categorised as

- (i) Chain isomerism
- (ii) Position isomerism
- (iii) Functional isomerism
- (iv) Metamerism
- (v) Tautomerism
- (vi) Ring chain isomerism
- (vii) Isotopic isomerism

NOTE *Tautomerism and ring chain isomerism are considered as the specialised sub-types of functional isomerism.*

Stereo Isomerism

When the isomerism is caused by different arrangement of atoms or groups in space, i.e. 3D-arrangement, the phenomenon is called stereo isomerism. In other words, the stereo isomerism is shown by those compounds which have the same structural formula (alongwith same molecular formula) but differ in configuration (the term configuration refers to three dimensional arrangement of atoms that characterise a particular compound).

This isomerism is called **stereo isomerism** or **configurational isomerism** and can be categorised as

- (i) Geometrical or *cis/trans*-isomerism
- (ii) Optical isomerism

Caution Point Neither resonance forms nor conformations constitute isomers.

Simple flow chart representing the classification of isomers

Geometrical Isomerism

When a π -bond is present between two atoms, it restricts the free rotation of atoms around its axis. It gives rise to two different structural formulae (properties of these forms differ due to different arrangement of atoms about double bonds in alkenes or about single bonds in cyclic compounds).

This isomerism which arises due to difference in spatial arrangement of groups about the

1. doubly bonded C-atoms in **alkenes**,
2. single bonded C-atoms in **cyclic compounds**,
3. doubly bonded C and N-atoms in **oximes**,
4. doubly bonded N-atoms in **diazo compounds**, is called geometrical isomerism.

Conditions for Exhibiting Geometrical Isomerism

The conditions for exhibiting geometrical isomerism include

1. There should be frozen rotation about two atoms in the molecules, e.g.
 - (i) $>C=C<$, frozen rotation about C—C double bond in alkenes.
 - (ii) $\triangle$, frozen rotation about carbon-carbon single bond in cycloalkanes.

(iii) $>C=N$, frozen rotation about carbon-nitrogen double bond in oximes and imines.

(iv) $-N=N-$, frozen rotation about nitrogen-nitrogen double bond in azo compounds.

2. Both the atoms of above written bonds should contain different substituents.

Geometrical Isomerism in Alkenes

The forms in which similar groups are present on the same side of double bond are called ***cis* forms** [Latin *cis* = same side] and the forms, in which similar groups are present on the different sides are called ***trans* forms** [Latin *trans* = across].

These forms show usually similar chemical but different physical properties. However, some forms may show difference in chemical properties as well. Geometrical isomerism is not seen in those forms in which the double bonded carbon atom have same groups attached to it. e.g.

Both the structures are identical

Both the structures are identical

Geometrical figures in (I) and (II) will be identical, hence, no geometrical isomers are possible.

The conversion of *cis*-isomer into *trans*-isomer or *vice-versa* is possible only if either of the isomer is heated to a high temperature or absorbs light. The heat supplies the energy to break the π -bond. Some examples of geometrical isomers are as

These isomers are

- (i) differ in physical properties such as melting point, dipole moment and acidities. The *trans*-isomer has no dipole moment since it is symmetrical, unlike the *cis*-isomer. The *cis*-isomer is stronger acid than the *trans*-isomer.

- (ii) differ even in chemical properties, e.g. *cis* acid undergo dehydration at 100°C and form an anhydride. However, the *trans*-acid does not form an anhydride until heated to 240°C.

Distinction Between *cis* and *trans*-Isomers

1. The *trans*-forms are more stable than the corresponding *cis*-isomer. This is because, in the *cis*-isomer, the bulky groups are on the same side of double bond. The steric repulsion of the groups makes the *cis*-isomer less stable than the *trans*-isomer in which the bulky groups are far apart (they are on the opposite sides of the double bond).
2. Melting point of *trans*-form is higher than the melting point of *cis*-form because of symmetrical packing of *trans*-compounds in its crystal lattice.
3. Boiling point of *cis*-form is higher than that of the *trans*-form because of steric hindrance in *cis*-compound and high polarity of *cis*-compound.
4. Solubility of *cis*-isomer is higher as compared to *trans*-isomer, as molecules of *trans*-isomer are more tightly held in the crystal lattice than the corresponding *cis*-isomer and hence, it is easier to break the crystal lattice of *cis*-isomer as compared to *trans*-isomer.
5. The *cis*-isomer of a symmetrical alkene (alkene in which both the carbon atoms have similar group) has a definite dipole moment, while the *trans*-isomer has zero dipole moment.

Optical Isomerism

Compounds with similar physical as well as chemical properties and with difference only in their behaviour towards plane polarised light are called optical isomers and this property is called optical isomerism.

Important Terms Related to Optical Isomerism

Before going in detail, it is better to understand some terms related to this isomerism:

- (a) **Plane polarised light** According to wave theory, an ordinary ray of light is considered to have particulate vibrations in all possible planes perpendicular to its path of propagation. However in polarised light, the particulate vibrations occur in one plane only.

Unpolarised light Polarised light

- (b) **Optical activity** The property of a compound by virtue of which it can rotate the plane of polarised light, is called optical activity.
- (c) **Asymmetric C-atom** C-atom having 4 different groups or atoms attached separately to its four valencies, is called asymmetric carbon atom or **stereocentre**.
- (d) **Chiral molecule** A molecule completely lacking plane of symmetry is called chiral molecule. In other words, it can also be defined as the one which is not superimposable on its mirror reflection or the one in which line of symmetrisation is lacking. An asymmetric C-atom will generally be considered as chiral and we can say that
- (1) A chiral molecule mostly possess at least one chiral carbon atom.
 - (2) A chiral molecule does not possess any element of symmetry like

(i) Plane of symmetry

(ii) Centre of symmetry

(iii) Axis of symmetry

- (e) **Achiral molecule** A molecule which is superimposable on its mirror image is called achiral.

Usually the compounds having atleast one asymmetric C-atom (the C-atom all the four valencies of which are satisfied by four different groups or atoms) are capable to exhibit optical isomerism, e.g. lactic acid.

The optical isomers can be categorised into the following two types :

(a) Optically Active Compounds

Those compounds which have the ability to rotate the plane of polarised light are called optically active compounds. These compounds are infact chiral, i.e. have absence of elements of symmetry.

Among the optically active compounds, following types are included :

1. **Dextrorotatory** or *d* or (+) forms which rotate the plane of polarised light to the right (clockwise).
2. **Laevorotatory** or *l* or (–) forms which rotate the plane of polarised light to the left (anticlockwise).

(b) Optically Inactive Compounds

Those compounds which do not have such an ability, i.e. which do not rotate the plane of polarised light are called **optically inactive compounds**.

The reasons for the inactivity of these compounds are :

- (i) Presence of element of symmetry
- (ii) Presence of *d* and *l*-forms in equal amounts

On the basis of above reasons, optically inactive compounds can be of two types :

1. **Meso form** It has the plane of symmetry within the molecule, i.e. the one-half of the molecule is dextrorotatory and rest half is laevorotatory. Thus, within the molecule, both halves show equal and opposite optical activity.

As a result, the molecule becomes optically inactive. This phenomenon of optical inactivation in which the rotation produced by one-half of the molecule is cancelled by its another half is called internal compensation, i.e. *meso* forms are said to be optically inactive due to the phenomenon of internal compensation, e.g. the optically active and inactive forms of tartaric acid are as follows :

Optically active forms Line of symmetrisation *Meso*-tartaric acid

2. **Racemic mixture** The equimolar mixture of two optically active forms (*d* and *l* forms) of a compound is called racemic mixture. The mixture is optically inactive as both the forms neutralises the effect of one another. Such a neutralising effect is called **external compensation**, thus racemic mixtures are optically inactive due to the process of external compensation. The formation of racemic mixture is called **racemisation** while separation of these forms from the mixture is called **resolution**.

Resolution can be achieved by mechanical method, biological method using enzymes, chemical methods (by making their diastereomers) or by chromatographic separation (by using special adsorbents).

Enantiomers and Diastereomers

Optically active compounds which are non-superimposable mirror images of each other are called enantiomers, e.g. in tartaric acid, first two figures written are called enantiomers.

Optical isomers which are not the mirror images of each other are called diastereomers, e.g. in the following representations, the structure of all the four figures is same but spatial arrangement of groups differ as fig. (1) and (2) are enantiomeric, similarly fig. (3) and (4) are enantiomeric.

However, Fig. (1) is diastereomeric with fig. (3) and (4) (same molecular formula, different optical behaviour and

not the mirror images of each other). Similarly, fig. (2) is diastereomeric with fig. (3) and (4). Contrary to enantiomers, two diastereomers have different melting points, boiling points and solubilities. They will have different chemical reactivities towards most reagents, i.e. show difference in physical as well as in chemical properties.

Projection Formulae

Different projection formulae have been given to define the structure a molecule completely. These can be converted into each other.

These are as follows :

(a) Wedge-Dash Formula

The configuration of organic molecules can be visualised by three dimensional (3D) structures, which may be depicted by any of the following representations.

Here the thick solid (solid wedge) line represents the bonds lying above the plane of paper (projecting towards the viewer), thin lines indicate the bonds lying within the plane of paper while the dotted line indicates the bonds lying below the plane of paper. Such a representation is called Wedge-Dash formula.

(b) Fischer Projection Formulae

A planar representation of the three dimensional structure is called Fischer projection formula.

Following guidelines are used to draw it :

1. The chain of carbon atoms is arranged vertically in such a way that the most oxidised carbon occupies the top position.
2. The asymmetric carbon atom lies in the plane of paper and is represented at the intersection of crossed lines.
3. The bonds going away from you are represented by vertical lines. In other words, vertical lines represent the groups present behind the plane of paper.

4. The bonds coming towards you, are represented by horizontal lines. In other words, group attached to the horizontal lines are understood to be present above the plane of the paper.

Using the above guidelines, the Fischer projection formulae for lactic acid and tartaric acid are shown as

Systems of Nomenclature of Optical Isomers

The nomenclature of optical isomers can be done in accordance with

(a) D, L-System of Nomenclature of Partial Configuration

The D, L system of nomenclature is used for optically active polyhydroxy carbonyl compounds (carbohydrates) mainly. This nomenclature was given by **Emil Fischer** who considered glyceraldehyde as the parental sugar.

All sugars whose Fischer projection formula shows the —OH group on the right hand side on chiral C-atom adjacent to the terminal —CH₂OH group (i.e. second last C-atom) are called the sugars of D-series. Similarly, if the —OH group is positioned left then it looks like

Here, L stands for laevo, i.e. left hand side and not laevorotatory. All such sugars having this configuration are supposed to belong to the L-series. It must be noted that there is no relation between the sign of rotation (i.e. +, – or *d, l*) and the configuration (D and L) of the enantiomer.

This nomenclature is also used for α -amino acids.
e.g.

(b) *R, S*-System of Nomenclature

The actual three dimensional arrangement of groups in an asymmetrical molecule is called its **absolute configuration**. We can specify the configuration by using the *R, S* system i.e. *rectus* and *sinister* system [Here, *rectus* = right hand side, *sinister* = left hand side].

This nomenclature was proposed by **Cahn, Ingold and Prelog** and involves two steps in it:

Step 1 Following a set of sequence rules, a sequence of priority is assigned to four different groups or atoms attached to a chiral C-atom. The most acceptable criterion of priority is based on atomic numbers, i.e. atom with higher atomic number will get higher priority, e.g. in the case of bromochloriodomethane, the sequence of priority is I, Br, Cl, and H.

Step 2 The molecule is next visualised so oriented that the group of lowest priority is directed away from you and the arrangement of remaining groups observed. While observing you have to proceed from the group of highest priority to the group of second priority and then to the third.

- (i) If your eye travels in a clockwise direction, the configuration is called *R* [Latin *rectus* = right].
- (ii) If your eye travels anticlockwise, the configuration is called *S* [Latin *sinister* = left].

Two positioning of the lowest priority group down and away from the observer can be assumed easily in three dimensions but difficult a bit in two dimensions. e.g.

Measurement of Optical Activity

Optical activity of a compound can be detected and measured by means of a **polarimeter**. When a solution of a known concentration of an optically active compound is placed in a polarimeter, the beam of polarised light is rotated through a certain number of degrees either to the right (clockwise) or to the left (anticlockwise). This degree is measured and called **rotation** produced by the solution.

The degree of rotation depends upon the number of molecules of the compound encountered by light along its path. This degree of rotation, if measured, is called **specific rotation** and can be defined as the rotation produced by a solution of 10 cm length and unit concentration (1 g/mL) for the given wavelength (λ) of light at the given temperature.

Thus, for a system in which plane of polarised light is rotated through α degrees at a temperature of $t^\circ\text{C}$ and using the sodium-*D* lines as the source, the specific rotation $[\alpha]_D^t$ is given by

$$[\alpha]_D^t = 100 \alpha / l \times c$$

Here, l = length of the fluid filled tube in decimeters
(10 cm = 1 decimetre)

c = number of grams per 100 mL of solution

The specific rotation varies both with light wavelength and temperature.

Conformations or Conformers

The σ electron cloud joining the carbon atoms in alkanes is cylindrically symmetrical about a line joining the two carbon nuclei, hence bond strength should be the same for all possible arrangements. Different arrangements of atoms that can be converted into one another by rotation about single bonds are called conformations. Arrangement I is called the eclipsed conformation; arrangement II is called the staggered conformation. The infinite intermediate conformations in between the above two are called **skew conformations**.

Caution point Conformers are also termed as rotamers and conformational isomerism as rotamerisms.

Conformations of Ethane

In ethane molecule ($\text{CH}_3\text{—CH}_3$), two carbon atoms are bonded by a single covalent bond. If one of the carbon atoms (methyl group) is kept fixed and the other is rotated about the C—C bond, an infinite number of arrangements of the hydrogen atoms attached to one carbon atom with respect to other are possible. These infinite numbers of different arrangements are called conformations.

To represent these conformations, we can draw three dimensional pictures.

However, chemists represent the conformations in two simple ways as shown below:

(a) Saw Horse Representation

In it, we view carbon-carbon bond from an oblique angle and indicate spatial arrangements by showing all the C—H bonds as shown in figure.

(b) Newmann Projection

It is a simple method to represent the conformations. In this method, two carbon atoms forming the σ -bond are represented by two circles, one behind the other so that only the front carbon is seen. The C—H bonds of the front carbon are depicted from the centre of the circle while C—H bonds of the back carbon are drawn from the circumference of the circle.

Out of all the conformations possible for ethane, only two extreme conformations are important, which are given below:

(a) Staggered Conformation

In this arrangement, the hydrogens of the carbon atoms are staggered with respect to one another. As a result, they are at maximum distance apart and have minimum repulsion between them.

(b) Eclipsed Conformation

In this conformation, the hydrogens of one carbon atom are directly behind those of the other. Consequently, the repulsion in these atoms is maximum. The saw horse projections of these conformations are represented in the figure given below.

The Newmann projections for staggered and eclipsed conformations of ethane are shown in figure given below. It is clear that when the staggered conformation is rotated through an angle of 60° , it changes to eclipsed conformation and similarly, when eclipsed conformation is rotated through the same angle, it gives back the staggered conformation.

Relative Stabilities of the Conformations of Ethane

Two conformations of ethane differ in their relative stabilities. The staggered conformation has minimum repulsions between the H-atoms attached tetrahedrally to the two carbon atoms. On the other hand, the eclipsed conformation has maximum force of repulsion between H-atoms. Therefore, the staggered conformation is more stable than the eclipsed conformation.

The difference in the energy contents of the staggered and eclipsed conformations is 12.5 kJ mol^{-1} . This small barrier to rotation is also called torsional barrier of the single bond. However, this energy difference is not large enough to prevent rotation. Even at ordinary temperatures, the molecules have thermal or kinetic energy to overcome this energy barrier.

Therefore, the two conformations of ethane go on changing from one form to another thus consequently, it is not possible to isolate the different conformations of ethane.

The variation of energy *versus* rotation about the C—C bond has been shown in the following figure :

The variation of energy *versus* rotation about C—C bond

The difference in the energy of various conformations constitutes an energy barrier in rotation. For free rotation, energy barrier is 0.6 kcal/mol . For restricted rotation, energy barrier is in between > 0.6 and $< 16 \text{ kcal/mol}$.

For frozen rotation, energy barrier is $\geq 16 \text{ kcal/mol}$.

Caution Point The dihedral angle between the C—H bonds on adjacent carbons in staggered and eclipsed conformations of ethane are 180° and 0° respectively whereas between two methyl groups in the gauche and anti conformations of *n*-butane, these are 60° and 180° respectively.

Practice Exercise

1. Which class of compounds can exhibit geometrical isomerism?

- $\text{C}_6\text{H}_5\text{CH}=\text{NOH}$
- $\text{CH}_3\text{CH}=\text{CHCH}_3$
- $\text{HOOCCH}=\text{CH}_2\text{CHCOOH}$
- All of the above

2. Which of the following shows geometrical isomerism?

- 1, 2-dichloroethene
- 1,2-dimethylcyclopropane
- $$\begin{array}{c} \text{CO}-\text{NH} \\ \diagup \quad \diagdown \\ \text{CH}_3\text{CH} \quad \text{CHCH}_3 \\ \diagdown \quad \diagup \\ \text{NH}-\text{CO} \end{array}$$
- All of the above

3. The number of isomers of the compound C_2FCIBrI is

- 3
- 4
- 5
- 6

4. Which will form geometrical isomers?

-
- $\text{CH}_3\text{CH}=\text{NOH}$
-
- All of these

5. In , the double bonds are

- cis, cis
- cis, trans
- trans, cis
- trans, trans

6. Number of geometrical isomers for the molecule

- a. 2
b. 3
c. 6
d. 5
7. Racemic modification can be resolved by
a. the use of enzymes
b. fractional crystallisation
c. fractional distillation
d. None of the above
8. Racemic tartaric acid is optically inactive due to
a. external compensation
b. internal compensation
c. presence of plane of symmetry
d. All of the above
9. (+) and (–) forms of optically active compounds are different in
a. boiling points
b. melting points
c. specific gravity
d. specific rotation
10. Which of the following Fischer projection formula is same as D-glyceraldehyde?
a. $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{OH} - \text{C} - \text{CHO} \\ | \\ \text{H} \end{array}$
b. $\begin{array}{c} \text{CH}_2\text{OH} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{CHO} \end{array}$
c. $\begin{array}{c} \text{CHO} \\ | \\ \text{H} - \text{C} - \text{OH} \\ | \\ \text{CH}_2\text{OH} \end{array}$
d. $\begin{array}{c} \text{CHO} \\ | \\ \text{H} - \text{C} - \text{CH}_2\text{OH} \\ | \\ \text{OH} \end{array}$
11. How many carbon atoms in the molecule $\text{HOOC}-(\text{CHOH})_2-\text{COOH}$ are asymmetric?
a. 1
b. 2
c. 3
d. None of these
12. Number of chiral centres in

- a. 1
b. 2
c. 3
d. 4
13. The following compound can exhibit
a. tautomerism
b. optical isomerism
c. geometrical isomerism
d. geometrical and optical isomerism

14. Which of the following statements is not correct?
a. A *meso* compound has chiral centres but exhibits no optical activity
b. A *meso* compound has no chiral centre, thus it is optically inactive
c. A *meso* compound has molecules in which one-half of molecule is superimposable on the other even through chiral centre is present in them
d. A *meso* compound is optically inactive because the rotation caused by one-half of molecule is cancelled by the rotation produced by another half
15. An enantiomerically pure acid is treated with racemic mixture of an alcohol having one chiral carbon. The ester formed will be
a. optically active mixture
b. pure enantiomer
c. *meso* compound
d. racemic mixture
16. Which of the following will exhibit geometrical isomerism?
a. Propene
b. Butene-2
c. Butene-1
d. 1,1-dichloro butane
17. Which statement is true?
a. A compound with *R* configuration is the (+) enantiomer
b. If configuration changes from + to –, that essentially means inversion of configuration takes place
c. An achiral molecule reacts always with racemic forms, to give a chiral molecule,
d. By breaking two bonds on the chiral centre, configuration changes
18. The compound whose stereo chemical formula is written below, exhibits *x*-geometrical isomers and *y*-optical isomers. The value of *x* and *y* respectively are

- a. 4 and 4
b. 2 and 2
c. 2 and 4
d. 4 and 2
19. Incorrect statement is
a. ethane can have an infinite number of conformations
b. cyclopropane molecule has considerable angle strain
c. eclipsed form of ethane is less stable than staggered conformation
d. staggered conformation possesses maximum energy
20. At room temperature, the eclipsed and the staggered forms of ethane cannot be isolated because
a. both the conformers are equally stable
b. they interconvert rapidly
c. there is a large energy barrier of rotation about the σ -bond
d. the energy difference between the conformers is large

21. The most stable conformation of ethane chlorohydrin at room temperature is

- a. fully eclipsed b. partially eclipsed
c. *gauche* d. staggered

22. The number of chiral carbon atoms present in the molecule

- a. 3 b. 4 c. 2 d. 1

23. Which of the following are diastereomers?

- a. (I) and (III) b. (II) and (IV)
c. (I) and (II) d. None of these

24. The *R*-isomer among the following are

- a. I and II b. II and III
c. III and IV d. I and III

Five compounds with formula $C_4H_8Br_2$. How many structures of *X* are possible?

- a. 2 b. 3
c. 4 d. 5

- a. *R, R* b. *R, S* c. *S, S* d. *S, R*

27. The specific rotation of a pure enantiomer is $+16^\circ$. Its observed rotation if it is isolated from a reaction with 25% racemisation and 75% retention, is

- a. -12°
b. $+12^\circ$
c. $+16^\circ$
d. -16°

28. Out of the following, the alkene that exhibits optical isomerism is

- a. 3-methyl-2-pentene
b. 4-methyl-1-pentene
c. 3-methyl-1-pentene
d. 2-methyl-2-pentene

29. The alkene that exhibits geometrical isomerism is

- a. propene
b. 2-methyl propene
c. 2-butene
d. 2-methyl-2-butene

30. The absolute configuration of

- a. *S, S*
b. *R, R*
c. *R, S*
d. *S, R*

BITSAT Archives

1. Which among the following is likely to show geometrical isomerism? [2012]

- a. $CH_3CH=NOH$
b. $CH_3CH=CH_2$
c. $CH_2=CH-CH=CCl_2$
d. $CH_3C(Cl)=C(CH_3)_2$

2. Which of the following compound (s) has *Z*-configuration? [2011]

- a. Only I b. Only II c. Only III d. I and III

Answer with Solutions

Practice Exercise

1. (d) All the compounds in which there should be restricted rotation about a bond in the molecule, show geometrical isomerism. Oximes of the type $R-CH=N-OH$, $C_6H_5-C=N-OH$ and cyclic compound like

2. (d) Disubstituted cyclic compounds and disubstituted alkenes show geometrical isomerism.

4. (d) The isomerism which arises due to restricted rotation about a bond in a molecule is known as geometrical isomerism.

All of these form geometrical isomers.

5. (c) In , the double bonds are *trans* and *cis*.

The first and third bonds are identical.

6. (b) When n = even number, then for two identical ends, number of geometrical isomers

$$= 2^{n-1} + 2^{n/2-1} = 2^1 + 2^0 = 3$$

7. (a) The separation of racemic mixture back into *d* and *l* isomers is known as resolution. It can be done by
- (I) mechanical method.
 - (II) biochemical method using enzymes.
 - (III) chemical method (salt formation).

8. (a) Racemic tartaric acid is optically inactive due to external compensation. Racemic tartaric acid is an equimolar mixture of optically active *d* and *l*-forms.
9. (d) If a substance rotates the plane polarised light in clockwise direction, it is dextrorotatory (+). If it rotates the plane polarised light in anticlockwise direction then it is laevorotatory (-). Thus, + / - form differ in specific rotation.

10. (c) The configuration in the Fischer projection of which —OH group is on right hand side, H-atom is on left hand side, —CHO group is on upper side and CH_2OH is on lower side is known as D-configuration.

11. (b) A carbon atom which is attached to four different group is called an asymmetric carbon atom or chiral centre. $HOOC(CHOH)_2COOH$ has two asymmetric carbon (C) atoms.

12. (b)
-
- (* is asymmetric C-atom)

13. (b)
-

The above compound has chiral centre. Hence, it can exhibit optical isomerism while geometrical isomerism is not possible due to the presence of identical groups on double bonded carbon atoms.

14. (d) Compounds which do not show optical activity inspite of the presence of chiral carbon atoms are called *meso*-compounds.
15. (a) If an enantiomerically pure acid is treated with racemic mixture of an alcohol having chiral carbon, the product formed will be optically active mixture.
16. (b) Butene-2 exhibits geometrical (*cis*, *trans*) isomerism.

17. (d) We know that by breaking two bonds on the chiral centre, configuration changes.

atom and one double bond thus, it has two geometrical (*cis* and *trans*) and two optical isomers.

19. (d) Staggered conformation is most stable due to its minimum energy.
20. (b) Staggered and eclipsed conformers cannot be physically separated because energy difference between them is so small that they most readily interconvert at room temperature.
21. (c)

The *gauche* conformation is most stable due to the presence of H-bonding between H-atom of OH and Cl.

22. (c) Carbon bonded with four different groups is known as chiral carbon atom. In case of given compound, the number of chiral carbon atoms are two.

23. (c) Superimposable compounds which are also not the mirror images of each other, are called diastereomers. Thus, I and II are diastereomers.

Note If H is on vertical line, *R* represents clockwise and *S* represents anticlockwise rotation. Opposite is true when H or lower priority group is present on horizontal line.

26. (b) Compounds in which the chiral centre is a part of the ring are handed in an analogous fashion.

27. (b) % Enantiomeric excess
- $$= \frac{\text{Observed specific rotation}}{\text{Specific rotation of pure enantiomer}} \times 100$$

$$\text{Observed specific rotation} = \frac{3/4}{100} \times (+16^\circ) \times 100 = +12^\circ$$

It has one chiral centre.

29. (c)

30. (b)

BITSAT Archives

1. (a) Among the given, only $\text{CH}_3\text{CH}=\text{NOH}$ (oxime) satisfy the conditions essential for exhibiting geometrical isomerism. So, it will exhibit *syn-anti* geometrical isomerism.

2. (d) When the groups with higher priority (i.e. with high atomic number) are present on same side of double bond, then the configuration is *Z* but when present on opposite side of double bond, the configuration is *E*.

(Priority : $\text{Cl} > \text{H}$ and $\text{Br} > \text{F}$)

(Priority : $\text{Cl} > \text{H}$ and $\text{Br} > \text{F}$)

(Priority : $\text{Br} > \text{Cl}$ and $\text{CH}_3 > \text{H}$)

Hence, compounds (I) and (III) have *Z*-configuration.

1

Complex Numbers

Complex Number and Its Representation

A number in the form of $z = x + iy$, where $x, y \in R, i = \sqrt{-1}$ is called a complex number. The real numbers x and y are respectively called real and imaginary parts of complex number z .

i.e. $x = \text{Re}(z)$ and $y = \text{Im}(z)$

The complex number $z = x + iy$ is represented by a point P , whose coordinates are referred to rectangular axes XOX' and YOY' which are called real and imaginary axes, respectively.

This plane is called argand plane or Gaussian plane. The magnitude of the complex number z is $|z| = \sqrt{x^2 + y^2}$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$

A complex number z is said to be purely real or imaginary, if $y = 0$ or $x = 0$, respectively.

NOTE i is neither 0 nor greater than 0 nor less than 0.

Integral Powers of i We know that, $i = \sqrt{-1}, i^2 = -1, i^3 = -i, i^4 = 1$, etc.

In general, $i^{4n} = 1, i^{4n+1} = i, i^{4n+2} = -1, i^{4n+3} = -i, \forall$ any integer n .

The sum of four consecutive powers of i is zero. i.e. $i^n + i^{n+1} + i^{n+2} + i^{n+3} = 0, n \in I$

Algebra of Complex Numbers

If $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are two complex numbers, then

(i) Addition of complex numbers is $z_1 + z_2 = (x_1 + x_2) + i(y_1 + y_2)$

Its additive identity is $0 + 0i$.

(ii) Subtraction of complex numbers is $z_1 - z_2 = (x_1 - x_2) + i(y_1 - y_2)$

(iii) Multiplication of complex numbers is $z_1 z_2 = (x_1 x_2 - y_1 y_2) + i(x_1 y_2 + x_2 y_1)$

Its multiplicative identity is $1 + 0i$.

(iv) Division of complex numbers is $\frac{z_1}{z_2} = \frac{(x_1 x_2 + y_1 y_2) + i(x_2 y_1 - x_1 y_2)}{x_2^2 + y_2^2}$

Conjugate of a Complex Number

Complex numbers $z = a + ib$ and $\bar{z} = a - ib$ are called conjugate to each other.

Properties of Conjugates

If z, z_1 and z_2 are complex numbers, then

- (i) $\overline{(\bar{z})} = z$ (ii) $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$
- (iii) $\overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2$ (iv) $\overline{z_1 z_2} = \bar{z}_1 \cdot \bar{z}_2$
- (v) $\overline{\left(\frac{z_1}{z_2}\right)} = \frac{\bar{z}_1}{\bar{z}_2}$
- (vi) $z + \bar{z} = 2\operatorname{Re}(\bar{z}) = 2\operatorname{Re}(z)$
- (vii) $z - \bar{z} = 2i\operatorname{Im}(z)$
- (viii) $z + \bar{z} = 0 \Rightarrow z$ is purely imaginary.
- (ix) $z = \bar{z} \Leftrightarrow z$ is purely real.
- (x) $z_1 \bar{z}_2 + \bar{z}_1 z_2 = 2\operatorname{Re}(\bar{z}_1 z_2) = 2\operatorname{Re}(z_1 \bar{z}_2)$
- (xi) If $z = f(z_1)$, then $\bar{z} = f(\bar{z}_1)$

Modulus of a Complex Number

Let $z = a + ib$, then the modulus of z is the positive real number $\sqrt{a^2 + b^2}$ and is denoted by $|z|$.

i.e. $|z| = \sqrt{a^2 + b^2} = \sqrt{|\operatorname{Re}(z)|^2 + |\operatorname{Im}(z)|^2}$, $|z| \geq 0, \forall z \in \mathbb{C}$

Properties of Moduli

- (i) $|z| \geq 0 \Rightarrow |z| = 0$ iff $z = 0$, i.e. $\operatorname{Re}(z) = \operatorname{Im}(z) = 0$
- (ii) $z\bar{z} = |\bar{z}|^2$
- (iii) $|z_1 z_2| = |z_1| |z_2|$
- (iv) $\left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}$
- (v) $|z^n| = |z|^n$
- (vi) $|z_1 + z_2| \leq |z_1| + |z_2|$
- (vii) $|z_1 - z_2| \geq ||z_1| - |z_2||$
- (viii) $||z_1| - |z_2|| \leq |z_1 + z_2| \leq |z_1| + |z_2|$
- (ix) $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + 2\operatorname{Re}(z_1 \bar{z}_2)$
- (x) $|z| = |\bar{z}| = |-z| = |-\bar{z}|$
- (xi) $z_1 \bar{z}_2 + \bar{z}_1 z_2 = 2|z_1||z_2|\cos(\theta_1 - \theta_2)$
where, $\theta_1 = \arg(z_1)$ and $\theta_2 = \arg(z_2)$
- (xii) $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2\{|z_1|^2 + |z_2|^2\}$

Argument of a Complex Number

For a complex number $z = x + iy$, the argument or amplitude of z ($z \neq 0$) = $\tan^{-1}\left(\frac{y}{x}\right)$

i.e. solution of the system of equations $\cos \theta = \frac{x}{\sqrt{x^2 + y^2}}$, $\sin \theta = \frac{y}{\sqrt{x^2 + y^2}}$ and is denoted by $\arg(z)$.

The value of θ is found by solving these equations and θ is called the argument or amplitude of z . If $-\pi < \theta \leq \pi$, then θ is called the principal argument of z .

- (i) If $x < 0, y < 0$, then principal $\arg(z)$ lies between $-\pi$ and $-\pi/2$.
- (ii) If $x = 0, y < 0$, then principal $\arg(z)$ is $-\pi/2$.
- (iii) If $x > 0, y < 0$, then principal $\arg(z)$ lies between $-\pi/2$ and 0 .
- (iv) If $x > 0, y = 0$, then principal $\arg(z)$ is 0 .
- (v) If $x > 0, y > 0$, then principal $\arg(z)$ lies between 0 and $\pi/2$.
- (vi) If $x = 0, y > 0$, then principal $\arg(z)$ is $\pi/2$.
- (vii) If $x < 0, y > 0$, then principal $\arg(z)$ is π .

Properties of $\arg(z)$

- (i) $\arg(z_1 z_2) = \arg(z_1) + \arg(z_2)$
- (ii) $\arg\left(\frac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2)$
- (iii) $\arg(z)$ is not defined, if $z = 0$
- (iv) $\arg(z^n) = n \arg(z)$ (v) $\arg(z) + \arg(\bar{z}) = 2\pi$
- (vi) If $\arg\left(\frac{z_2}{z_1}\right) = \theta$, then $\arg\left(\frac{z_1}{z_2}\right) = 2k\pi - \theta, k \in \mathbb{I}$

Polar Form of a Complex Number

Expression $r(\cos \theta + i \sin \theta)$ is called the polar form of the complex number $x + iy$.

Here,

$$r = \sqrt{x^2 + y^2}$$

$$\cos \theta = \frac{x}{\sqrt{x^2 + y^2}}$$

$$\Rightarrow \sin \theta = \frac{y}{\sqrt{x^2 + y^2}}$$

Triangle Inequality

In any triangle, sum of any two sides is greater than the third side and difference of any two sides is less than the third side.

- (i) $|z_1 + z_2| \leq |z_1| + |z_2|$ (ii) $|z_1 + z_2| \geq ||z_1| - |z_2||$
- (iii) $|z_1 - z_2| \leq |z_1| + |z_2|$ (iv) $|z_1 - z_2| \geq ||z_1| - |z_2||$

NOTE Complex numbers do not possess the inequality, i.e. $3 + 2i > 1 + 2i$ does not make any sense.

De-Moivre's Theorem

If n is an integer, positive, negative or a rational number, then

$$(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$$

Other Forms of De-Moivre's Theorem

- (i) $(\cos \theta + i \sin \theta)^{-n} = \cos n\theta - i \sin n\theta$
- (ii) $(\cos \theta - i \sin \theta)^n = \cos n\theta - i \sin n\theta$
- (iii) $(\cos \theta - i \sin \theta)^{-n} = \cos n\theta + i \sin n\theta$

Square Roots of a Complex Number

If $z = a + ib$ is a complex number, such that

$\sqrt{a + ib} = x + iy$, where x, y are real numbers, then $a + ib = (x + iy)^2 \Rightarrow a + ib = (x^2 - y^2) + i(2xy)$ and square root of z by equating real and imaginary part can be given

$$\begin{aligned}\sqrt{z} &= \pm \left[\sqrt{\frac{1}{2}(\sqrt{a^2 + b^2} + a)} + i \sqrt{\frac{1}{2}(\sqrt{a^2 + b^2} - a)} \right], b > 0 \\ &= \pm \left[\sqrt{\frac{1}{2}(\sqrt{a^2 + b^2} + a)} - i \sqrt{\frac{1}{2}(\sqrt{a^2 + b^2} - a)} \right], b < 0\end{aligned}$$

n th Roots of Unity

$$(\cos \theta + i \sin \theta)^{1/n} = \cos \left(\frac{2k\pi}{n} \right) + i \sin \left(\frac{2k\pi}{n} \right) = e^{\frac{2\pi k i}{n}}$$

where, $k = 0, 1, 2, \dots, (n-1)$

Thus, n th roots of unity are $1, \alpha, \alpha^2, \alpha^3, \dots, \alpha^{n-1}$

where, $\alpha = e^{i 2\pi/n} = \cos \frac{2\pi}{n} + i \sin \frac{2\pi}{n}$

Cube Roots of Unity

Cube roots of unity are $1, \omega, \omega^2$, where

$$\omega = \frac{-1 + \sqrt{3}i}{2}; \omega^2 = \frac{-1 - \sqrt{3}i}{2} \text{ and } \omega^3 = 1$$

Some Important Results

- The sum of the cube root of unity i.e. $1 + \omega + \omega^2 = 0$ and their product $= 1 \cdot \omega \cdot \omega^2 = \omega^3 = 1$
In general, $(\omega)^{3n} = 1, (\omega)^{3n+1} = \omega$ and $(\omega)^{3n+2} = \omega^2$, where n is an integer.
- Each complex root of unity is the square of the other.
- The three cube roots of unity are the vertices of an equilateral triangle inscribed in the circle $|z| = 1$.
- The four fourth roots of unity are $1, -1, i, -i$

Properties of Roots of Unity

- (i) Sum of the roots of unity in square roots, cube roots, 4th roots or n th roots is zero.
- (ii) They are in GP of common ratio $d = e^{2\pi i/r}$, where $r = 2, 3, 4, \dots, (n-1)$.
- (iii) Sum of their p th powers is zero.

$$\text{i.e. } 1 + \alpha^p + \alpha^{2p} + \dots + \alpha^{(n-1)p} = \frac{1 - (\alpha^n)^p}{1 - \alpha^p} = 0$$

$$\therefore \alpha^n = 1, p \neq kn$$

If $p = kn$, then sum of their p th powers is n .

$$\text{i.e. if } p = kn, \text{ then } \alpha^p = \alpha^{kn} = (\alpha^n)^k = 1.$$

$\therefore$ Each root is 1.

$$\therefore \text{Sum} = 1 + 1 + 1 + \dots + 1 = n$$

Geometrical Applications of Complex Numbers

1. If z_1 and z_2 are two complex numbers, then

- (i) $|z_1 - z_2|$ is the distance between the points affixes z_1 and z_2 .
- (ii) $\frac{mz_2 + nz_1}{m+n}$ is the affix of the point dividing the line joining the points with affixes z_1 and z_2 in the ratio $m : n$ internally, where $m \neq n$.
- (iii) $\frac{mz_2 - nz_1}{m-n}$ is the affix of the point dividing the line joining the points with affixes z_1 and z_2 in the ratio $m : n$ externally, where $m \neq n$.
- (iv) If the affixes of the vertices of the triangle are z_1, z_2 and z_3 , then the affix of its centroid is $\frac{z_1 + z_2 + z_3}{3}$.

2. Three points with affixes z_1, z_2, z_3 are collinear, if

$$\begin{vmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{vmatrix} = 0$$

3. (i) $|z - z_1| = r$ represents the circle with centre z_1 and radius r .

(ii) $|z - z_1| < r$ represents the interior of the circle with centre z_1 and radius r .

4. $\left| \frac{z - z_1}{z - z_2} \right| = k$ represents a circle, if $k \neq 1$ and if $k = 1$, then it represent a straight line which is the perpendicular bisector of the line segment joining points with affixes z_1 and z_2 .

5. $(z - z_1)(\bar{z} - \bar{z}_2) + (\bar{z} - \bar{z}_1)(z - z_2) = 0$ represents the circle with line joining points with affixes z_1 and z_2 as a diameter.

6. If z_1, z_2 and z_3 are the affixes of the points A, B, C respectively, then the angle between AB and AC is given by $\arg \left(\frac{z_3 - z_1}{z_2 - z_1} \right)$.

Practice Exercise

- The multiplicative inverse of $(6 + 5i)^2$ is
 a. $\frac{11}{61} - \frac{60}{61}i$ b. $\frac{11}{61} + \frac{60}{61}i$ c. $\frac{9}{61} - \frac{60}{61}i$ d. None
- If $8iz^3 + 12z^2 - 18z + 27i = 0$, then the value of $|z|$ is
 a. $\frac{3}{2}$ b. $\frac{2}{3}$ c. 1 d. $\frac{3}{4}$
- If z_1 and z_2 are two complex numbers such that $|z_1| = |z_2|$ and $\arg(z_1) + \arg(z_2) = \pi$, then z_1 is equal to
 a. $2\bar{z}_2$ b. $\bar{z}_2$
 c. $-\bar{z}_2$ d. None of these
- If $|z - 1| = 1$, then $\arg(z)$ is equal to
 a. $\frac{1}{2} \arg(z)$ b. $\frac{1}{3} \arg(z + 1)$
 c. $\frac{1}{2} \arg(z - 1)$ d. None of these
- If $z_1 = 8 + 4i$, $z_2 = 6 + 4i$ and $\arg\left(\frac{z - z_1}{z - z_2}\right) = \frac{\pi}{4}$, then z satisfies
 a. $|z - 7 - 4i| = 1$ b. $|z - 7 - 5i| = \sqrt{2}$
 c. $|z - 4i| = 8$ d. $|z - 7i| = \sqrt{18}$
- If z_1, z_2 and z_3 are three complex numbers such that $|z_1| = |z_2| = |z_3| = \left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right| = 1$, then $|z_1 + z_2 + z_3|$ is
 a. equal to 1 b. less than 1
 c. greater than 3 d. equal to 3
- If 1, ω and ω^2 are the three cube roots of unity and α, β and γ are the cube roots of p, q (< 0), then for any x, y and z , the expression $\left(\frac{x\alpha + y\beta + z\gamma}{x\beta + y\gamma + z\alpha}\right)$ is equal to
 a. 1 b. ω
 c. ω^2 d. None of these
- If $\begin{vmatrix} x+1 & \omega & \omega^2 \\ x+\omega & \omega^2 & 1 \\ x+\omega^2 & 1 & \omega \end{vmatrix} = 3$ is an equation of x , where 1, ω and ω^2 are the complex cube roots of unity. Then, the value of x is
 a. 0 b. 1
 c. -1 d. None of these
- If a, b and c are integers not all equal and ω is a cube root of unity (where $\omega \neq 1$), then minimum value of $|a + b\omega + c\omega^2|^2$ is equal to
 a. 0 b. 1 c. $\frac{\sqrt{3}}{2}$ d. $\frac{1}{2}$
- If $z = 1 + \cos \frac{\pi}{5} + i \sin \frac{\pi}{5}$, then $\sin(\arg z)$ is equal to
 a. $\frac{\sqrt{10 - 2\sqrt{5}}}{4}$ b. $\frac{\sqrt{5} - 1}{4}$ c. $\frac{\sqrt{5} + 1}{4}$ d. $\frac{\sqrt{2} - 1}{4}$
- If $\operatorname{Re}\left(\frac{1}{z}\right) = 3$, then z lies on
 a. circle with centre on Y -axis
 b. circle with centre on X -axis not passing through origin
 c. circle with centre on X -axis passing through origin
 d. None of the above
- If a complex number z lies in the interior or on the boundary of a circle of radius 3 and centre at $(-4, 0)$, then the greatest and least values of $|z + 1|$ are
 a. 5, 0 b. 6, 1
 c. 6, 0 d. None of these
- If $\arg(\bar{z}_1) = \arg(z_2)$, then
 a. $z_2 = kz_1^{-1}$ ($k > 0$) b. $z_2 = kz_1$ ($k > 0$)
 c. $|z_2| = |\bar{z}_1|$ d. None of these
- If z_1 and z_2 are two complex numbers such that $\frac{z_1}{z_2} + \frac{z_2}{z_1} = 1$, then
 a. z_1, z_2 are collinear
 b. z_1, z_2 and the origin form a right angled triangle
 c. z_1, z_2 and the origin form an equilateral triangle
 d. None of the above
- If z_1, z_2 and z_3, z_4 are two pairs of conjugate complex numbers, then $\arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right)$ is equal to
 a. 0 b. $\pi/2$ c. $3\pi/2$ d. π
- If $a = \cos \alpha + i \sin \alpha, b = \cos \beta + i \sin \beta, c = \cos \gamma + i \sin \gamma$ and $\frac{b}{c} + \frac{c}{a} + \frac{a}{b} = 1$, then $\cos(\beta - \gamma) + \cos(\gamma - \alpha) + \cos(\alpha - \beta)$ is equal to
 a. $3/2$ b. $-3/2$ c. 0 d. 1
- The least positive integer n for which $\left(\frac{1+i}{1-i}\right)^n = \frac{2}{\pi}(\sec^{-1} \frac{1}{x} + \sin^{-1} x)$, where $x \neq 0; -1 \leq x \leq 1$, is
 a. 2 b. 4
 c. 6 d. 8
- If $z = \sqrt{(5 + 12i)} + \sqrt{(12i - 5)}$, then the principal value of $\arg(z)$ can be
 a. $\frac{\pi}{4}$ b. $-\frac{\pi}{4}$ c. $-\frac{3\pi}{4}$ d. All of these

19. If $\arg\left(\frac{2-z}{2+z}\right) = \frac{\pi}{6}$, then locus of z is
 a. straight line b. circle
 c. parabola d. None of these
20. If $z_r = \text{cis } \frac{\pi}{2^r}$, then $z_1 z_2 \dots$ is equal to
 a. 1 b. -1 c. -2 d. $-\frac{1}{2}$
21. If z_1, z_2 and z_3 represent the vertices of an equilateral triangle such that $|z_1| = |z_2| = |z_3|$, then
 a. $z_1 + z_2 = z_3$ b. $z_1 + z_2 + z_3 = 0$
 c. $z_1 z_2 = \frac{1}{z_3}$ d. $z_1 - z_2 = z_3 - z_2$
22. For any two complex numbers z_1 and z_2 , we have $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$, then
 a. $\text{Re}\left(\frac{z_1}{z_2}\right) = 0$ b. $\text{Im}\left(\frac{z_1}{z_2}\right) = 0$
 c. $\text{Re}\left(\frac{z_1}{z_2}\right) \neq 0$ d. None of these
23. If α, β are two different complex numbers such that $|\alpha| = 1, |\beta| = 1$, then the expression $\left|\frac{\beta - \alpha}{1 - \bar{\alpha}\beta}\right|$ equals
 a. $\frac{1}{2}$ b. 1 c. 2 d. None
24. The value of $\sum_{n=1}^{13} (i^n + i^{n+1})$, where $i = \sqrt{-1}$, equals
 a. i b. $i - 1$ c. $-i$ d. 0
25. The continued product of the four values of $\left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}\right)^{3/4}$ is
 a. -1 b. 1 c. $\frac{3}{2}$ d. $-\frac{1}{2}$
26. If $x_n = \cos\left(\frac{\pi}{2^n}\right) + i \sin\left(\frac{\pi}{2^n}\right), n \in N$, then $x_1 x_2 x_3 \dots$ is equal to
 a. 1 b. -1 c. zero d. None
27. If $\alpha + i\beta = \cot^{-1}(z)$, where $z = x + iy$ and α is a constant, then the locus of z is
 a. $x^2 + y^2 - x \cot 2\alpha - 1 = 0$
 b. $x^2 + y^2 - 2x \cot \alpha - 1 = 0$
 c. $x^2 + y^2 - 2x \cot 2\alpha + 1 = 0$
 d. $x^2 + y^2 - 2x \cot 2\alpha - 1 = 0$
28. If $(a_1 + ib_1)(a_2 + ib_2) \dots (a_n + ib_n) = A + iB$, then $\sum_{i=1}^n \tan^{-1}\left(\frac{b_i}{a_i}\right)$ is equal to
 a. $\frac{B}{A}$ b. $\tan\left(\frac{B}{A}\right)$ c. $\tan^{-1}\left(\frac{B}{A}\right)$ d. $\tan^{-1}\left(\frac{A}{B}\right)$

29. The maximum value of $|z|$, when z satisfy the condition $|z + 3/z| = 3$, is

a. $\frac{2 - \sqrt{21}}{2}$ b. $\frac{3 - \sqrt{20}}{2}$ c. $\frac{3 + \sqrt{21}}{2}$ d. $\frac{3 + \sqrt{20}}{2}$

30. If $i = \sqrt{-1}$, then $4 + 5\left(-\frac{1}{2} + \frac{i\sqrt{3}}{2}\right)^{334} + 3\left(-\frac{1}{2} + \frac{i\sqrt{3}}{2}\right)^{335}$ is equal to

a. $1 - i\sqrt{3}$ b. $-1 + i\sqrt{3}$ c. $i\sqrt{3}$ d. $-i\sqrt{3}$

Directions (Q. Nos. 31 and 32) Let $z = a + ib = (a, b)$ be any complex number, $\forall a, b \in R$ and $i = \sqrt{-1}$. If $(a, b) \neq (0, 0)$, then $\arg(z) = \tan^{-1}\left(\frac{b}{a}\right)$, where $\arg(z) \leq \pi$

and $\arg(\bar{z}) + \arg(-z) = \begin{cases} \pi, & \text{if } \arg(z) < 0 \\ -\pi, & \text{if } \arg(z) > 0 \end{cases}$

31. If $\arg(z) > 0$, then $\arg(-z) - \arg(z) = \lambda_1$ and if $\arg(z) < 0$, then $\arg(z) - \arg(-z) = \lambda_2$, where
 a. $\lambda_1 + \lambda_2 = 0$ b. $\lambda_1 - \lambda_2 = 0$
 c. $3\lambda_1 - 2\lambda_2 = 0$ d. $2\lambda_1 - 3\lambda_2 = 0$

32. The value of $\sqrt{\{\arg(z) + \arg(\bar{z}) - 2\pi\}\{\arg(-z) + \arg(\bar{z})\}}$, $\forall z = x + iy$, where $i = \sqrt{-1}; x, y > 0$, is
 a. π b. $-\pi$ c. 0 d. not defined

33. The complex numbers z_1, z_2 and z_3 satisfying $\frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2}$, are the vertices of a triangle which is

a. of area zero b. right angled triangle
 c. equilateral d. obtuse angled triangle

34. Let z_1 and z_2 be n th roots of unity which subtend a right angle at the origin, then n must be of the form
 a. $4k + 1$ b. $4k + 2$ c. $4k + 3$ d. $4k$

35. The value of $\begin{vmatrix} 1+\omega & \omega^2 & 1+\omega^2 \\ -\omega & -(1+\omega^2) & 1+\omega \\ -1 & -(1+\omega^2) & 1+\omega \end{vmatrix}$, where ω is cube

root of unity, is equal to

a. 2ω b. $3\omega^2$ c. $-3\omega^2$ d. 3ω

36. The square roots of $7 + 24i$ are

a. $\pm(4 + 3i)$ b. $\pm(4 - 3i)$ c. $\pm(3 + 4i)$ d. $\pm(3 - 4i)$

37. If $|z_1| = |z_2|$ and $\arg\left(\frac{z_1}{z_2}\right) = \pi$, then $z_1 + z_2$ is equal to

a. 0 b. purely imaginary
 c. purely real d. None of these

38. If $\left(\frac{1-i}{1+i}\right)^{100} = a + ib$, then

a. $a = 2, b = -1$ b. $a = 1, b = 0$
 c. $a = 0, b = 1$ d. $a = -1, b = 2$

39. If $\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = x + iy$, then

- a. $x = 3, y = 1$
 b. $x = 1, y = 3$
 c. $x = 0, y = 3$
 d. $x = 0, y = 0$

40. Let z_1 and z_2 be two complex numbers such that $z_1 \neq z_2$ and $|z_1| = |z_2|$. If z_1 has positive real part and z_2 has negative imaginary part, then $\frac{(z_1 + z_2)}{(z_1 - z_2)}$ may be

- a. purely imaginary
 b. real and positive
 c. real and negative
 d. None of the above

BITSAT Archives

1. The complex number $z = x + iy$ which satisfies the equation $\left| \frac{z - 3i}{z + 3i} \right| = 1$, lies on [2014]

- a. the X-axis
 b. the straight line $y = 3$
 c. a circle passing through origin
 d. None of the above

2. The value of $\sum_{k=1}^6 \left(\frac{\sin 2\pi k}{7} - \frac{i \cos 2\pi k}{7} \right)$ is [2013]

- a. -1 b. 0 c. -i d. i

3. If $(x + iy)^{1/3} = 2 + 3i$, then $3x + 2y$ is equal to [2013]

- a. -20 b. -60 c. -120 d. 60

4. Area of the triangle in the argand diagram formed by the complex numbers $z, iz, z + iz$, where $z = x + iy$, is [2012]

- a. $|z|$ b. $|z|^2$
 c. $2|z|^2$ d. $\frac{1}{2}|z|^2$

5. If $z = \cos \theta + i \sin \theta$, then the value of $z^n + \frac{1}{z^n}$ will be [2011]

- a. $\sin 2n\theta$ b. $2 \sin n\theta$ c. $2 \cos n\theta$ d. $\cos 2n\theta$

6. Find the least value of n for which $\left(\frac{1+i}{1-i} \right)^n = 1$. [2010]

- a. 4 b. 3 c. -4 d. 1

7. If ω is a cube root of unity, then $\begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix}$ is equal

to [2010, 06]

- a. 1 b. ω c. ω^2 d. 0

8. If $a = \cos \theta + i \sin \theta$, then $\frac{1+a}{1-a}$ is equal to [2009]

- a. $\cot \frac{\theta}{2}$ b. $\cot \theta$
 c. $i \cot \frac{\theta}{2}$ d. $i \tan \frac{\theta}{2}$

9. If ω is a complex cube root of unity, then $\sin \left\{ (\omega^{10} + \omega^{23}) \pi - \frac{\pi}{4} \right\}$ is equal to [2008]

- a. $\frac{1}{\sqrt{2}}$ b. $\frac{1}{2}$
 c. 1 d. $\frac{\sqrt{3}}{2}$

10. If $(\cos \theta + i \sin \theta)(\cos 2\theta + i \sin 2\theta) \dots (\cos n\theta + i \sin n\theta) = 1$, then the value of θ is [2007]

- a. $\frac{2m\pi}{n(n+1)}$ b. $4m\pi$
 c. $\frac{4m\pi}{n(n+1)}$ d. $\frac{m\pi}{n(n+1)}$

11. For all complex numbers z_1 and z_2 satisfying $|z_1| = 12$ and $|z_2 - 3 - 4i| = 5$, the minimum value of $|z_1 - z_2|$ is [2007]

- a. 4 b. 3
 c. 1 d. 2

12. The amplitude of $\frac{1+i\sqrt{3}}{\sqrt{3}+i}$ is [2006]

- a. $\frac{\pi}{6}$ b. $\frac{\pi}{3}$
 c. 0 d. None of these

13. Let $x = \alpha + \beta, y = \alpha\omega + \beta\omega^2, z = \alpha\omega^2 + \beta\omega$, ω being an imaginary cube root of unity. Product of xyz is [2005]

- a. $\alpha^2 + \beta^2$ b. $\alpha^2 - \beta^2$
 c. $\alpha^3 + \beta^3$ d. $\alpha^3 - \beta^3$

Answer with Solutions

Practice Exercise

1. (a) Let $z = (6 + 5i)^2 = 36 + 2 \times 6 \times 5i + 25i^2 = 11 + 60i$

Then, $\bar{z} = 11 - 60i$

and $|z| = \sqrt{(11)^2 + (60)^2} = \sqrt{121 + 3600} = \sqrt{3721} = 61$

$\therefore$ Multiplicative inverse of $z = \frac{\bar{z}}{|z|^2}$

$$= \frac{11 - 60i}{(61)^2} = \frac{11}{(61)^2} - \frac{60}{(61)^2}i$$

2. (a) Given, $8iz^3 + 12z^2 - 18z + 27i = 0$

$\Rightarrow 4z^2(2iz + 3) + 9i(2iz + 3) = 0$

$\Rightarrow (2iz + 3)(4z^2 + 9i) = 0$

$\Rightarrow 2iz + 3 = 0$ or $4z^2 + 9i = 0 \Rightarrow |z| = \frac{3}{2}$

3. (c) Let $z_1 = r(\cos \theta_1 + i \sin \theta_1)$

and $z_2 = r(\cos \theta_2 + i \sin \theta_2)$

Since $|z_2| = |z_1|$

Also, $\arg(z_1) + \arg(z_2) = \pi$

$\therefore \arg(z_2) = \pi - \arg(z_1) \Rightarrow \arg(z_2) = \pi - \theta_1$

$\therefore z_2 = r_1 \{ \cos(\pi - \theta_1) + i \sin(\pi - \theta_1) \}$
 $= r_1 (-\cos \theta_1 + i \sin \theta_1)$
 $= -r_1 (\cos \theta_1 - i \sin \theta_1) = -\bar{z}_1$

$\Rightarrow z_1 = -\bar{z}_2$

4. (c) Given, $|z - 1| = 1$

$\Rightarrow z - 1 = e^{i\theta}$, where $\arg(z - 1) = \theta$... (i)

$\Rightarrow z = e^{i\theta} + 1 \Rightarrow z = 1 + \cos \theta + i \sin \theta$
 $= 2 \cos^2 \frac{\theta}{2} + 2i \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} \quad [\because e^{i\theta} = \cos \theta + i \sin \theta]$

$\Rightarrow \arg(z) = \frac{\theta}{2} = \frac{1}{2} \arg(z - 1)$ [from Eq. (i)]

5. (b) Hint $\frac{z - z_1}{z - z_2} = \frac{(x - 8) + i(y - 4)}{(x - 6) + i(y - 4)}$

$\Rightarrow \tan^{-1} \left(\frac{y - 4}{x - 8} \right) - \tan^{-1} \left(\frac{y - 4}{x - 6} \right) = \frac{\pi}{4}$

$\Rightarrow \frac{(y - 4) \frac{2}{(x - 8)(x - 6)}}{(x - 8)(x - 6) + (y - 4)^2} = \tan \frac{\pi}{4} = 1$

$\Rightarrow (x - 7)^2 + (y - 5)^2 = (\sqrt{2})^2$

$\Rightarrow |z - 7 - 5i| = \sqrt{2}$

6. (a) $|z_1| = |z_2| = |z_3| = 1$ [given]

Now, $|z_1| = 1 \Rightarrow |z_1|^2 = 1$

$\Rightarrow z_1 \bar{z}_1 = 1$

Similarly, $z_2 \bar{z}_2 = 1, z_3 \bar{z}_3 = 1$

Now, $\left| \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} \right| = 1$

$\Rightarrow \left| \frac{\bar{z}_1}{z_1 \bar{z}_1} + \frac{\bar{z}_2}{z_2 \bar{z}_2} + \frac{\bar{z}_3}{z_3 \bar{z}_3} \right| = 1$

and $\left| \frac{\bar{z}_1}{z_1 + z_2 + z_3} \right| = 1$

$\Rightarrow |z_1 + z_2 + z_3| = 1 \Rightarrow |z_1 + z_2 + z_3| = 1$

7. (c) $\because p < 0$, take $p = -q^3$ ($q > 0$)

$\therefore p^{1/3} = q(-1)^{1/3} = -q, -q\omega, -q\omega^2$

Thus, $\alpha = -q, \beta = -q\omega, \gamma = -q\omega^2$

$\therefore$ Given expression $= \frac{x + y\omega + z\omega^2}{x\omega + y\omega^2 + z} = \omega^2$

8. (d) $\begin{vmatrix} x+1 & \omega & \omega^2 \\ x+\omega & \omega^2 & 1 \\ x+\omega^2 & 1 & \omega \end{vmatrix} = 3$

LHS $= \begin{vmatrix} x+1+\omega+\omega^2 & \omega & \omega^2 \\ x+\omega+\omega^2+1 & \omega^2 & 1 \\ x+\omega^2+1+\omega & 1 & \omega \end{vmatrix}$ [applying $C_1 \rightarrow C_1 + C_2 + C_3$]

$= \begin{vmatrix} x+0 & \omega & \omega^2 \\ x+0 & \omega^2 & 1 \\ x+0 & 1 & \omega \end{vmatrix} = x \begin{vmatrix} 1 & \omega & \omega^2 \\ 1 & \omega^2 & 1 \\ 1 & 1 & \omega \end{vmatrix}$ [$\because 1 + \omega + \omega^2 = 0$]

$= x \begin{vmatrix} 3 & 1+\omega+\omega^2 & 1+\omega+\omega^2 \\ 1 & \omega^2 & 1 \\ 1 & 1 & \omega \end{vmatrix}$

[applying $R_1 \rightarrow R_1 + R_2 + R_3$]

$= x \begin{vmatrix} 3 & 0 & 0 \\ 1 & \omega^2 & 1 \\ 1 & 1 & \omega \end{vmatrix} = 3x(\omega^3 - 1)$

$\Rightarrow 3x(\omega^3 - 1) = 3 \Rightarrow x(\omega^3 - 1) = 1 \Rightarrow x \times 0 = 1$ [$\because \omega^3 = 1$]

$\therefore x = \frac{1}{0}$ [not defined]

9. (b) $|a + b\omega + c\omega^2|^2 = (a + b\omega + c\omega^2)(a + b\bar{\omega} + c\bar{\omega}^2)$

$= (a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$ [$\because \bar{\omega} = \omega^2$ and $\bar{\omega}^2 = \omega$]

$= a^2 + b^2 + c^2 - ab - bc - ca$

$= \frac{1}{2} [(a - b)^2 + (b - c)^2 + (c - a)^2]$

So, it has minimum value 1 for $a = b = 1$ and $c = 2$.

10. (b) If $z = 1 + \cos \theta + i \sin \theta$, then $\arg(z) = \frac{\theta}{2}$

$\therefore \arg(z) = \frac{\pi}{2} = \frac{\pi}{10}$

$\Rightarrow \sin(\arg z) = \sin\left(\frac{\pi}{10}\right) = \sin 18^\circ = \frac{\sqrt{5} - 1}{4}$

$$11. (c) \text{ Given, } \operatorname{Re}\left(\frac{1}{z}\right) = 3 \Rightarrow \operatorname{Re}\left(\frac{\bar{z}}{|z|^2}\right) = 3 \quad \left[\because \frac{1}{z} = \frac{\bar{z}}{|z|^2} \right]$$

$$\Rightarrow \frac{x}{x^2 + y^2} = 3 \Rightarrow 3x^2 + 3y^2 - x = 0$$

So, it is a circle whose centre is on X-axis and passes through the origin.

$$12. (c) \text{ Given, } |z + 4| \leq 3$$

$$\text{Now, } |z + 1| = |z + 4 - 3| \leq |z + 4| + |3| \\ = |z + 4| + 3 \leq 3 + 3 = 6$$

Hence, the greatest value of $|z + 1| = 6$

Since, least value of the modulus of a complex number is 0.

$$\therefore |z + 1| = 0 \Rightarrow z = -1$$

$$\text{Now, } |z + 4| = |-1 + 4| = 3$$

So, $|z + 4| \leq 3$ is satisfied by $z = -1$.

$$\therefore \text{Least value of } |z + 1| = 0$$

$$13. (a) \text{ Here, } \bar{z}_1 = \frac{z_1 \bar{z}_1}{z_1} = |z_1|^2 z_1^{-1}$$

$$\Rightarrow \arg(z_1^{-1}) = \arg(\bar{z}_1) = \arg(z_2) \Rightarrow z_2 = kz_1^{-1} (k > 0)$$

$$14. (c) \text{ Given, } \frac{z_1}{z_2} + \frac{z_2}{z_1} = 1 \Rightarrow z_1^2 + z_2^2 = z_1 z_2$$

$$\Rightarrow z_1^2 + z_2^2 + z_3^2 = z_1 z_2 + z_1 z_3 + z_2 z_3, \text{ where } z_3 = 0$$

So, z_1, z_2 and the origin form an equilateral triangle.

$$15. (a) \text{ Since, } z_2 = \bar{z}_1 \text{ and } z_4 = \bar{z}_3$$

$$\therefore z_1 z_2 = z_1 \bar{z}_1 = |z_1|^2 \text{ and } z_3 z_4 = z_3 \bar{z}_3 = |z_3|^2$$

$$\text{Now, } \arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right) = \arg\left(\frac{z_1 z_2}{z_4 z_3}\right) = \arg\left(\frac{|z_1|^2}{|z_3|^2}\right) \\ = \arg\left(\left(\frac{z_1}{z_3}\right)^2\right) = 0 \quad \left[\because \left|\frac{z_1}{z_3}\right| \text{ is a real number} \right]$$

$$16. (d) \text{ Here, } \frac{a}{b} = \cos(\alpha - \beta) + i \sin(\alpha - \beta),$$

$$\frac{b}{c} = \cos(\beta - \gamma) + i \sin(\beta - \gamma) \text{ and } \frac{c}{a} = \cos(\gamma - \alpha) + i \sin(\gamma - \alpha)$$

$$\therefore \frac{a}{b} + \frac{b}{c} + \frac{c}{a} = 1$$

$$\therefore \cos(\alpha - \beta) + \cos(\beta - \gamma) + \cos(\gamma - \alpha) + i[\sin(\alpha - \beta) + \sin(\beta - \gamma) + \sin(\gamma - \alpha)] = 1 + 0i$$

On equating real parts, we get

$$\cos(\alpha - \beta) + \cos(\beta - \gamma) + \cos(\gamma - \alpha) = 1$$

$$17. (b) \text{ For } -1 \leq x \leq 1 \text{ and } x \neq 0, \sec^{-1}\left(\frac{1}{x}\right) = \cos^{-1} x$$

$$\therefore \sec^{-1}\left(\frac{1}{x}\right) + \sin^{-1} x = \cos^{-1} x + \sin^{-1} x = \frac{\pi}{2}$$

$$\therefore \left(\frac{1+i}{1-i}\right)^n = \frac{2}{\pi} \times \frac{\pi}{2} = 1$$

$$\Rightarrow \left[\frac{(1+i)^2}{2}\right]^n = 1 \Rightarrow i^n = 1$$

So, the least positive integral value of n is 4.

$$18. (d) \text{ Here, } \sqrt{(5+12i)} = \sqrt{5+2(3)(2i)} = \sqrt{(3+2i)^2} = \pm(3+2i) \\ \text{and } \sqrt{(12i-5)} = \sqrt{-5+2(3)(2i)} \\ = \sqrt{(2+3i)^2} = \pm(2+3i)$$

$$\therefore z = \sqrt{(5+12i)} + \sqrt{(12i-5)}$$

$$= \pm(3+2i) \pm (2+3i)$$

$$\Rightarrow z = 5+5i, -1+i, -5-5i, 1-i$$

Hence, the principal values of $\arg(z)$ are $\frac{\pi}{4}, \frac{3\pi}{4}, -\frac{3\pi}{4}, -\frac{\pi}{4}$.

$$19. (b) \text{ Hint } \arg(2-z) - \arg(2+z) = \frac{\pi}{6}$$

$$\Rightarrow \arg[(2-x) - iy] - \arg[(2+x) + iy] = \frac{\pi}{6}$$

$$\Rightarrow \tan^{-1}\left(\frac{-y}{2-x}\right) - \tan^{-1}\left(\frac{y}{2+x}\right) = \frac{\pi}{6}$$

$$\Rightarrow \frac{4y}{x^2 - 4 + y^2} = \tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}$$

20. (b) The argument of a product is the sum of the arguments of the factors.

$$\therefore \arg(z_1 \cdot z_2 \dots) = \frac{\pi}{2} + \frac{\pi}{2^2} + \frac{\pi}{2^3} + \dots$$

$$= \frac{\frac{\pi}{2}}{1 - \frac{1}{2}} = \pi \quad \left[\because S_{\infty} = \frac{a}{1-r} \right]$$

$$\therefore z_1 z_2 z_3 \dots = \operatorname{cis} \pi = -1$$

$$21. (b) \text{ Since, } |z_1| = |z_2| = |z_3|$$

$\therefore O$ is the circumcentre of an equilateral $\triangle ABC$.

$$\therefore \frac{x_1 + x_2 + x_3}{3} = 0 = \frac{y_1 + y_2 + y_3}{3}$$

$$\text{where, } z_1 = x_1 + iy_1$$

$$\Rightarrow \frac{x_1 + x_2 + x_3}{3} + i \frac{y_1 + y_2 + y_3}{3} = 0$$

$$\Rightarrow (x_1 + iy_1) + (x_2 + iy_2) + (x_3 + iy_3) = 0$$

$$\Rightarrow z_1 + z_2 + z_3 = 0$$

$$22. (a) \text{ We have, } |z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$$

$$\Rightarrow |z_1|^2 + |z_2|^2 + 2|z_1||z_2|\cos(\theta_1 - \theta_2) = |z_1|^2 + |z_2|^2$$

where, $\theta_1 = \arg(z_1), \theta_2 = \arg(z_2)$

$$\Rightarrow \cos(\theta_1 - \theta_2) = 0 \Rightarrow \theta_1 - \theta_2 = \frac{\pi}{2}$$

$$\Rightarrow \arg\left(\frac{z_1}{z_2}\right) = \frac{\pi}{2} \Rightarrow \operatorname{Re}\left(\frac{z_1}{z_2}\right) = \frac{|z_1|}{|z_2|} \cos\left(\frac{\pi}{2}\right) = 0$$

$$23. (b) \left| \frac{\beta - \alpha}{1 - \bar{\alpha}\beta} \right| = \left| \frac{\beta - \alpha}{\beta \bar{\beta} - \bar{\alpha}\beta} \right| \quad \left[\because |\beta| = 1 \right]$$

$$= \left| \frac{\beta - \alpha}{\beta(\bar{\beta} - \bar{\alpha})} \right| = \frac{1}{|\beta|} \frac{|\beta - \alpha|}{|\bar{\beta} - \bar{\alpha}|} = \frac{|\beta - \alpha|}{|\beta - \alpha|} = 1$$

$$[\because |\beta| = 1 \text{ and } |\bar{\beta} - \bar{\alpha}| = |\beta - \alpha|]$$

$$\text{or } \left| \frac{\beta - \alpha}{1 - \bar{\alpha}\beta} \right| = \left| \frac{\beta - \alpha}{1 - \frac{1}{\alpha}\beta} \right| \quad \left[\because \alpha \bar{\alpha} = 1 \Rightarrow \bar{\alpha} = \frac{1}{\alpha} \right]$$

$$= |\alpha| \frac{|\beta - \alpha|}{|\alpha - \beta|} = 1 \cdot 1 = 1 \quad [\because |\beta - \alpha| = |\alpha - \beta|]$$

$$\begin{aligned} 24. (b) \sum_{n=1}^{13} (i^n + i^{n+1}) &= \sum_{n=1}^{13} i^n (1 + i) \\ &= (1 + i)[i + i^2 + i^3 + \dots + i^{13}] \\ &= (1 + i)[(i + i^2 + i^3 + i^4) + (i^5 + i^6 + i^7 + i^8) \\ &\quad + (i^9 + i^{10} + i^{11} + i^{12}) + i^{13}] \quad [\because i^{13} = i] \\ &= (1 + i)[0 + 0 + i] = i + i^2 = i - 1 \end{aligned}$$

$$\begin{aligned} 25. (b) \left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right)^{3/4} &= \left[\cos \left(2k\pi + \frac{\pi}{3} \right) + i \sin \left(2k\pi + \frac{\pi}{3} \right) \right]^{3/4} \\ &= \left[\cos(6k + 1) \frac{\pi}{3} + i \sin(6k + 1) \frac{\pi}{3} \right]^{3/4}; k = 0, 1, 2, 3, \dots \\ &= \cos \left[(6k + 1) \frac{\pi}{3} \cdot \frac{3}{4} \right] + i \sin \left[(6k + 1) \frac{\pi}{3} \cdot \frac{3}{4} \right] \\ &\quad \text{[by De-Moivre's theorem]} \\ &= \left[\cos(6k + 1) \frac{\pi}{4} \right] + i \left[\sin(6k + 1) \frac{\pi}{4} \right] \end{aligned}$$

$$\therefore \text{Roots are } \cos \frac{\pi}{4} + i \sin \frac{\pi}{4}, (k = 0);$$

$$\cos \frac{7\pi}{4} + i \sin \frac{7\pi}{4}, (k = 1); \cos \frac{13\pi}{4} + i \sin \frac{13\pi}{4}, (k = 2)$$

$$\text{and } \cos \frac{19\pi}{4} + i \sin \frac{19\pi}{4}, (k = 3)$$

$$\begin{aligned} \text{Products of roots} &= \left[\cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right] \left[\cos \frac{7\pi}{4} + i \sin \frac{7\pi}{4} \right] \\ &\quad \left[\cos \frac{13\pi}{4} + i \sin \frac{13\pi}{4} \right] \left[\cos \frac{19\pi}{4} + i \sin \frac{19\pi}{4} \right] \\ &= \cos \left(\frac{\pi}{4} + \frac{7\pi}{4} + \frac{13\pi}{4} + \frac{19\pi}{4} \right) + i \sin \left(\frac{\pi}{4} + \frac{7\pi}{4} + \frac{13\pi}{4} + \frac{19\pi}{4} \right) \\ &= \cos 10\pi + i \sin 10\pi = 1 \end{aligned}$$

$$26. (b) \text{ We have, } x_n = e^{i \frac{\pi}{2^n}}$$

$$\therefore x_1 x_2 x_3 \dots = e^{i\pi \left(\frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots \right)} = -1$$

$$27. (d) \alpha + i\beta = \cot^{-1}(z) \text{ or } \cot(\alpha + i\beta) = x + iy$$

$$\text{and } \cot(\alpha - i\beta) = x - iy$$

$$\begin{aligned} \therefore \cot 2\alpha &= \cot[(\alpha + i\beta) + (\alpha - i\beta)] \\ &= \frac{\cot(\alpha + i\beta) \cdot \cot(\alpha - i\beta) - 1}{\cot(\alpha + i\beta) + \cot(\alpha - i\beta)} = \frac{(x^2 + y^2 - 1)}{2x} \\ \therefore x^2 + y^2 - 2x \cot 2\alpha - 1 &= 0 \end{aligned}$$

$$28. (c) \text{ Let } a_k + ib_k = r_k (\cos \theta_k + i \sin \theta_k)$$

$$\text{Then, } r_k = \sqrt{a_k^2 + b_k^2} \text{ and } \tan \theta_k = \frac{b_k}{a_k}$$

$$\begin{aligned} \therefore (a_1 + ib_1)(a_2 + ib_2) \dots (a_n + ib_n) &= A + iB \\ \Rightarrow r_1 r_2 \dots r_n [\cos(\theta_1 + \theta_2 + \dots + \theta_n) + i \sin(\theta_1 + \theta_2 + \dots + \theta_n)] \\ &= A + iB \Rightarrow r_1 r_2 r_3 \dots r_n = A^2 + B^2 \end{aligned}$$

$$\text{and } \theta_1 + \theta_2 + \dots + \theta_n = \tan^{-1} \left(\frac{B}{A} \right)$$

$$\begin{aligned} \sum_{i=1}^n \tan^{-1} \left(\frac{b_i}{a_i} \right) &= \tan^{-1} \left(\frac{b_1}{a_1} \right) + \dots + \tan^{-1} \left(\frac{b_n}{a_n} \right) \\ &= \tan^{-1} \left(\frac{B}{A} \right) \end{aligned}$$

$$29. (c) |z| = |z + 3/z - 3/z| \leq |z + 3/z| + |-3/z| = 3 + \frac{3}{|z|}$$

$$\text{Let } |z| = t, t \leq 3 + \frac{3}{t} \Rightarrow \frac{t^2 - 3t - 3}{t} \leq 0 \Rightarrow \left(t - \frac{1}{2} \right)^2 \leq \frac{21}{4}$$

$$\text{So, } \frac{3 - \sqrt{21}}{2} < t \leq \frac{3 + \sqrt{21}}{2}$$

$$\text{Hence, the maximum value of } |z| \text{ is } \frac{3 + \sqrt{21}}{2}.$$

$$30. (c) \text{ Hint The given expression becomes}$$

$$4 + 5\omega^{334} + 3\omega^{335} = 4 + 5\omega + 3\omega^2$$

$$[\because \omega^{334} = (\omega^3)^{111} \cdot \omega \text{ and } \omega^{335} = (\omega^3)^{111} \cdot \omega^2]$$

$$31. (b) \text{ Given, } \arg(z) > 0 \text{ and } \arg(-z) - \arg(z) = \lambda_1, \text{ then}$$

$$(\arg \bar{z}) + \arg(-z) = \lambda_1$$

$$\Rightarrow -\pi = \lambda_1 \Rightarrow \lambda_1 = -\pi$$

$$\text{Again, given } \arg(z) < 0$$

$$\text{Then, } \arg(z) - \arg(-z) = \lambda_2$$

$$\Rightarrow -[-\arg(z) + \arg(-z)] = \lambda_2$$

$$\Rightarrow \lambda_2 = -\pi$$

$$\therefore \lambda_1 = \lambda_2$$

$$\begin{aligned} 32. (a) \sqrt{\{\arg(z) + \arg(-\bar{z}) - 2\pi\} \{\arg(-z) + \arg(\bar{z})\}} \\ = \sqrt{\{\arg(z) + \pi - \arg(z) - 2\pi\} \{\arg(-z) - \arg(z)\}} \\ = \sqrt{(-\pi) - \{\arg(z) - \arg(-z)\}} = \sqrt{(-\pi)(-\pi)} = \pi \end{aligned}$$

$$33. (c) \frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2}$$

$$= \cos \left(-\frac{\pi}{3} \right) + i \sin \left(-\frac{\pi}{3} \right)$$

$$= e^{-i\frac{\pi}{3}}$$

$$\therefore \left| \frac{z_1 - z_3}{z_2 - z_3} \right| = |e^{-i\pi/3}| = 1$$

$$\text{and angle between } z_1 - z_3 \text{ and } z_2 - z_3 \text{ is } \frac{\pi}{3}.$$

Therefore, triangle is equilateral.

$$34. (d) z = (1)^{1/n} = (\cos 0 + i \sin 0)^{1/n} = \frac{\cos 2r\pi}{n} + i \frac{\sin 2r\pi}{n}$$

or $z = e^{i \frac{2r\pi}{n}}$, where r varies from 0 to $n-1$ and each root is unimodular as $|e^{i\theta}| = 1$.

Let $z_1 = 1$ and $z_2 = e^{\frac{i2k\pi}{n}}$
 where, $z_2 - 0 = (z_1 - 0)e^{\frac{\pi j}{2}}$ [by given condition]
 or $e^{\frac{i2k\pi}{n}} = 1 \cdot e^{\frac{\pi j}{2}}$
 $\therefore n = 4k$

35. (c) Using $1 + \omega + \omega^2 = 0$, then

$$\Delta = \begin{vmatrix} 1+\omega & \omega^2 & -\omega \\ 1+\omega^2 & \omega & -\omega^2 \\ \omega^2+\omega & \omega & -\omega^2 \end{vmatrix}$$

Applying $C_1 \rightarrow C_1 + C_2$

$$\Delta = \begin{vmatrix} 0 & \omega^2 & -\omega \\ 0 & \omega & -\omega^2 \\ \omega^2+2\omega & \omega & -\omega^2 \end{vmatrix} = (\omega^2 + 2\omega)(-\omega + \omega^2) = -3\omega^2$$

36. (a) Let $z = 7 + 24i$, then $|z| = 25$, $x = 7$

$$\therefore \text{Square root} = \pm \left[\left(\frac{25+7}{2} \right)^{1/2} + i \left(\frac{25-7}{2} \right)^{1/2} \right] \quad [\because y > 0]$$

$$= \pm (4 + 3i)$$

37. (a) We have, $\arg\left(\frac{z_1}{z_2}\right) = \pi$

$$\Rightarrow \arg(z_1) - \arg(z_2) = \pi$$

$$\Rightarrow \arg(z_1) = \arg(z_2) + \pi$$

$$\text{Let } \arg(z_2) = \theta$$

$$\text{Then, } \arg(z_1) = \pi + \theta$$

$$\therefore z_1 = |z_1|[\cos(\pi + \theta) + i \sin(\pi + \theta)]$$

$$= |z_1|(-\cos \theta - i \sin \theta)$$

$$\text{and } z_2 = |z_2|(\cos \theta + i \sin \theta)$$

$$= |z_1|(\cos \theta + i \sin \theta) \quad [\because |z_1| = |z_2|]$$

$$\text{Hence, } z_1 + z_2 = 0$$

38. (b) Given, $\left(\frac{1-i}{1+i}\right)^{100} = a + ib$

$$\Rightarrow \left[\left(\frac{1-i}{1+i} \right) \times \left(\frac{1-i}{1-i} \right) \right]^{100} = a + ib$$

$$\Rightarrow a + ib = \left[\frac{(1-i)^2}{2} \right]^{100} = \left[\frac{-2i}{2} \right]^{100} = (-i)^{100}$$

$$\Rightarrow a + ib = [(i)^4]^{25} = 1 + 0i \quad [\because (-1)^{100} = 1]$$

$$\text{Hence, } a = 1, b = 0$$

39. (d) We have, $\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = \begin{vmatrix} 6i & 0 & 1 \\ 4 & 0 & -1 \\ 20 & 0 & i \end{vmatrix}$

[applying $C_2 \rightarrow C_2 + 3iC_3$]

$$\Rightarrow 0 = 0 + 0i$$

$$\therefore x = 0, y = 0$$

40. (a) Let $z_1 = a + ib = (a, b)$ and $z_2 = c - id = (c, -d)$

where, $b > 0$ and $d > 0$

$$\text{Then, } |z_1| = |z_2|$$

$$\Rightarrow a^2 + b^2 = c^2 + d^2$$

$$\text{Now, } \frac{z_1 + z_2}{z_1 - z_2} = \frac{(a + ib) + (c - id)}{(a + ib) - (c - id)} \quad \dots (i)$$

$$= \frac{[(a + c) + i(b - d)][(a - c) - i(b + d)]}{[(a - c) + i(b + d)][(a + c) - i(b - d)]}$$

$$= \frac{(a^2 + b^2) - (c^2 + d^2) - 2(ad + bc)i}{a^2 + c^2 - 2ac + b^2 + d^2 + 2bd}$$

$$= \frac{-(ad + bc)i}{a^2 + b^2 - ac + bd}$$

[$\because |z_1| = |z_2|$, from Eq. (i)]

So, $\frac{(z_1 + z_2)}{(z_1 - z_2)}$ is purely imaginary.

BITSAT Archives

1. (a) Given, $\left| \frac{z-3i}{z+3i} \right| = 1 \Rightarrow |z-3i| = |z+3i|$

[if $|z-z_1| = |z-z_2|$, then it is a perpendicular bisector of z_1 and z_2]

Hence, perpendicular bisector of $(0, 3)$ and $(0, -3)$ is X -axis.

2. (d) $\sum_{k=1}^6 \left(\frac{\sin 2\pi k}{7} - \frac{i \cos 2\pi k}{7} \right)$

$$= \sum_{k=1}^6 -i \left(\frac{\cos 2\pi k}{7} - \frac{i \sin 2\pi k}{7} \right) = -i \sum_{k=1}^6 e^{i2\pi k/7}$$

$$= -i [e^{i2\pi/7} + e^{i4\pi/7} + \dots + e^{i12\pi/7}]$$

$$= -i \left[e^{i2\pi/7} \frac{(1 - e^{i12\pi/7})}{1 - e^{i2\pi/7}} \right] = -i \left[\frac{e^{i2\pi/7} - e^{i14\pi/7}}{1 - e^{i2\pi/7}} \right]$$

$$= -i \left[\frac{e^{i2\pi/7} - e^{2\pi i}}{1 - e^{i2\pi/7}} \right]$$

$$= -i \left[\frac{e^{i2\pi/7} - 1}{1 - e^{i2\pi/7}} \right] = i$$

3. (c) $(x + iy)^{1/3} = 2 + 3i$

On cubing both sides, we get

$$x + iy = (2 + 3i)^3$$

$$\Rightarrow x + iy = (2)^3 + (3i)^3 + 3 \times 2 \times 3i(2 + 3i)$$

$$\Rightarrow x + iy = 8 - 27i + 18i(2 + 3i)$$

$$\Rightarrow x + iy = 8 - 27i + 36i - 54 \Rightarrow x + iy = -46 + 9i$$

On comparing real and imaginary parts both sides, we get

$$x = -46, y = 9$$

$$\text{Then, } 3x + 2y = 3(-46) + 2(9) = -138 + 18 = -120$$

4. (d) Since, $iz = ze^{i\pi/2}$. This implies that iz is the vector obtained by rotating vector z in anti-clockwise direction through 90° .

$$\therefore OA \perp AB$$

$$\text{So, area of } \triangle OAB = \frac{1}{2} OA \times OB$$

$$= \frac{1}{2} |z| |iz| = \frac{1}{2} |z|^2$$

5. (c) Given, $z = \cos \theta + i \sin \theta$

$$\begin{aligned} \therefore z^n + \frac{1}{z^n} &= (\cos \theta + i \sin \theta)^n + (\cos \theta + i \sin \theta)^{-n} \\ &= \cos n\theta + i \sin n\theta + \cos n\theta - i \sin n\theta \\ &= 2 \cos n\theta \end{aligned}$$

6. (a) Hint $\left(\frac{1+i}{1-i} \times \frac{1+i}{1+i} \right)^n = 1 \Rightarrow i^n = 1$

7. (d) Applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix} = \begin{vmatrix} 1+\omega+\omega^2 & \omega & \omega^2 \\ \omega+\omega^2+1 & \omega^2 & 1 \\ \omega^2+\omega+1 & 1 & \omega \end{vmatrix} = \begin{vmatrix} 0 & \omega & \omega^2 \\ 0 & \omega^2 & 1 \\ 0 & 1 & \omega \end{vmatrix} = 0$$

8. (c) Since, $a = \cos \theta + i \sin \theta$

$$\begin{aligned} \therefore \frac{1+a}{1-a} &= \frac{1+\cos \theta + i \sin \theta}{1-\cos \theta - i \sin \theta} \\ &= \frac{[(1+\cos \theta) + i \sin \theta][(1-\cos \theta) + i \sin \theta]}{[(1-\cos \theta) - i \sin \theta][(1-\cos \theta) + i \sin \theta]} \\ &= \frac{2i \sin \theta}{(1-\cos \theta)^2 + \sin^2 \theta} = \frac{i \cdot 4 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2}}{4 \sin^2 \frac{\theta}{2}} = i \cot \frac{\theta}{2} \end{aligned}$$

9. (a) Since, ω is a cube root of unity.

$$\begin{aligned} \therefore \sin \left\{ (\omega^{10} + \omega^{23}) \pi - \frac{\pi}{4} \right\} &= \sin \left\{ (\omega + \omega^2) \pi - \frac{\pi}{4} \right\} \\ &= \sin \left(-\pi - \frac{\pi}{4} \right) \quad [\because 1 + \omega + \omega^2 = 0] \\ &= -\sin \left(\pi + \frac{\pi}{4} \right) = \sin \frac{\pi}{4} = \frac{1}{\sqrt{2}} \end{aligned}$$

10. (c) We have, $(\cos \theta + i \sin \theta)(\cos 2\theta + i \sin 2\theta) \dots (\cos n\theta + i \sin n\theta) = 1$

$$\begin{aligned} \therefore \cos(\theta + 2\theta + 3\theta + \dots + n\theta) + i \sin(\theta + 2\theta + 3\theta + \dots + n\theta) &= 1 \\ \Rightarrow \cos \left(\frac{n(n+1)}{2} \theta \right) + i \sin \left(\frac{n(n+1)}{2} \theta \right) &= 1 \end{aligned}$$

On comparing the coefficients of real and imaginary parts both sides, we get

$$\cos \left(\frac{n(n+1)}{2} \theta \right) = 1 \text{ and } \sin \left(\frac{n(n+1)}{2} \theta \right) = 0$$

$$\therefore \frac{n(n+1)}{2} \theta = 2m\pi \Rightarrow \theta = \frac{4m\pi}{n(n+1)}$$

11. (d) The two circles whose centre and radius are $C_1(0, 0)$, $r_1 = 12$, $C_2(3, 4)$, $r_2 = 5$ and it passes through origin, i.e. the centre of C_1 .

Now,

$$C_1 C_2 = \sqrt{3^2 + 4^2} = 5$$

and

$$r_1 - r_2 = 12 - 5 = 7$$

$\therefore$

$$C_1 C_2 < r_1 - r_2$$

Hence, circle C_2 lies inside the circle C_1 .

From figure, the minimum distance between them is

$$AB = C_1 B - C_1 A = r_1 - 2r_2 = 12 - 10 = 2$$

$$\begin{aligned} 12. (a) \text{ Let } z &= \frac{1+i\sqrt{3}}{\sqrt{3}+i} = \frac{1+i\sqrt{3}}{(\sqrt{3}+i)} \times \frac{(\sqrt{3}-i)}{(\sqrt{3}-i)} \\ &= \frac{\sqrt{3}-i+3i+\sqrt{3}}{3+1} = \frac{\sqrt{3}+i}{2} \end{aligned}$$

$$\therefore \text{amp}(z) = \tan^{-1} \left(\frac{1}{\sqrt{3}} \right) = \frac{\pi}{6}$$

13. (c) Given that, $x = \alpha + \beta$, $y = \alpha\omega + \beta\omega^2$, $z = \alpha\omega^2 + \beta\omega$

Now,

$$\begin{aligned} xyz &= (\alpha + \beta)(\alpha\omega + \beta\omega^2)(\alpha\omega^2 + \beta\omega) \\ &= (\alpha + \beta)(\alpha^2\omega^3 + \alpha\beta\omega^2 + \alpha\beta\omega^4 + \beta^2\omega^3) \\ &= (\alpha + \beta)[\alpha^2 + \alpha\beta(\omega^2 + \omega) + \beta^2] \end{aligned}$$

$$[\because 1 + \omega + \omega^2 = 0 \text{ and } \omega^3 = 1]$$

$$= (\alpha + \beta)(\alpha^2 - \alpha\beta + \beta^2) = \alpha^3 + \beta^3$$

2

Quadratic Equation

Quadratic Equation

An equation of the form $ax^2 + bx + c = 0$, where $a \neq 0$ and $a, b, c, x \in R$, is called a **real quadratic equation**. The numbers a, b and c are called the **coefficients** of the equation. The quantity $D = b^2 - 4ac$ is known as the **discriminant** of the equation $ax^2 + bx + c = 0$ and its roots are given by $x = \frac{-b \pm \sqrt{D}}{2a}$.

An equation of the form $az^2 + bz + c = 0$, where $a \neq 0$ and $a, b, c, z \in C$ (complex), is called a **complex quadratic equation** and its roots are given by $z = \frac{-b \pm \sqrt{D}}{2a}$.

Nature of Roots of Quadratic Equation

Nature of roots of a quadratic equation $ax^2 + bx + c = 0$ implies whether the roots are real or imaginary by analysing the quantity D .

- Let $a, b, c \in R$ and $a \neq 0$, then the equation $ax^2 + bx + c = 0$ has
 - real and distinct roots if and only if $D > 0$.
 - real and equal roots if and only if $D = 0$.
 - complex roots with non-zero imaginary parts if and only if $D < 0$. If $p + iq$ (where, $p, q \in R, q \neq 0$) is one root of $ax^2 + bx + c = 0$, then second root will be $(p - iq)$.
- If $a, b, c \in Q$ and D is a perfect square, then $ax^2 + bx + c = 0$ has **rational roots**.
- If $a, b, c \in Q$ and $p + \sqrt{q}$ (where, $p, q \in Q$) is an **irrational root** of $ax^2 + bx + c = 0$, then other root will be $(p - \sqrt{q})$.
- If $a = 1, b, c \in I$ are roots of $ax^2 + bx + c = 0$, are rational numbers, then these roots must be **integers**.
- If $ax^2 + bx + c = 0$ is satisfied by more than two distinct complex numbers, then it becomes an identity i.e. $a = b = c = 0$.

6. If the roots of $ax^2 + bx + c = 0$ are both positive, then the signs of a and c should be like and opposite to the sign of b .
7. If the roots of $ax^2 + bx + c = 0$ are both negative, then signs of a, b and c should be like.
8. If the roots of $ax^2 + bx + c = 0$ are equal in magnitude but opposite in sign, then $b = 0$ and $c < 0$.
9. If the roots of $ax^2 + bx + c = 0$ are reciprocal to each other, then $c = a$.
10. In the equation $ax^2 + bx + c = 0$ (where, $a, b, c \in R$), if $a + b + c = 0$, then the roots are $1, \frac{c}{a}$ and if $a - b + c = 0$, then the roots are -1 and $-\frac{c}{a}$.

Relation between Roots and Coefficients

1. Quadratic Roots

If α and β are the roots of quadratic equation $ax^2 + bx + c = 0$, then

$$\text{Sum of roots} = \alpha + \beta = -\frac{b}{a}$$

and product of roots $= \alpha\beta = \frac{c}{a}$

2. Cubic Roots

If α, β, γ are the roots of cubic equation $ax^3 + bx^2 + cx + d = 0; a \neq 0$, then

$$\alpha + \beta + \gamma = -\frac{b}{a}$$

$$\beta\gamma + \gamma\alpha + \alpha\beta = \frac{c}{a} \quad \text{and} \quad \alpha\beta\gamma = -\frac{d}{a}$$

3. Biquadratic Roots

If α, β, γ and δ are the roots of biquadratic equation $ax^4 + bx^3 + cx^2 + dx + e = 0; a \neq 0$, then

$$\alpha + \beta + \gamma + \delta = -\frac{b}{a}$$

$$(\alpha + \beta)(\gamma + \delta) + \alpha\beta + \gamma\delta = \frac{c}{a}$$

$$\alpha\beta(\gamma + \delta) + \gamma\delta(\alpha + \beta) = -\frac{d}{a} \quad \text{and} \quad \alpha\beta\gamma\delta = \frac{e}{a}$$

4. Symmetric Roots

If α and β are the roots of quadratic equation $ax^2 + bx + c = 0$, then to find the symmetric function of α and β , we use the following results:

- (i) $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$
- (ii) $(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$
- (iii) $\alpha^3 + \beta^3 = (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)$
- (iv) $\alpha^3 - \beta^3 = (\alpha - \beta)^3 + 3\alpha\beta(\alpha - \beta)$

5. Common Roots (Conditions)

Suppose that the quadratic equations are $ax^2 + bx + c = 0$ and $a'x^2 + b'x + c' = 0$.

- (i) When one root is common, then the condition is $(a'c - ac')^2 = (bc' - b'c)(ab' - a'b)$.
- (ii) When both roots are common, then the condition is $\frac{a}{a'} = \frac{b}{b'}$.

Formation of an Equation

1. Quadratic Equation

If α and β are the roots of a quadratic equation, then the equation will be of the form

$$x^2 - (\alpha + \beta)x + \alpha\beta = 0$$

2. Cubic Equation

If α, β and γ are the roots of the cubic equation, then the equation will be of the form

$$x^3 - (\alpha + \beta + \gamma)x^2 + (\alpha\beta + \beta\gamma + \gamma\alpha)x - \alpha\beta\gamma = 0$$

3. Biquadratic Equation

If α, β, γ and δ are the roots of the biquadratic equation, then the equation will be of the form

$$x^4 - (\alpha + \beta + \gamma + \delta)x^3 + (\alpha\beta + \beta\gamma + \gamma\alpha + \alpha\delta + \beta\delta + \gamma\delta)x^2 - (\alpha\beta\gamma + \beta\gamma\delta + \gamma\delta\alpha + \delta\alpha\beta)x + \alpha\beta\gamma\delta = 0$$

Sign of Quadratic Equation

Let $f(x) = ax^2 + bx + c$ or $y = ax^2 + bx + c$, where $a, b, c \in R$ and $a \neq 0$.

- (i) If $a > 0$ and $D < 0$, then $f(x) > 0, \forall x \in R$.
- (ii) If $a < 0$ and $D < 0$, then $f(x) < 0, \forall x \in R$.
- (iii) If $a > 0$ and $D = 0$, then $f(x) \geq 0, \forall x \in R$.
- (iv) If $a < 0$ and $D = 0$, then $f(x) \leq 0, \forall x \in R$.
- (v) If $a > 0, D > 0$ and $f(x) = 0$ have two real roots α and β (where, $\alpha < \beta$), then $f(x) > 0, \forall x \in (-\infty, \alpha) \cup (\beta, \infty)$ and $f(x) < 0, \forall x \in (\alpha, \beta)$.
- (vi) If $a < 0, D > 0$ and $f(x) = 0$ have two real roots α and β (where, $\alpha < \beta$), then $f(x) < 0, \forall x \in (-\infty, \alpha) \cup (\beta, \infty)$ and $f(x) > 0, \forall x \in (\alpha, \beta)$.

Greatest and Least Values of Quadratic Expression $y = ax^2 + bx + c$

The maximum and minimum values are as follows:

Value of a	Graph	Maximum value	Minimum value
$a > 0$		Not defined	$-\frac{D}{4a}$ at $x = -\frac{b}{2a}$
$a < 0$		$-\frac{D}{4a}$ at $x = -\frac{b}{2a}$	Not defined

Practice Exercise

- If $x = \sqrt{1 + \sqrt{1 + \sqrt{1 + \dots}}}$, then x equals
 a. $\frac{1 + \sqrt{5}}{2}$ b. $\frac{2 + \sqrt{5}}{2}$ c. $\frac{-1 + \sqrt{5}}{2}$ d. $\frac{-1 - \sqrt{5}}{2}$
- If $a + b + c = 0$, then the roots of the equation $4ax^2 + 3bx + 2c = 0$, where $a, b, c \in R$, are
 a. real and distinct b. imaginary
 c. real and equal d. infinite
- If the roots of the quadratic equation $x^2 - 4x - \log_3 a = 0$ are real, then the least value of a is
 a. 81 b. $\frac{1}{81}$ c. $\frac{1}{64}$ d. None
- If α, β are the roots of $ax^2 + bx + c = 0$ and $\alpha + h, \beta + h$ are the roots of $px^2 + qx + r = 0$, then the value of h is
 a. $\left(\frac{b}{a} - \frac{q}{p}\right)$ b. $\frac{1}{2}\left(\frac{b}{a} - \frac{q}{p}\right)$ c. $-\frac{1}{2}\left(\frac{a}{b} - \frac{p}{q}\right)$ d. None
- If the equation $(3x)^2 + (27 \times 3^{1/p} - 15)x + 4 = 0$ has equal roots, then p is equal to
 a. zero b. 2 c. $-\frac{1}{2}$ d. None
- If the equations $x^2 + ax + 12 = 0$, $x^2 + bx + 15 = 0$ and $x^2 + (a + b)x + 36 = 0$ have a common positive root, then the ordered pair (a, b) is
 a. $(-6, -7)$ b. $(-7, -8)$ c. $(-6, -8)$ d. $(-8, -7)$
- The condition that $x^3 - px^2 + qx - r = 0$ may have two of its roots equal to each other but of opposite sign, is
 a. $r = pq$ b. $r = 2p^3 + pq$
 c. $r = p^2q$ d. None of these
- The number of values of k for which the equation $x^2 - 3x + k = 0$ has two distinct roots lying in the interval $(0, 1)$, is
 a. three b. two
 c. infinite d. no value of k will satisfy
- If $ax^2 + 2bx - 3c = 0$ has no real root and $\frac{3c}{4} < a + b$, then the range of c is
 a. $(-1, 1)$ b. $(0, 1)$ c. $(0, \infty)$ d. $(-\infty, 0)$
- If the roots of the equation $\frac{1}{x+p} + \frac{1}{x+q} = \frac{1}{r}$ are equal in magnitude but opposite in sign, then the product of the roots is
 a. $-2(p^2 + q^2)$ b. $-(p^2 + q^2)$
 c. $-\frac{(p^2 + q^2)}{2}$ d. $-pq$
- The harmonic mean of the roots of the equation $(5 + \sqrt{2})x^2 - (4 + \sqrt{5})x + (8 + 2\sqrt{5}) = 0$ is
 a. 2 b. 4 c. 7 d. 8
- The roots of the equation $|x^2 - x - 6| = x + 2$ are
 a. $-2, 1, 4$ b. $0, 2, 4$ c. $0, 1, 4$ d. $-2, 2, 4$

13. In $\triangle PQR, R = \frac{\pi}{2}$. If $\tan \frac{P}{2}$ and $\tan \frac{Q}{2}$ are the roots of the equation $ax^2 + bx + c = 0$, then
 a. $a = b + c$ b. $b = c + a$ c. $c = a + b$ d. $b = c$
14. If the roots of the equation $(a + 1)x^2 - 3ax + 4a = 0$ ($a \neq -1$) are greater than unity, then the values of a are
 a. $\left[-\frac{16}{7}, -1\right)$ b. $[0, -1]$ c. $\left[-\frac{16}{7}, 1\right]$ d. $[0, 1]$
15. The number of real roots of the equation $(x - 1)^2 + (x - 2)^2 + (x - 3)^2 = 0$ is
 a. 2 b. 1 c. 0 d. 3
16. If $y = 3^{x-1} + 3^{-x-1}$ (where, x is real), then the least value of y is
 a. 2 b. 6 c. $\frac{2}{3}$ d. None
17. If the equation $x^2 - (2 + m)x + (m^2 - 4m + 4) = 0$ has coincident roots, then
 a. $m = 0, m = 1$ b. $m = 0, m = 2$
 c. $m = \frac{2}{3}, m = 6$ d. $m = \frac{2}{3}, m = 1$
18. If α, β are the roots of $x^2 + x + 2 = 0$ and γ, δ are the roots of $x^2 + 3x + 4 = 0$, then $(\alpha + \gamma)(\alpha + \delta)(\beta + \gamma)(\beta + \delta)$ is equal to
 a. -18 b. 18 c. 24 d. 44
19. If $a^2 + b^2 + c^2 = 1$, then $ab + bc + ca$ lies in the interval
 a. $[1, 2]$ b. $\left[0, \frac{1}{2}\right]$ c. $\left[-\frac{1}{2}, 1\right]$ d. $[0, 1]$
20. If $x^2 - 5x + 1 = 0$, then $x^5 + \frac{1}{x^5}$ is equal to
 a. 2424 b. 3232 c. 2525 d. None
21. The value of k for which the number 3 lies between the roots of the equation $x^2 + (1 - 2k)x + (k^2 - k - 2) = 0$, is given by
 a. $k < 2$ b. $2 < k < 5$ c. $2 < k < 3$ d. $k > 5$
22. If α, β and γ are the roots of the equation, $x^3 - x - 1 = 0$, then $\frac{1+\alpha}{1-\alpha} + \frac{1+\beta}{1-\beta} + \frac{1+\gamma}{1-\gamma}$ has the value
 a. 0 b. -1 c. -7 d. 1
23. If one root of the equation $x^2 - \lambda x + 12 = 0$ is even prime while $x^2 + \lambda x + \mu = 0$ has equal roots, then μ is equal to
 a. 8 b. 16 c. 24 d. 32
24. If α and β are the roots of the equation $ax^2 + bx + c = 0$, then $(1 + \alpha + \alpha^2)(1 + \beta + \beta^2)$ is equal to
 a. 0 b. positive c. negative d. None
25. The number of real solutions of the equation $(5 + 2\sqrt{6})^{x^2-3} + (5 - 2\sqrt{6})^{x^2-3} = 10$ is
 a. 2 b. 4 c. 6 d. None
26. If $b > a$, then the equation $(x - a)(x - b) - 1 = 0$ has
 a. both roots in $[a, b]$
 b. both roots in $(-\infty, a)$
 c. one root in (b, ∞) and other in $(b, -\infty)$
 d. one root in $(-\infty, a)$
27. If α and β ($\alpha < \beta$) are the roots of the equation $x^2 + bx + c = 0$, where $c < 0 < b$, then
 a. $0 < \alpha < \beta$ b. $\alpha < 0 < \beta < |\alpha|$
 c. $\alpha < \beta < 0$ d. $\alpha < 0 < |\alpha| < \beta$
28. If the roots of the equation $lx^2 + mx + m = 0$ are in ratio $a : b$, then the value of $\sqrt{\frac{a}{b}} + \sqrt{\frac{b}{a}} + \sqrt{\frac{m}{l}}$ is equal to
 a. 0 b. 1 c. 3 d. None
29. For the equation $3x^2 + px + 3 = 0, p > 0$, if one of the roots is square of the other, then p is equal to
 a. $\frac{1}{2}$ b. 1 c. 3 d. $\frac{2}{3}$
30. If $x^2 + 5 = 2x - 4 \cos(a + b)$, where $a, b \in (0, 5)$, is satisfied for atleast one real x , then the maximum value of $a + b$ in $[0, 2\pi]$ is
 a. 3π b. 2π
 c. π d. None of these
31. If $a, b, c \in R$ and $ax^2 + bx + c = 0$ has no real roots, then
 a. $c(a + b + c) > 0$ b. $c - c(a - b - c) > 0$
 c. $c + c(a - b - c) > 0$ d. $c(a - b - c) > 0$
32. The value of P such that the difference of the roots of the equation $x^2 - Px + 8 = 0$ is 2, is
 a. ± 3 b. ± 6 c. ± 2 d. ± 1
33. If α and β are the roots of the equation $ax^2 + bx + c = 0$, then the quadratic equation whose roots are $\frac{\alpha}{1+\alpha}$ and $\frac{\beta}{1+\beta}$, is
 a. $ax^2 - b(1-x) + c(1-x)^2 = 0$
 b. $ax^2 - b(x-1) + c(x-1)^2 = 0$
 c. $ax^2 + b(1-x) + c(1-x)^2 = 0$
 d. $ax^2 + b(x+1) + c(1+x)^2 = 0$
34. If $a + b + c > \frac{9c}{4}$ and the equation $ax^2 + 2bx - 5c = 0$ has non-real complex roots, then
 a. $a > 0, c > 0$ b. $a > 0, c < 0$
 c. $a < 0, c < 0$ d. $a < 0, c > 0$
35. For real values of x , the expression $\frac{(x-b)(x-c)}{(x-a)}$ will assume all real values provided
 a. $a \leq c \leq b$ b. $b \geq a \geq c$
 c. $b \leq c \leq a$ d. $a \geq b \geq c$

BITSAT Archives

- If α and β are the roots of the equation $x^2 - px + q = 0$, then the value of $(\alpha + \beta)x - \left(\frac{\alpha^2 + \beta^2}{2}\right)x^2 + \left(\frac{\alpha^3 + \beta^3}{3}\right)x^3 + \dots$ is [2014]
 - $\log(1 - px + qx^2)$
 - $\log(1 + px - qx^2)$
 - $\log(1 + px + qx^2)$
 - None of these
- The set of all real x satisfying the inequality $\frac{3 - |x|}{4 - |x|} \geq 0$, is [2013]
 - $[-3, 3] \cup (-\infty, -4) \cup (4, \infty)$
 - $(-\infty, -4) \cup (4, \infty)$
 - $(-\infty, -3) \cup (4, \infty)$
 - $(-\infty, -3) \cup (3, \infty)$
- If N is any four digit number say x_1, x_2, x_3, x_4 , then the maximum value of $\frac{N}{x_1 + x_2 + x_3 + x_4}$ is equal to [2013]
 - 1000
 - $\frac{1111}{4}$
 - 800
 - None
- If $4 - 5i$ is the root of the quadratic equation $x^2 + ax + b = 0$, then (a, b) is equal to [2012]
 - $(8, 41)$
 - $(-8, 41)$
 - $(41, 8)$
 - $(-41, 8)$
- If α and β are the roots of the quadratic equation $4x^2 + 3x + 7 = 0$, then the value of $\frac{1}{\alpha} + \frac{1}{\beta}$ is [2012]
 - $-\frac{3}{4}$
 - $-\frac{3}{7}$
 - $\frac{3}{7}$
 - $\frac{4}{7}$
- If α, β are the roots of $ax^2 + bx + c = 0$ and $\alpha + k, \beta + k$ are the roots of $px^2 + qx + r = 0$, then $\frac{b^2 - 4ac}{q^2 - 4pr}$ is equal to [2012]
 - $\frac{a}{p}$
 - 1
 - $\left(\frac{a}{p}\right)^2$
 - 0
- If α and β are the roots of the equation $x^2 - 2x + 4 = 0$, then the value of $\alpha^n + \beta^n$ will be [2011]
 - $i2^{n+1} \sin(n\pi/3)$
 - $2^{n+1} \cos(n\pi/3)$
 - $i2^{n-1} \sin(n\pi/3)$
 - $2^{n-1} \cos(n\pi/3)$
- If the roots of the equation $ax^2 + bx + c = 0$ are real and distinct, then [2010]
 - both roots are greater than $-\frac{b}{2a}$
 - both roots are less than $-\frac{b}{2a}$
 - one of the roots exceeds $-\frac{b}{2a}$
 - None of the above
- The number of solutions of the equation $z^2 + \bar{z} = 0$ is [2010, 09]
 - 1
 - 2
 - 3
 - 4
- If the sum of the roots of the equation $ax^2 + 2x + 3a = 0$ is equal to their product, then the value of a is [2009]
 - $-2/3$
 - -3
 - 4
 - $-1/2$
- If $\alpha + \beta = -2$ and $\alpha^3 + \beta^3 = -56$, then the quadratic equation whose roots are α and β , is [2008]
 - $x^2 + 2x - 16 = 0$
 - $x^2 + 2x + 15 = 0$
 - $x^2 + 2x - 12 = 0$
 - $x^2 + 2x - 8 = 0$
- The cubic equation whose roots are thrice to each of the roots of $x^3 + 2x^2 - 4x + 1 = 0$, is [2008]
 - $x^3 - 6x^2 + 36x + 27 = 0$
 - $x^3 + 6x^2 + 36x + 27 = 0$
 - $x^3 - 6x^2 - 36x + 27 = 0$
 - $x^3 + 6x^2 - 36x + 27 = 0$
- The number of solutions of the equation $1 + \sin x \sin^2 \frac{x}{2} = 0$, in $[-\pi, \pi]$, is [2007]
 - 0
 - 1
 - 2
 - 3
- If one root of the quadratic equation $ax^2 + bx + c = 0$ is equal to n th power of the other root, then the value of $(ac^n)^{\frac{1}{n+1}} + (a^n c)^{\frac{1}{n+1}}$ is equal to [2007]
 - b
 - $-b$
 - $\frac{1}{b^{n+1}}$
 - $-b^{n+1}$
- If α, β, γ are the roots of the equation $2x^3 - 3x^2 + 6x + 1 = 0$, then $\alpha^2 + \beta^2 + \gamma^2$ is equal to [2006]
 - $-\frac{15}{4}$
 - $\frac{15}{4}$
 - $\frac{9}{4}$
 - 4
- If $\sin A, \sin B, \cos A$ are in GP, then the roots of $x^2 + 2x \cot B + 1 = 0$ are always [2005]
 - real
 - imaginary
 - greater than 1
 - equal

Answer with Solutions

Practice Exercise

- (a) Hint $x = \sqrt{1 + \sqrt{1 + \sqrt{1 + \dots}}}$
 $\Rightarrow x = \sqrt{1 + x} \Rightarrow x^2 = 1 + x \Rightarrow x^2 - x - 1 = 0$
- (a) Here, $D = (3b)^2 - 4 \cdot (4a) \cdot (2c)$
 $= 9b^2 - 32ac = 9(-a-c)^2 - 32ac = 9a^2 - 14ac + 9c^2$
 $= 9c^2 \left[\left(\frac{a}{c}\right)^2 - \frac{14}{9} \cdot \frac{a}{c} + 1 \right] = 9c^2 \left[\left(\frac{a}{c} - \frac{7}{9}\right)^2 - \frac{49}{81} + 1 \right] > 0$
Hence, the roots are real and distinct.
- (b) Since, the roots of the given equation are real.
 $\therefore D > 0 \Rightarrow 16 + 4 \log_3 a \geq 0 \Rightarrow \log_3 a \geq -4$
 $\Rightarrow a \geq 3^{-4} \Rightarrow a \geq \frac{1}{81}$
- (b) Hint $\alpha + \beta = -\frac{b}{a}, \alpha\beta = \frac{c}{a}$
Also, $\alpha + h + \beta + h = -\frac{q}{p}$ and $(\alpha + h)(\beta + h) = \frac{r}{p}$
- (c) The given equation will have equal roots iff
 $b^2 - 4ac = 0 \Rightarrow (27 \times 3^{1/p} - 15)^2 - 144 = 0$
 $\Rightarrow 27 \times 3^{1/p} - 15 = \pm 12 \Rightarrow 27 \times 3^{1/p} = 27 \text{ or } 3$
Now, $3^{1/p} = 1 \Rightarrow \frac{1}{p} = 0$
Also, $3^{1/p} = 3^{-2} \Rightarrow \frac{1}{p} = -2$
But $\frac{1}{p}$ cannot be zero, so $p = -\frac{1}{2}$.
- (b) We have, $x^2 + ax + 12 = 0$... (i)
 $x^2 + bx + 15 = 0$... (ii)
and $x^2 + (a+b)x + 36 = 0$... (iii)
On adding Eqs. (i) and (ii), we get
 $2x^2 + (a+b)x + 27 = 0$... (iv)
On subtracting Eq. (iii) from Eq. (iv), we get
 $x^2 - 9 = 0 \Rightarrow x = 3, -3$
Thus, common positive root is 3.
 $\therefore (3)^2 + 3a + 12 = 0 \Rightarrow a = -7$
and $9 + 3b + 15 = 0 \Rightarrow b = -8$
Hence, the ordered pair (a, b) is $(-7, -8)$.
- (a) Let α, β, γ be the roots of the given equation such that $\alpha = -\beta$, then
 $\alpha + \beta + \gamma = p \Rightarrow \gamma = p$
Since, γ is a root of the given equation, so it satisfies the equation
 $\gamma^3 - p\gamma^2 + q\gamma - r = 0$
 $\Rightarrow p^3 - p^3 + pq - r = 0 \Rightarrow r = pq$

- (d) Given equation is $x^2 - 3x + k = 0$
 $\therefore$ Discriminant, $D = b^2 - 4ac$
 $= (-3)^2 - 4 \times 1 \times k = 9 - 4k$
For distinct roots, $D > 0$
 $\Rightarrow 9 - 4k > 0 \Rightarrow 9 > 4k \Rightarrow k < \frac{9}{4}$
Every value of k which is less than $\frac{9}{4}$ will give two distinct roots. But these roots will not lie in the interval $(0, 1)$.
- (d) Here, $D = 4b^2 + 12ca < 0$
 $\Rightarrow b^2 + 3ca < 0$... (i)
 $\Rightarrow ca < 0$
If $c > 0$, then $a < 0$
Also, $\frac{3c}{4} < a + b \Rightarrow 3ca > 4a^2 + 4ab$
 $\Rightarrow b^2 + 3ca > 4a^2 + 4ab + b^2 = (2a + b)^2 \geq 0$... (ii)
From Eqs. (i) and (ii), $c > 0$, which is not true.
 $\therefore c < 0$
- (c) Simplified form of given equation is
 $(2x + p + q)r = (x + p)(x + q)$
 $\Rightarrow x^2 + (p + q - 2r)x - (p + q)r + pq = 0$
Since, sum of roots = 0
 $\therefore -(p + q - 2r) = 0 \Rightarrow r = \frac{p + q}{2}$
and product of roots $= -(p + q)r + pq$
 $= -\frac{(p + q)^2}{2} + pq = -\frac{1}{2}(p^2 + q^2)$
- (b) Let α, β be the roots of the given equation.
Then, $\alpha + \beta = \frac{4 + \sqrt{5}}{5 + \sqrt{2}}$ and $\alpha\beta = \frac{8 + 2\sqrt{5}}{5 + \sqrt{2}}$
Let H be the HM of α and β , then
 $H = \frac{2\alpha\beta}{\alpha + \beta} = \frac{16 + 4\sqrt{5}}{4 + \sqrt{5}} = 4$
- (d) We have, $|x^2 - x - 6|$
 $= \begin{cases} x^2 - x - 6, & \text{if } x \leq -2 \text{ or } x \geq 3 \\ -(x^2 - x - 6), & \text{if } -2 < x < 3 \end{cases}$
Case I When $x \leq -2$ or $x \geq 3$, then
 $|x^2 - x - 6| = x + 2 \Rightarrow x^2 - x - 6 = x + 2$
 $\Rightarrow x^2 - 2x - 8 = 0 \Rightarrow (x - 4)(x + 2) = 0 \Rightarrow x = -2, 4$
Case II When $-2 < x < 3$, then
 $|x^2 - x - 6| = x + 2$
 $\Rightarrow -(x^2 - x - 6) = x + 2$
 $\Rightarrow x^2 - 4 = 0 \Rightarrow x = \pm 2$
Hence, roots are $-2, 2$ and 4 .

13. (c) We have, $R = \frac{\pi}{2} \Rightarrow P + Q = \frac{\pi}{2} \Rightarrow \frac{P}{2} + \frac{Q}{2} = \frac{\pi}{4}$

$$\Rightarrow 1 = \tan \frac{\pi}{4} = \frac{\tan \frac{P}{2} + \tan \frac{Q}{2}}{1 - \tan \frac{P}{2} \tan \frac{Q}{2}}$$

$$\Rightarrow 1 = \frac{-\frac{b}{a}}{1 - \frac{c}{a}} = \frac{b}{c-a}$$

$$\Rightarrow a + b = c$$

14. (a) For roots greater than unity,

Discriminant ≥ 0 , sum of roots > 2 and $(a+1)f(1) > 0$

$$\Rightarrow 9a^2 - 16a(a+1) \geq 0, \frac{3a}{a+1} > 2$$

$$\text{and } (a+1)(a+1-3a+4a) > 0$$

$$\Rightarrow a(7a+16) \leq 0, \frac{a-2}{a+1} > 0$$

$$\text{and } (a+1)(2a+1) > 0$$

$$\Rightarrow \frac{-16}{7} \leq a \leq 0, a < -1 \text{ or } a > 2$$

$$\text{and } a < -1 \text{ or } a > -\frac{1}{2}$$

$$\Rightarrow -\frac{16}{7} \leq a < -1$$

15. (c) Since, $(x-1)^2, (x-2)^2, (x-3)^2$ cannot be zero simultaneously for any real value of x .
 $\therefore$ Number of roots = 0

16. (c) Since, $3^{x-1} + 3^{-x-1} = \frac{1}{3}(3^x + 3^{-x})$

$$\geq \frac{1}{3} \cdot 2\sqrt{3^x \cdot 3^{-x}} \quad [\because \text{AM} \geq \text{GM}]$$

$$\Rightarrow 3^{x-1} + 3^{-x-1} \geq \frac{2}{3}$$

17. (c) Hint $b^2 - 4ac = 0$

18. (d) Since, $\alpha + \beta = -1, \alpha\beta = 2, \gamma + \delta = -3, \gamma\delta = 4$

$$\therefore (\alpha + \gamma)(\alpha + \delta)(\beta + \gamma)(\beta + \delta) = (\alpha^2 - 3\alpha + 4)(\beta^2 - 3\beta + 4)$$

$$= 4 - 3\alpha\beta^2 + 4\beta^2 - 3\alpha^2\beta + 9\alpha\beta - 12\beta^2 + 4\alpha^2 - 12\alpha + 16$$

$$= 4 - 3(2)\beta + 4\beta^2 + 4\alpha^2 - 3(2)\alpha + 9(2) - 12(\beta + \alpha) + 16$$

$$= 4 - 6\beta + 4(\alpha^2 + \beta^2) - 6\alpha + 18 + 12 + 16$$

$$= 50 + 6 + 4[(\alpha + \beta)^2 - 2\alpha\beta]$$

$$= 56 - 12 = 44$$

19. (c) Since, $a^2 + b^2 + c^2 - ab - bc - ca = \frac{1}{2} \sum (a-b)^2 \geq 0$

$$\therefore 1 - \sum ab \geq 0 \Rightarrow \sum ab \leq 1 \quad \dots(i)$$

$$\text{Now, } (a+b+c)^2 = \sum a^2 + 2 \sum ab$$

$$\Rightarrow \sum ab \geq -\frac{1}{2} \quad \dots(ii)$$

From Eqs. (i) and (ii), $\sum ab$ lie in $\left[-\frac{1}{2}, 1\right]$.

20. (c) $x + \frac{1}{x} = 5 \Rightarrow x^2 + \frac{1}{x^2} = 5^2 - 2 = 23$

$$\text{and } x^3 + \frac{1}{x^3} = 5^3 - 3 \times 5 = 110$$

$$\text{Now, } \left(x^2 + \frac{1}{x^2}\right)\left(x^3 + \frac{1}{x^3}\right) = 23 \times 110 = 2530$$

$$\therefore x^5 + \frac{1}{x^5} = 2530 - \left(x + \frac{1}{x}\right) = 2525$$

21. (b) Let $f(x) = x^2 + (1-2k)x + k^2 - k - 2$

The number 3 lies between the roots of the given equation, if $f(3) < 0$.

$$\text{Now, } f(3) = 9 + (1-2k)3 + k^2 - k - 2$$

$$\Rightarrow f(3) = k^2 - 7k + 10$$

Hence, $f(3) < 0$

$$\Rightarrow k^2 - 7k + 10 < 0 \text{ or } (k-2)(k-5) < 0$$

$$\therefore k > 2 \text{ and } k < 5 \text{ or } k < 2 \text{ and } k > 5$$

$\therefore k$ lies in the interval $(2, 5)$.

22. (c) Given, α, β and γ are the roots of the given equation.

Then, $\alpha + \beta + \gamma = 0, \alpha\beta + \beta\gamma + \gamma\alpha = -1$ and $\alpha \cdot \beta \cdot \gamma = 1$

$$\text{Let } y = \frac{1+x}{1-x} \Rightarrow x = \frac{y-1}{y+1}$$

$$\Rightarrow y^3 + 7y^2 - y + 1 = 0 \Rightarrow \sum \frac{1+\alpha}{1-\alpha} = -7$$

23. (b) We know that, only even prime is 2, then

$$(2)^2 - \lambda(2) + 12 = 0$$

$$\Rightarrow \lambda = 8 \quad \dots(i)$$

and $x^2 + \lambda x + \mu = 0$ has equal roots.

$$\therefore \lambda^2 - 4\mu = 0 \quad [\because D = 0]$$

$$\Rightarrow (8)^2 - 4\mu = 0 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \mu = 16$$

24. (b) Given equation is

$$ax^2 + bx + c = 0$$

Since, α, β are the roots of this equation.

$$\therefore \alpha + \beta = \frac{-b}{a} \quad \dots(i)$$

$$\text{and } \alpha\beta = \frac{c}{a} \quad \dots(ii)$$

Now, $(1+\alpha+\alpha^2)(1+\beta+\beta^2)$

$$= 1 + (\alpha + \beta) + \alpha^2 + \beta^2 + \alpha\beta(1 + \alpha + \beta) + \alpha^2\beta^2$$

$$= 1 - \frac{b}{a} + \left(\frac{-b}{a}\right)^2 - \frac{2c}{a} + \frac{c}{a}\left(1 - \frac{b}{a}\right) + \frac{b^2}{a^2}$$

[from Eqs. (i) and (ii)]

$$= \frac{a^2 - ab + b^2 - ac - bc + c^2}{a^2}$$

$$= \frac{(a^2 + b^2 - 2ab) + (b^2 + c^2 - 2bc) + (c^2 + a^2 - 2ac)}{2a^2}$$

$$= \frac{(a-b)^2 + (b-c)^2 + (c-a)^2}{2a^2}$$

Here, all terms are in square, therefore it is always positive.

$$25. (b) \text{ We have, } 5 - 2\sqrt{6} = \frac{(5 - 2\sqrt{6})(5 + 2\sqrt{6})}{(5 + 2\sqrt{6})}$$

$$= \frac{25 - 24}{5 + 2\sqrt{6}} = \frac{1}{5 + 2\sqrt{6}}$$

$$\text{Let } (5 + 2\sqrt{6})^{x^2 - 3} = y$$

Then, given equation becomes

$$y + \frac{1}{y} = 10 \Rightarrow y^2 - 10y + 1 = 0$$

$$\Rightarrow y = \frac{10 \pm 4\sqrt{6}}{2} = 5 \pm 2\sqrt{6}$$

When $y = 2\sqrt{6} + 5$, then

$$(5 + 2\sqrt{6})^{x^2 - 3} = (5 + 2\sqrt{6}) \Rightarrow x^2 - 3 = 1$$

$$\Rightarrow x^2 = 4 \Rightarrow x = \pm 2$$

When $y = 5 - 2\sqrt{6}$, then $(5 + 2\sqrt{6})^{x^2 - 3} = (5 - 2\sqrt{6})$

$$\Rightarrow (5 + 2\sqrt{6})^{x^2 - 3} = (5 + 2\sqrt{6})^{-1} \Rightarrow x^2 - 3 = -1$$

$$\Rightarrow x^2 = 2 \Rightarrow x = \pm \sqrt{2}$$

$$\therefore x = 2, -2 - \sqrt{2}, \sqrt{2}$$

26. (d) The given equation can be rewritten as

$$x^2 - (a + b)x + ab - 1 = 0$$

Let α, β be its roots.

$$\therefore \alpha + \beta = a + b, \alpha\beta = ab - 1$$

If one root is less than a , then the other root will be greater than b .

So, we have one root lies in $(-\infty, a)$ and other in (b, ∞) .

27. (b) Clearly, $\alpha + \beta = -b < 0$

$$\alpha\beta = c < 0$$

Now, $\alpha\beta < 0$ and $\alpha < \beta$

$\Rightarrow \alpha$ is a negative root.

$$\alpha + \beta < 0 \text{ and } \alpha < 0 \Rightarrow \beta < |\alpha|$$

$$\therefore \alpha < 0 < \beta < |\alpha|$$

28. (a) Let α, β be the roots of the given equation, then

$$\alpha + \beta = \frac{-m}{l}, \alpha\beta = \frac{m}{l}$$

$$\text{Also } \frac{\alpha}{\beta} = \frac{a}{b}$$

$$\text{Now, } \sqrt{\frac{a}{b}} + \sqrt{\frac{b}{a}} + \sqrt{\frac{m}{l}} = \sqrt{\frac{\alpha}{\beta}} + \sqrt{\frac{\beta}{\alpha}} + \sqrt{\frac{m}{l}}$$

$$= \frac{\alpha + \beta}{\sqrt{\alpha\beta}} + \sqrt{\frac{m}{l}} = \frac{-m/l}{\sqrt{m/l}} + \sqrt{\frac{m}{l}} = -\sqrt{\frac{m}{l}} + \sqrt{\frac{m}{l}} = 0$$

29. (c) Let α, α^2 be the roots.

$\therefore$ Product of the roots,

$$\alpha \cdot \alpha^2 = 1 \Rightarrow \alpha^3 = 1$$

$$\Rightarrow \alpha = 1, \omega, \omega^2$$

$$\text{Again, } \alpha + \alpha^2 = -\frac{p}{3} \Rightarrow 1 + 1 = -\frac{p}{3}$$

$$\Rightarrow p = -6 \text{ (if } \alpha = 1)$$

But $p > 0$

$\therefore \alpha = 1$ is not possible.

If $\alpha = \omega$, then $\alpha + \alpha^2 = \omega + \omega^2 = -1$

$$\therefore -1 = -\frac{p}{3} \Rightarrow p = 3$$

Again, if $\alpha = \omega^2$, then

$$\alpha + \alpha^2 = \omega^2 + \omega^4 = \omega^2 + \omega = -1$$

$$\therefore -1 = -\frac{p}{3} \Rightarrow p = 3$$

30. (c) We have, $x^2 + 5 = 2x - 4 \cos(a + b)$

$$\Rightarrow x^2 - 2x + 1 + 4 = -4 \cos(a + b)$$

$$\Rightarrow (x - 1)^2 + 4[1 + \cos(a + b)] = 0$$

$$\Rightarrow x = 1 \text{ and } 1 + \cos(a + b) = 0$$

$$\Rightarrow \cos(a + b) = -1 \Rightarrow a + b = \pi, 3\pi, \dots$$

31. (a) Since, the roots of $ax^2 + bx + c = 0$ are non-real. Thus, $2f(x) = ax^2 + bx + c$ will have same sign for every value of x .

$$\Rightarrow f(0) = c, f(1) = a + b + c, f(-1) = a - b + c$$

$$\text{and } f(2) = 4a - 2b + c$$

$$\therefore c \cdot (a + b + c) > 0$$

$$c(a - b + c) > 0 \text{ and } c(4a - 2b + c) > 0$$

32. (b) Hint Using $\alpha - \beta = \pm \sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$

33. (c) Since, roots of $ax^2 + bx + c = 0$ are α and β .

Hence, roots of $cx^2 + bx + a = 0$ will be $\frac{1}{\alpha}$ and $\frac{1}{\beta}$.

Now, if we replace x by $x - 1$, then roots of $c(x - 1)^2 + b(x - 1) + a = 0$ will be $1 + \frac{1}{\alpha}$ and $1 + \frac{1}{\beta}$.

Again replace x by $\frac{1}{x}$, we get

$$c(1 - x)^2 + b(1 - x) + ax^2 = 0$$

whose roots are $\frac{\alpha}{1 + \alpha}$ and $\frac{\beta}{1 + \beta}$.

34. (b) Given, $4a + 4b - 5c > 0$

Let $f(x) = ax^2 + 2bx - 5c$, then $f(2) = 4a + 4b - 5c > 0$

Since, $f(x) = 0$ has imaginary roots, therefore $f(x)$ will have same sign as that of a for all $x \in R$.

Since, $f(2) > 0$, therefore $a > 0$ and $c < 0$.

35. (b) Suppose $m = \frac{(x - b)(x - c)}{(x - a)}$

$$\Rightarrow x^2 - (b + c + m)x + (bc + am) = 0$$

Since, x is real, so we must have

$$(b + c + m)^2 - 4(bc + am) \geq 0$$

$$\Rightarrow m^2 + 2(b + c - 20)m + (b - c)^2 \geq 0$$

$$\Rightarrow [m + (b + c - 2a)]^2 + (b - c)^2 - (b + c - 2a)^2 \geq 0$$

Since, m may take any real value, so we must have

$$(b - c)^2 - (b + c - 2a)^2 \geq 0 \Rightarrow (b - a)(a - c) \geq 0$$

$$\Rightarrow (a - b)(a - c) \leq 0 \Rightarrow b \geq a \geq c \text{ or } b \leq a \leq c$$

BITSAT Archives

$$1. (a) \text{ Given, } \left[\alpha x - \frac{1}{2}(\alpha x)^2 + \frac{1}{3}(\alpha x)^3 - \dots \right] + \left[\beta x - \frac{1}{2}(\beta x)^2 + \frac{1}{3}(\beta x)^3 - \dots \right]$$

$$= \log(1 - \alpha x) + \log(1 - \beta x) = \log[1 - (\alpha + \beta)x + \alpha\beta x^2]$$

$$\text{Now, } \alpha + \beta = p \text{ and } \alpha\beta = q$$

$$\therefore \text{ Given series} = \log(1 - px + qx^2)$$

$$2. (a) \text{ Given, } \frac{3 - |x|}{4 - |x|} \geq 0$$

$$\Rightarrow 3 - |x| \leq 0 \text{ and } 4 - |x| < 0$$

$$\text{or } 3 - |x| \geq 0 \text{ and } 4 - |x| > 0$$

$$\Rightarrow |x| \geq 3 \text{ and } |x| > 4$$

$$\text{or } |x| \leq 3 \text{ and } |x| < 4$$

$$\Rightarrow |x| > 4 \text{ or } |x| \leq 3$$

$$\Rightarrow x \in (-\infty, -4) \cup [-3, 3] \cup (4, \infty)$$

$$3. (a) \text{ We have, } \frac{N}{x_1 + x_2 + x_3 + x_4} = \frac{1000x_1 + 100x_2 + 10x_3 + x_4}{x_1 + x_2 + x_3 + x_4} = 1000 - \left(\frac{900x_2 + 990x_3 + 999x_4}{x_1 + x_2 + x_3 + x_4} \right)$$

$$\therefore \text{ Maximum value is } 1000.$$

$$4. (b) \text{ If } 4 - 5i \text{ is the root of } x^2 + ax + b = 0, \text{ then } 4 + 5i \text{ is also the root.}$$

$$\therefore \text{ Sum of roots} = -a = 8 \Rightarrow a = -8$$

$$\text{and product of roots} = b = 16 + 25 = 41$$

$$\therefore (a, b) = (-8, 41)$$

$$5. (b)$$

$$6. (c) \text{ Since, } \alpha, \beta \text{ are the roots of the equation } ax^2 + bx + c = 0.$$

$$\text{Then, } \alpha = -\frac{b}{2a} + \frac{\sqrt{b^2 - 4ac}}{2a} \quad \dots(i)$$

$$\text{and } \beta = -\frac{b}{2a} - \frac{\sqrt{b^2 - 4ac}}{2a}$$

$$\text{Also, } \alpha + k, \beta + k \text{ are the roots of the equation } px^2 + qx + r = 0.$$

$$\text{Then, } \alpha + k = -\frac{q}{2p} + \frac{\sqrt{q^2 - 4pr}}{2p}$$

$$\text{and } \beta + k = -\frac{q}{2p} - \frac{\sqrt{q^2 - 4pr}}{2p}$$

$$\Rightarrow k = -\frac{q}{2p} + \frac{\sqrt{q^2 - 4pr}}{2p} + \frac{b}{2a} - \frac{\sqrt{b^2 - 4ac}}{2a} \quad [\text{from Eq. (i)}]$$

$$\text{and } k = -\frac{q}{2p} - \frac{\sqrt{q^2 - 4pr}}{2p} + \frac{b}{2a} + \frac{\sqrt{b^2 - 4ac}}{2a} \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \frac{\sqrt{q^2 - 4pr}}{2p} - \frac{\sqrt{b^2 - 4ac}}{2a} = \frac{-\sqrt{q^2 - 4pr}}{2p} + \frac{\sqrt{b^2 - 4ac}}{2a}$$

$$\Rightarrow \frac{\sqrt{q^2 - 4pr}}{p} = \frac{\sqrt{b^2 - 4ac}}{a} \Rightarrow \frac{q^2 - 4pr}{p^2} = \frac{b^2 - 4ac}{a^2}$$

$$\therefore \frac{b^2 - 4ac}{q^2 - 4pr} = \left(\frac{a}{p} \right)^2$$

$$7. (b) \text{ Since, } \alpha \text{ and } \beta \text{ are the roots of } x^2 - 2x + 4 = 0.$$

$$\therefore \alpha + \beta = 2 \text{ and } \alpha\beta = 4$$

$$\text{Now, } (\alpha - \beta) = \sqrt{(\alpha + \beta)^2 - 4\alpha\beta} = \sqrt{4 - 16} = 2\sqrt{3}i$$

$$\text{On solving, we get}$$

$$2\alpha = 2 + 2\sqrt{3}i$$

$$\Rightarrow \alpha = 2 \left(\frac{1}{2} + \frac{\sqrt{3}}{2}i \right) = 2 \left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right)$$

$$\text{and } \beta = \frac{2 - 2\sqrt{3}i}{2} = 2 \left(\cos \frac{\pi}{3} - i \sin \frac{\pi}{3} \right)$$

$$\therefore \alpha^n + \beta^n = \left[2 \left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right) \right]^n + \left[2 \left(\cos \frac{\pi}{3} - i \sin \frac{\pi}{3} \right) \right]^n$$

$$= 2^n \left[2 \cos \frac{n\pi}{3} \right] = 2^{n+1} \cos \frac{n\pi}{3}$$

$$8. (c) \text{ The roots of the given equation are}$$

$$\alpha = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

$$\text{and } \beta = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$

$$\text{Since, } \alpha, \beta \text{ are real and distinct, therefore } b^2 - 4ac > 0.$$

$$\text{If } a > 0, \text{ then } \beta > -\frac{b}{2a} \text{ and if } a < 0, \text{ then } a > -\frac{b}{2a}. \text{ Thus, one of the roots exceeds } -\frac{b}{2a}.$$

$$9. (d) \text{ Let } z = x + iy, \text{ then}$$

$$z^2 + \bar{z} = 0$$

$$\Rightarrow (x^2 - y^2 + 2ixy) + (x - iy) = 0$$

$$\Rightarrow x^2 - y^2 + x = 0 \text{ and } 2xy - y = 0$$

$$\text{Now, } 2xy - y = 0 \Rightarrow y(2x - 1) = 0$$

$$\Rightarrow y = 0 \text{ or } x = 1/2$$

$$\text{If } y = 0, \text{ then}$$

$$x^2 - y^2 + x = 0$$

$$\Rightarrow x^2 + x = 0$$

$$\Rightarrow x = 0 \text{ or } x = -1$$

$$\text{If } x = 1/2, \text{ then } x^2 - y^2 + x = 0$$

$$\Rightarrow y = \pm \frac{\sqrt{3}}{2}$$

$$\text{Thus, the given equation has four solutions.}$$

10. (a)

11. (d) Given, $\alpha + \beta = -2$ and $\alpha^3 + \beta^3 = -56$

$$\Rightarrow (\alpha + \beta)(\alpha^2 + \beta^2 - \alpha\beta) = -56 \Rightarrow \alpha^2 + \beta^2 - \alpha\beta = 28$$

$$\text{Now, } (\alpha + \beta)^2 = (-2)^2 \Rightarrow \alpha^2 + \beta^2 + 2\alpha\beta = 4$$

$$\Rightarrow 28 + 3\alpha\beta = 4 \Rightarrow \alpha\beta = -8$$

$\therefore$ Required equation is

$$x^2 - (-2)x + (-8) = 0 \Rightarrow x^2 + 2x - 8 = 0$$

12. (d) Given equation is $x^3 + 2x^2 - 4x + 1 = 0$

Let α, β and γ be the roots of the given equation.

$$\text{Then, } \alpha + \beta + \gamma = -2$$

$$\alpha\beta + \beta\gamma + \gamma\alpha = -4 \text{ and } \alpha\beta\gamma = -1$$

Let the required cubic equation has the roots $3\alpha, 3\beta$ and 3γ .

$$\Rightarrow 3\alpha + 3\beta + 3\gamma = -6$$

$$3\alpha \cdot 3\beta + 3\beta \cdot 3\gamma + 3\gamma \cdot 3\alpha = -36$$

$$\text{and } 3\alpha \cdot 3\beta \cdot 3\gamma = -27$$

$\therefore$ Required equation is

$$x^3 - (-6)x^2 + (-36)x - (-27) = 0$$

$$\Rightarrow x^3 + 6x^2 - 36x + 27 = 0$$

13. (a) Given that, $1 + \sin x \cdot \sin^2 \frac{x}{2} = 0$

$$\therefore 1 + \sin x \left(\frac{1 - \cos x}{2} \right) = 0$$

$$\Rightarrow 2 + \sin x - \sin x \cos x = 0$$

$$\Rightarrow \sin 2x - 2 \sin x = 4$$

Since, the maximum values of $\sin x$ and $\sin 2x$ are 1, which is not possible for any x in $[-\pi, \pi]$.

14. (b) Hint Let α and α^n be the roots of the equation. Then,

$$\alpha + \alpha^n = \frac{-b}{a} \quad \dots(i)$$

$$\text{and } \alpha \cdot \alpha^n = \frac{c}{a} \Rightarrow \alpha^{n+1} = \frac{c}{a}$$

$$\Rightarrow \alpha = \left(\frac{c}{a} \right)^{\frac{1}{n+1}} \quad \dots(ii)$$

15. (a) Hint Here, $\alpha + \beta + \gamma = \frac{3}{2}$... (i)

$$\Rightarrow \alpha^2 + \beta^2 + \gamma^2 + 2[\alpha\beta + \beta\gamma + \gamma\alpha] = \frac{9}{4}$$

16. (a) Since, $\sin A, \sin B$ and $\cos A$ are in GP.

$$\therefore \sin^2 B = \sin A \cos A \quad \dots(i)$$

$$x^2 + 2x \cot B + 1 = 0 \quad [\text{given}]$$

$$\text{Now, } b^2 - 4ac = 4 \cot^2 B - 4$$

$$= \frac{4 \cos^2 B - 4 \sin^2 B}{\sin^2 B}$$

$$= \frac{4(1 - \sin^2 B) - 4 \sin^2 B}{\sin^2 B}$$

$$= \frac{4[1 - 2 \sin^2 B]}{\sin^2 B}$$

$$= \frac{4[1 - 2 \sin A \cos A]}{\sin^2 B} \quad [\text{from Eq. (i)}]$$

$$= 4 \left(\frac{\sin A - \cos A}{\sin B} \right)^2 > 0$$

$\therefore$ Roots are always real.

3

Sequences and Series

Sequences and Series

Sequence is a function whose domain is a subset of N i.e. a set of natural numbers. It displays the images of $1, 2, 3, \dots, n, \dots$ as $f_1, f_2, f_3, \dots, f_n, \dots$, where $f_n = f(n)$. If the terms of a sequence follows certain pattern, then it is called a **progression**. If $a_1, a_2, a_3, \dots, a_n$ is a sequence, then the expression gives the **series** $a_1 + a_2 + a_3 + \dots + a_n$.

Arithmetic Progression (AP)

It is a sequence in which the difference between two consecutive terms is same.

i.e. $a, a + d, a + 2d, a + 3d, \dots$ where, a is the first term and d is the common difference.

n th Term of an AP

Let a be the first term, l be the last term and d be the common difference of a certain sequence in AP. Then, n th term of AP is $T_n = a + (n - 1)d = l$

where,

$$d = T_n - T_{n-1}, n \geq 2, n \in N$$

n th term from last,

$$T'_n = l - (n - 1)d$$

Sum of the First n Terms of an AP

If first term of an AP is a , common difference is d and number of terms is n , then

(i) Sum of n terms, $S_n = \frac{n}{2} [2a + (n - 1)d]$

(ii) When first term and last term are given, then

$$S_n = \frac{n}{2} [a + l]$$

(iii) When last term and the common difference are given, then

$$S_n = \frac{n}{2} [2l - (n - 1)d]$$

Properties of an AP

- If $a_1, a_2, a_3, \dots$ are in AP, then
 - > $a_1 \pm k, a_2 \pm k, a_3 \pm k, \dots$ are also in AP.
 - > $a_1 k, a_2 k, a_3 k, \dots$ and $\frac{a_1}{k}, \frac{a_2}{k}, \frac{a_3}{k}, \dots$ are also in AP.
- If $a_1, a_2, a_3, \dots$ and $b_1, b_2, b_3, \dots$ are two AP's, then
 - > $a_1 \pm b_1, a_2 \pm b_2, a_3 \pm b_3, \dots$ are also in AP.
 - > $a_1 b_1, a_2 b_2, a_3 b_3, \dots$ and $\frac{a_1}{b_1}, \frac{a_2}{b_2}, \frac{a_3}{b_3}, \dots$ are not in AP.
- If $a_1, a_2, a_3, \dots$ are in AP, then
 - > $a_1 + a_n = a_2 + a_{n-1} = a_3 + a_{n-2} = \dots$
 - > $a_r = \frac{a_{r-k} + a_{r+k}}{2}, \forall k; 0 \leq k \leq n-r$
- Three numbers in an AP can be taken as $a-d, a, a+d$.
- Four numbers in an AP can be taken as $a-3d, a-d, a+d, a+3d$
- If n th term of any sequence is linear expression in n such that $t_n = an + b$, then sequence is an AP with common difference a .
- If sum of n terms of any sequence is quadratic expression in n i.e. $S_n = an^2 + bn$, then sequence is an AP.

Geometric Progression (GP)

It is a sequence in which the ratio of any two consecutive terms is same i.e. $a, ar, ar^2, \dots$

where, a is the first term and r is the common ratio.

n th Term of a GP

Let the series be $a, ar, ar^2, ar^3, \dots$

$$\begin{aligned} t_1 &= a = ar^{1-1} \\ t_2 &= ar = ar^{2-1} \\ &\vdots \\ t_n &= ar^{n-1} \end{aligned}$$

(i) So, n th term of a GP,

$$t_n = ar^{n-1} = l \quad \left[\because r = \frac{t_n}{t_{n-1}} \right]$$

(ii) n th term of a GP from the end,

$$t'_n = \frac{l}{r^{n-1}}$$

Sum of n Terms of a GP

Let the first term of a GP be a and common ratio be r , then series is $a, ar, ar^2, \dots, ar^{n-1}$.

$$\text{Let } S = a + ar + ar^2 + \dots + ar^{n-1} \quad \dots(i)$$

$$S \cdot r = ar + ar^2 + \dots + ar^{n-1} + ar^n \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$S(1-r) = a - ar^n, \text{ so}$$

$$(i) S_n = \frac{a(1-r^n)}{1-r}, \text{ when } r < 1$$

$$(ii) S_n = \frac{a(r^n-1)}{r-1}, \text{ when } r > 1$$

(iii) If last term (l) is known, then

$$S_n = \begin{cases} \frac{a-lr}{1-r}, & \text{when } r < 1 \\ \frac{lr-a}{r-1}, & \text{when } r > 1 \end{cases}$$

Sum of Infinite Terms of a GP

When $|r| < 1$ and number of terms is infinite, then

$$\lim_{n \rightarrow \infty} r^n = 0$$

$$\therefore S_\infty = \frac{a}{1-r}, \text{ where } r = \frac{t_n}{t_{n-1}}$$

Properties of a GP

- If $a_1, a_2, a_3, \dots$ are in GP, then
 - > $a_1 k, a_2 k, a_3 k, \dots$ and $\frac{a_1}{k}, \frac{a_2}{k}, \frac{a_3}{k}, \dots$ are also in GP.
 - > $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \frac{1}{a_4}, \dots$ are also in GP.
- If $a_1, a_2, a_3, a_4, \dots$ and $b_1, b_2, b_3, b_4, \dots$ are in GP, then
 - > $a_1 b_1, a_2 b_2, a_3 b_3, \dots$ and $\frac{a_1}{b_1}, \frac{a_2}{b_2}, \frac{a_3}{b_3}, \dots$ are also in GP.
 - > But $a_1 \pm b_1, a_2 \pm b_2, a_3 \pm b_3, \dots$ are not in GP.
- If $a_1, a_2, a_3, \dots$ are in GP ($a_i > 0, \forall i$), then
 - > $\log a_1, \log a_2, \log a_3, \dots$ are in AP. In this case, the converse is also true.
 - > $a_1^r, a_2^r, a_3^r, \dots$ are also in GP, where $r \in \mathbb{Q}$.
 - > $a_1 a_n = a_2 a_{n-1} = a_3 a_{n-2} = \dots$
 - > $a_r = \sqrt[a_{r-k} \cdot a_{r+k}], \forall k; 0 \leq k \leq n-r$
- If $a_1, a_2, a_3, a_4, \dots, a_{n-1}, a_n$ are in GP, then

$$\frac{a_2}{a_1} = \frac{a_3}{a_2} = \frac{a_4}{a_3} = \dots$$

$$= \frac{a_n}{a_{n-1}} = r$$

• Three numbers in GP can be taken as $\frac{a}{r}, a, ar$.

• Four numbers in GP can be taken as $\frac{a}{r^3}, \frac{a}{r}, ar, ar^3$.

NOTE If a, b, c are in AP as well as in GP, then $a = b = c$.

Arithmetic Mean (AM)

Let a , x and b be in AP. Then, the arithmetic mean of AP is x and can be written as

$$x = \frac{a+b}{2} = A$$

Similarly, AM of n numbers $a_1, a_2, \dots, a_n$ is

$$\frac{1}{n}(a_1 + a_2 + \dots + a_n)$$

Insertion of n Arithmetic Mean between Two Given Numbers

Let $x_1, x_2, x_3, \dots, x_n$ be n AM's between a and b . Then, $a, x_1, x_2, x_3, \dots, x_n, b$ are in AP and total number of terms are $n+2$. If d is the common difference of an AP, then

$$t_{n+2} = a + (n+2-1)d = b$$

$$d = \frac{b-a}{n+1}$$

Then, $x_r = a + r\left(\frac{b-a}{n+1}\right)$, where $r = 1, 2, 3, \dots$

(i) Sum of n arithmetic means

$$= x_1 + x_2 + x_3 + \dots + x_n = \frac{n}{2}(x_1 + x_n) \quad [\text{sum of AP}]$$

$$= \frac{n}{2}[a + d + b - d] = n\left(\frac{a+b}{2}\right) \quad [\text{AM of } a \text{ and } b]$$

(ii) Sum of n AM's between a and b is nA .

$$\text{i.e. } A_1 + A_2 + A_3 + \dots + A_n = nA$$

(iii) Any three numbers in AP can be taken as $a-d, a, a+d$.

(iv) Any four numbers in AP can be taken as $a-3d, a-d, a+d, a+3d$.

(v) In arithmetic series containing even numbers, we assume, number of terms in such series as $2n$, n th and $(n+1)$ th terms will be two middle terms.

(vi) In arithmetic series containing odd numbers, we assume, number of terms in such series as $(2n+1)$, then $(n+1)$ th term will be middle term.

(vii) Sum of terms from beginning and end of arithmetic series is constant.

NOTE • If p th term of an AP is q and q th term is p , then $T_{p+q} = 0$

• If $S_p = q$ and $S_q = p$ for an AP, then $S_{p+q} = -(p+q)$

> If $S_p = S_q$ for an AP, then $S_{p+q} = 0$.

> If p th term is $\frac{1}{q}$ and q th term is $\frac{1}{p}$, then

$$T_{pq} = 1$$

Geometric Mean (GM)

If three numbers are in GP, then middle one is called the GM between the other two.

Let a , x and b be in GP. Then,

$$\frac{x}{a} = \frac{b}{x}$$

$$\Rightarrow x^2 = ab$$

$$\Rightarrow x = \sqrt{ab} = G$$

Insertion of Geometric Mean between Two Given Numbers

Let a and b be the given numbers and $x_1, x_2, x_3, \dots, x_n$ be n geometric means inserted between them.

Then, $a, x_1, x_2, x_3, \dots, x_n, b$ are in GP.

$$\therefore b = t_{n+2} = ar^{n+1}; r = \left(\frac{b}{a}\right)^{\frac{1}{n+1}}$$

$$x_1 = t_2 = ar$$

$$x_2 = t_3 = ar^2$$

$$\vdots \quad \vdots \quad \vdots$$

$$x_n = t_{n+1} = ar^n$$

$$\therefore x_r = a \left(\frac{b}{a}\right)^{\frac{r}{n+1}}, \text{ where } r = 1, 2, 3, \dots$$

On putting the value of r , we shall find n geometric means. The product of n geometric means between a and b is equal to the n th power of geometric mean of a and b .

$$\text{i.e. } G_1 \cdot G_2 \dots G_n = (ab)^{n/2} = G^n \quad [\because G = \sqrt{ab}]$$

(i) The product of n geometric means between a and $\frac{1}{a}$ is 1.

(ii) Three numbers in GP can be taken as $\frac{a}{r}, a, ar$.

(iii) Four numbers in GP can be taken as $\frac{a}{r^3}, \frac{a}{r}, ar, ar^3$.

(iv) Five numbers in GP can be taken as $\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$.

NOTE • If A and G are the AM and GM between two numbers a and b , then a, b are given by $[A \pm \sqrt{(A+G)(A-G)}]$

• The product of first n terms of GP is

$$P = a \cdot ar \cdot ar^2 \dots ar^{n-1} = a^n r^{\frac{n(n-1)}{2}}$$

Relation between AM and GM

If a and b are two numbers, then

$$AM = \frac{a+b}{2}$$

and

$$GM = \sqrt{ab}$$

Now,

$$\begin{aligned} AM - GM &= \frac{a+b}{2} - \sqrt{ab} \\ &= \left(\frac{\sqrt{a} - \sqrt{b}}{\sqrt{2}} \right)^2 \geq 0 \end{aligned}$$

$\Rightarrow$

$$AM - GM \geq 0$$

Hence,

$$AM \geq GM$$

NOTE • If A and G are the AM and GM between two positive numbers, then the numbers are $A \pm \sqrt{A^2 - G^2}$.

• If A and G are respectively AM and GM between two positive numbers a and b , then the quadratic equation having a and b as its roots, is $x^2 - 2Ax + G^2 = 0$.

Arithmetico-Geometric Progression (AGP)

A series in which each term is the product of the corresponding terms of an AP and GP, is called arithmetico-geometric progression (AGP).

e.g. $1 + 3x + 5x^2 + 7x^3 + \dots$

Here, $1, 3, 5, \dots$ are in AP and $1, x, x^2, \dots$ are in GP.

Sum of n Terms of AGP

Let $a_1, a_2, \dots, a_n$ be in AP and $b_1, b_2, \dots, b_n$ be in GP.

Then, $a_1b_1, a_2b_2, \dots, a_nb_n$ will be in AGP. If the first term of an AP is a , common difference is d and first term of a GP is b , common ratio is r , then

$ab, (a+d)br, (a+2d)br^2, \dots$ are in AGP.

$$\text{Now, } S_n = \frac{ab}{1-r} + \frac{dbr(1-r^{n-1})}{(1-r)^2} - \frac{[a+(n-1)d]br^n}{1-r}, r \neq 1$$

If $-1 < r < 1$, then $\lim_{n \rightarrow \infty} r^n = 0$

and $\lim_{n \rightarrow \infty} nr^n = 0$

$$\therefore \text{Sum to infinity, } S_\infty = \frac{ab}{1-r} + \frac{dbr}{(1-r)^2} \quad [\because -1 < r < 1]$$

Harmonic Progression (HP)

A sequence is said to be a harmonic progression, if reciprocal of terms of the sequence form an AP i.e.

$a_1, a_2, a_3, \dots, a_n$ are in HP, if $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \dots, \frac{1}{a_n}$ are in AP.

n th term of HP from beginning,

$$T_n = \frac{1}{\frac{1}{a_1} + (n-1)\left(\frac{1}{a_2} - \frac{1}{a_1}\right)} = \frac{a_1a_2}{a_2 + (n-1)(a_1 - a_2)}$$

n th term of HP from end,

$$\begin{aligned} T'_n &= \frac{1}{\frac{1}{a_n} - (n-1)\left(\frac{1}{a_2} - \frac{1}{a_1}\right)} \\ &= \frac{a_1a_2a_n}{a_1a_2 - a_n(n-1)(a_1 - a_2)} \end{aligned}$$

Harmonic Mean (HM)

If two numbers a and b are in HP, then harmonic mean (HM) between them is given by $HM = \frac{2ab}{a+b}$.

Insertion of Harmonic Mean

If $a, x_1, x_2, \dots, x_n, b$ are in HP, then $x_1, x_2, \dots, x_n$ are n harmonic means between a and b .

These are the reciprocal of n arithmetic means between $\frac{1}{a}$ and $\frac{1}{b}$.

Hence, $x_1 = \frac{(n+1)ab}{a+nb}$, $x^2 = \frac{(n+1)}{2a+(n-1)b}$, ... and so on.

Relation between AM, GM and HM

Let a and b be two real positive unequal numbers, then AM, GM and HM between them are respectively,

$$A = \frac{a+b}{2}, G = \sqrt{ab}, H = \frac{2ab}{a+b} \Rightarrow G^2 = AH$$

Also,

$$A > G > H$$

Hence, G lies between A and H .

NOTE If A, G and H are arithmetic, geometric and harmonic means between three given numbers a, b and c , then the equation having a, b, c as its roots, is

$$x^3 - 3Ax^2 + \frac{3G^3}{H}x - G^3 = 0$$

Sum upto n Terms of Special Series $\sum n$, $\sum n^2$, $\sum n^3$, etc.

(i) Sum of first n natural numbers

$$\sum_{k=1}^n k = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

(ii) Sum of the squares of first n natural numbers

$$\sum_{k=1}^n k^2 = 1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{1}{6} n(n+1)(2n+1)$$

(iii) Sum of the cubes of first n natural numbers

$$\sum_{k=1}^n k^3 = 1^3 + 2^3 + \dots + n^3 = \left(\sum_{k=1}^n k \right)^2 = \left[\frac{1}{2} n(n+1) \right]^2$$

(iv) Sum of product of first n natural numbers taken two at a time is

$$\frac{1}{2} [\sum n^3 - \sum n^2] = \frac{n(n+1)(n-1)(3n+2)}{24}$$

(v) (a) Sum of first even natural numbers

$$2 + 4 + 6 + \dots + 2n = n(n+1)$$

(b) Sum of first odd natural numbers

$$1 + 3 + 5 + \dots + (2n-1) = n^2$$

(vi) Sum of n terms of series

$$1^2 - 2^2 + 3^2 - 4^2 + 5^2 - 6^2 + \dots = \begin{cases} \frac{n(n+1)}{2}, & \text{when } n \text{ is odd} \\ \frac{-n(n+1)}{2}, & \text{when } n \text{ is even} \end{cases}$$

NOTE

- $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{n(n+1)} = \frac{n}{n+1}$
- $\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{1}{4} - \frac{1}{2(n+1)(n+2)}$
- $1 \cdot 2 + 2 \cdot 3 + \dots + n(n+1) = \frac{n(n+1)(n+2)}{3}$
- $1 \cdot 2 \cdot 3 \cdot 4 + 2 \cdot 3 \cdot 4 \cdot 5 + \dots + n(n+1)(n+2)(n+3) = \frac{1}{5} n(n+1)(n+2)(n+3)(n+4)$

Practice Exercise

- The number of numbers lying between 100 and 500 that are divisible by 7 but not by 21, is
a. 57 b. 19 c. 38 d. 40
- Let S_n denotes the sum of n terms of an AP, whose first term is a . If the common difference $d = S_n - kS_{n-1} + S_{n-2}$, then k is equal
a. 3 b. 2 c. 5 d. 7
- The sum upto n terms of the sequence $\log a, \log ar, \log ar^2, \dots$ is
a. $\frac{n}{2} \log a^2 r^{n-1}$ b. $\frac{n}{2} \log ar^{n-1}$
c. $\frac{3n}{2} \log ar^{n-1}$ d. $\frac{5n}{2} \log a^2 r^{n-1}$
- If m times the m th term of an AP with non-zero common difference equals n times the n th term of an AP, where $m \neq n$, then $(m+n)$ th term of this AP is
a. mn b. zero
c. $2mn$ d. None
- Let T_r be the r th term of an AP, for $r = 1, 2, 3, \dots$. If for some positive integers m and n , $t_m = \frac{1}{n}$, $t_n = \frac{1}{m}$, then m th term of an AP is equal to
a. $\frac{1}{m}$ b. $\frac{1}{m} + \frac{1}{n}$
c. 1 d. None
- The first, second and middle terms of an AP are a, b, c respectively. Then, their sum is equal to
a. $\frac{2(c-a)}{b-a}$ b. $\frac{2c(c-a)}{b-a} + c$
c. $\frac{2c(b-a)}{c-a}$ d. None of these
- The number of common terms to the two sequences 17, 21, 25, ..., 417 and 16, 21, 26, ..., 466 is
a. 21 b. 19 c. 20 d. 91
- The least value of a for which $5^{1+x} + 5^{1-x}, \frac{a}{2}, 25^x + 25^{-x}$ are three consecutive terms of an AP, is
a. 10 b. 5
c. 12 d. None of these
- Let $a_1, a_2, a_3, \dots$ be in AP with common difference not multiple of 3. Then, the maximum number of consecutive terms so that all are prime number, is
a. 2 b. 3
c. 5 d. infinite
- If $\log_3 2, \log_3 (2^x - 5)$ and $\log_3 \left(2^x - \frac{7}{2} \right)$ are in AP, then x is equal to
a. 2 b. 3
c. 4 d. 2, 3

11. If the sum of n terms of an AP is given by $S_n = a + bn + cn^2$, where a, b and c are independent of n , then
 a. $a \neq 0$
 b. $d \neq 3b$
 c. $d = 2c$
 d. first term of an AP is $b - c$
12. A farmer buys a used tractor of ₹12000. He pays ₹6000 cash and agrees to pay the balance in annual installment of ₹500 plus 12% interest on the unpaid amount. How much will the tractor cost him?
 a. ₹16680 b. ₹16670 c. ₹16681 d. ₹16682
13. In a GP of positive terms, if any term is equal to the sum of the next two terms. Then, the common ratio of the GP is
 a. $\sin 18^\circ$ b. $2 \cos 18^\circ$ c. $\cos 18^\circ$ d. $2 \sin 18^\circ$
14. Let S be the sum, P be the product and R be the sum of the reciprocals of 3 terms of a GP. Then, $P^2 R^3 : S^3$ is equal to
 a. $1 : 1$
 b. $(\text{common ratio})^n : 1$
 c. $(\text{first term})^2 : (\text{common ratio})^2$
 d. None of the above
15. The sum of three numbers in GP is 56. If we subtract 1, 7 and 21 from these numbers in that order, we obtain an AP. Then, the numbers are
 a. 8, 16, 32 b. 8, 16, 30 c. 16, 0, 30 d. 32, 16, 9
16. The product of $(32)(32)^{1/6}(32)^{1/36} \dots$, is equal to
 a. 16 b. 64 c. 32 d. 0
17. If S denotes the sum of infinity and S_n denotes the sum of n terms of the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$, such that $S - S_n < \frac{1}{1000}$, then the least value of n is
 a. 8 b. 9 c. 10 d. 11
18. Let a_n be the n th term of a GP of positive integers. If $\sum_{n=1}^{100} a_{2n} = \alpha$ and $\sum_{n=1}^{100} a_{2n+1} = \beta$ such that $\alpha \neq \beta$, then the common ratio is
 a. $\frac{\alpha}{\beta}$
 b. $\frac{\beta}{\alpha}$
 c. $\left(\frac{\alpha}{\beta}\right)^{1/2}$
 d. $\left(\frac{\beta}{\alpha}\right)^{1/2}$
19. Let $S_1, S_2, \dots$ be squares such that for each $n \geq 1$, the length of a side of S_n equals the length of a diagonal of S_{n+1} . If the length of a side of S_1 is 10 cm, then for which of the following values of n is the area of S_n less than 1 sq cm?
 a. 7 b. 8 c. 9 d. 10
20. If one GM, g and two AM's, p and q are inserted between two numbers a and b , then $(2p - q)(p - 2q)$ is equal to
 a. g^2
 b. $-g^2$
 c. $2g$
 d. $3g^2$
21. If a, b, c are in GP and x, y are the AM's between a, b and b, c respectively, then
 a. $\frac{a}{x} + \frac{c}{y} = 2$
 b. $\frac{a}{x} + \frac{2c}{y} = \frac{c}{2a}$
 c. $\frac{1}{x} + \frac{1}{y} = \frac{3}{b}$
 d. $\frac{2}{x} + \frac{1}{2y} = \frac{3}{ac}$
22. If x, y and z are positive integers, then the value of $(x + y)(y + z)(z + x)$
 a. $= 8xyz$
 b. $> 8xyz$
 c. $< 8xyz$
 d. $= 4xyz$
23. The minimum value of the expression $3^x + 3^{1-x}$, $x \in R$, is
 a. 0
 b. $\frac{1}{3}$
 c. 3
 d. $2\sqrt{3}$
24. If A_1, A_2 are two AM's and G_1, G_2 are two GM's between a and b , then $\frac{A_1 + A_2}{G_1 G_2}$ is equal to
 a. $\frac{a+b}{2ab}$
 b. $\frac{2ab}{a+b}$
 c. $\frac{a+b}{ab}$
 d. $\frac{a+b}{\sqrt{ab}}$
25. If a, b, c are in GP, then the equations $ax^2 + 2bx + c = 0$ and $dx^2 + 2ex + f = 0$ have a common root, if $d/a, e/b, f/c$ are in
 a. GP
 b. AP
 c. HP
 d. None of these
26. If the sum to infinity of the series $1 + 4x + 7x^2 + 10x^3 + \dots$ is $\frac{35}{16}$. Then, the value of x is
 a. $2/5$
 b. $1/5$
 c. $3/5$
 d. None of these
27. If $\cos(x - y)$, $\cos x$ and $\cos(x + y)$ are in HP, then $\cos x \sec(y/2)$ is equal to
 a. $\pm\sqrt{2}$
 b. $\pm 1/\sqrt{2}$
 c. ± 2
 d. None of the above
28. If AM, GM and HM of first and last terms of the series 25, 26, 27, $\dots$, $N - 1, N$ are the terms of the series, then find the value of N .
 a. 25
 b. 225
 c. 1225
 d. None of the above

BITSAT Archives

1. If p, q, r and s are positive real numbers such that $p + q + r + s = 2$, then $M = (p + q)(r + s)$ satisfies the relation [2014]
 - a. $0 < M \leq 1$
 - b. $1 \leq M \leq 2$
 - c. $2 \leq M \leq 3$
 - d. $3 \leq M \leq 4$
2. The sum of the series [2013]

$$1 + 2 \cdot 2 + 3 \cdot 2^2 + 4 \cdot 2^3 + \dots + 100 \cdot 2^{99}$$
 is
 - a. $100 \cdot 2^{100} + 1$
 - b. $99 \cdot 2^{100} + 1$
 - c. $99 \cdot 2^{99} - 1$
 - d. $100 \cdot 2^{100} - 1$
3. The sum of the sequence $5 + 55 + 555 + \dots$ upto n terms is [2013]
 - a. $\frac{5}{9} \left[\frac{10(10^n - 1)}{9} + n \right]$
 - b. $\frac{5}{9} \left[\frac{10(10^n - 1)}{9} - n \right]$
 - c. $\frac{5}{9} \left[\frac{10(10^{n+1} - 1)}{9} - n \right]$
 - d. $\frac{5}{9} \left[\frac{10(10^{n-1} - 1)}{9} - n \right]$
4. If a, b, c are in GP and $a^{1/x} = b^{1/y} = c^{1/z}$, then x, y, z are in [2013]
 - a. AP
 - b. GP
 - c. HP
 - d. None of these
5. The sum of n terms of the series $\frac{1}{2} + \frac{3}{4} + \frac{7}{8} + \frac{15}{16} + \dots$ is [2012]
 - a. $n - 1 + 2^{-n}$
 - b. 1
 - c. $n - 1$
 - d. $1 + 2^{-n}$
6. $0.2 + 0.22 + 0.222 + \dots$ upto n terms is equal to [2012]
 - a. $\left(\frac{2}{9}\right) - \left(\frac{2}{81}\right)(1 - 10^{-n})$
 - b. $n - \left(\frac{1}{9}\right)(1 - 10^{-n})$
 - c. $\left(\frac{2}{9}\right) \left[n - \left(\frac{1}{9}\right)(1 - 10^{-n}) \right]$
 - d. $\frac{2}{9}$
7. If AM and HM between two numbers are 27 and 12 respectively, then their GM is [2011]
 - a. 9
 - b. 18
 - c. 24
 - d. 36
8. The value of $\frac{2}{1!} + \frac{2+4}{2!} + \frac{2+4+6}{3!} + \dots$ is [2011]
 - a. e
 - b. $2e$
 - c. $3e$
 - d. None of these
9. Let $a_1, a_2, \dots, a_{10}$ be in AP and $h_1, h_2, \dots, h_{10}$ be in HP. If $a_1 = h_1 = 2$ and $a_{10} = h_{10} = 3$, then $a_4 h_7$ is [2010]
 - a. 2
 - b. 3
 - c. 5
 - d. 6
10. The sum of the infinite series [2009]

$$1 + \frac{2}{3} \cdot \frac{1}{2} + \frac{2}{3} \cdot \frac{5}{6} \cdot \frac{1}{2^2} + \frac{2}{3} \cdot \frac{5}{6} \cdot \frac{8}{9} \cdot \frac{1}{2^3} + \dots,$$
 is
 - a. $2^{1/3}$
 - b. $4^{1/3}$
 - c. $8^{1/3}$
 - d. $2^{1/5}$
11. The HM of two numbers is 4. If their arithmetic mean A and geometric mean G satisfy the relation $2A + G^2 = 27$, then the numbers are [2009]
 - a. 2, 6
 - b. 3, 6
 - c. 1, 3
 - d. 1, 2
12. For any integer $n \geq 1$, $\sum_{k=1}^n k(k+2)$ is equal to [2008]
 - a. $\frac{n(n+1)(n+2)}{6}$
 - b. $\frac{n(n+1)(2n+1)}{6}$
 - c. $\frac{n(n+1)(2n+7)}{6}$
 - d. $\frac{n(n+1)(2n+9)}{6}$
13. In $\triangle ABC$, if $\frac{1}{b+c} + \frac{1}{c+a} = \frac{3}{a+b+c}$, then C is equal to [2008]
 - a. 90°
 - b. 60°
 - c. 45°
 - d. 30°
14. The sum of 24 terms of the series $\sqrt{2} + \sqrt{8} + \sqrt{18} + \sqrt{32} + \dots$, is [2007]
 - a. 300
 - b. $200\sqrt{2}$
 - c. $300\sqrt{2}$
 - d. $250\sqrt{2}$
15. The sum to n terms of the infinite series $1 \cdot 3^2 + 2 \cdot 5^2 + 3 \cdot 7^2 + \dots$ is [2007]
 - a. $\frac{n}{6}(n+1)(6n^2 + 14n + 7)$
 - b. $\frac{n}{6}(n+1)(2n+1)(3n+1)$
 - c. $4n^3 + 4n^2 + n$
 - d. None of the above
16. If $a = \log_2 3$, $b = \log_2 5$ and $c = \log_7 2$, then $\log_{140} 63$ in terms of a, b, c is [2007]
 - a. $\frac{2ac + 1}{2c + abc + 1}$
 - b. $\frac{2ac + 1}{2a + c + a}$
 - c. $\frac{2ac + 1}{2c + ab + a}$
 - d. None of these

 - a. 4
 - b. 8
 - c. 2
 - d. 6
18. Let α, β, γ and δ be four positive real numbers such that their product is unity, then the least value of $(1+\alpha)(1+\beta)(1+\gamma)(1+\delta)$ is [2005]
 - a. 6
 - b. 16
 - c. 0
 - d. 32

Answer with Solutions

Practice Exercise

1. (c) The numbers between 100 and 500 that are divisible by 7, are 105, 112, 119, 126, ..., 490, 497.

Let such numbers be n .

$$\therefore t_n = a_n + (n-1)d \Rightarrow 497 = 105 + (n-1) \times 7$$

$$\Rightarrow n-1 = 56 \therefore n = 57$$

The numbers between 100 and 500 that are divisible by 21, are 105, 126, 147, ..., 483.

Let such numbers be m .

$$\therefore 483 = 105 + (m-1) \times 21 \Rightarrow 18 = m-1 \Rightarrow m = 19$$

$$\therefore \text{Required number} = n - m = 57 - 19 = 38$$

2. (b) We know that, $t_n = S_n - S_{n-1}$... (i)

$$\text{and } t_{n-1} = S_{n-1} - S_{n-2} \quad \dots (ii)$$

$$\text{Now, } d = t_n - t_{n-1} \Rightarrow d = (S_n - S_{n-1}) - (S_{n-1} - S_{n-2})$$

$$\Rightarrow d = S_n - 2S_{n-1} + S_{n-2}$$

$$\text{Hence, } k = 2$$

3. (a) The sequence can be rewritten as

$$\log a, (\log a + \log r), (\log a + 2 \log r), \dots$$

which is an AP, where $A = \log a$, $D = \log r$

$$\text{Now, } t_n = A + (n-1)D = \log a + (n-1) \log r = l$$

$$\therefore S_n = \frac{n}{2} (A + l) = \frac{n}{2} [\log a + \log a + (n-1) \log r]$$

$$= \frac{n}{2} \log a^2 r^{n-1}$$

4. (b) Hint $ma_m = na_n \Rightarrow m[a + (m-1)d] = n[a + (n-1)d]$

5. (c) Let first term be a and common difference be d of an AP.

$$\text{Then, } T_m - T_n = \frac{1}{n} - \frac{1}{m} \Rightarrow (m-n)d = \frac{m-n}{mn}$$

$$\Rightarrow d = \frac{1}{mn}, \text{ so } a = \frac{1}{mn}$$

$$\therefore T_{mn} = a + (mn-1)d = \frac{1}{mn} + mn \cdot \frac{1}{mn} - \frac{1}{mn} = 1$$

6. (b) We have, first term = a , second term = b , difference (d) = $b - a$ and middle term = c .

This means that there are an odd number of terms in AP.

Let there be $(2n+1)$ terms in AP.

Then, $(n+1)$ th term is the middle term.

$$\text{Middle term, } c = a + nd \Rightarrow c = a + n(b-a) \Rightarrow n = \frac{c-a}{b-a}$$

$$\therefore \text{Sum} = \frac{2n+1}{2} [2a + (2n+1-1)d]$$

$$\therefore S_n = \frac{n}{2} [2a + (n-1)d]$$

$$= \frac{1}{2} \left\{ 2 \left(\frac{c-a}{b-a} \right) + 1 \right\} \left\{ 2a + 2 \left(\frac{c-a}{b-a} \right) (b-a) \right\}$$

$$= \frac{1}{2} \left[\frac{2(c-a)}{b-a} + 1 \right] 2c = \frac{2c(c-a)}{b-a} + c$$

7. (c) Let m th term of the first sequence be equal to n th term of the second sequence. Then,

$$17 + 4(m-1) = 16 + 5(n-1) \Rightarrow 4m + 13 = 5n + 11$$

$$\Rightarrow 4m + 2 = 5n \Rightarrow n = m - (1/5)(m-2)$$

Since, n is an integer, so $m-2$ must be a multiple of 5 and must be of the form $5k+2$ with $k \geq 0$.

Then, $n = 4k+2$. The first sequence has 101 terms and the second has 91 terms.

$$\therefore 0 \leq 5k+2 < 101 \text{ and } 0 \leq 4k+2 \leq 91$$

$$\Rightarrow 0 \leq k \leq 19$$

Hence, the given sequence have 20 common terms.

8. (c) $5^{1+x} + 5^{1-x}, \frac{a}{2}, 25^x + 25^{-x}$ are in AP.

$$\Rightarrow 2 \cdot \frac{a}{2} = 5^{1+x} + 5^{1-x} + 25^x + 25^{-x}$$

$$\Rightarrow a = 5 \cdot 5^x + 5 \cdot 5^{-x} + (5^{2x} + 5^{-2x})$$

$$\Rightarrow a = 5 \left(5^x + \frac{1}{5^x} \right) \left(5^{2x} + \frac{1}{5^{2x}} \right)$$

We know that the sum of a positive real number and its reciprocal is always greater than or equal to 2.

$$\therefore \left(5^x + \frac{1}{5^x} \right) \geq 2 \text{ and } \left(5^{2x} + \frac{1}{5^{2x}} \right) \geq 2 \text{ for all } x$$

$$\Rightarrow a = 5 \left(5^x + \frac{1}{5^x} \right) + \left(5^{2x} + \frac{1}{5^{2x}} \right) \geq 5(2) + 2 \Rightarrow a \geq 12, \forall x$$

9. (d) $\because a_2 - a_1 = a_3 - a_2 = \dots$ = common difference

$$\neq \text{multiple of } 3 = d$$

[say]

Then, consecutive terms are

$$a_1, a_1 + d, a_1 + 2d, a_1 + 3d, \dots$$

$\therefore d$ is not a multiple of 3.

$$\text{Let } d = 3\lambda + 1 \text{ or } 3\lambda + 2$$

$\therefore$ Consecutive terms

$$a_1, a_1 + 1 + 3\lambda, a_1 + 2 + 6\lambda, a_1 + 3 + 9\lambda, \dots \text{ are all prime.}$$

Hence, number of terms is infinite.

10. (b) $\because 2 \log_3(2^x - 5) = \log_3 2 + \log_3 \left(2^x - \frac{7}{2} \right)$

$$\therefore (2^x - 5)^2 = 2 \left(2^x - \frac{7}{2} \right)$$

$$\Rightarrow t^2 + 25 - 10t = 2t - 7 \quad [\text{put } 2^x = t]$$

$$\Rightarrow t^2 - 12t + 32 = 0 \Rightarrow (t-8)(t-4) = 0$$

$$\Rightarrow 2^x = 8 \text{ or } 2^x = 4$$

$$\therefore x = 3 \text{ or } x = 2$$

At $x = 2, \log_3(2^x - 5)$ is not defined.

Hence, $x = 3$ is the only solution.

11. (c) $S_n = \frac{n}{2} [2a' + (n-1)d] = a + bn + cn^2$

$$\Rightarrow na' + \frac{n(n-1)}{2} d = a + bn + cn^2$$

$$\Rightarrow \left(a' - \frac{d}{2}\right)n + \frac{n^2 d}{2} = a + bn + cn^2$$

$$\Rightarrow a = 0, b = a' - \frac{d}{2}, c = \frac{d}{2} \Rightarrow d = 2c$$

12. (a) Tractor cost = ₹ 12000, Down payment = ₹ 6000
Balance amount = ₹ 6000

$$\text{Interest on Ist installment} = \frac{6000 \times 12 \times 1}{100} \left[\because I = \frac{P \times R \times T}{100} \right]$$

$$= ₹ 720$$

$$\text{Now, unpaid amount} = 6000 - 500 = ₹ 5500$$

$$\text{Interest on IInd installment} = \frac{5500 \times 12 \times 1}{100} = ₹ 660$$

$$\text{Again, unpaid amount} = 5500 - 500 = ₹ 5000$$

$$\text{Interest on IIIrd installment} = \frac{5000 \times 12 \times 1}{100} = ₹ 600$$

$$\text{Total interest paid by him} \\ = 720 + 660 + 600 + \dots + 12 \text{ terms}$$

which is an AP with

$$a = 720, d = 660 - 720 = -60$$

Therefore, total interest

$$= \frac{12}{2} [2 \times 720 + (12 - 1)(-60)] \\ = 6 [1440 - 11 \times 60] = 6 [1440 - 660] \\ = 6 \times 780 = ₹ 4680$$

$$\text{Hence, total amount or actual cost} \\ = 12000 + 4680 = ₹ 16680$$

13. (d) $\because t_n = t_{n+1} + t_{n+2}$

$$\therefore ar^{n-1} = ar^n + ar^{n+1} \Rightarrow 1 = r + r^2$$

$$\Rightarrow r = \frac{-1 \pm \sqrt{5}}{2} \quad [r > 0]$$

$$\text{Therefore, } r = 2 \frac{\sqrt{5} - 1}{4} = 2 \sin 18^\circ$$

14. (a) Let us take a GP with three terms $\frac{a}{r}, a, ar$. Then,

$$S = \frac{a}{r} + a + ar = \frac{a(r^2 + r + 1)}{r}$$

$$\text{and } P = a^3, R = \frac{r}{a} + \frac{1}{a} + \frac{1}{ar} = \frac{1}{a} \left(\frac{r^2 + r + 1}{r} \right)$$

$$\therefore \frac{P^2 R^3}{S^3} = \frac{a^6 \cdot \frac{1}{a^3} \left(\frac{r^2 + r + 1}{r} \right)^3}{a^3 \left(\frac{r^2 + r + 1}{r} \right)^3} = 1$$

Therefore, the ratio is 1:1.

15. (a) Let three numbers in GP be a, ar, ar^2 .

$$\text{Then, } a + ar + ar^2 = 56 \quad \dots(i)$$

Again, $a - 1, ar - 7, ar^2 - 21$ are in AP.

$$\Rightarrow 2(ar - 7) = (a - 1) + (ar^2 - 21)$$

[if a, b and c are in AP, then $2b = a + c$]

$$\Rightarrow 2ar - 14 = a + ar^2 - 22$$

$$\Rightarrow a + ar^2 - 2ar = -14 + 22$$

$$\Rightarrow a + ar^2 - 2ar = 8 \quad \dots(ii)$$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{a + ar + ar^2}{a + ar^2 - 2ar} = \frac{56}{8}$$

$$\Rightarrow \frac{1 + r + r^2}{1 + r^2 - 2r} = \frac{7}{1}$$

$$\Rightarrow 1 + r + r^2 = 7 + 7r^2 - 14r$$

$$\Rightarrow 6r^2 - 15r + 6 = 0$$

$$\Rightarrow 2r^2 - 5r + 2 = 0 \quad [\text{dividing by 3}]$$

On factorising it by splitting the middle term, we get

$$2r^2 - (4 + 1)r + 2 = 0$$

$$\Rightarrow 2r^2 - 4r - r + 2 = 0$$

$$\Rightarrow 2r(r - 2) - (r - 2) = 0$$

$$\Rightarrow (r - 2)(2r - 1) = 0$$

$$\Rightarrow r = 2, \frac{1}{2}$$

If $r = 2$, then from Eq. (i), we get

$$a + 2a + 4a = 56$$

$$\Rightarrow 7a = 56 \Rightarrow a = 8$$

Then, numbers are $a = 8, ar = 8 \times 2 = 16$

and $ar^2 = 8 \times 4 = 32$

i.e. 8, 16, 32

If $r = \frac{1}{2}$, then from Eq. (i), we get

$$\frac{a}{1} + \frac{a}{2} + \frac{a}{4} = 56 \Rightarrow \frac{4a + 2a + a}{4} = 56$$

$$\Rightarrow \frac{7a}{4} = 56 \Rightarrow a = 32$$

Then, numbers are

$$a = 32, ar = 32 \times \frac{1}{2} = 16$$

$$\text{and } ar^2 = 32 \times \frac{1}{4} = 8$$

i.e. 32, 16, 8

Hence, required numbers are 8, 16, 32 or 32, 16, 8.

16. (b) We have, $(32)(32)^{1/6}(32)^{1/36} \dots$

$$= (32)^{1 + \frac{1}{6} + \frac{1}{36} + \dots} = (32)^t$$

$$\text{where, } t = 1 + \frac{1}{6} + \frac{1}{36} + \dots = \frac{1}{1 - \frac{1}{6}} \quad \left[\because S_\infty = \frac{a}{1 - r} \right]$$

$$= \frac{6}{5}$$

$$\therefore \text{Product} = (2^5)^{6/5} = 2^6 = 64$$

17. (d) $S = 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$

$$S = \frac{1}{1 - \frac{1}{2}} = 2$$

$$\left[\because S_\infty = \frac{a}{1 - r} \right]$$

$$S_n = \frac{1 \left[1 - \left(\frac{1}{2} \right)^n \right]}{1/2} = 2 - \left(\frac{1}{2} \right)^{n-1} \quad \left[\because S_n = \frac{a(1-r^n)}{1-r} \right]$$

$$\text{Now, } S - S_n = \left(\frac{1}{2} \right)^{n-1} < \frac{1}{1000}$$

$$\Rightarrow n = 9$$

$$\text{but } 2^9 = 512 < 1000$$

$$\text{However, } 2^{10} = 1024 > 1000$$

$$\therefore n - 1 = 10 \Rightarrow n = 11$$

18. (b) Let r be the common ratio of the GP and a be the first term of the GP i.e. $a_1 = a$.

$$\therefore a_2 = ar, a_3 = ar^2, a_4 = ar^3$$

$$\text{Now, } \sum_{n=1}^{100} a_{2n} = a_2 + a_4 + a_6 + \dots + a_{200} = \alpha$$

$$\Rightarrow ar + ar^3 + \dots + ar^{199} = \alpha$$

$$\Rightarrow \frac{ar[1 - (r^2)^{100}]}{1 - r^2} = \alpha$$

$$\Rightarrow \frac{ar(1 - r^{200})}{1 - r^2} = \alpha \quad \dots(i)$$

$$\text{Again, } \sum_{n=1}^{100} a_{2n+1} = a_3 + a_5 + \dots + a_{201} = \beta$$

$$\Rightarrow ar^2 + ar^4 + \dots + ar^{200} = \beta$$

$$\Rightarrow \frac{ar^2[1 - (r^2)^{100}]}{1 - r^2} = \beta$$

$$\Rightarrow \frac{ar^2(1 - r^{200})}{1 - r^2} = \beta \quad \dots(ii)$$

$$\text{Dividing Eq. (ii) by Eq. (i), we get } r = \frac{\beta}{\alpha}$$

19. (b) We have,

$$\text{Length of a side of } S_n = \text{Length of a diagonal of } S_{n+1}$$

$$\Rightarrow \text{Length of a side of } S_n = \sqrt{2} \text{ (Length of a side of } S_{n+1})$$

$$\Rightarrow \frac{\text{Length of a side of } S_{n+1}}{\text{Length of side of } S_n} = \frac{1}{\sqrt{2}} \text{ for all } n \geq 1$$

$$\therefore \text{Sides of } S_1, S_2, \dots, S_n \text{ form a GP with common ratio } \frac{1}{\sqrt{2}}$$

and first term 10.

$$\text{Side of } S_n = 10 \left(\frac{1}{\sqrt{2}} \right)^{n-1} = \frac{10}{(2)^{\frac{n-1}{2}}}$$

$$\therefore \text{Area of } S_n = (\text{Side})^2 = \left(\frac{10}{(2)^{\frac{n-1}{2}}} \right)^2 = \frac{100}{2^{n-1}}$$

$$\text{Now, area of } S_n < 1$$

$$\Rightarrow \frac{100}{2^{n-1}} < 1 \Rightarrow 2^{n-1} > 100$$

$$\Rightarrow n - 1 \geq 7 \Rightarrow n \geq 8$$

Hence, for $n = 8$, the area of S_n will be less than 1 sq cm.

20. (b) Since, $g = \sqrt{ab}$. Also, a, p, q and b are in AP.

$$\text{So, common difference } d \text{ is } \frac{b-a}{3}.$$

$$\therefore p = a + d = a + \frac{b-a}{3} = \frac{2a+b}{3}$$

$$\text{and } q = b - d = b - \frac{b-a}{3} = \frac{a+2b}{3}$$

$$\begin{aligned} \text{Now, } (2p - q)(p - 2q) &= \frac{(4a + 2b - a - 2b)}{3} \cdot \frac{(2a + b - 2a - 4b)}{3} \\ &= -ab = -g^2 \end{aligned}$$

21. (a) Given that, a, b and c are in GP.

$$\text{Then, } b^2 = ac \quad \dots(i)$$

Since, x is AM of a and b .

$$\therefore 2x = a + b \quad \dots(ii)$$

Also, y is AM of b and c .

$$\therefore 2y = b + c \quad \dots(iii)$$

$$\begin{aligned} \text{Now, } \frac{a}{x} + \frac{c}{y} &= a \times \frac{2}{a+b} + c \times \frac{2}{b+c} \\ &= 2 \left[\frac{ab+ac+ac+bc}{ab+ac+b^2+bc} \right] = 2 \quad [\because b^2 = ac] \end{aligned}$$

22. (b) AM > GM, $\frac{x+y}{2} > \sqrt{xy}$, $\frac{y+z}{2} > \sqrt{yz}$ and $\frac{z+x}{2} > \sqrt{zx}$

On multiplying the three inequalities, we get

$$\begin{aligned} \frac{x+y}{2} \cdot \frac{y+z}{2} \cdot \frac{z+x}{2} &> \sqrt{(xy)(yz)(zx)} \\ \therefore (x+y)(y+z)(z+x) &> 8xyz \end{aligned}$$

23. (d) We know that AM $\geq$ GM for positive numbers.

$$\begin{aligned} \therefore \frac{3^x + 3^{1-x}}{2} &\geq \sqrt{3^x \cdot 3^{1-x}} \\ \Rightarrow \frac{3^x + 3^{1-x}}{2} &\geq \sqrt{3^x \cdot \frac{3}{3^x}} \Rightarrow 3^x + 3^{1-x} \geq 2\sqrt{3} \end{aligned}$$

24. (c) Let common difference be d and common ratio be r . Then, a, A_1, A_2, b are in AP, b is the 4th term.

$$\therefore b = a + 3d \quad [\because T_n = a + (n-1)d]$$

$$\Rightarrow d = \frac{b-a}{3}$$

$$\text{So, } A_1 = a + \frac{b-a}{3} = \frac{2a+b}{3}$$

$$\text{and } A_2 = A_1 + d = \frac{2a+b}{3} + \frac{b-a}{3} = \frac{a+2b}{3}$$

Now, a, G_1, G_2, b are in GP and b is the 4th term.

$$\Rightarrow b = ar^3 \Rightarrow r = \left(\frac{b}{a} \right)^{1/3}$$

$$\text{So, } G_1 = ar = a \left(\frac{b}{a} \right)^{1/3} = a^{2/3} b^{1/3}$$

$$\text{and } G_2 = G_1 r = a^{2/3} b^{1/3} \left(\frac{b}{a} \right)^{1/3} = a^{1/3} b^{2/3}$$

$$\text{Then, } \frac{A_1 + A_2}{G_1 \times G_2} = \frac{\frac{2a+b}{3} + \frac{a+2b}{3}}{a^{2/3} b^{1/3} \times a^{1/3} b^{2/3}} = \frac{a+b}{ab}$$

25. (b) Given equation is $ax^2 + 2bx + c = 0$... (i)

Now, a, b, c are in GP.

$$\Rightarrow b^2 = ac$$

Discriminant of the above equation is

$$D = (2b)^2 - 4ac = 4(b^2 - ac) = 0 \quad [\text{from Eq. (i)}]$$

Its roots are equal, let roots be α and α .

$$\text{Then, } \alpha + \alpha = \frac{-2b}{a}$$

$$\Rightarrow \alpha = \frac{-b}{a} \quad \dots (ii)$$

$$\text{Other equation is } dx^2 + 2ex + f = 0 \quad \dots (iii)$$

One common root is α .

$$\Rightarrow d\alpha^2 + 2e\alpha + f = 0 \quad \dots (iv)$$

Put $\alpha = -\frac{b}{a}$ in Eq. (iv).

$$\Rightarrow \frac{db^2}{a^2} - \frac{2eb}{a} + f = 0$$

$$\Rightarrow \frac{b^2}{a} \left(\frac{d}{a} - \frac{2e}{b} + \frac{fa}{b^2} \right) = 0$$

$$\Rightarrow \frac{b^2}{a} \left(\frac{d}{a} - \frac{2e}{b} + \frac{f}{c} \right) = 0$$

$$\left[\because b^2 = ac \Rightarrow c = \frac{b^2}{a} \Rightarrow \frac{1}{c} = \frac{a}{b^2} \right]$$

$$\text{Now, } \frac{b^2}{a} \neq 0$$

$$\text{So, } \frac{d}{a} - \frac{2e}{b} + \frac{f}{c} = 0 \Rightarrow \frac{d}{a}, \frac{e}{b}, \frac{f}{c} \text{ are in AP.}$$

26. (b) The given series is in AGP, where $1, 4, 7, \dots$ are in AP and $1, x, x^2, \dots$ are in GP.

Here, $a = 1, b = 1, d = 3, r = x$

Using direct formula,

$$S_{\infty} = \frac{ab}{1-r} + \frac{dbr}{(1-r)^2}$$

$$\Rightarrow \frac{35}{16} = \frac{1}{1-x} + \frac{3x}{(1-x)^2} \quad \left[\because S_{\infty} = \frac{35}{16} \right]$$

$$\Rightarrow \frac{35}{16} = \frac{1}{(1-x)^2} (1-x + 3x)$$

$$\Rightarrow 35(1-x)^2 = 16 + 32x$$

$$\Rightarrow 35x^2 - 102x + 19 = 0$$

$$\Rightarrow (7x - 19)(5x - 1) = 0$$

$$\Rightarrow x \neq \frac{19}{5}$$

[since, for infinite series, common ratio (r) < 1]

$$\therefore x = \frac{1}{5}$$

27. (a) Given that $\cos(x-y), \cos x, \cos(x+y)$ are in HP.

$$\text{Then, } \cos x = \frac{2 \cos(x-y) \cos(x+y)}{\cos(x-y) + \cos(x+y)}$$

$$\Rightarrow \cos x = \frac{2(\cos^2 x - \sin^2 y)}{2 \cos x \cos y}$$

$$\Rightarrow \cos^2 x \cos y = \cos^2 x - \sin^2 y$$

$$\Rightarrow \cos^2 x (\cos y - 1) = -\sin^2 y$$

$$\Rightarrow \cos^2 x (1 - \cos y) = \sin^2 y$$

$$\Rightarrow \cos^2 x (1 - \cos y) = 1 - \cos^2 y$$

$$\Rightarrow \cos^2 x (1 - \cos y) = (1 - \cos y)(1 + \cos y)$$

$$\Rightarrow \cos^2 x = 1 + \cos y$$

$$\Rightarrow \cos^2 x = 2 \cos^2 y/2$$

$$\Rightarrow \cos^2 x \sec^2 (y/2) = 2$$

$$\Rightarrow \cos x \sec (y/2) = \pm \sqrt{2}$$

28. (c) Let $A = \text{Arithmetic mean} = \frac{25 + N}{2}$

$$G = \text{Geometric mean} = \sqrt{25} = 5\sqrt{N}$$

$$\text{and } H = \text{Harmonic mean} = \frac{2 \times 25N}{25 + N} = \frac{50N}{25 + N}$$

Let A, G, H be the p th, q th and r th terms of an AP.

$$\text{Then, } 25 + (p-1)1 = \frac{25 + N}{2} \text{ or } N = 2p + 23$$

Since, p is a positive integer, so putting

$p = 1, 2, 3, \dots$, we get

$$N = 25, 27, 29, 31, \dots \quad \dots (i)$$

$$\text{Again, } 25 + (q-1)1 = 5\sqrt{N} \text{ or } \sqrt{N} = \frac{q+24}{5}$$

Since, N is a positive integer, so we give to q those values which make N a positive integer. These values are clearly

$$q = 1, 6, 11, 16, 21, \dots$$

$$\text{Then, } N = 25, 36, 49, 64, 81, \dots \quad \dots (ii)$$

$$\text{Finally, } 25 + (r-1)1 = \frac{50N}{25 + N}$$

$$\Rightarrow 625 + 25N + 25r + Nr - 25 - N = 50N$$

$$\Rightarrow N = \frac{25(24 + r)}{26 - r}$$

We take those positive value of r which make N a positive integer.

These values of r are 1, 21 and 25 only (because higher values of r make N negative).

$$\text{Hence, } N = 25, 225, 1225 \quad \dots (iii)$$

The value of N which satisfies Eqs. (i), (ii) and (iii) is

$$N = 1225$$

BITSAT Archives

1. (a) Since, $AM \geq GM$

$$\therefore \frac{(p+q)+(r+s)}{2} \geq \sqrt{(p+q)(r+s)}$$

$$\Rightarrow \frac{2}{2} \geq \sqrt{M} \Rightarrow \sqrt{M} \leq 1 \Rightarrow M \leq 1$$

Also, $(p+q)(r+s) > 0$ $[\because p, q, r, s > 0]$

$\therefore M > 0$

Hence, $0 < M \leq 1$

2. (b) Let $S = 1 + 2 \cdot 2 + 3 \cdot 2^2 + 4 \cdot 2^3 + \dots + 100 \cdot 2^{99}$... (i)

It is an arithmetico-geometric series.

On multiplying Eq. (i) by 2 and then subtracting it from Eq. (i), we get

$$\begin{aligned} S &= 1 + 2 \cdot 2 + 3 \cdot 2^2 + 4 \cdot 2^3 + \dots + 100 \cdot 2^{99} \\ 2S &= 1 \cdot 2 + 2 \cdot 2^2 + 3 \cdot 2^3 + \dots + 99 \cdot 2^{99} + 100 \cdot 2^{100} \\ \hline -S &= 1 + 2 + 2^2 + 2^3 + \dots + 2^{99} - 100 \cdot 2^{100} \\ \Rightarrow -S &= \frac{1(2^{100} - 1)}{2 - 1} - 100 \cdot 2^{100} \\ \Rightarrow -S &= 2^{100} - 1 - 100 \cdot 2^{100} \\ \Rightarrow -S &= -1 - 99 \cdot 2^{100} \\ \Rightarrow S &= 99 \cdot 2^{100} + 1 \end{aligned}$$

3. (b) $S_n = 5 + 55 + 555 + \dots$ upto n terms

$$\begin{aligned} &= 5[1 + 11 + 111 + \dots \text{upto } n \text{ terms}] \\ &= \frac{5}{9}[9 + 99 + 999 + \dots \text{upto } n \text{ terms}] \\ &= \frac{5}{9}[(10 - 1) + (10^2 - 1) + (10^3 - 1) + \dots \text{upto } n \text{ terms}] \\ &= \frac{5}{9}[(10 + 10^2 + 10^3 + \dots \text{upto } n \text{ terms}) \\ &\quad - (1 + 1 + 1 + \dots \text{upto } n \text{ terms})] \\ &= \frac{5}{9} \left[\frac{10(10^n - 1)}{10 - 1} - n \right] = \frac{5}{9} \left[\frac{10(10^n - 1)}{9} - n \right] \end{aligned}$$

4. (a) Given, $a^{1/x} = b^{1/y} = c^{1/z}$

Let $a^{1/x} = b^{1/y} = c^{1/z} = k$

Then, $a = k^x, b = k^y, c = k^z$

$\therefore a, b, c$ are in GP.

Therefore, $b^2 = ac \Rightarrow (k^y)^2 = k^x \cdot k^z$

$\Rightarrow k^{2y} = k^{x+z} \Rightarrow 2y = x + z$

$\therefore x, y$ and z are in AP.

5. (a) **Hint** Let $S_n = \left(1 - \frac{1}{2}\right) + \left(1 - \frac{1}{4}\right) + \left(1 - \frac{1}{8}\right) + \dots$
- $$= n - \frac{1}{2} \cdot \frac{(1 - 1/2)}{(1 - 1/2)}$$

6. (c) **Hint** $0.2 + 0.22 + 0.222 + \dots$ n terms

$$= 2(0.1 + 0.11 + 0.111 + \dots n \text{ terms})$$

$$= 2 \left(\frac{1}{10} + \frac{11}{100} + \frac{111}{1000} + \dots n \text{ terms} \right)$$

$$\begin{aligned} &= \frac{2}{9} \left(\frac{9}{10} + \frac{99}{100} + \frac{999}{1000} + \dots n \text{ terms} \right) \\ &= \frac{2}{9} \left(1 - \frac{1}{10} + 1 - \frac{1}{100} + 1 - \frac{1}{1000} + \dots n \text{ terms} \right) \end{aligned}$$

7. (b) Let a and b be two numbers, then

$$AM = \frac{a+b}{2} \Rightarrow 27 = \frac{a+b}{2} \Rightarrow a+b = 54 \text{ and } HM = \frac{2ab}{a+b}$$

$$\Rightarrow 12 = \frac{2ab}{54} \Rightarrow ab = 324$$

$$\therefore GM = \sqrt{ab} = \sqrt{324} = 18$$

8. (c) Here, $T_n = \frac{n(n+1)}{n!} = \frac{n-1+2}{(n-1)!} = \frac{1}{(n-2)!} + \frac{2}{(n-1)!}$

$$\begin{aligned} \therefore S &= \sum_{n=1}^{\infty} T_n = \sum_{n=1}^{\infty} \frac{1}{(n-2)!} + 2 \sum_{n=1}^{\infty} \frac{1}{(n-1)!} \\ &= e + 2e = 3e \end{aligned}$$

9. (d) Let d be the common difference of AP.

Then, $a_{10} = 3 \Rightarrow a_1 + 9d = 3$

$\Rightarrow 2 + 9d = 3 \Rightarrow d = 1/9$

$$\therefore a_4 = a_1 + 3d = 2 + \frac{1}{3} = \frac{7}{3}$$

Let D be the common difference of $\frac{1}{h_1}, \frac{1}{h_2}, \dots, \frac{1}{h_{10}}$, then

$$\begin{aligned} h_{10} = 3 &\Rightarrow \frac{1}{h_{10}} = \frac{1}{3} \\ \Rightarrow \frac{1}{h_1} + 9D &= \frac{1}{3} \Rightarrow \frac{1}{2} + 9D = \frac{1}{3} \\ \Rightarrow 9D &= -\frac{1}{6} \Rightarrow D = -\frac{1}{54} \\ \therefore \frac{1}{h_7} &= \frac{1}{h_1} + 6D = \frac{1}{2} - \frac{1}{9} \\ \Rightarrow h_7 &= \frac{18}{7} \\ \therefore a_4 h_7 &= \frac{7}{3} \times \frac{18}{7} = 6 \end{aligned}$$

10. (b) Let $S = 1 + \frac{2}{3} \cdot \frac{1}{2} + \frac{2}{3} \cdot \frac{5}{6} \cdot \frac{1}{2^2} + \frac{2}{3} \cdot \frac{5}{6} \cdot \frac{8}{9} \cdot \frac{1}{2^3} + \dots$

We know that,

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!} x^2 + \frac{n(n-1)(n-2)}{3!} x^3 + \dots$$

On comparing these two, we get

$$nx = \frac{2}{3} \cdot \frac{1}{2} \quad \dots (i)$$

$$\text{and } \frac{n(n-1)}{2 \cdot 1} = \frac{2}{3} \cdot \frac{5}{6} \cdot \frac{1}{2^2} \quad \dots (ii)$$

From Eqs. (i) and (ii),

$$\frac{n(n-1)}{2 \cdot 1} = \frac{\frac{2}{3} \times \frac{5}{6} \times \frac{1}{4}}{\frac{2}{3} \times \frac{1}{2} \times \frac{2}{3} \times \frac{1}{2}}$$

$$\Rightarrow \frac{n-1}{2n} = \frac{5}{4} \Rightarrow \frac{n-1}{n} = \frac{5}{2}$$

$$\Rightarrow 5n = 2n - 2 \Rightarrow 3n = -2 \Rightarrow n = -\frac{2}{3}$$

On putting the value of n in Eq. (i), we get

$$x = -\frac{1}{2}$$

$$\therefore \text{Sum of series} = \left(1 - \frac{1}{2}\right)^{-2/3} = (4)^{1/3}$$

11. (b) Let the numbers be a and b .

If H is the harmonic mean, then

$$H = 4, 2A + G^2 = 27 \quad [\text{given}] \dots(i)$$

But we know that, $AH = G^2$

$$\therefore 4A = G^2$$

$$\text{From Eq. (i), } 2A + 4A = 27 \Rightarrow A = \frac{27}{6} = \frac{9}{2}$$

$$\Rightarrow \frac{a+b}{2} = \frac{9}{2} \quad \left[\because A = \frac{a+b}{2} \right]$$

$$\Rightarrow a + b = 9 \quad \dots(ii)$$

$$\text{Again, } H = \frac{2ab}{a+b}$$

$$\Rightarrow 4 = \frac{2ab}{9} \quad [\because H = 4]$$

$$\therefore ab = 18 \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get

$$a - b = \sqrt{(a+b)^2 - 4ab}$$

$$= \sqrt{9^2 - 4 \times 18} = \pm 3 \quad \dots(iv)$$

On solving Eqs. (ii) and (iv), we get

$$2a = 9 \pm 3 \text{ and } 2b = 9 \mp 3$$

$$\therefore a = 6, 3 \text{ and } b = 3, 6$$

Hence, numbers are 3 and 6.

12. (c) We have, $\sum_{k=1}^n k(k+2) = \sum_{k=1}^n (k^2 + 2k) = \sum_{k=1}^n k^2 + 2 \sum_{k=1}^n k$

$$= \frac{n(n+1)(2n+1)}{6} + \frac{2 \cdot n(n+1)}{2}$$

$$= n(n+1) \left(\frac{2n+1}{6} + 1 \right) = \frac{n(n+1)(2n+7)}{6}$$

13. (b) Given that, $\frac{1}{b+c} + \frac{1}{c+a} = \frac{3}{a+b+c}$

$$\Rightarrow 1 + \frac{b}{a+c} + 1 + \frac{a}{b+c} = 3$$

$$\Rightarrow b(b+c) + a(a+c) = (a+c)(b+c)$$

$$\Rightarrow b^2 + bc + a^2 + ac = ab + ac + bc + c^2$$

$$\Rightarrow a^2 + b^2 - c^2 = ab$$

$$\text{We know that, } \cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

$$= \frac{ab}{2ab} = \frac{1}{2}$$

$$\Rightarrow C = 60^\circ$$

14. (c) We have, $\sqrt{2} + \sqrt{8} + \sqrt{18} + \sqrt{32} + \dots$

$$= 1 \times \sqrt{2} + 2 \times \sqrt{2} + 3 \times \sqrt{2} + 4 \times \sqrt{2} + \dots$$

$$= \sqrt{2}(1 + 2 + 3 + 4 + \dots \text{ upto 24 terms})$$

$$= \sqrt{2} \times \frac{24 \times 25}{2} = 300\sqrt{2} \quad \left[\because \sum n = \frac{n(n+1)}{2} \right]$$

15. (a) Given series is

$$1 \cdot 3^2 + 2 \cdot 5^2 + 3 \cdot 7^2 + \dots$$

This is an arithmetico-geometric series whose n th term is given by

$$T_n = n(2n+1)^2 = 4n^3 + 4n^2 + n$$

$$\therefore S_n = \sum_{n=1}^n T_n = \sum_{n=1}^n (4n^3 + 4n^2 + n)$$

$$= 4 \sum_{n=1}^n n^3 + 4 \sum_{n=1}^n n^2 + \sum_{n=1}^n n$$

$$= 4 \left(\frac{n}{2}(n+1) \right)^2 + \frac{4}{6} n(n+1)(2n+1) + \frac{n}{2}(n+1)$$

$$= n(n+1) \left[n^2 + n + \frac{4}{6}(2n+1) + \frac{1}{2} \right]$$

$$= \frac{n}{6}(n+1)(6n^2 + 14n + 7)$$

16. (d) We have, $\log_{140} 63 = \log_{2^2 \times 5 \times 7} (3 \times 3 \times 7)$

$$= \frac{\log_2(3 \times 3 \times 7)}{\log_2(2^2 \times 5 \times 7)}$$

$$= \frac{\log_2 3 + \log_2 3 + \log_2 7}{2 \log_2 2 + \log_2 5 + \log_2 7}$$

$$= \frac{2a + \frac{1}{c}}{2 + b + \frac{1}{c}} = \frac{2ac + 1}{2c + bc + 1}$$

17. (c) Since, $2^1 = 2, 2^2 = 4, 2^3 = 8, 2^4 = 16, 2^5 = 32$. It is clear that unit place is repeated after every four power.

$$\text{Then, } 2^{301} = (2^4)^{75} \cdot 2 = (16)^{75} \cdot 2$$

So, digit at unit's place in $(16)^{75}$ is 6.

$\therefore$ Digit at unit's place in 2^{301}

$$= \text{Digit at unit's place in } (6) \cdot 2 = 2$$

Hence, the remainder, when 2^{301} is divided by 5, is 2.

18. (b) Given that,

$$\alpha\beta\gamma\delta = 1 \quad \dots(i)$$

As, we know $AM \geq GM$

$$\Rightarrow \frac{1+\alpha}{2} \geq \sqrt{\alpha}$$

$$\Rightarrow 1+\alpha \geq 2\sqrt{\alpha} \quad \dots(ii)$$

$$\text{Similarly, } 1+\beta \geq 2\sqrt{\beta} \quad \dots(iii)$$

$$1+\gamma \geq 2\sqrt{\gamma} \quad \dots(iv)$$

$$\text{and } 1+\delta \geq 2\sqrt{\delta} \quad \dots(v)$$

On multiplying Eqs. (ii), (iii), (iv) and (v), we get

$$(1+\alpha)(1+\beta)(1+\gamma)(1+\delta) \geq 16\sqrt{\alpha\beta\gamma\delta}$$

$$\Rightarrow (1+\alpha)(1+\beta)(1+\gamma)(1+\delta) = 16$$

4

Exponential and Logarithmic Series

Exponential Series

The sum of the series $1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots$ is denoted by the number e which is an irrational number lying between 2 and 3.

i.e. $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e = \lim_{x \rightarrow 0} (1 + x)^{1/x}$

1. $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$, for all real values of x , $e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$

2. For $a > 0$, $a^x = 1 + \frac{x}{1!} (\log_e a) + \frac{x^2}{2!} (\log_e a)^2 + \frac{x^3}{3!} (\log_e a)^3 + \dots = e^{x \log_e a}$

3. $e^{-x} = 1 - \frac{x}{1!} + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots = \sum_{n=0}^{\infty} (-1)^n \frac{x^n}{n!}$

4. $\frac{e^x + e^{-x}}{2} = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \frac{x^6}{6!} + \dots = \sum_{n=0}^{\infty} \frac{x^{2n}}{2n!}$

5. $\frac{e^x - e^{-x}}{2} = \frac{x}{1!} + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{(2n+1)!}$

6. $\frac{e + e^{-1}}{2} = \frac{1}{1!} + \frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + \dots = \sum_{n=0}^{\infty} \frac{1}{2n!}$

7. $\frac{e - e^{-1}}{2} = \frac{1}{1!} + \frac{1}{3!} + \frac{1}{5!} + \dots = \sum_{n=0}^{\infty} \frac{1}{(2n+1)!}$

8. $\sum_{n=0}^{\infty} \frac{1}{n!} = \sum_{n=1}^{\infty} \frac{1}{(n-1)!} = \sum_{n=2}^{\infty} \frac{1}{(n-2)!} = e$

9. $e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots$

10. $e^{-1} = 1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \dots$

11. $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = \lim_{n \rightarrow \infty} (1 + n)^{1/n} = e$

Logarithm

If a is a positive real number other than 1 and $a^x = m$, then x is called the logarithm of m to the base a , written as $\log_a m$. In $\log_a m$, m should always be positive.

- (i) If $m < 0$, then $\log_a m$ will be imaginary and if $m = 0$, then $\log_a m$ will be meaningless.
- (ii) $\log_a m$ exists, if $m, a > 0$ and $a \neq 1$.

Properties of Logarithm

1. $a^{\log_a x} = x$; $a \neq 0, \neq 1, x > 0$
2. $a^{\log_b x} = x^{\log_b a}$; $a, b > 0, \neq 1, x > 0$
3. $\log_a a = 1, a > 0, \neq 1$
4. $\log_a x = \frac{1}{\log_x a}$; $x, a > 0, \neq 1$
5. $\log_a x = \log_a b \log_b x = \frac{\log_b x}{\log_b a}$; $a, b > 0, \neq 1, x > 0$
6. For $m, n > 0$ and $a > 0, \neq 1$, then
 - (i) $\log_a (m \cdot n) = \log_a m + \log_a n$
 - (ii) $\log_a \left(\frac{m}{n}\right) = \log_a m - \log_a n$
 - (iii) $\log_a (m^n) = n \log_a m$
7. For $x > 0, a > 0, \neq 1$
 - (i) $\log_{a^n} (x) = \frac{1}{n} \log_a x$
 - (ii) $\log_{a^n} x^m = \left(\frac{m}{n}\right) \log_a x$

8. For $x > y > 0$
 - (i) $\log_a x > \log_a y$, if $a > 1$
 - (ii) $\log_a x < \log_a y$, if $0 < a < 1$
9. If $a > 1$ and $x > 0$, then
 - (i) $\log_a x > p \Rightarrow x > a^p$
 - (ii) $0 < \log_a x < p \Rightarrow 0 < x < a^p$
10. If $0 < a < 1$, then
 - (i) $\log_a x > p \Rightarrow 0 < x < a^p$
 - (ii) $0 < \log_a x < p \Rightarrow a^p < x < 1$

Logarithmic Series

1. $\log_e (1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$
2. $\log_e (1-x) = -\left(x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \dots\right)$, where $-1 \leq x$
3. $\log_e \left(\frac{1+x}{1-x}\right) = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \dots\right)$
4. $\log [(1+x)(1-x)] = 2 - \left(\frac{x^2}{2} + \frac{x^4}{4} + \frac{x^6}{6} + \dots\right)$
5. $\log_e (n+1) - \log_e (n-1) = 2\left(\frac{1}{n} + \frac{1}{3n^3} + \frac{1}{5n^5} + \dots\right)$
6. $\log_e 2 = \left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots\right) = 0.693147$
or $0.61 < \log 2 < 0.76$
 $\log_e 2 = \frac{1}{1 \cdot 2} + \frac{1}{3 \cdot 4} + \frac{1}{5 \cdot 6} + \dots$

Practice Exercise

1. The sum of the series $1 + \frac{1+2}{2!} + \frac{1+2+2^2}{3!} + \frac{1+2+2^2+2^3}{4!} + \dots$ is
a. e^2 b. $e^2 + e$ c. $e^2 - e$ d. $e^2 - e - 1$
2. The sum of the series $\frac{2}{3!} + \frac{4}{5!} + \frac{6}{7!} + \dots$ is
a. e^{-1} b. $2e^{-1}$ c. e^{-2} d. $2e^{-2}$
3. The sum of the series $1 + \frac{3}{2!} + \frac{7}{3!} + \frac{15}{4!} + \dots$ is
a. $e(e+1)$ b. $e(1-e)$ c. $e(e-1)$ d. $3e$
4. The sum of the series $\frac{5}{1 \cdot 2 \cdot 3} + \frac{7}{3 \cdot 4 \cdot 5} + \frac{9}{5 \cdot 6 \cdot 7} + \dots$ is
a. $\log \frac{8}{e}$ b. $\log \frac{e}{8}$ c. $\log mn$ d. $\log \frac{m}{n}$
5. $\frac{9}{1!} + \frac{16}{2!} + \frac{27}{3!} + \frac{42}{4!} + \dots$ is equal to
a. $5e$ b. $7e$ c. $9e$ d. $11e - 6$
6. The sum of the series $\frac{1}{1 \cdot 2} + \frac{1 \cdot 3}{1 \cdot 2 \cdot 3 \cdot 4} + \frac{1 \cdot 3 \cdot 5}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} + \dots$ is
a. $e - 1$ b. $e^{1/2} - 1$
c. $e^{1/2} + e$ d. None of these
7. If $\frac{e^{5x} + e^x}{e^{3x}}$ is expanded in a series of ascending power of x and n is an odd natural number, then the coefficient of x^n is
a. $\frac{2^n}{n!}$ b. $\frac{2^{n+1}}{(2n)!}$ c. $\frac{2^{2n}}{(2n)!}$ d. 0

8. The coefficient of x^n in the expansion of $\frac{a+bx+cx^2}{e^x}$ is
 a. $\frac{(-1)^n}{n!} [cn^2 - (b+c)n + a]$
 b. $\frac{(-1)^n}{n!} [cn^2 + (b+c)n + a]$
 c. $\frac{(-1)^n}{n!} [cn^2 + (b+c)n - a]$
 d. None of the above
9. The sum of the infinite series $\frac{2^2}{2!} + \frac{2^4}{4!} + \frac{2^6}{6!} + \dots$ is
 a. $\frac{e^2 + 1}{2e}$ b. $\frac{e^4 + 1}{2e^2}$ c. $\frac{(e^2 - 1)^2}{2e^2}$ d. $\frac{(e^2 + 1)^2}{2e^2}$
10. The sum of the infinite series $1 + \frac{1}{2!} + \frac{1 \cdot 3}{4!} + \frac{1 \cdot 3 \cdot 5}{6!} + \dots$ is
 a. e b. e^2 c. $\sqrt{e}$ d. $\frac{1}{e}$
11. The value of $\frac{2}{3!} + \frac{4}{5!} + \frac{6}{7!} + \dots$ is
 a. $e^{1/2}$ b. e^{-1} c. e d. $e^{-1/3}$
12. $1 + \frac{2^3}{2!} + \frac{3^3}{3!} + \frac{4^3}{4!} + \dots$ is equal to
 a. $5e$ b. $4e$ c. $3e$ d. $2e$
13. The value of $1 + \frac{1+2}{2!} + \frac{1+2+3}{3!} + \frac{1+2+3+4}{4!} + \dots$ is
 a. e b. $2e$ c. $\frac{3e}{2}$ d. $\frac{4e}{5}$
14. $\frac{\frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + \dots}{1 + \frac{1}{3!} + \frac{1}{5!} + \dots}$ equals
 a. $e + 1$ b. $\frac{e-1}{e+1}$ c. $e-1$ d. 0
15. The coefficient of x^n in the series $1 + \frac{a+bx}{1!} + \frac{(a+bx)^2}{2!} + \frac{(a+bx)^3}{3!} + \dots$ is
 a. $\frac{(ab)^n}{n!}$ b. $e^b \cdot \frac{a^n}{n!}$
 c. $e^a \cdot \frac{b^n}{n!}$ d. $e^{a+b} \cdot \frac{(ab)^n}{n!}$
16. The sum of the series $\sum_{n=1}^{\infty} \frac{2n}{(2n+1)!}$ is
 a. e b. e^{-1} c. $2e$ d. None
17. The coefficient of x^k in the expansion of $\frac{1-2x-x^2}{e^{-x}}$ is
 a. $\frac{1-k-k^2}{k!}$ b. $\frac{k^2+1}{k!}$
 c. $\frac{1-k}{k!}$ d. $\frac{1}{k!}$
18. If $\frac{1}{e^{3x}} (e^x + e^{5x}) = a_0 + a_1x + a_2x^2 + \dots$, then $2a_1 + 2^3a_3 + 2^5a_5 + \dots$ is equal to
 a. e b. e^{-1} c. 1 d. 0
19. If n is not a multiple of 3, then the coefficient of x^n in the expansion of $\log_e (1+x+x^2)$ is
 a. $\frac{1}{n}$ b. $\frac{2}{n}$ c. $-\frac{1}{n}$ d. $-\frac{2}{n}$
20. If α, β are the roots of the equation $x^2 - px + q = 0$, then the value of $(\alpha + \beta)x - \left(\frac{\alpha^2 + \beta^2}{2}\right)x^2 + \left(\frac{\alpha^3 + \beta^3}{2}\right)x^3 - \dots$ is
 a. $\log(1 - px + qx^2)$ b. $\log(1 + px - qx^2)$
 c. $\log(1 + px + qx^2)$ d. None of these
21. The sum of the series $\frac{1}{2}x^2 + \frac{2}{3}x^3 + \frac{3}{4}x^4 + \frac{4}{5}x^5 + \dots$ is
 a. $\frac{x}{1+x} + \log(1+x)$ b. $\frac{x}{1-x} + \log(1-x)$
 c. $\frac{-x}{1+x} + \log(1+x)$ d. None of these
22. The sum of the series $\frac{1}{2}\left(\frac{1}{2} + \frac{1}{3}\right) - \frac{1}{4}\left(\frac{1}{2^2} + \frac{1}{3^2}\right) + \frac{1}{6}\left(\frac{1}{2^3} + \frac{1}{3^3}\right) + \dots$ is
 a. $\log_e 2$ b. $\log_e 3$ c. $2\log_e 2$ d. $\frac{1}{2}\log_e 2$
23. The number of solutions of $\log_4(x-1) = \log_2(x-3)$ is
 a. 3 b. 1 c. 2 d. 0
24. The least value of the expression $2\log_{10} x - \log_x 0.01$ for $x > 1$, is
 a. 2 b. 3 c. 5 d. 4
25. If $S = \sum_{n=0}^{\infty} \frac{(\log x)^{2n}}{(2n)!}$, then S equals
 a. $x + x^{-1}$ b. $x - x^{-1}$ c. $\frac{1}{2}(x + x^{-1})$ d. 0
26. If x, y, z are three consecutive positive integers and $x - z + 2 = 0$, then $\frac{1}{2}\log_e x + \frac{1}{2}\log_e z + \frac{1}{2xz+1} + \frac{1}{3}\left(\frac{1}{2xz+1}\right)^3 + \dots$ is equal to
 a. $\log_e x$ b. $\log_e y$ c. $\log_e z$ d. 0
27. The coefficient of n^{-r} in the expansion of $\log_{10} \left(\frac{n}{n-1}\right)$ is
 a. $\frac{1}{r \log_e 10}$ b. $-\frac{1}{r \log_e 10}$
 c. $-\frac{1}{r! \log_e 10}$ d. None of these

28. $\log_e \left(\frac{1+3x}{1-2x} \right)$ is equal to

- a. $-5x - \frac{5x^2}{2} - \frac{35x^3}{3} - \dots$ b. $-5x + \frac{5x^2}{2} - \frac{35x^3}{3} + \dots$
 c. $5x - \frac{5x^2}{2} + \frac{35x^3}{3} - \dots$ d. $5x + \frac{5x^2}{2} + \frac{35x^3}{3} + \dots$

29. The sum of the infinite series $\frac{1}{2} \left(\frac{1}{3} + \frac{1}{4} \right) - \frac{1}{4} \left(\frac{1}{3^2} + \frac{1}{4^2} \right) + \frac{1}{6} \left(\frac{1}{3^3} + \frac{1}{4^3} \right) - \dots$ is

- a. $\frac{1}{2} \log 2$ b. $\log \frac{3}{5}$ c. $\log \frac{5}{3}$ d. $\frac{1}{2} \log \frac{5}{3}$

30. The sum of the series $1 + \frac{1}{3} \cdot \frac{1}{4} + \frac{1}{5} \cdot \frac{1}{4^2} + \frac{1}{7} \cdot \frac{1}{4^3} + \dots$ is

- a. $\log_e 1$ b. $\log_e 2$
 c. $\log_e 3$ d. $\log_e 4$

31. The sum of the series $\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{3 \cdot 4 \cdot 5} + \frac{1}{5 \cdot 6 \cdot 7} + \dots$ is

- a. $\log_e 2 - \frac{1}{2}$ b. $\log_e 2$ c. $\log_e 2 + \frac{1}{2}$ d. $\log_e 2 + 1$

32. The sum of the series

$$\log_9 3 + \log_{27} 3 - \log_{81} 3 + \log_{243} 3 - \dots \text{ is}$$

a. $1 - \log_e 2$ b. $1 + \log_e 2$ c. $\log_e 2$ d. $\log_e 3$

33. The sum of the infinite series

$$\left(\frac{1}{3} \right)^2 + \frac{1}{3} \left(\frac{1}{3} \right)^4 + \frac{1}{5} \left(\frac{1}{3} \right)^6 + \dots \text{ is}$$

- a. $\frac{1}{4} \log_e 2$ b. $\frac{1}{2} \log_e 2$ c. $\frac{1}{6} \log_e 2$ d. $\frac{1}{4} \log_e \frac{3}{2}$

34. $\frac{x-y}{x} + \frac{1}{2} \left(\frac{x-y}{x} \right)^2 + \frac{1}{3} \left(\frac{x-y}{x} \right)^3 + \dots$ is equal to

- a. $\log_e(x-y)$ b. $\log_e(x+y)$
 c. $\log_e \left(\frac{x}{y} \right)$ d. $\log_e xy$

35. $\log_e 3 - \frac{\log_e 9}{2^2} + \frac{\log_e 27}{3^2} - \frac{\log_e 81}{4^2} + \dots$ is equal to

- a. $(\log_e 3)(\log_e 2)$ b. $\log_e 3$
 c. $\log_e 2$ d. $\frac{\log_e 5}{\log_e 3}$

BITSAT Archives

1. If $\frac{e^x}{1-x} = B_0 + B_1x + B_2x^2 + \dots + B_nx^n + \dots$, then the value of $B_n - B_{n-1}$ is [2014]

- a. 1 b. $\frac{1}{n}$
 c. $\frac{1}{n!}$ d. None of these

2. The sum of the series $\log_4 2 - \log_8 2 + \log_{16} 2 - \dots$ is [2014, II]

- a. e^2 b. $\log_e 2 + 1$
 c. $\log_e 3 - 2$ d. $1 - \log_e 2$

3. If $a = \sum_{n=0}^{\infty} \frac{x^{3n}}{(3n)!}$, $b = \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!}$ and $c = \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$, then the value of $a^3 + b^3 + c^3 - 3abc$ is [2014]

- a. 1 b. 0
 c. -1 d. -2

4. The coefficient of x^n in the expansion of $\log_e \left(\frac{1}{1+x+x^2+x^3} \right)$, when n is odd, is [2013]

- a. $-\frac{2}{n}$ b. $-\frac{1}{n}$
 c. $1/n$ d. None of these

5. The value of $7 \log \left(\frac{16}{15} \right) + 5 \log \left(\frac{25}{24} \right) + 3 \log \left(\frac{81}{80} \right)$ is [2011]

- a. $\log 2$ b. 3
 c. 5 d. 7

6. The value of $\frac{2}{1!} + \frac{2+4}{2!} + \frac{2+4+6}{3!} + \dots$ is [2011]

- a. e b. $2e$
 c. $3e$ d. None of these

7. The value of $\frac{1}{3} + \frac{1}{3 \cdot 3^3} + \frac{1}{5 \cdot 3^5} + \frac{1}{7 \cdot 3^7} + \dots$ is [2010]

- a. $\frac{1}{2} \log_e 2$ b. $\log_e 2$
 c. $\log_e 3$ d. None of these

8. If $a = \log_2 3$, $b = \log_2 5$ and $c = \log_7 2$, then $\log_{140} 63$ in terms of a, b, c is [2007]

- a. $\frac{2ac+1}{2c+abc+1}$
 b. $\frac{2ac+1}{2a+c+a}$
 c. $\frac{2ac+1}{2c+ab+a}$
 d. None of the above

Answer with Solutions

Practice Exercise

1. (c) $T_n = \frac{1 + 2 + 2^2 + \dots + 2^{n-1}}{n!}$

The series in numerator is GP with common ratio 2.

$$\therefore T_n = \frac{1 \cdot (2^n - 1)}{n!} = \frac{2^n - 1}{n!} = \frac{2^n}{n!} - \frac{1}{n!}$$

where, $n = 1, 2, \dots$

Now, $T_1 = \frac{2}{1!} - \frac{1}{1!}$, $T_2 = \frac{2^2}{2!} - \frac{1}{2!}$, $T_3 = \frac{2^3}{3!} - \frac{1}{3!}$

and so on.

On adding these terms, we get

$$T_1 + T_2 + \dots = \left(\frac{2}{1!} + \frac{2^2}{2!} + \frac{2^3}{3!} + \dots \right) - \left(\frac{1}{1!} + \frac{1}{2!} + \dots \right)$$

We know that,

$$e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \dots \Rightarrow e^2 = 1 + \frac{2}{1!} + \frac{2^2}{2!} + \frac{2^3}{3!} + \dots$$

and $e^2 - 1 = \frac{2}{1!} + \frac{2^2}{2!} + \frac{2^3}{3!} + \dots$

Also, $\frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots = e - 1$

$$\therefore T_1 + T_2 + T_3 + \dots = (e^2 - 1) - (e - 1) = e^2 - e$$

2. (a) We have, $\frac{2}{3!} + \frac{4}{5!} + \frac{6}{7!} + \dots = \sum_{n=1}^{\infty} \frac{2n}{(2n+1)!} = \sum_{n=1}^{\infty} \frac{2n+1-1}{(2n+1)!}$

$$\begin{aligned} &= \sum_{n=1}^{\infty} \left[\frac{1}{(2n)!} - \frac{1}{(2n+1)!} \right] \\ &= \frac{1}{0!} - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \frac{1}{6!} - \frac{1}{7!} + \dots \\ &= \frac{1}{0!} - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \dots = e^{-1} \end{aligned}$$

3. (c) We have, $1 + \frac{3}{2!} + \frac{7}{3!} + \frac{15}{4!} + \dots$

$\therefore$ Sum of the series is $T_n = \frac{2^n - 1}{n!}$

$$\begin{aligned} \therefore S_n &= \sum_{n=1}^{\infty} T_n = \sum_{n=1}^{\infty} \left[\frac{2^n}{n!} - \frac{1}{n!} \right] \\ &= (e^2 - 1) - (e - 1) = e^2 - e = e(e - 1) \end{aligned}$$

4. (a) We have, $\frac{5}{1 \cdot 2 \cdot 3} + \frac{7}{3 \cdot 4 \cdot 5} + \frac{9}{5 \cdot 6 \cdot 7} + \dots$

$$\begin{aligned} &= \frac{3+2}{1 \cdot 2 \cdot 3} + \frac{5+2}{3 \cdot 4 \cdot 5} + \frac{7+2}{5 \cdot 6 \cdot 7} + \dots \\ &= \left(\frac{1}{1 \cdot 2} + \frac{2}{1 \cdot 2 \cdot 3} \right) + \left(\frac{1}{3 \cdot 4} + \frac{2}{3 \cdot 4 \cdot 5} \right) + \left(\frac{1}{5 \cdot 6} + \frac{2}{5 \cdot 6 \cdot 7} \right) \\ &\quad \left(\frac{1}{1 \cdot 2} + \frac{1}{3 \cdot 4} + \frac{1}{5 \cdot 6} + \dots \right) + 2 \left(\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{3 \cdot 4 \cdot 5} + \frac{1}{5 \cdot 6 \cdot 7} + \dots \right) \end{aligned}$$

$$\begin{aligned} &= \left(\frac{2-1}{1 \cdot 2} + \frac{4-3}{3 \cdot 4} + \frac{6-5}{5 \cdot 6} + \dots \right) \\ &\quad + \left[\left(\frac{1}{1 \cdot 2} - \frac{1}{2 \cdot 3} \right) + \left(\frac{1}{3 \cdot 4} - \frac{1}{4 \cdot 5} \right) + \dots \right] \\ &= \left(1 - \frac{1}{2} \right) + \left(\frac{1}{3} - \frac{1}{4} \right) + \left(\frac{1}{5} - \frac{1}{6} \right) \\ &\quad + \dots + \left[\left(1 - \frac{1}{2} \right) - \left(\frac{1}{2} - \frac{1}{3} \right) + \left(\frac{1}{3} - \frac{1}{4} \right) - \left(\frac{1}{4} - \frac{1}{5} \right) + \dots \right] \\ &= \log 2 + 1 - 2 \left(\frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \dots \right) \\ &= \log 2 + 2 \left[1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots \right] - 1 \\ &= \log 2 + 2 \log 2 - 1 = 3 \log 2 - 1 = \log 8 - \log e = \log \frac{8}{e} \end{aligned}$$

5. (d) Let $S_n = 9 + 16 + 27 + 42 + \dots + T_{n-1} + T_n$

Also, $S_n = 9 + 16 + 27 + \dots + T_{n-1} + T_n$

On subtracting, we get

$$0 = 9 + (7 + 11 + 15 + \dots \text{upto } (n-1) \text{ terms}) - T_n$$

i.e. the series becomes AP.

$$\begin{aligned} \therefore T_n &= 9 + \frac{n-1}{2} [2 \cdot 7 + (n-1-1) 4] \\ &= 9 + \frac{n-1}{2} [14 + 4n - 8] \\ &= 9 + (n-1) [3 + 2n] = 2n^2 + n + 6 \end{aligned}$$

$\therefore$ n th term of the given series is given by

$$\begin{aligned} \frac{2n^2 + n + 6}{n!} &= \frac{2n}{(n-1)!} + \frac{1}{(n-1)!} + \frac{6}{n!} \\ &= \frac{2(n-1)+2}{(n-1)!} + \frac{1}{(n-1)!} + \frac{6}{n!} \\ &= \frac{2}{(n-2)!} + \frac{3}{(n-1)!} + \frac{6}{n!} \end{aligned}$$

Putting $n = 2, 3, 4, \dots$ and then adding, we get

$$\begin{aligned} &T_2 + T_3 + T_4 + \dots \\ &= 2 \left[\frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \dots \right] + 3 \left[\frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots \right] \\ &\quad + 6 \left[\frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots \right] \end{aligned}$$

$$= 2e + 3(e - 1) + 6(e - 2) = 11e - 15$$

$$\therefore T_1 + T_2 + T_3 + \dots = 9 + 11e - 15 = 11e - 6$$

6. (b) We have, $\frac{1}{1 \cdot 2} + \frac{1 \cdot 3}{1 \cdot 2 \cdot 3 \cdot 4} + \frac{1 \cdot 3 \cdot 5}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} + \dots$

$$\begin{aligned} T_n &= \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \dots (2n)} \\ &= \frac{1 \cdot 2 \cdot 3 \cdot 4 \dots (2n-2) (2n-1) 2n}{[1 \cdot 2 \cdot 3 \dots (2n-1) (2n)] [2 \cdot 4 \cdot 6 \dots (2n)]} \end{aligned}$$

$$= \frac{(2n)!}{(2n)! 2^n n!} = \frac{1}{2^n n!}$$

$$\therefore \text{Required sum} = \sum_{n=0}^{\infty} \frac{\left(\frac{1}{2}\right)^n}{n!} = \sum_{n=0}^{\infty} \frac{\left(\frac{1}{2}\right)^n}{n!} - 1 = e^{1/2} - 1$$

7. (d) We have, $\frac{e^{5x} + e^x}{e^{3x}} = e^{2x} + e^{-2x}$

$$= \sum_{n=0}^{\infty} \frac{(2x)^n}{n!} + \sum_{n=0}^{\infty} \frac{(-2x)^n}{n!} = 2 \left[1 + \frac{2^2 x^2}{2!} + \frac{2^4 x^4}{4!} + \dots \right]$$

[higher terms will cancel]

Since, this series does not contain any odd power of x .

$\therefore$ Coefficient of $x^n = 0$

8. (a) Given, $\frac{a + bx + cx^2}{e^x} = (a + bx + cx^2) e^{-x}$

$$= (a + bx + cx^2) \sum_{n=0}^{\infty} \frac{(-1)^n x^n}{n!}$$

$$= a \sum_{n=0}^{\infty} \frac{(-1)^n x^n}{n!} + b \sum_{n=0}^{\infty} \frac{(-1)^n x^{n+1}}{n!} + c \sum_{n=0}^{\infty} \frac{(-1)^n x^{n+2}}{n!}$$

$\therefore$ Coefficient of x^n in the expansion of $\frac{a + bx + cx^2}{e^x}$

$$= a \frac{(-1)^n}{n!} + b \frac{(-1)^{n-1}}{(n-1)!} + c \frac{(-1)^{n-2}}{(n-2)!}$$

$$= \frac{(-1)^n}{n!} [a - bn + cn(n-1)]$$

$$= \frac{(-1)^n}{n!} [cn^2 - (b+c)n + a]$$

9. (c) Hint $\frac{e^2 + e^{-2}}{2} - 1 = \left[\frac{2^2}{2!} + \frac{2^4}{4!} + \dots \right]$

$$\Rightarrow \frac{e^4 + 1 - 2e^2}{2e^2} = \left[\frac{2^2}{2!} + \frac{2^4}{4!} + \dots \right]$$

10. (c) Let $S = 1 + \frac{1}{2!} + \frac{1 \cdot 3}{4!} + \frac{1 \cdot 3 \cdot 5}{6!} + \dots$

$$\therefore T_n = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{(2n)!} \times \frac{2 \cdot 4 \dots 2n}{2 \cdot 4 \dots 2n}$$

$$= \frac{(2n)!}{(2n)! 2^n (n)!} = \frac{1}{2^n (n)!}$$

$$\therefore S = 1 + \sum T_n = 1 + \frac{1}{2(1)!} + \frac{1}{2^2(2)!} + \dots = e^{1/2} = \sqrt{e}$$

11. (b) Hint $T_n = \frac{2n}{(2n+1)!} = \frac{1}{2n!} - \frac{1}{(2n+1)!}$

$$\therefore \sum T_n = \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \dots$$

12. (a) Here, $T_n = \frac{n^3}{n!} = \frac{n^2-1}{(n-1)!} + \frac{1}{(n-1)!} = \frac{n+1}{(n-2)!} + \frac{1}{(n-1)!}$

$$= \frac{1}{(n-3)!} + \frac{3}{(n-2)!} + \frac{1}{(n-1)!}$$

$$\therefore \sum T_n = \sum \left(\frac{1}{(n-3)!} + \frac{3}{(n-2)!} + \frac{1}{(n-1)!} \right)$$

$$= e + 3e + e = 5e$$

13. (c) Here, $T_n = \frac{1+2+3+\dots+n}{n!} = \frac{n(n+1)}{2(n)!} \left[\therefore \sum n = \frac{n(n+1)}{2} \right]$

$$= \frac{(n+1)}{2(n-1)!} = \frac{1}{2(n-2)!} + \frac{1}{(n-1)!}$$

Now, $T_1 = 0 + \frac{1}{1!}, T_2 = \frac{1}{2} \cdot \frac{1}{1!} + \frac{1}{1!}, T_3 = \frac{1}{2} \cdot \frac{1}{1!} + \frac{1}{2!}, \dots$

and so on.

$$\therefore S = \sum T_n = \frac{1}{2} \left(1 + \frac{1}{1!} + \frac{1}{2!} + \dots \right) + \left(1 + \frac{1}{1!} + \frac{1}{2!} + \dots \right)$$

$$= \frac{1}{2} e + e = \frac{3}{2} e$$

14. (b) Given, $\frac{\frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + \dots}{1 + \frac{1}{3!} + \frac{1}{5!} + \dots} = \frac{\frac{e + e^{-1}}{2} - 1}{\frac{e - e^{-1}}{2}}$

$$= \frac{e^2 + 1 - 2e}{e^2 - 1} = \frac{e-1}{e+1}$$

15. (c) $1 + \frac{(a+bx)}{1!} + \frac{(a+bx)^2}{2!} + \frac{(a+bx)^3}{3!} + \dots = e^{a+bx}$

$\therefore$ Coefficient of x^n in $e^a e^{bx} = e^a \cdot \frac{(b)^n}{n!}$

16. (b) Hint $\sum_{n=1}^{\infty} \frac{2n}{(2n+1)!} = \sum_{n=1}^{\infty} \frac{2n+1-1}{(2n+1)!}$

$$= \sum_{n=1}^{\infty} \frac{1}{(2n)!} - \sum_{n=1}^{\infty} \frac{1}{(2n+1)!}$$

17. (a) We have, $(1-2x-x^2)(e^x)$

$$\left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots + \frac{x^k}{k!} + \dots \right)$$

$$= \left(1 + x + \frac{x^2}{2!} + \dots + \frac{x^k}{k!} + \dots \right)$$

$$= (1-2x-x^2) - 2 \left(x + x^2 + \frac{x^3}{2!} + \dots + \frac{x^k}{(k-1)!} + \frac{x^{k+1}}{k!} + \dots \right)$$

$$- \left(x^2 + x^3 + \frac{x^4}{2!} + \dots + \frac{x^k}{(k-2)!} \right)$$

$$+ \left(\frac{x^{k+1}}{(k-1)!} + \frac{x^{k+2}}{k!} + \dots \right)$$

$\therefore$ Coefficient of x^k in $\left(\frac{1-2x-x^2}{e^{-x}} \right) = \frac{1}{k!} - \frac{2}{(k-1)!} - \frac{1}{(k-2)!}$

$$= \frac{1}{k!} - \frac{2k}{k!} - \frac{k(k-1)}{k!}$$

$$= \frac{1-k-k^2}{k!}$$

18. (d) Given, $e^{\frac{1}{3x}} (e^x + e^{5x}) = a_0 + a_1 x + a_2 x^2 + \dots$

$$\Rightarrow (e^{-2x} + e^{2x}) = a_0 + a_1 x + a_2 x^2 + \dots$$

$$\Rightarrow 2 \left[1 + \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} + \dots \right] = a_0 + a_1 x + a_2 x^2 + \dots$$

$$\Rightarrow a_1 = a_3 = a_5 = \dots = 0$$

$$\therefore 2a_1 + 2^3 a_3 + 2^5 a_5 + \dots = 0$$

19. (a) $\log_e(1+x+x^2) = \log_e \left(\frac{1-x^3}{1-x} \right)$
 $= \log_e(1-x^3) - \log_e(1-x)$
 $= \left[-x^3 - \frac{x^6}{2} - \frac{x^9}{3} - \dots \right] + \left[x + \frac{x^2}{2} + \dots + \frac{x^n}{n} + \dots \right]$
 Since, n is not a multiple of 3.
 $\therefore$ Coefficient of x^n in the first bracket = 0
 $[\because \text{all powers of } x \text{ are multiple of } 3]$
 and coefficient of x^n in the second bracket = $\frac{1}{n}$

Hence, coefficient of $x^n = \frac{1}{n}$

20. (a) Given series can be rewritten as

$$\left[\alpha x - \frac{1}{2}(\alpha x)^2 + \frac{1}{2}(\alpha x)^3 - \dots \right] + \left[\beta x - \frac{1}{2}(\beta x)^2 + \frac{1}{3}(\beta x)^3 - \dots \right]$$

$$= \log(1-\alpha x) + \log(1-\beta x)$$

$$= \log[1-(\alpha+\beta)x + \alpha\beta x^2]$$

Now, $\alpha + \beta = p$ and $\alpha\beta = q$

$\therefore$ Given series = $\log(1-px + qx^2)$

21. (b) We have, $\frac{x^2}{2} + \frac{2}{3}x^3 + \frac{3}{4}x^4 + \frac{4}{5}x^5 + \dots$

$$= \sum_{n=1}^{\infty} \frac{n}{n+1} x^{n+1} = \sum_{n=1}^{\infty} \frac{n+1-1}{n+1} x^{n+1} = \sum_{n=1}^{\infty} \left(1 - \frac{1}{n+1} \right) x^{n+1}$$

$$= \sum_{n=1}^{\infty} x^{n+1} - \sum_{n=1}^{\infty} \frac{x^{n+1}}{n+1} = \frac{x^2}{1-x} + x - \sum_{n=0}^{\infty} \frac{x^{n+1}}{n+1}$$

$$= \frac{x^2}{1-x} + x + \log(1-x) = \frac{x}{1-x} + \log(1-x)$$

22. (d) Hint

$$\left(\frac{1}{2 \cdot 2} - \frac{1}{4 \cdot 2^2} + \frac{1}{6 \cdot 2^3} - \dots \right) + \left(\frac{1}{2 \cdot 3} - \frac{1}{4 \cdot 3^2} + \frac{1}{6 \cdot 3^3} - \dots \right)$$

$$= \frac{1}{2} \left[\frac{1}{2} - \frac{1}{2} \left(\frac{1}{2} \right)^2 + \frac{1}{3} \left(\frac{1}{2} \right)^3 - \dots \right]$$

$$+ \frac{1}{2} \left[\frac{1}{3} - \frac{1}{2} \left(\frac{1}{3} \right)^2 + \frac{1}{3} \left(\frac{1}{3} \right)^3 - \dots \right]$$

$$= \frac{1}{2} \log \left(1 + \frac{1}{2} \right) + \frac{1}{2} \log \left(1 + \frac{1}{3} \right)$$

23. (b) The given equation can be written as

$$\frac{\log(x-1)}{\log 4} = \frac{\log(x-3)}{\log 2}$$

We know that, $\log 4 = 2 \log 2$

Then, $\log(x-1) = 2 \log(x-3) = \log(x-3)^2$

$\therefore (x-3)^2 - (x-1) = 0$

or $x^2 - 7x + 10 = 0$

$\therefore (x-2)(x-5) = 0$

$\therefore x = 2, 5$

Neglecting $x = 2$ as $x > 3$

Hence, $x = 5$ is the only one solution.

24. (d) $2 \log_{10} x - \log_x 0.01 = 2 \log_{10} x - \frac{\log_{10} 0.01}{\log_{10} x}$
 $= 2 \log_{10} x - \frac{\log_{10} 10^{-2}}{\log_{10} x} = 2 \log_{10} x + \frac{2}{\log_{10} x} \quad [\because \log_e e = 1]$
 $= 2 \left(\log_{10} x + \frac{1}{\log_{10} x} \right) \quad \dots(i)$

Since, $x > 1$, $\log_{10} x > 0$

But $\frac{1}{2} \left(\log_{10} x + \frac{1}{\log_{10} x} \right) \geq \sqrt{\left(\log_{10} x \times \frac{1}{\log_{10} x} \right)} = 1$

$[\because \text{AM} \geq \text{GM}]$

$\therefore \log_{10} x + \frac{1}{\log_{10} x} \geq 2 \quad \dots(ii)$

Thus, $2 \log_{10} x - \log_x 0.01 \geq 4$ [from Eqs. (i) and (ii)]

Hence, minimum value of $2 \log_{10} x - \log_x 0.01 = 4$

25. (c) We have, $S = \sum_{n=0}^{\infty} \frac{(\log x)^{2n}}{(2n)!} = \left(\frac{e^{\log x} + e^{-\log x}}{2} \right) = \frac{x + x^{-1}}{2}$

26. (b)

27. (a) We have, $\log_{10} \left(\frac{n}{n-1} \right) = \log_e \left(\frac{n}{n-1} \right) (\log_{10} e)$

$$= -\log_e \left(\frac{n-1}{n} \right) \log_{10} e = -\log_e \left(1 - \frac{1}{n} \right) \log_{10} e$$

$$= \log_{10} e \left[\frac{1}{n} + \frac{1}{2} \cdot \frac{1}{n^2} + \frac{1}{3} \cdot \frac{1}{n^3} + \dots + \frac{1}{r} \cdot \frac{1}{n^r} + \dots \right]$$

$\therefore$ Coefficient of $n^{-r} = \frac{1}{r} \log_{10} e = \frac{1}{r \log_e 10}$

28. (c) Hint $\log_e \left(\frac{1+3x}{1-2x} \right) = \log_e(1+3x) - \log_e(1-2x)$

29. (d) $\frac{1}{2} \left(\frac{1}{3} + \frac{1}{4} \right) - \frac{1}{4} \left(\frac{1}{3^2} + \frac{1}{4^2} \right) + \frac{1}{6} \left(\frac{1}{3^3} + \frac{1}{4^3} \right) - \dots$
 $= \frac{1}{2} \left[\frac{1}{3} - \frac{1}{2} \left(\frac{1}{3^2} \right) + \frac{1}{3} \left(\frac{1}{3^3} \right) - \dots \right]$
 $+ \frac{1}{2} \left[\frac{1}{4} - \frac{1}{2} \left(\frac{1}{4^2} \right) + \frac{1}{3} \left(\frac{1}{4^3} \right) - \dots \right]$
 $= \frac{1}{2} \left[\log \left(1 + \frac{1}{3} \right) \right] + \frac{1}{2} \left[\log \left(1 + \frac{1}{4} \right) \right]$
 $= \frac{1}{2} \left[\log \left(\frac{4}{3} \right) \times \left(\frac{5}{4} \right) \right] = \frac{1}{2} \log \left(\frac{5}{3} \right)$

30. (c) Since, $\log(1+x) - \log(1-x) = 2 \left[x + \frac{x^3}{3} + \frac{x^5}{5} + \dots \right]$

Put $x = \frac{1}{2}$ on both sides, we get

$$\log \left(\frac{3}{2} \right) - \log \left(\frac{1}{2} \right) = 2 \left(\frac{1}{2} + \frac{1}{3} \cdot \frac{1}{2^3} + \frac{1}{5} \cdot \frac{1}{2^5} + \dots \right)$$

$\Rightarrow \log_e 3 = 1 + \frac{1}{3} \cdot \frac{1}{4} + \frac{1}{5} \cdot \frac{1}{4^2} + \dots$

31. (a) Hint $T_n = \frac{1}{(2n-1)(2n)(2n+1)}$
 $= \frac{1}{2} \left[\frac{1}{2n-1} - \frac{1}{2n} \right] - \frac{1}{2} \left[\frac{1}{2n} - \frac{1}{2n+1} \right]$

$$\begin{aligned}
 T_1 &= \frac{1}{2} \left[\frac{1}{1} - \frac{1}{2} \right] - \frac{1}{2} \left[\frac{1}{2} - \frac{1}{3} \right] \\
 T_2 &= \frac{1}{2} \left[\frac{1}{3} - \frac{1}{4} \right] - \frac{1}{2} \left[\frac{1}{4} - \frac{1}{5} \right] \\
 &\vdots \\
 \therefore S &= \frac{1}{2} \left[1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \dots \right] \\
 &\quad - \frac{1}{2} \left[\frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \frac{1}{6} - \frac{1}{7} + \dots \right]
 \end{aligned}$$

32. (c) Hint $\log_{3^2} 3 + \log_{3^3} 3 - \log_{3^4} 3 + \log_{3^5} 3 - \dots$

$$= \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots + 1 - 1$$

BITSAT Archives

1. (a) We have, $e^x = (1-x)(B_0 + B_1x + B_2x^2 + \dots + B_{n-1}x^{n-1} + B_nx^n + \dots)$

By the expansion of e^x , we get

$$1 + \frac{x}{1!} + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots = (1-x)(B_0 + B_1x + B_2x^2 + \dots + B_{n-1}x^{n-1} + B_nx^n + \dots)$$

Equating the coefficient of x^n on both sides, we get

$$B_n - B_{n-1} = \frac{1}{n!}$$

2. (d) Hint $\log_4 2 - \log_8 2 + \log_{16} 2 - \dots$

$$= \frac{1}{\log_2 4} - \frac{1}{\log_2 8} + \frac{1}{\log_2 16} - \dots = \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \dots$$

3. (a) We have, $a = \sum_{n=0}^{\infty} \frac{x^{3n}}{(3n)!}$, $b = \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!}$

and $c = \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$

$$\text{Now, } a + b + c = \sum_{n=0}^{\infty} \frac{x^{3n}}{(3n)!} + \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!} + \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$$

$$= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots = e^x$$

$$\text{Also, } a + b\omega + c\omega^2 = 1 + \omega x + \frac{\omega^2 x^2}{2!} + \frac{\omega^3 x^3}{3!} + \dots = e^{\omega x}$$

and $a + b\omega^2 + c\omega = e^{\omega^2 x}$, where ω is imaginary cube root of unity.

$$\text{Now, } a^3 + b^3 + c^3 - 3abc$$

$$= (a + b + c)(a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$$

$$= e^x \cdot e^{\omega x} \cdot e^{\omega^2 x} = e^{x(1 + \omega + \omega^2)} = e^{0 \cdot x} = 1$$

4. (b) $\log_e \left(\frac{1}{1+x+x^2+x^3} \right) = \log_e \left(\frac{1-x}{1-x^4} \right)$

$$= \log_e(1-x) - \log_e(1-x^4) = - \sum_{r=1}^{\infty} \frac{x^r}{r} + \sum_{r=1}^{\infty} \frac{x^{4r}}{r}$$

$$\begin{aligned}
 33. (c) & \left(\frac{1}{3} \right)^2 + \frac{1}{3} \left(\frac{1}{3} \right)^4 + \frac{1}{5} \left(\frac{1}{3} \right)^6 + \dots \\
 &= \frac{1}{3} \left[\left(\frac{1}{3} \right) + \frac{1}{3} \left(\frac{1}{3} \right)^3 + \frac{1}{5} \left(\frac{1}{3} \right)^5 + \dots \right] \\
 &= \frac{1}{3} \cdot \frac{1}{2} \log \left(\frac{1 + \frac{1}{3}}{1 - \frac{1}{3}} \right) = \frac{1}{6} \log_e 2
 \end{aligned}$$

34. (c)

$$\begin{aligned}
 35. (a) & \log_e 3 - \frac{\log_e 9}{2^2} + \frac{\log_e 27}{3^2} - \frac{\log_e 81}{4^2} + \dots \\
 &= (\log_e 3) \left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots \right) = (\log_e 3) \log_e 2
 \end{aligned}$$

When n is odd, there is no term in the second series containing x^n , therefore the coefficient of x^n is zero in the second series and in the first series, the coefficient of x^n is $-\frac{1}{n}$.

Hence, when n is odd, then the coefficient of x^n in the whole expansion is $-\frac{1}{n} + 0 = -\frac{1}{n}$.

$$\begin{aligned}
 5. (a) & 7 \log \left(\frac{16}{15} \right) + 5 \log \left(\frac{25}{24} \right) + 3 \log \left(\frac{81}{80} \right) \\
 &= \log \left[\left(\frac{16}{15} \right)^7 \cdot \left(\frac{25}{24} \right)^5 \cdot \left(\frac{81}{80} \right)^3 \right] = \log 2
 \end{aligned}$$

$$6. (c) \text{ Here, } T_n = \frac{n(n+1)}{n!} = \frac{n-1+2}{(n-1)!} = \frac{1}{(n-2)!} + \frac{2}{(n-1)!}$$

$$\therefore S = \sum_{n=1}^{\infty} T_n = \sum_{n=1}^{\infty} \frac{1}{(n-2)!} + 2 \sum_{n=1}^{\infty} \frac{1}{(n-1)!} = e + 2e = 3e$$

7. (a) Given series is $\frac{1}{3} + \frac{1}{3 \cdot 3^3} + \frac{1}{5 \cdot 3^5} + \frac{1}{7 \cdot 3^7} + \dots$... (i)

Putting $\frac{1}{3} = x$ in Eq. (i), we get

$$\begin{aligned}
 \frac{1}{3} + \frac{1}{3 \cdot 3^3} + \frac{1}{5 \cdot 3^5} + \frac{1}{7 \cdot 3^7} + \dots &= \left(x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \dots \right) \\
 &= \frac{1}{2} \log_e \left(\frac{1+x}{1-x} \right) = \frac{1}{2} \log_e \left(\frac{1 + \frac{1}{3}}{1 - \frac{1}{3}} \right) \quad \left[\because x = \frac{1}{3} \right] \\
 &= \frac{1}{2} \log_e 2
 \end{aligned}$$

8. (d) Here, $\log_{140} 63 = \log_{2^2 \times 5 \times 7} (3 \times 3 \times 7) = \frac{\log_2 (3 \times 3 \times 7)}{\log_2 (2^2 \times 5 \times 7)}$

$$= \frac{\log_2 3 + \log_2 3 + \log_2 7}{2 \log_2 2 + \log_2 5 + \log_2 7} = \frac{2a + \frac{1}{c}}{2 + b + \frac{1}{c}} = \frac{2ac + 1}{2c + bc + 1}$$

5

Permutations and Combinations

Fundamental Principle of Counting

The fundamental principle of counting is a way to figure out the total number of ways in which different events can occur. If a certain work A can be done in m ways and another work B in n ways, then

- (i) the number of ways of doing the work A or B is $m + n$. [addition principle]
- (ii) the number of ways of doing both the works is mn . [multiplication principle]

Factorial Notation

Let n be a positive integer. Then, the continued product of first n natural numbers is called factorial n . It is denoted by $n!$ or $\underline{n}$.

Thus, $n! = n (n - 1) (n - 2) \dots 3 \cdot 2 \cdot 1$

e.g. $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$ and $4! = 4 \times 3 \times 2 \times 1 = 24$

Properties of Factorial Notation

- 1. $0! = 1! = 1$
- 2. Factorials of negative integers and fractions are not defined.
- 3. $n! = n (n - 1)! = n (n - 1) (n - 2)!$
- 4. $\frac{n!}{r!} = n (n - 1) (n - 2) \dots (r + 1)!$

Permutation

Each of different arrangements which can be made by taking some or all of a number of things, is called a permutation and number of permutations of n distinct objects taking r at a time is denoted by ${}^n P_r$.

$${}^n P_r = \frac{n!}{(n-r)!}, \forall 0 \leq r \leq n = n(n-1)(n-2)\dots(n-r+1), \forall n \in N \text{ and } r \in W$$

Properties of ${}^n P_r$

- The number of permutations of n distinct objects taken all at a time is ${}^n P_n = n!$
- ${}^n P_0 = 1$, ${}^n P_1 = n$ and ${}^n P_{n-1} = n!$
- ${}^n P_r = n {}^{n-1} P_{r-1} = r {}^{n-1} P_{r-1} + {}^{n-1} P_r$
- ${}^{n-1} P_r = (n-r) {}^{n-1} P_{r-1}$

Number of Permutations without Repetition

- (i) Arranging n distinct objects, taken r at a time equivalent to filling r places from n things

Number of place	1	2	3	4	...	r
Number of choices	n	$(n-1)$	$(n-2)$	$(n-3)$	...	$n-(r-1)$

Number of arrangements = Number of ways of filling r places

$$\begin{aligned}
 &= n(n-1)(n-2)\dots(n-r+1) \\
 &= \frac{n(n-1)(n-2)\dots(n-r+1)\{(n-r)!\}}{(n-r)!} \\
 &= \frac{n!}{(n-r)!} = {}^n P_r
 \end{aligned}$$

- (ii) The number of arrangements of n different objects taken all at a time

$$= {}^n P_n = n!$$

$$(a) {}^n P_0 = \frac{n!}{n!} = 1, {}^n P_r = n {}^{n-1} P_{r-1}$$

$$(b) 0! = 1, 1/(-r)! = 0 \text{ or } (-r)! = \infty \quad [\because r \in \mathbb{N}]$$

Number of Permutations with Repetition

r -places	1	2	3	4	...	r
Number of choices	n	n	n	n	...	n

- (i) The number of permutations (arrangements) of n different objects, taken r at a time, when each object may occur once, twice, thrice,... upto r times in any arrangement is equal to the number of ways of filling r places, where each place can be filled by anyone of n objects.

Number of permutations = Number of ways of filling r places $= (n)^r$

- (ii) The number of arrangements that can be formed using n objects out of which p are identical (and of one kind), q are identical (and of another kind), r are identical (and of another kind) and the rest are distinct, is $\frac{n!}{p!q!r!}$.

Circular Permutation

If objects are arranged along a closed curve, then permutation is known as circular permutation.

Important Results on Circular Permutation

- (i) The number of circular permutations of n different things taken all at a time is $(n-1)!$. If clockwise and anti-clockwise orders are taken as different.
- (ii) If clockwise and anti-clockwise circular permutations are considered to be the same, then it is $\frac{(n-1)!}{2}$.
- (iii) Number of circular permutations of n different things, taken r at a time, when clockwise and anti-clockwise orders are taken as different, is $\frac{{}^n P_r}{r}$.
- (iv) Number of circular permutations of n different things, taken r at a time, when clockwise and anti-clockwise orders are not different, is ${}^n P_r / 2r$.
- (v) Number of circular permutations of n things, when p are alike and the rest different, taken all at a time distinguishing clockwise and anti-clockwise arrangements is $\frac{(n-1)!}{p!}$.

Combination

Each of the different groups or selections which can be formed by taking some or all of the number of objects, irrespective of their arrangements, is called a combination.

If ${}^n C_r$ denotes the number of combinations of n different

things taken r at a time, then ${}^n C_r = \frac{n!}{r!(n-r)!} = \frac{{}^n P_r}{r!}$, where

$r < n$, $n \in \mathbb{N}$ and $r \in \mathbb{W}$.

Properties of ${}^n C_r$

- ${}^n C_r = {}^n C_{n-r}$
- ${}^n C_r + {}^n C_{r-1} = {}^{n+1} C_r$
- ${}^n C_r = 0$, if $r \notin \{0, 1, 2, 3, \dots, n\}$
- ${}^n P_r = {}^n C_r \cdot r!$

Number of Combinations with Repetition

- (i) Number of ways in which atleast one object is selected out of n distinct objects
 $\Rightarrow {}^nC_1 + {}^nC_2 + {}^nC_3 + \dots + {}^nC_n = 2^n - 1$
- (ii) The total number of ways in which it is possible to make groups by taking some or all out of $n = (n_1 + n_2 + \dots)$ things, when n_1 are alike (of one kind), n_2 are alike (of second kind) and so on, is $\{(n_1 + 1)(n_2 + 1) \dots\} - 1$.
- (iii) The number of selections of r objects out of n identical objects is 1.
- (iv) Total number of selections of zero or more objects from n identical objects is $n + 1$.
- (v) The number of selections taking atleast one out of $a_1 + a_2 + a_3 + \dots + a_n + k$ objects, where a_1 are alike (of one kind), a_2 are alike (of second kind) and so on $\dots a_n$ are alike (of n th kind) and k is distinct, is $[(a_1 + 1)(a_2 + 1)(a_3 + 1) \dots (a_n + 1)] 2^k - 1$.
- (vi) If $N = p^{a_1} \cdot q^{a_2} \cdot r^{a_3} \dots$, where $p, q, r, \dots$ are different prime numbers and $a_1, a_2, a_3, \dots$ are natural numbers, then
- Total number of divisors of N (including 1 and N)
 $= (a_1 + 1)(a_2 + 1)(a_3 + 1) \dots$
 - Total number of divisors of N (excluding 1 and N)
 $= \{(a_1 + 1)(a_2 + 1)(a_3 + 1) \dots\} - 2$
 - Total number of divisors of N (excluding 1 or N)
 $= \{(a_1 + 1)(a_2 + 1)(a_3 + 1) \dots\} - 1$
 - The sum of these divisors is

$$= (p^0 + p^1 + p^2 + \dots + p^{a_1}) (q^0 + q^1 + q^2 + \dots + q^{a_2}) (r^0 + r^1 + r^2 + \dots + r^{a_3})$$
 - The number of ways in which a composite number N can be decomposed into two factors is
- Case I** When N is not a perfect square, then
 $\frac{1}{2} \{(a_1 + 1)(a_2 + 1) \dots\}$
- Case II** When N is a perfect square, then
 $\frac{1}{2} [\{(a_1 + 1)(a_2 + 1)(a_3 + 1) \dots\} + 1]$
- (f) The number of ways in which a composite number N can be decomposed in two-two factors which are coprime, is 2^{k-1} , where k is the number of different factors of N .

Applications of Permutations and Combinations

The functional and the geometrical applications of permutations and combinations are as given below:

Functional Applications

- The number of all permutations (arrangements) of n different objects taken r at a time,
 - when a particular object is always included in each arrangement, is ${}^{n-1}C_{r-1} \times r!$.
 - when a particular object is never taken in each arrangement, is ${}^{n-1}C_r \times r!$.
- If the sets A has m elements and B has n elements, then
 - the number of functions from A to B is n^m .
 - the number of one-one functions from A to B is nP_m , where $m \leq n$.

Geometrical Applications

- Number of triangles formed from n points, when no three points are collinear, is nC_3 .
- Out of n non-concurrent and non-parallel straight lines, the points of intersection are nC_2 .
- Number of parallelograms in two systems of parallel lines (when 1st system contains m parallel lines and 2nd system contains n parallel lines) = ${}^nC_2 \times {}^mC_2$.
- The number of diagonals in a polygon of n sides, is ${}^nC_2 - n$.
- The number of total triangles formed by joining the n points on a plane of which m are collinear, is ${}^nC_3 - {}^mC_3$.
- The number of total different straight lines formed by joining the n points on a plane of which m are collinear, is ${}^nC_2 - {}^mC_2 + 1$.
- The number of rectangles of any size in a square of $n \times n$ is $\sum_{r=1}^n r^3$ and number of squares of any size is $\sum_{r=1}^n r^2$.

Prime Factors

Any integer greater than 1 can be expressed as product of primes

e.g. $7 = 7^1$, $12 = 2^2 \cdot 3^1$, $360 = 2^3 \cdot 3^2 \cdot 5^1$

Let $n = p_1^{\alpha_1} \cdot p_2^{\alpha_2} \cdot p_3^{\alpha_3} \cdot \dots \cdot p_r^{\alpha_r}$, where $p_i, i = 1, 2, \dots, r$ are distinct primes and $\alpha_i, i = 1, 2, \dots, r$ are positive integers.

- (i) Number of divisors of
- n
- is

$$(\alpha_1 + 1)(\alpha_2 + 1)(\alpha_3 + 1) \dots (\alpha_r + 1)$$

- (ii) Sum of divisors of
- n
- is

$$\frac{(p_1^{\alpha_1+1}-1)}{(p_1-1)} \frac{(p_2^{\alpha_2+1}-1)}{(p_2-1)} \dots \frac{(p_r^{\alpha_r+1}-1)}{(p_r-1)}$$

- (iii) If
- p
- is a prime and
- p^r
- divides, then
- $r = \left[\frac{n}{p} \right] + \left[\frac{n}{p^2} \right] + \dots$

Division of Objects into Groups

The division of objects into groups are taken place as when the objects are different and identical as given below:

When Objects are Different

1. The number of ways of dividing n different objects into 3 groups of p, q and r ($p + q + r = n$) is

(i) $\frac{n!}{p!q!r!}$; p, q and r are unequal.

(ii) $\frac{n!}{p!2!(q!)^2}$; $q = r$ (iii) $\frac{n!}{3!(p!)^3}$; $p = q = r$

2. The number of ways of dividing n different objects into r groups is

$$\frac{1}{r!} \left[r^n - \binom{r}{1} (r-1)^n + \binom{r}{2} (r-2)^n - \binom{r}{3} (r-3)^n + \dots \right]$$

3. The number of ways of dividing n different objects into r groups taking into account the order of the groups and also the order of objects in each group, is

$${}^{(n+r-1)}P_r = r(r+1)(r+2) \dots (r+n-1).$$

When Objects are Identical

1. The number of ways of dividing n identical objects among r persons, such that each gets 1, 2, 3, ... objects, is the coefficient of x^{n-r} in the expansion of $(1+x+x^2+\dots+x^{k-1})^r$.

2. The number of ways of dividing n identical objects among r persons such that each one may get at most n objects, is $\binom{n+r-1}{r-1}$.

In other words, the total number of ways of dividing n identical objects into r groups, if blank groups are allowed, is ${}^{n+r-1}C_{r-1}$.

3. The total number of ways of dividing n identical objects among r persons and each one of them, receives atleast one item, is ${}^{n-1}C_{r-1}$.

In other words, the number of ways in which n identical things can be divided into r groups such that blank groups are not allowed, is ${}^{n-1}C_{r-1}$.

4. The total number of selections of some or all out of $p + q + r$ items, where p are alike of one kind, q are alike of second kind and rest are alike of third kind, is $[(p+1) \cdot (q+1) \cdot (r+1) - 1]$.

Restricted Selection/Arrangement

1. The number of ways in which r objects can be selected from n different objects, if k particular objects are

(a) always included $= {}^{n-k}C_{r-k}$

(b) never included $= {}^{n-k}C_r$

2. The number of arrangements of n distinct objects taken r at a time, so that k particular objects are

(a) always included $= {}^{n-k}C_{r-k} \cdot r!$

(b) never included $= {}^{n-k}C_r \cdot r!$

Dearrangement

Any change in the given order of the things, is called a dearrangement.

1. If n things form an arrangement in a row, then the number of ways in which they can be dearranged, so that none of them occupies its original place, is

$$n! \left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \dots + (-1)^n \cdot \frac{1}{n!} \right).$$

2. If n things are arranged at n places, then the number of ways to rearrange exactly r things at right places, is

$$\frac{n!}{r!} \left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} + \dots + (-1)^{n-r} \frac{1}{(n-r)!} \right]$$

Practice Exercise

- How many 3-digit numbers can be formed by using 1, 2, 3, 4, 5 without repetition of digits?
 - 12
 - 22
 - 50
 - 60
- A college offers 10 courses in the morning and 7 in the evening. Find the number of ways a student can select exactly one course, either in the morning or in the evening.
 - 10
 - 29
 - 30
 - 17
- The number of words from the letters of the word 'BHARAT' in which B and H will never come together, is
 - 360
 - 240
 - 120
 - None of these
- In how many ways the letters of the word 'ARRANGE' can be arranged without altering the relative positions of vowels and consonants?
 - 36
 - 26
 - 62
 - None
- The sum of the digits in unit place of all the numbers formed with the help of 3, 4, 5 and 6 taken all at a time is
 - 432
 - 108
 - 36
 - 18
- The total number of different combinations of one or more letters which can be made from the letters of the word 'MISSISSIPPI', is
 - 150
 - 148
 - 149
 - None of these
- If $\frac{{}^nP_{r-1}}{a} = \frac{{}^nP_r}{b} = \frac{{}^nP_{r+1}}{c}$, then
 - $b^2 = a(b+c)$
 - $c^2 = a(b+c)$
 - $ab = a^2 + bc$
 - $bc = a^3 + b^2$
- If $m > n$, then the number of ways m men and n women can be seated in a row, so that no two women sit together, is
 - $\frac{m!n!}{(m+n)!}$
 - $\frac{(m+n)!}{m!(n+1)!}$
 - $\frac{m!(n+1)!}{(m-n+1)!}$
 - $\frac{m!(m+1)!}{(m-n+1)!}$
- If all the letters of the word 'QUEST' are arranged in all possible ways and put in dictionary order, then find the rank of the given word.
 - 40
 - 43
 - 45
 - 47
- Eight chairs are numbered 1 to 8. 2 women and 3 men wish to occupy one chair each. First, the women choose the chairs marked 1 to 4 and then the men select from amongst the remaining chairs. The number of seating arrangements is
 - 1250
 - 1360
 - 1440
 - 1560
- In a class of 10 students, there are 3 girls. The number of ways they can be arranged in a row, so that no 2 girls are consecutive, is $k \cdot 8!$, where k is equal to
 - 12
 - 24
 - 36
 - 42
- The number of numbers greater than 1000 but not greater than 4000 that can be formed with the digits 0, 1, 2, 3, 4 when repetition of digits is allowed, is
 - 375
 - 625
 - 125
 - None
- The number of words that can be formed by using the letters of the word 'MATHEMATICS' that start as well as end with T, are
 - 90720
 - 28060
 - 713090
 - None of these
- The total number of permutations of $n (> 1)$ different things taken not more than r at a time, when each thing may be repeated any number of times, is
 - $\frac{n(n^n-1)}{n-1}$
 - $\frac{n^r-1}{n-1}$
 - $\frac{n(n^r-1)}{n-1}$
 - None of these
- Consider 23 different coloured beads in a necklace. In how many ways can the beads be placed in the necklace, so that 3 specific beads always remain together?
 - $\frac{22!3!}{2}$
 - $\frac{21!3!}{2}$
 - $\frac{20!3!}{2}$
 - $20!3! \times 2$
- Six boys and six girls sit along in a line alternatively in x ways and along a circle, (again alternatively in y ways), then
 - $x = y$
 - $y = 12x$
 - $x = 10y$
 - $x = 12y$
- ${}^nC_r + 2 {}^nC_{r-1} + {}^nC_{r-2}$ is equal to
 - ${}^{n+1}C_r$
 - ${}^{n+1}C_{r+1}$
 - ${}^{n+2}C_r$
 - ${}^{n+2}C_{r+1}$
- If ${}^nC_{r-1} = 36$, ${}^nC_r = 84$ and ${}^nC_{r+1} = 126$, then r is equal to
 - 1
 - 2
 - 3
 - None of these

19. The value of expression ${}^{47}C_4 + \sum_{j=1}^5 {}^{52-j}C_3$ is
 a. ${}^{52}C_4$ b. ${}^{52}C_2$
 c. ${}^{52}C_6$ d. None of these
20. A sports team of 11 students is to be constituted, choosing atleast 5 from Class XI and atleast 5 from Class XII. If there are 20 students in each of these classes, then in how many ways can the team be constituted?
 a. ${}^{20}C_5 \times {}^{20}C_6$ b. $2({}^{20}C_5 \times {}^{20}C_6)$
 c. $2({}^{20}C_5)^2$ d. None of these
21. In how many ways, we can select 4 letters from the letters of the word 'MISSISSIPPI'?
 a. 20 b. 21 c. 22 d. 23
22. There are 5 advanced round candidates in an election and 3 of them are to be elected. A voter can cast any number of votes but not more than three. The number of ways in which he can cast his vote is
 a. 5 b. 15 c. 20 d. 25
23. In how many ways can 6 persons be selected from 4 officers and 8 constables, if atleast one officer has to be included?
 a. 224 b. 672 c. 896 d. None
24. The number of ways in which any four letters can be selected out of the letters of the word 'PCBDCC', is
 a. 8 b. 5 c. 7 d. 6
25. The greatest possible number of points of intersection of 8 straight lines and 4 circles is
 a. 32 b. 64 c. 76 d. 104
26. In a steamer, there are stalls for 12 animals and there are horses, cows and calves (not less than 12 each) ready to be shipped. In how many ways, can the ship load be made?
 a. $3^{12} - 1$ b. 3^{12} c. $(12)^3 - 1$ d. $(12)^3$
27. In an examination of 9 papers, a candidate has to pass in more papers, then the number of papers in which he fails in order to be successful. The number of ways in which he can be unsuccessful, is
 a. 255 b. 256 c. 193 d. 319
28. A box contains 2 white balls, 3 black balls and 4 red balls. The number of ways of drawing 3 balls from the box, if atleast one black ball is included, is
 a. 36 b. 42
 c. 56 d. 64
29. A group of 6 is chosen from 10 men and 7 women so as to contain atleast 3 men and 2 women. The number of ways this can be done, if two particular women refuse to serve on the same group, is
 a. 8000 b. 7800
 c. 7600 d. 7200
30. A candidate is required to answer 7 questions out of 12 questions, which are divided into two groups, each containing 6 questions. He is not permitted to attempt more than 5 questions from either group. Find the number of different ways of doing questions.
 a. 779 b. 781 c. 780 d. 782
31. A committee of 4 persons is to be formed from 2 ladies, 2 old men and 4 young men such that it includes atleast 1 lady, atleast 1 old man and atmost 2 young men. Then, the total number of ways in which this committee can be formed, is
 a. 40 b. 41 c. 16 d. 32
32. Find the number of divisors of 1350. Also, find the sum of all divisors.
 a. 25, 3520 b. 24, 3720 c. 6, 2340 d. None
33. The number of times the digit 5 will be written when listing the integers from 1 to 1000, is
 a. 271 b. 272 c. 300 d. None
34. In a certain test, there are n questions, in this test 2^{n-i} students gave wrong answers to atleast i questions, where $i = 1, 2, 3, \dots, n$. If the total number of wrong answers given is 2047, then n is equal to
 a. 10 b. 11 c. 12 d. 13
35. In an election, a voter may vote for any number of candidates, not greater than the number to be elected. There are 10 candidates and 4 are to be elected. If a voter votes for atleast one candidate, then the number of ways in which he can vote is
 a. 5040 b. 6210
 c. 385 d. 1110
36. If the letters of the word 'SACHIN' are arranged in all possible ways and these words are written out as in dictionary, then the word 'SACHIN' appears at serial number
 a. 602 b. 603
 c. 600 d. 601
37. How many ways are there, to arrange the letters in the word 'GARDEN' with the vowels in alphabetical order?
 a. 360 b. 240
 c. 120 d. 480
38. The number of ways to sit 3 men and 2 women in a bus such that total number of sitted men and women on each side is 3, is
 a. 5! b. ${}^6C_5 \times 5!$
 c. $6! \times {}^6C_5$ d. $5! + {}^6C_5$
39. Eighteen guests have to be seated half on each side of a long table. Four particular guests desire to sit on one particular side and three others on the other side. The number of sitting arrangements is
 a. ${}^{11}C_7(9!)^2$ b. ${}^{11}C_5(9!)^2$
 c. $7 \cdot (9!)^2$ d. $10!9!$

40. Possible number of words, taking all letters at a time such that in each word both M's are together and both T's are together but both A's are not together, is
- a. $7! \cdot {}^8C_2$ b. $\frac{11!}{2!2!2!} - \frac{10!}{2!2!}$
 c. $\frac{6!4!}{2!2!}$ d. $\frac{9!}{2!2!2!}$
41. There are m points on one straight line AB and n points on another straight line AC , none of them being A . How many triangles can be formed with these points as vertices, if point A is also included?
- a. $\frac{mn}{2}(m+n-2)$ b. ${}^{m+1}C_2 \times {}^nC_1 + {}^{m-1}C_1 \times {}^nC_2$
 c. $\frac{mn}{2}(m+n)$ d. None of these
42. Out of 5 apples, 10 mangoes and 15 oranges, the number of ways of distributing 15 fruits each to two persons is
- a. 56 b. 64 c. 66 d. 72
43. In how many ways 20 identical bananas may be divided among 4 persons and if each person is to be given atleast one banana?
- a. 10626, 4845 b. 1771, 969
 c. 2024, 1140 d. None of these
44. A shopkeeper sells three varieties of the perfumes and he has a large number of bottles of the same size of each variety in his stock. There are 5 places in a row in his showcase. The number of different ways of displaying the three varieties of perfumes in the showcase is
- a. 6
 b. 50
 c. 150
 d. None of the above
45. There are 3 letters and 3 envelopes. The number of ways in which all letters are put in the wrong envelopes, is
- a. 4 b. 2 c. 6 d. 8

BITSAT Archives

1. A student is allowed to select atmost n books from a collection of $(2n+1)$ books. If the number of ways in which he can do this, is 64, then the value of n is [2014]
- a. 6 b. n c. 3 d. None
2. There are 10 points in a plane, out of these 6 are collinear. If n is the number of triangles formed by joining these points, then [2013]
- a. $n \leq 100$ b. $100 < n < 140$
 c. $140 < n \leq 190$ d. $n > 190$
3. $\frac{{}^8C_0}{6} - {}^8C_1 + {}^8C_2 \cdot 6 - {}^8C_3 \cdot 6^2 + {}^8C_4 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^7$ is equal to [2013]
- a. 0 b. 6^7 c. 6^8 d. $\frac{5^8}{6}$
4. The number of ways in which four boys can be seated around a round table in four chairs of different colours, is [2012]
- a. 24 b. 12 c. 23 d. 64
5. The number of ways in which a team of 11 players can be selected from 22 players including 2 of them and excluding 4 of them, is [2012]
- a. ${}^{16}C_{11}$ b. ${}^{16}C_5$ c. ${}^{16}C_9$ d. ${}^{20}C_8$
6. In a cricket championship, there are 36 matches. The number of teams, if each plays 1 match with other are [2009]
- a. 9 b. 10
 c. 8 d. 12
7. ${}^{n-2}C_r + 2{}^{n-2}C_{r-1} + {}^{n-2}C_{r-2}$ equals [2009]
- a. ${}^{n+1}C_r$ b. nC_r c. ${}^nC_{r+1}$ d. ${}^{n-1}C_r$
8. 9 balls are to be placed in 9 boxes and 5 of the balls cannot fit into 3 small boxes. The number of ways of arranging one ball in each of the boxes is [2008]
- a. 18720 b. 18270 c. 17280 d. 12780
9. If ${}^nP_r = 30240$ and ${}^nC_r = 252$, then the ordered pair (n, r) is equal to [2008]
- a. (12, 6) b. (10, 5) c. (9, 4) d. (16, 7)
10. In how many ways can 5 boys and 5 girls sit in a circle so that no two boys sit together? [2007]
- a. $5! \times 5!$ b. $4! \times 5!$ c. $\frac{5! \times 5!}{2}$ d. None
11. Six X's have to be placed in the square of the figure such that each row contains atleast one X. In how many different ways can this be done? [2007]

- a. 27 b. 28 c. 26 d. 35
12. If ${}^nC_{12} = {}^nC_6$, then nC_2 is equal to [2006]
- a. 72 b. 153 c. 306 d. 2556
13. Total number of books is $2n+1$. One is allowed to select a minimum of the one book and a maximum of n books. If total number of selections is 63, then the value of n is [2005]
- a. 3 b. 6
 c. 2 d. None of these

Answer with Solutions

Practice Exercise

1. (d) Making a 3-digit number is equivalent to filling 3 places.

Places 1 2 3

Number of choices 5 4 3

Number of ways of filling all the three places

$$= 5 \times 4 \times 3 = 60$$

Hence, the total possible 3-digit numbers are 60.

2. (d) The student has 10 choices from the morning courses, out of which he can select one course in 10 ways.

For the evening course, he has 7 choices out of which he can select one course in 7 ways.

$\therefore$ Total number of ways = $10 + 7 = 17$

3. (b) There are 6 letters in the word BHARAT, 2 of them are identical.

Hence, total number of words with these letters

$$= \frac{6!}{2!} = 360$$

Also, the number of words in which B and H come together = $\frac{5! \cdot 2!}{2!} = 120$

$$\therefore \text{Required number of words} = 360 - 120 = 240$$

4. (a) $\therefore$ The consonants in their positions can be arranged in

$$\frac{4!}{2!} = 12 \text{ ways}$$

and the vowels in their positions can be arranged in

$$\frac{3!}{2!} = 3 \text{ ways}$$

$\therefore$ Total number of arrangements = $12 \times 3 = 36$

5. (b) The sum of the digits in unit place of all the numbers formed

$$= 3!(3 + 4 + 5 + 6) = 6 \times 18 = 108$$

6. (c) Here, we have 1 M, 4 I, 4 S and 2 P.

Therefore, total number of selections of one or more letters

$$= (1+1)(4+1)(4+1)(2+1) - 1 = 149$$

7. (a) $\therefore \frac{{}^nP_{r-1}}{a} = \frac{{}^nP_r}{b} = \frac{{}^nP_{r+1}}{c}$

From first two terms, $\frac{b}{a} = n - r + 1$

From last two terms, $\frac{c}{b} = n - r$

Hence, $\frac{b}{a} = \frac{c}{b} + 1 \Rightarrow b^2 = a(b + c)$

8. (d) Here, m men can be seated in $m!$ ways and n women can be seated in the $m+1$ gaps between the m men in ${}^{m+1}P_n$ ways.

$$\therefore \text{Number of ways} = m! \cdot {}^{(m+1)}P_n = \frac{m!(m+1)!}{(m-n+1)!}$$

9. (b) Number of words beginning with E = ${}^4P_4 = 24$

Number of words beginning with QE = ${}^3P_3 = 6$

Number of words beginning with QS = 6

Number of words beginning with QT = 6

So, the next word is 'QUEST'.

$$\therefore \text{Rank} = 24 + 6 + 6 + 6 + 1 = 43$$

10. (c) Since, 2 women can choose the seats from 1 to 4 in ${}^4P_2 = 12$ ways and 3 men can choose the remaining 6 seats in ${}^6P_3 = 120$ ways.

$$\therefore \text{Required number} = 12 \times 120 = 1440$$

11. (d) Here, 7 boys can be arranged in row in $7!$ ways. There will be 6 gaps between them and one place before them and one place after them. The 3 girls can be arranged in a row in ${}^8P_3 = 8 \cdot 7 \cdot 6$ ways

$$\therefore \text{Number of ways} = 7! \times 8 \cdot 7 \cdot 6 = 42 \cdot 8!$$

12. (a) The required numbers are of four digits whose left most digit can be 1, 2, 3.

Thus the left most place can be filled in 3 ways.

Since, repetition of digits is allowed, then each of the remaining place can be filled in 5 ways.

Number of ways of filling of the remaining positions

$$= 5 \times 5 \times 5 = 125$$

$\therefore$ Total number of required numbers

$$= 3 \times 125 = 375$$

13. (a) In the word MATHEMATICS, there are 11 letters out of which 2M's, 2A's, 2T's, 1H, 1E, 1C and 1S.

If we feed T at there starting and end the remaining.

T										T
---	--	--	--	--	--	--	--	--	--	---

A letter, out of which (2A's, 2T's) can be arranged by

$$\frac{9!}{2!2!} = \frac{9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{4} = 90720$$

14. (c) When we arrange one thing at a time, then the number of possible permutations is n . When we arrange them two at a time, the number of possible permutations are $n \times n = n^2$ and so on.

Thus, the total number of permutations are

$$n + n^2 + \dots + n^r = \frac{n(n^r - 1)}{n - 1} \quad [\because n > 1]$$

15. (c) By theory, let us consider 3 beads as one. Hence, we have 21 beads, i.e. $n = 21$.

The number of arrangements = $(n-1)! = (21-1)! = 20!$

Also, the number of ways in which 3 beads can be arranged between themselves is $3! = 3 \times 2 \times 1 = 6$.

$$\text{Thus, the total number of arrangements} = \frac{20! \cdot 3!}{2}$$

16. (d) $x = 6! \times 6! + 6! \times 6! = 2(6!)^2$

$$\begin{aligned} y &= 5! \times 6! \\ \therefore \frac{x}{y} &= 2 \times 6 \Rightarrow x = 12y \end{aligned}$$

17. (c) ${}^nC_r + 2{}^nC_{r-1} + {}^nC_{r-2} = {}^nC_r + {}^nC_{r-1} + {}^nC_{r-1} + {}^nC_{r-2}$
 $= {}^{n+1}C_r + {}^{n+1}C_{r-1} = {}^{n+2}C_r$

18. (c) Given, ${}^nC_{r-1} = 36$, ${}^nC_r = 84$, ${}^nC_{r+1} = 126$

$$\Rightarrow \frac{n!}{(r-1)!(n-r+1)!} = 36 \quad \dots(i)$$

$$\Rightarrow \frac{n!}{r!(n-r)!} = 84 \quad \dots(ii)$$

$$\Rightarrow \frac{n!}{(r+1)!(n-r-1)!} = 126 \quad \dots(iii)$$

Dividing Eq. (ii) by Eq. (i), we get

$$\frac{(r-1)!(n-r+1)!}{r!(n-r)!} = \frac{84}{36}$$

$$\Rightarrow \frac{n-r+1}{r} = \frac{7}{3}$$

$$\Rightarrow 3n - 10r = -3 \quad \dots(iv)$$

Dividing Eq. (iii) by Eq. (ii), we get

$$\frac{r!(n-r)!}{(r+1)!(n-r-1)!} = \frac{126}{84} \Rightarrow \frac{n-r}{r+1} = \frac{3}{2}$$

$$\Rightarrow 2n - 5r = 3 \quad \dots(v)$$

Now, solving Eqs. (iv) and (v), we get $n = 9$, $r = 3$.

19. (a) **Hint** $({}^{47}C_4 + {}^{47}C_3) + {}^{48}C_3 + {}^{49}C_3 + {}^{50}C_3 + {}^{51}C_3$
 $= {}^{48}C_4 + {}^{48}C_3 + {}^{49}C_3 + {}^{50}C_3 + {}^{51}C_3$

20. (b) There are two cases arises.

Case I Choose six from Class XI and five from class XII
 $\therefore$ Number of ways $= {}^{20}C_6 \times {}^{20}C_5$

Case II Choose five from Class XI and six from Class XII
 $\therefore$ Number of ways $= {}^{20}C_5 \times {}^{20}C_6$

$\therefore$ Required number of ways $= 2({}^{20}C_5 \times {}^{20}C_6)$

21. (b) We have, M, IIII, SSSS, PP

Number of ways of selecting 4 different letters $= {}^4C_4 = 1$

Number of ways of selecting 2 alike letters $= {}^3C_2 = 3$

Number of ways of selecting 3 alike and 1 different letter
 $= {}^2C_1 \times {}^3C_1 = 6$

Number of ways of selecting 4 alike letters $= {}^2C_1 = 2$

Number of ways of selecting 2 alike and 2 different letters
 $= {}^3C_1 \times {}^3C_2 = 9$

$\therefore$ Total number of ways $= 1 + 3 + 6 + 2 + 9 = 21$

22. (d) Since, the voter can cast one or two or three votes.

So, total number of ways in which he can cast his vote
 $= {}^5C_1 + {}^5C_2 + {}^5C_3 = 5 + 10 + 10 = 25$

23. (c) Required number of ways

$$\begin{aligned} &= {}^4C_1 \times {}^8C_5 + {}^4C_2 \times {}^8C_4 + {}^4C_3 \times {}^8C_3 + {}^4C_4 \times {}^8C_2 \\ &= 4 \times 56 + 6 \times 70 + 4 \times 56 + 1 \times 28 = 896 \end{aligned}$$

24. (c) As there are three letters alike, out of six letters and the three others are different.

Selection can be done in the following manner:

(i) All different $= {}^4C_1 = 1$

(ii) 2 alike, 2 different $= {}^1C_1 \cdot {}^3C_2 = 3$

(iii) 3 alike and 1 different $= {}^1C_1 \cdot {}^3C_1 = 3$

Therefore,

total number of ways $= 1 + 3 + 3 = 7$

25. (d) Required number of points

$$= {}^8C_2 \times 1 + {}^4C_2 \times 2 + ({}^8C_1 \times {}^4C_1) \times 2$$

$$= 28 + 12 + 32 \times 2 = 104$$

26. (b) First stall can be filled in 3 ways, second stall can be filled in 3 ways and so on.

$\therefore$ Number of ways of loading steamer

$$= {}^3C_1 \times {}^3C_1 \times \dots \times {}^3C_1 \text{ (12 times)}$$

$$= 3 \times 3 \times \dots \times 3 \text{ (12 times)} = 3^{12}$$

27. (b) Since the candidate is unsuccessful, if he fails in 9 or 8 or 7 or 6 or 5 papers.

$\therefore$ Numbers of ways to be unsuccessful

$$= {}^9C_9 + {}^9C_8 + {}^9C_7 + {}^9C_6 + {}^9C_5$$

$$= {}^9C_0 + {}^9C_1 + {}^9C_2 + {}^9C_3 + {}^9C_4$$

$$= \frac{1}{2} ({}^9C_0 + {}^9C_1 + \dots + {}^9C_9)$$

$$= \frac{1}{2} (2^9) = 2^8 = 256$$

28. (d) The number of ways of drawing 1 black and 2 non-black balls

$$= {}^3C_1 \cdot {}^6C_2 = 3 \cdot 15 = 45$$

The number of ways of drawing 2 black and 1 non-black ball

$$= {}^3C_2 \cdot {}^6C_1 = 3 \cdot 6 = 18$$

The number of ways of drawing 3 black balls is ${}^3C_3 = 1$

$\therefore$ Number of ways $= 45 + 18 + 1 = 64$

29. (b) Let the men be $M_1, M_2, \dots, M_{10}$ and women be $W_1, W_2, \dots, W_7$.

Let W_1 and W_2 do not want to be in the same group.

The six members group can contain 4 men and 2 women or 3 men and 3 women.

The number of ways of forming 4M, 2W group

$$= {}^{10}C_4 ({}^5C_2 + 2 {}^5C_1) = 4200$$

where, 5C_2 is the number of ways without W_1 and W_2 and

5C_1 is the number of ways with W_1 and without W_2 or with W_2 and without W_1 .

The number of ways of forming 3M, 3W group

$$= {}^{10}C_3 ({}^5C_3 + 2 {}^5C_2) = 3600$$

where, 5C_3 is the number of ways without W_1 and W_2 and

5C_2 is the number of ways with W_1 or W_2 but not both.

$\therefore$ Number of ways $= 4200 + 3600$
 $= 7800$

30. (c) Total number of ways
 = (Attempt 3 from group I and 4 from group II)
 + (Attempt 4 from group I and 3 from group II)
 + (Attempt 5 from group I and 2 from group II)
 + (Attempt 2 from group I and 5 from group II)
 $= {}^6C_3 \times {}^6C_4 + {}^6C_4 \times {}^6C_3 + {}^6C_5 \times {}^6C_2 + {}^6C_2 \times {}^6C_5$
 $= 2({}^6C_3 \times {}^6C_4) + 2({}^6C_5 \times {}^6C_2)$
 $= 2(20 \times 15) + 2(6 \times 15) = 600 + 180 = 780$

31. (b) Ladies = 2, old men = 2, young men = 4

Case I 1 lady, 1 old man, 2 young men
 $= {}^2C_2 \cdot {}^2C_1 \cdot {}^4C_2 = 2 \cdot 2 \cdot 6 = 24$

Case II 2 ladies, 1 old man, 1 young man
 $= {}^2C_2 \cdot {}^2C_1 \cdot {}^4C_1 = 1 \cdot 2 \cdot 4 = 8$

Case III 1 lady, 2 old men, 1 young man
 $= {}^2C_1 \cdot {}^2C_2 \cdot {}^4C_1 = 2 \cdot 1 \cdot 4 = 8$

Case IV 2 ladies, 2 old men, 0 young man
 $= {}^2C_2 \cdot {}^2C_1 \cdot {}^4C_0 = 1 \cdot 1 \cdot 1 = 1$

$\therefore$ Required number of ways = $24 + 8 + 8 + 1 = 41$

32. (b) $\therefore 1350 = 2 \times 3^3 \times 5^2$
 $\therefore$ Number of divisors = $(1+1)(3+1)(2+1) = 24$
 and sum of divisors = $(1+2)(1+3+3^2+3^3)(1+5+5^2)$
 $= 3720$

33. (c) Any number between 1 to 999 is of the form abc when $0 \leq a, b, c \leq 9$. Let us first count the number in which 5 occurs exactly once.

Since 5 can occur at one place in $1 \times {}^3C_1 \times 9 \times 9 = 243$ ways, next 5 can occur in exactly two places in ${}^3C_2 \times 9 = 27$. Lastly, 5 can occur in all three digits in only one way.

Hence, the number of times 5 occurs

$$= 1 \times 243 + 27 \times 2 + 1 \times 3 \\ = 243 + 54 + 3 = 300$$

34. (b) The number of students answering exactly i ($1 \leq i \leq n-1$) questions wrongly is $2^{n-i} - 2^{n-i-1}$.

The number of students answering all n questions wrongly is 2^0 .

Hence, the total number of wrong answers

$$= \sum_{i=1}^{n-1} i(2^{n-i} - 2^{n-i-1}) + n(2^0) = 2047$$

$$\Rightarrow 2^{n-1} + 2^{n-2} + 2^{n-3} + \dots + 2^0 = 2047$$

$$\Rightarrow 2^n - 1 = 2047 \Rightarrow 2^n = 2048 \Rightarrow 2^n = 2^{11} \Rightarrow n = 11$$

35. (c) Required number of ways
 $= {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4$
 $= 10 + 45 + 120 + 210 = 385$

36. (d) Given, word = SACHIN
 Number of words start with A = $5!$
 Number of words start with C = $5!$

Number of words start with H = $5!$

Number of words start with I = $5!$

Number of words start with N = $5!$

Total number of words

$$= 5! + 5! + 5! + 5! + 5! = 5(5!) = 600$$

Now, add the rank of SACHIN.

$\therefore$ Required rank of SACHIN = $600 + 1 = 601$

37. (a) $\therefore$ Number of letters = 6

Number of vowels = 2 namely A, E

These alphabets can arrange themselves by $2!$ ways.

$$\therefore \text{Number of words} = \frac{6!}{2!} = 360$$

38. (b) Since, 3 men and 2 women equal to 5 and a group of 5 members make $5!$ permutations with each other.

$\therefore$ Number of ways to sit 5 members = $5!$

6 places are filled by 5 members by 6C_5 ways.

$\therefore$ Total number of ways to sit 5 members on 6 seats of a bus = ${}^6C_5 \times 5!$

39. (b) Here, 4 guests G_1, G_2, G_3, G_4 can be seated on a particular side in 4P_4 ways.

Also, 3 guests G_5, G_6, G_7 can be seated on the opposite side in 3P_3 ways.

The other 11 guests can be seated in the remaining 11 seats in $11!$ ways.

$\therefore$ Number of sitting arrangements = ${}^4P_4 \cdot {}^3P_3 \cdot 11!$

$$= \frac{(9!)^2 \cdot 11!}{5! \cdot 6!} = {}^{11}C_5 (9!)^2$$

40. (a) Make a group of both M's and another of T's. Then, except A's, we have S letters remaining. So 'M's, T's and the letters except A's can be arranged in $7!$ ways.

$\therefore$ Total number of arrangements = $7! \times {}^8C_2$

41. (c) A triangle can be constructed in two ways:

(i) By taking two points on AB and one point on AC .

(ii) By taking two points on AC and one point on AB .

If point A is included, then total number of triangles

$$= {}^{m+1}C_2 \times {}^nC_1 + {}^mC_1 \times {}^nC_2 = \frac{mn}{2}(m+n)$$

42. (c) Required number is the coefficient of x^{15} in the product $(1+x+x^2+\dots+x^5)(1+x+x^2+\dots+x^{10})(1+x+x^2+\dots+x^{15})$

$$= (1-x^6)(1-x^{11})(1-x^{16})(1-x)^{-3}$$

$$= (1-x^6-x^{11}+\dots) \left(1 + \binom{3}{1}x + \binom{4}{2}x^2 + \dots \right)$$

$$\text{which is } \binom{17}{15} - \binom{11}{9} - \binom{6}{4} = \binom{17}{2} - \binom{11}{2} - \binom{6}{2} \\ = 136 - 55 - 15 = 66$$

43. (b) Identical bananas may be divided among 4 persons in ${}^{20+4-1}C_{4-1} = {}^{23}C_3 = 1771$ ways

If each person is to be given atleast one banana, then number of ways will be ${}^{20-1}C_{4-1} = {}^{19}C_3 = 969$ ways

Possibilities	Selections	Arrangements
One triplet, two different	${}^3C_1 \times {}^2C_2 = 3$	$3 \times \frac{5!}{3!} = 60$
Two pairs, one different	${}^3C_2 \times {}^1C_1 = 3$	$3 \times \frac{5!}{2! \times 3!} = 90$

BITSAT Archives

1. (c) **Hint** Number of ways

$$= {}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \dots + {}^{2n+1}C_n$$

$$= \frac{1}{2}(2^{2n+1}) = 2^{2n}$$

2. (a) **Case I** Taking 2 points from collinear points and one from non-collinear.

i.e. Number of triangles so formed = ${}^6C_2 \times {}^4C_1$

$$= \frac{6 \cdot 5}{1 \cdot 2} \times \frac{4}{1} = 60$$

Case II Taking 1 point from collinear and two from non-collinear points.

i.e. Number of triangles so formed = ${}^6C_1 \times {}^4C_2$

$$= \frac{6}{1} \times \frac{4 \cdot 3}{1 \cdot 2} = 36$$

Case III All the three points from non-collinear points.

i.e. Number of triangles so formed

$$= {}^4C_3 = {}^4C_1 = \frac{4}{1} = 4$$

$\therefore$ Total number of triangles = $60 + 36 + 4 = 100$

3. (d) $\frac{{}^8C_0}{6} - {}^8C_1 + {}^8C_2 \cdot 6 - {}^8C_3 \cdot 6^2 + {}^8C_4 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^7$
- $$= \frac{1}{6} [{}^8C_0 - {}^8C_1 \cdot 6^1 + {}^8C_2 \cdot 6^2 - {}^8C_3 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^8]$$
- $$= \frac{1}{6} [1 - 6]^8 = \frac{1}{6} \times (-5)^8 = \frac{5^8}{6}$$

4. (a) Required number of ways = $4! = 24$

5. (c) Required number of ways
- $$= {}^{22-4-2}C_{11-2} = {}^{16}C_9$$

6. (a) **Hint** ${}^nC_2 = 36$

7. (b) ${}^{n-2}C_r + 2 {}^{n-2}C_{r-1} + {}^{n-2}C_{r-2}$
- $$= ({}^{n-2}C_r + {}^{n-2}C_{r-1}) + ({}^{n-2}C_{r-1} + {}^{n-2}C_{r-2})$$
- $$= {}^{n-1}C_r + {}^{n-1}C_{r-1} = {}^nC_r \quad [\because {}^nC_{r-1} + {}^nC_r = {}^{n+1}C_r]$$

8. (c) Required number of arrangements
- $$= {}^6P_5 \times 4! = 720 \times 24 = 17280$$

Hence, the required number of ways

$$= 60 + 90 = 150$$

45. (b) The required number of ways

$$= 3! \left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} \right]$$

$$= 3! \left(\frac{2}{6} \right)$$

$$= 3 \times 2 \times \frac{1}{3} = 2$$

9. (b) Given that, ${}^nP_r = 30240$ and ${}^nC_r = 252$

$$\Rightarrow \frac{n!}{(n-r)!} = 30240 \text{ and } \frac{n!}{(n-r)!r!} = 252$$

$$\Rightarrow r! = \frac{30240}{252} = 120 \Rightarrow r = 5 \therefore \frac{n!}{(n-5)!} = 30240$$

$$\Rightarrow n(n-1)(n-2)(n-3)(n-4) = 30240$$

$$\Rightarrow n(n-1)(n-2)(n-3)(n-4)$$

$$= 10(10-1)(10-2)(10-3)(10-4)$$

$$\Rightarrow n = 10$$

Hence, required ordered pair is (10, 5).

10. (b) First, we fix the alternate position of the girls. Five girls can be seated around the circle in $(5-1)! = 4!$. 5 boys can be seated in five vacant places by 5!.

$\therefore$ Required number of ways = $4! \times 5!$

11. (c) In all, we have 8 squares in which six X have to be placed and it can be done in ${}^8C_6 = 28$ ways. But this includes the possibility that either the top or horizontal row does not have any X.

Since we want each row must have atleast one X, these two possibilities are to be excluded.

Hence, required number of ways = $28 - 2 = 26$

12. (b) Given, ${}^nC_{12} = {}^nC_6$ or ${}^nC_{n-12} = {}^nC_6$

$$\Rightarrow n - 12 = 6 \Rightarrow n = 18$$

$$\therefore {}^nC_2 = {}^{18}C_2 = \frac{18 \times 17}{2 \times 1} = 153$$

13. (a) Since, $(1+x)^{2n+1} = C_0 + C_1x + \dots + C_nx^n + C_{n+1}x^{n+1} + \dots + x^{2n+1}C_n$
- $$= 2(C_0 + C_1 + \dots + C_nx^n)$$

Put $x = 1$

$$(1+1)^{2n-1} = 2(C_0 + C_1 + \dots + C_n)$$

$$\Rightarrow 2^{2n} = (C_0 + C_1 + \dots + C_n)$$

$$\Rightarrow 2^{2n} - 1 = C_1 + C_2 + \dots + C_n \Rightarrow 2^{2n} - 1 = 63$$

$$\Rightarrow 2^{2n} = 64 \Rightarrow 2^{2n} = 2^6 \Rightarrow 2n = 6 \Rightarrow n = 3$$

Binomial Theorem and Mathematical Induction

Introduction

An expression having two terms connected by either + or – sign, is called a **binomial expression**. e.g. $x + y$, $\left(\frac{1}{x} - \frac{1}{x^3}\right)$, $\left(7x - \frac{3}{4y}\right)$, etc., are all binomial expressions. Similarly, a ‘trinomial expression’ has three terms. In general, multinomial expression has more than two terms.

Binomial Theorem

The expansion of a binomial expression raised to the power of n , where n can be positive, negative or a fraction, is called binomial theorem.

Binomial Theorem for Positive Index

If n is any positive integer, then $(x + a)^n = {}^nC_0x^n + {}^nC_1x^{n-1}a + \dots + {}^nC_na^n = \sum_{r=0}^n {}^nC_r x^{n-r} a^r$, where x and a are real (complex) numbers.

- (i) In the expansion of $(x + a)^n$, it contains $(n + 1)$ terms.
- (ii) In the expansion of $(x + a)^n$, the sum of the powers of x and a in each term is equal to n .
- (iii) The coefficient of terms equidistant from the beginning and the end are equal.
- (iv) The values of the binomial coefficients steadily increase to maximum and then steadily decrease.
- (v) $(x - a)^n = {}^nC_0x^n - {}^nC_1x^{n-1}a + \dots + (-1)^n {}^nC_na^n$
- (vi) $(1 + x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + \dots + {}^nC_nx^n$

(vii) If n is a positive integer, then the number of terms in $(x + y + z)^n$ is $\frac{(n+1)(n+2)}{2}$.

(viii) The number of terms in the expansion of $(x + a)^n + (x - a)^n = \begin{cases} \frac{n+2}{2}, & \text{if } n \text{ is even} \\ \frac{n+1}{2}, & \text{if } n \text{ is odd} \end{cases}$

(ix) The number of terms in the expansion of $(x + a)^n - (x - a)^n = \begin{cases} \frac{n}{2}, & \text{if } n \text{ is even} \\ \frac{n+1}{2}, & \text{if } n \text{ is odd} \end{cases}$

(x) Binomial coefficient ${}^nC_r = \frac{n!}{r!(n-r)!}$ for $0 \leq r \leq n$

So, ${}^nC_0 = 1$,

$${}^nC_1 = n, {}^nC_2 = \frac{n(n-1)}{2!},$$

$${}^nC_3 = \frac{n(n-1)(n-2)}{3!}$$

$${}^nC_n = 1$$

(xi) The coefficients in the expansion follow a certain pattern known as Pascal's triangle.

Pascal's Triangle

From the Pascal's triangle, it is clear that each coefficient of any row is obtained by adding two coefficients of preceding row, one on the immediate left and other on the immediate right and each row has 1 on both extreme sides.

Index of binomial	Coefficients of all terms
0	1
1	1 1
2	1 2 1
3	1 3 3 1
4	1 4 6 4 1
5	1 5 10 10 5 1

General Term in a Binomial Expansion

Let $(r+1)$ th term be the general term in the expansion of $(x + a)^n$.

Then, $T_{r+1} = {}^nC_r x^{n-r} a^r$

If expansion is $(x - a)^n$, then the general term is

$$(-1)^r \cdot {}^nC_r x^{n-r} a^r$$

Middle Term in a Binomial Expansion

The middle term in the expansion of $(a + x)^n$ is as follows :

Case I If n is even, then $\left(\frac{n}{2} + 1\right)$ th term is the middle term.

Case II If n is odd, then $\frac{(n+1)}{2}$ th term and $\frac{(n+3)}{2}$ th term are the middle terms.

r th Term from the End in the Binomial Expansion

In the binomial expansion of $(x + a)^n$, r th term from the end is $(n+1-r+1)$ i.e. $(n-r+2)$ th term.

Method for Finding the Independent Term

Write down general term in the expansion of $(x + a)^n$.

i.e. $T_{r+1} = {}^nC_r x^{n-r} a^r$... (i)

For making a term independent of x , we put $r = n$ in Eq. (i).

So, we get ${}^nC_n a^n$, which is independent of x .

For making a term independent of a , we put $r = 0$ in Eq. (i).

So, we get ${}^nC_0 x^n$, which is independent of a .

NOTE An independent term is also known as constant term.

Greatest Term

If T_r and T_{r+1} are the r th and $(r+1)$ th terms in the expansion of $(1 + x)^n$, then

$$\frac{T_{r+1}}{T_r} = \frac{{}^nC_r x^r}{{}^nC_{r-1} x^{r-1}} = \frac{n-r+1}{r} x$$

Let numerically, T_{r+1} be the greatest term in the above expansion. Then,

$$T_{r+1} \geq T_r \quad \text{or} \quad \frac{T_{r+1}}{T_r} \geq 1$$

$$\therefore \frac{n-r+1}{r} |x| \geq 1 \quad \text{or} \quad r \leq \frac{(n+1)}{(1+|x|)} |x| \quad \dots (i)$$

Now, substituting the values of n and x in Eq. (i), we get $r \leq m + f$ or $r \leq m$, where m is a positive integer and f is a fraction such that $0 < f < 1$.

When n is even, then T_{m+1} is the greatest term and when n is odd, then T_m and T_{m+1} are the greatest terms and both are equal.

Greatest Coefficients in the Expansion of $(x + a)^n$

(i) If n is even, nC_r is greatest when $r = \frac{n}{2}$ i.e. greatest coefficient is ${}^nC_{n/2}$.

(ii) If n is odd, nC_r is greatest when $r = \frac{n-1}{2}$ or $r = \frac{n+1}{2}$ i.e. greatest coefficients are ${}^nC_{\frac{n-1}{2}}$ and ${}^nC_{\frac{n+1}{2}}$.

Properties of Binomial Coefficients

In the binomial expansion of $(1+x)^n$,

$(1+x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + \dots + {}^nC_rx^r + \dots + {}^nC_nx^n$, where ${}^nC_0, {}^nC_1, \dots, {}^nC_n$ are the coefficients of various powers of x , are called **binomial coefficient** and it is also written as

$$C_0, C_1, \dots, C_n \text{ or } \binom{n}{0} + \binom{n}{1} + \dots + \binom{n}{n}.$$

$$(i) {}^nC_r = {}^nC_s \Rightarrow r = s \text{ or } r + s = n \Rightarrow {}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r$$

$$(ii) {}^{n+1}C_{r+1} = \frac{n+1}{r+1} {}^nC_r \quad (iii) \frac{{}^nC_r}{{}^nC_{r-1}} = \frac{n-r+1}{r}$$

$$(iv) C_0 + C_1 + C_2 + \dots + C_n = 2^n$$

$$(v) C_0 + C_2 + C_4 + \dots = C_1 + C_3 + C_5 + \dots = 2^{n-1}$$

$$(vi) C_0 - C_1 + C_2 - C_3 + \dots + (-1)^n \cdot C_n = 0$$

$$(vii) C_0^2 + C_1^2 + C_2^2 + \dots + C_n^2 = {}^{2n}C_n = \frac{(2n)!}{(n!)^2}$$

$$(viii) C_0C_r + C_1C_{r+1} + \dots + C_{n-r}C_n = {}^{2n}C_{n-r} = \frac{(2n)!}{(n-r)!(n+r)!}$$

$$(ix) C_1 - 2C_2 + 3C_3 - \dots = 0$$

$$(x) C_0 + 2C_1 + 3C_2 + \dots + (n+1) \cdot C_n = (n+2)2^{n-1}$$

$$(xi) C_0 + \frac{C_1}{2}x + \frac{C_2}{3}x^2 + \frac{C_3}{4}x^3 + \dots + \frac{C_n}{n+1} \cdot x^n = \frac{(1+x)^{n+1} - 1}{(n+1)n}$$

$$(xii) C_0 - C_2 + C_4 - C_6 + \dots = (\sqrt{2})^n \cos \frac{n\pi}{4}$$

$$(xiii) C_1 - C_3 + C_5 - C_7 + \dots = (\sqrt{2})^n \sin \frac{n\pi}{4}$$

Applications of Binomial Theorem

(i) R - f Factor Relation

Here, we are going to discuss problems involving

$$(\sqrt{A} + B)^n = l + f$$

where, l and n are positive integers.

$$0 \leq f \leq 1, |A - B^2| = k \text{ and } |\sqrt{A} - B| < 1$$

(ii) Divisibility Problem

In the expansion of $(1+\alpha)^n = 1 + {}^nC_1\alpha + {}^nC_2\alpha^2 + \dots + {}^nC_n\alpha^n$, we can conclude that $(1+\alpha)^n - 1 = {}^nC_1\alpha + {}^nC_2\alpha^2 + \dots + {}^nC_n\alpha^n$ is divisible by α i.e. it is a multiple of α .

Binomial Theorem for Negative/Rational Index

Let n be a rational number and x be a real number such that $|x| < 1$, then

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots$$

e.g. The expansion of $(x+a)^n = a^n \left(1 + \frac{x}{a}\right)^n$

$$= a^n \left\{ 1 + n\left(\frac{x}{a}\right) + \frac{n(n-1)}{2!}\left(\frac{x}{a}\right)^2 + \dots \right\}$$

The above expansion is valid only, when $\left|\frac{x}{a}\right| < 1$.

This expansion is infinite. It terminates after $(n+1)$ terms, if n is +ve integer, otherwise it goes to infinity.

General Term in the Expansion of $(1+x)^n$

General term in the expansion of $(1+x)^n$ is

$$T_{r+1} = \frac{[n(n-1)(n-2)\dots\{n-(r-1)\}]}{r!} x^r$$

Important Expansions and Results

$$(i) (1+x)^n = {}^nC_0x^0 + {}^nC_1x + {}^nC_2x^2 + \dots + {}^nC_rx^r + \dots + {}^nC_{n-1}x^{n-1} + {}^nC_nx^n$$

$$= \sum_{r=0}^n {}^nC_rx^r$$

$$(ii) (1-x)^n = {}^nC_0 x^0 - {}^nC_1 x + {}^nC_2 x^2 - \dots + {}^nC_{n-1} (-1)^{n-1} x^{n-1} + {}^nC_n (-1)^n x^n$$

$$= \sum_{r=0}^n (-1)^r \cdot {}^nC_r x^r$$

$$(iii) (x+a)^n = {}^nC_0 x^n + {}^nC_1 x^{n-1} a + {}^nC_2 x^{n-2} a^2 + \dots + {}^nC_r x^{n-r} a^r + \dots + {}^nC_n x^0 a^n$$

$$(iv) (a+x)^n = {}^nC_0 a^n x^0 + {}^nC_1 a^{n-1} x + {}^nC_2 a^{n-2} x^2 + \dots + {}^nC_r a^{n-r} \cdot x^r + \dots + {}^nC_n x^n$$

$$= \sum_{r=0}^n {}^nC_r a^{n-r} \cdot x^r$$

$$(v) (a-x)^n = {}^nC_0 a^n x^0 - {}^nC_1 a^{n-1} x + {}^nC_2 a^{n-2} x^2 - \dots + (-1)^r {}^nC_r a^{n-r} x^r + \dots + (-1)^n {}^nC_n a^{n-n} x^n$$

$$= \sum_{r=0}^n (-1)^r \cdot {}^nC_r a^{n-r} x^r$$

$$(vi) (a+x)^n + (a-x)^n = 2({}^nC_0 a^n x^0 + {}^nC_2 a^{n-2} x^2 + \dots)$$

$$= 2(\text{Sum of the terms at odd places})$$

$$(vii) (a+x)^n - (a-x)^n = 2({}^nC_1 a^{n-1} x + {}^nC_3 a^{n-3} x^3 + \dots)$$

$$= 2(\text{Sum of the terms at even places})$$

$$(viii) (1+x)^{-1} = 1 - x + x^2 - x^3 \dots + (-1)^r x^r + \dots$$

$$(ix) (1-x)^{-1} = 1 + x + x^2 + x^3 \dots + x^r + \dots$$

$$(x) (1+x)^{-2} = 1 - 2x + 3x^2 - 4x^3 \dots + (-1)^r (r+1)x^r + \dots$$

$$(xi) (1-x)^{-2} = 1 + 2x + 3x^2 + 4x^3 \dots + (r+1)x^r + \dots$$

$$(xii) (1+x)^{-3} = 1 - 3x + 6x^2 - \dots + (-1)^r (r+1)(r+2)x^r + \dots$$

$$(xiii) (1-x)^{-3} = 1 + 3x + 6x^2 + \dots + (r+1)(r+2)x^r + \dots$$

$$(xiv) \text{ If the coefficients of } r\text{th, } (r+1)\text{th, } (r+2)\text{th terms of } (1+x)^n \text{ are in AP, then } n^2 - (4r+1)n + 4r^2 = 2.$$

Principle of Mathematical Induction

In an algebra, there are certain results that are formulated in terms of n , where n is a positive integer. Such results can be proved by specific techniques, which is known as the principle of mathematical induction.

First Principle of Mathematical Induction

It consists of the following three steps.

Step I Actual verification of the proposition for the starting value i .

Step II Assuming the proposition to be true for $k, k \geq i$ and proving that it is true for the value $(k+1)$, which is next higher integer.

Step III To combine the above two steps, let $p(n)$ be a statement involving the natural number n such that

(i) $p(1)$ is true i.e. $p(n)$ is true for $n = 1$.

(ii) $p(m+1)$ is true, whenever $p(m)$ is true i.e. $p(m)$ is true $\Rightarrow p(m+1)$ is true. Then, $p(n)$ is true for all natural numbers n .

Second Principle of Mathematical Induction

The second principle of mathematical induction consists of following steps:

Step I Actual verification of the proposition for the starting values of i and $(i+1)$.

Step II Assuming the proposition to be true for $k-1$ and k and then proving that it is true for the value $k+1; k \geq i+1$.

Step III To combine the above two steps, let $p(n)$ be a statement involving the natural number n such that

(i) $p(1)$ is true i.e. $p(n)$ is true for $n = 1$.

(ii) $p(m+1)$ is true, whenever $p(m)$ is true for all n , where $i \leq n \leq m$. Then, $p(n)$ is true for all natural numbers.

For $a \neq b$, the expression $a^n - b^n$ is divisible by

(a) $a+b$, if n is even.

(b) $a-b$, if n is odd or even.

Practice Exercise

- In the expansion of $\left(2^{1/3} + \frac{1}{3^{1/3}}\right)^n$, if the ratio of 7th term from the beginning to 7th term from the end is 1 : 6, then n is equal to
a. 7 b. 8 c. 9 d. 10
- In the expansion of $\left[\frac{1}{a} + a^{\log_{10} a}\right]^5$, if the value of the third term is 1000, then the value of a is
a. 10 b. 100 c. 1000 d. 99
- If $z = \left(\frac{\sqrt{3}}{2} + \frac{i}{2}\right)^5 + \left(\frac{\sqrt{3}}{2} - \frac{i}{2}\right)^5$, then
a. $\operatorname{Re}(z) = 0$ b. $\operatorname{Im}(z) = 0$
c. $\operatorname{Re}(z) > 0, \operatorname{Im}(z) > 0$ d. $\operatorname{Re}(z) > 0, \operatorname{Im}(z) < 0$
- The expansion of $(x + \sqrt{x^3 - 1})^5 + (x - \sqrt{x^3 - 1})^5$ is a polynomial of degree
a. 5 b. 7 c. 9 d. 6
- The coefficient of x^4 in the expansion of $\left(\frac{x}{2} - \frac{3}{x^2}\right)^{10}$ is
a. $\frac{305}{256}$ b. $\frac{405}{256}$ c. $\frac{504}{256}$ d. 0
- The expression $7^{2n} + 2^{3n-3} \cdot 3^{n-1}$, where $n \in N$, is divisible by
a. 7 b. 25 c. 2 d. 5
- If 7th term in the binomial expansion of $\left(\frac{3}{\sqrt[3]{84}} + \sqrt{3} \ln x\right)^9$, $x > 0$ is equal to 729, then x can be
a. e^2 b. e c. $\frac{e}{2}$ d. $2e$
- If the coefficients of r th, $(r+1)$ th and $(r+2)$ th terms in the binomial expansion of $(1+y)^m$ are in AP, then m and r satisfy the equation
a. $m^2 - m(4r-1) + 4r^2 + 2 = 0$
b. $m^2 - m(4r+1) + 4r^2 - 2 = 0$
c. $m^2 - m(4r+1) + 4r^2 + 2 = 0$
d. $m^2 - m(4r-1) + 4r^2 - 2 = 0$
- Which of the following is middle term in the expansion of $(1+x)^{2n}$?
a. $\frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{n!} 2^n \cdot x^n$ b. $\frac{1 \cdot 2 \cdot 3 \cdot 4 \dots (n+1)}{(n+1)!}$
c. $\frac{1 \cdot 2 \cdot 3 \cdot 4 \dots n}{n!}$ d. None of these
- The middle term in the expansion of $\left(\frac{2}{3}x^2 - \frac{3}{2x}\right)^{20}$ is
a. ${}^{20}C_{10} x^{11}$ b. ${}^{20}C_9 x^{10}$ c. ${}^{20}C_{10} x^{10}$ d. ${}^{20}C_9 x^9$
- If the last term in $\left(\sqrt[3]{2} + \frac{1}{\sqrt{2}}\right)^n$ is $\left[\frac{1}{3(9)^{1/3}}\right]^{\log_3 8}$, then the fifth term is
a. 210 b. 310 c. 200 d. 300
- In the expansion of $(5^{1/6} + 2^{1/8})^{100}$, the number of irrational terms are
a. 93 b. 95 c. 97 d. 99
- The greatest term in the expansion of $\sqrt{3}\left(1 + \frac{1}{\sqrt{3}}\right)^{20}$ is
a. $\binom{20}{7} \frac{1}{27}$ b. $\binom{20}{6} \frac{1}{81}$ c. $\frac{1}{9} \binom{20}{9}$ d. $\binom{20}{8} \frac{1}{3}$
- The greatest term in the expansion of $(3+5x)^{15}$, when $x = \frac{1}{5}$, is
a. ${}^{15}C_3$ b. ${}^{15}C_4 \cdot 3^{11}$ c. ${}^{15}C_{10} \cdot 3^{10}$ d. ${}^{15}C_3 \cdot 3^{13}$
- The term independent of x in the expansion of $\left(3x - \frac{2}{x^2}\right)^{15}$ is
a. $-3003(3^{10})(2^5)$ b. $-3003(3^{10})(2^4)$
c. $3003(3^{10})(2^5)$ d. None of these
- If p is a real number and the middle term in the expansion of $\left(\frac{p}{2} + 2\right)^8$ is 1120, then the value of p is
a. ± 3 b. ± 1 c. ± 2 d. ± 4
- The constant term in the expansion of $\left(1+x+\frac{2}{x}\right)^6$ is
a. 479 b. 517 c. 569 d. 581
- If $(r+1)$ th term in the expansion of $\left(\sqrt[3]{\frac{a}{b}} + \sqrt{\frac{b}{a}}\right)^{21}$ has the same power of a and b , then the value of r is
a. 9 b. 10 c. 8 d. 6
- If the coefficients of x^7 and x^8 are equal in $\left(2 + \frac{x}{3}\right)^n$, then n is
a. 56 b. 55 c. 45 d. 15
- If the coefficient of three consecutive terms in the expansion of $(1+a)^n$ are in the ratio 1 : 7 : 42, then the value of n is
a. 51 b. 53 c. 55 d. 57

21. If the sum of all the coefficients in the expansion of $(1 - 3x + 10x^2)^n$ is α and the sum of all the coefficients in the expansion of $(1 + x^2)^n$ is β , then which of the following is correct?
 a. $\alpha = 3\beta$ b. $\alpha = \beta^3$ c. $\beta = \alpha^3$ d. $\alpha = 2\beta$
22. If $C_0, C_1, C_2, \dots, C_n$ denote the binomial coefficients in the expansion of $(1 + x)^n$, then $C_0^2 + 2C_1^2 + 3C_2^2 + \dots + (n + 1)C_n^2$ equals
 a. $(2n + 1)^{2n}C_n$ b. $(2n - 1)^{2n}C_n$
 c. $\left(\frac{n}{2} + 1\right)^{2n}C_n$ d. $\left(\frac{n}{2} + 1\right)^{2n-1}C_n$
23. If a_1, a_2, a_3 and a_4 are the coefficients of any four consecutive terms in the expansion of $(1 + x)^n$, then the value of $\frac{a_1}{a_1 + a_2} + \frac{a_3}{a_3 + a_4}$ is
 a. $\frac{2a_2}{a_2 + a_3}$ b. $\frac{2a_2}{a_3}$ c. $\frac{a_2}{a_2 + a_3}$ d. $\frac{a_3}{a_2}$
24. The ratio of the coefficient of x^{15} to the term independent of x in the expansion of $\left(x^2 + \frac{2}{x}\right)^{15}$, is
 a. 7 : 16 b. 7 : 64 c. 1 : 4 d. 1 : 32
25. The term independent of x in the expansion of $\left(\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{x-1}{x - x^{1/2}}\right)^{10}$ is
 a. 4 b. 120 c. 210 d. 310
26. The coefficient of x^7 in the expansion of $(1 - x - x^2 + x^3)^6$ is
 a. -132 b. -144 c. 132 d. 144
27. The value of ${}^{50}C_4 + \sum_{r=1}^6 {}^{56-r}C_3$ is
 a. ${}^{56}C_4$ b. ${}^{56}C_3$ c. ${}^{55}C_3$ d. ${}^{55}C_4$
28. If $\binom{n}{r+1} = 56$, $\binom{n}{r} = 28$ and $\binom{n}{r-1} = 8$, then $n + r$ is equal to
 a. 8 b. 10 c. 12 d. 9
29. If $(1 + x - 2x^2)^6 = 1 + a_1x + a_2x^2 + \dots + a_{12}x^{12}$, then the expression $a_2 + a_4 + \dots + a_{12}$ is equal to
 a. 32 b. 63 c. 64 d. 31
30. The least positive integer n such that $\binom{n-1}{3} + \binom{n-1}{4} > \binom{n}{3}$, is
 a. 6 b. 7 c. 8 d. 9
31. If $C_r = \binom{10}{r}$, then $\sum_{r=1}^{10} C_{r-1} C_r$ is equal to
 a. $\binom{20}{9}$ b. $\binom{20}{10}$ c. $\binom{20}{13}$ d. $\binom{20}{8}$
32. If $n \in N$, then $121^n - 25^n + 1900^n - (-4)^n$ is divisible by
 a. 1904 b. 2000 c. 2002 d. 2006
33. The remainder left out when $8^{2n} - (62)^{2n+1}$ is divided by 9, is
 a. 0 b. 2 c. 7 d. 8
34. If $x = (7 + 4\sqrt{3})^{2n} = [x] + f$, then the value of $x(1 - f)$ is
 a. 2^{2n} b. 3^{2n} c. 1^{2n} d. 4
35. The expression $n^3 + 3n^2 + 5n + 3$, $n \in N$, is divisible by
 a. 3 b. 4 c. 5 d. 6
36. The sum of the series ${}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - {}^{20}C_3 + \dots + {}^{20}C_{10}$ is
 a. $-{}^{20}C_{10}$ b. $\frac{1}{2} {}^{20}C_{10}$ c. 0 d. ${}^{20}C_{10}$
37. The number of terms in the expansion of $(a + b + c)^n$, where $n \in N$, is
 a. $\frac{(n+1)(n+2)}{2}$ b. $n + 1$
 c. $n + 2$ d. $(n + 1)n$
38. The value of $\sum_{r=0}^{n-1} \frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}}$ is
 a. $\frac{n}{2}$ b. $\frac{n+1}{2}$ c. $\frac{n-1}{2}$ d. $2n$
39. The sum of the rational terms in the binomial expansion of $(2^{1/2} + 3^{1/5})^{10}$ is
 a. 25 b. 32 c. 9 d. 41
40. If a and b are the coefficients of x^r and x^{n-r} , respectively in the expansion of $(1 + x)^n$, then
 a. $a = b$ b. $a + b = n^2$ c. $a = nb$ d. $a + b = 2^{n/2}$
41. If n is a positive integer, then $(\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n}$ is
 a. an irrational number
 b. an odd positive integer
 c. an even positive integer
 d. a rational number other than positive integers
42. Using principle of mathematical induction, the value of the series $\frac{1}{3 \cdot 7} + \frac{1}{7 \cdot 11} + \frac{1}{11 \cdot 14} + \dots + \frac{1}{(4n-1)(4n+3)}$ is
 a. $\frac{n}{3(4n+3)}$ b. $\frac{n}{5(5n+3)}$ c. $\frac{n}{3(7n+3)}$ d. 0
43. In the expansion of $\left(x^3 - \frac{1}{x^2}\right)^{15}$, the constant term is
 a. ${}^{15}C_9$ b. 0 c. ${}^{10}C_9$ d. $-{}^{15}C_9$
44. If $s_n = \sum_{r=0}^n \frac{1}{{}^nC_r}$ and $t_n = \sum_{r=0}^n \frac{r}{{}^nC_r}$, then $\frac{t_n}{s_n}$ is equal to
 a. $\frac{n}{2}$ b. $\frac{n}{2} - 1$ c. $n - 1$ d. $\frac{2n-1}{2}$
45. The number of terms in the expansion of $(1 + 5\sqrt{2}x)^{19} + (1 - 5\sqrt{2}x)^{19}$ is
 a. 10 b. 7 c. 13 d. 4

BITSAT Archives

1. $2^{3n} - 7n - 1$ is divisible by [2014]
a. 64 b. 36 c. 49 d. 25
2. If n is a positive integer, then $n^3 + 2n$ is divisible by [2014]
a. 2 b. 6 c. 15 d. 3
3. The sum of the coefficients in the expansion of $(5x - 4y)^n$, where n is a positive integer, is [2014]
a. 0 b. n c. 1 d. -1
4. If $a = \sum_{n=0}^{\infty} \frac{x^{3n}}{3n!}$, $b = \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!}$ and $c = \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$, then the value of $a^3 + b^3 + c^3 - 3abc$ is [2014]
a. 1 b. 0 c. -1 d. -2
5. $10^n + 3(4^{n+2}) + 5$ is divisible by [2014]
a. 7 b. 5 c. 9 d. 17
6. The coefficient of x^n in the expansion of $\log_e \left(\frac{1}{1+x+x^2+x^3} \right)$, when n is odd, is [2013]
a. $-\frac{2}{n}$ b. $-\frac{1}{n}$ c. $\frac{1}{n}$ d. $\frac{2}{n}$
7. $\frac{{}^8C_0}{6} - {}^8C_1 + {}^8C_2 \cdot 6 - {}^8C_3 \cdot 6^2 + {}^8C_4 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^7$ equals [2013]
a. 0 b. 6^7 c. 6^8 d. $\frac{5^8}{6}$
8. If the coefficient of second, third and fourth terms in the expansion of $(1+x)^n$ are in AP, then n is equal to [2012]
a. 7 b. 4 c. 5 d. 6
9. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \dots + C_nx^n$, then $C_0 - C_1 + C_2 - C_3 + \dots + (-1)^n \cdot C_n$ is equal to [2011]
a. 3^n b. 2^n c. 1 d. 0

a. ${}^{18}C_9$ b. $-{}^{18}C_9$ c. ${}^{18}C_{10}$ d. $-{}^{18}C_{10}$

Answer with Solutions

Practice Exercise

1. (c) Hint $\binom{n}{6} (2^{1/3})^{n-6} \left(\frac{1}{3^{1/3}}\right)^6 : \binom{n}{n-6} (2^{1/3})^6 \left(\frac{1}{3^{1/3}}\right)^{n-6} = 1:6$

$$\Rightarrow 6 \cdot 2^{\frac{n}{3}-4} \cdot 3^{\frac{n}{3}-4} = 1$$

2. (b) $\therefore T_3 = 1000$

$$\therefore {}^5C_2 \left(\frac{1}{a}\right)^{5-2} (a^{\log_{10} a})^2 = 1000$$

$$\Rightarrow 10 \cdot (a^{\log_{10} a})^2 \cdot a^{-3} = 1000$$

$$\Rightarrow a^{2\log_{10} a} \cdot a^{-3} = 100$$

$$\Rightarrow [a]^{2\log_{10} a - 3} = 10^2$$

$$\Rightarrow (2\log_{10} a - 3)\log a = \log 10^2$$

$$\Rightarrow 2\log_{10} a - 3 = \frac{2\log 10}{\log a}$$

$$\Rightarrow 2x - 3 = \frac{2}{x} \quad [\text{put } \log_{10} a = x]$$

$$\Rightarrow 2x^2 - 3x = 2 \Rightarrow 2x^2 - 3x - 2 = 0$$

$$\Rightarrow (2x+1)(x-2) = 0 \Rightarrow x = 2 \quad \left[\because x \neq -\frac{1}{2} \right]$$

$$\therefore \log_{10} a = 2$$

$$\Rightarrow a = 10^2 = 100$$

3. (b) On simplification, we get

$$z = 2 \left[{}^5C_0 \left(\frac{\sqrt{3}}{2} \right)^5 + {}^5C_2 \left(\frac{\sqrt{3}}{2} \right)^3 \left(\frac{i}{2} \right)^2 + {}^5C_4 \left(\frac{\sqrt{3}}{2} \right) \left(\frac{i}{2} \right)^4 \right]$$

Since, $i^2 = -1$ and $i^4 = 1$, so z will not contain any i and hence $\text{Im}(z) = 0$.

4. (b) We know that,

$$(a+y)^n + (a-y)^n = 2[{}^nC_0 a^n y^0 + {}^nC_2 a^{n-2} y^2 + \dots]$$

$$\therefore (x + \sqrt{x^3 - 1})^5 + (x - \sqrt{x^3 - 1})^5$$

$$= 2[x^5 + 10x^3(x^3 - 1) + 5x(x^3 - 1)^2]$$

Clearly, it is a polynomial of degree 7.

5. (b) Since, $T_{r+1} = {}^{10}C_r \left(\frac{x}{2} \right)^{10-r} \left(-\frac{3}{x^2} \right)^r$
- $$= {}^{10}C_r x^{10-3r} (-3)^r (2)^{r-10}$$

So, for coefficient of x^4 , $10 - 3r = 4 \Rightarrow r = 2$

$$\therefore T_{2+1} = {}^{10}C_2 x^4 \cdot (-3)^2 \cdot 2^{-10}$$

So, the coefficient of x^4

$$= {}^{10}C_2 (-3)^2 \cdot 2^{-8} = {}^{10}C_2 \frac{9}{2^8} = \frac{5 \times 9 \times 9}{2^8} = \frac{405}{256}$$

6. (b) Let $P(n) = 7^{2n} + 2^{3n-3} \cdot 3^{n-1}$

For $n = 1$, $P(1) = 7^2 + 2^0 \cdot 3^0 = 49 + 1 = 50 = 25 \times 2$

Thus, $P(1)$ is divisible by 25.

Now, assume $P(m)$ is divisible by 25, so that we may write

$$7^{2m} + 2^{3m-3} \cdot 3^{m-1} = 25k$$

where, k is a positive integer.

Then, $P(m+1) = 7^{2(m+1)} + 2^{3(m+1)-3} \cdot 3^{(m+1)-1}$

$$= 7^{2m} \cdot 7^2 + 2^{3m-3} \cdot 3^{m-1} \cdot 3$$

$$= 49 \cdot 7^{2m} + 24 \cdot 2^{3m-3} \cdot 3^{m-1}$$

$$= 49 \cdot 7^{2m} + 24 \cdot 2^{3m-3} \cdot 3^{m-1}$$

$$= (50-1) \cdot 7^{2m} + (25-1) 2^{3m-3} \cdot 3^{m-1}$$

$$= 25(2 \cdot 7^{2m} + 2^{3m-3} \cdot 3^{m-1}) - (7^{2m} + 2^{3m-3} \cdot 3^{m-1})$$

$$= 25(2 \cdot 7^{2m} + 2^{3m-3} \cdot 3^{m-1} - 25k)$$

So, $P(m+1)$ is divisible by 25.

Hence, by mathematical induction, $P(n)$ is divisible by 25 for all positive integers n .

7. (b) $T_7 = {}^9C_6 \left(\frac{3}{\sqrt[3]{84}} \right)^3 (\sqrt{3} \ln x)^6 = 729$

$$\Rightarrow \frac{84 \times 3^3}{84} \times 3^3 \times (\ln x)^6 = 729 \Rightarrow (\ln x)^6 = 1 \Rightarrow x = e$$

8. (b) **Hint** Since, the coefficients of given terms are ${}^mC_{r-1}$, mC_r , ${}^mC_{r+1}$ respectively and they are also in AP.

$$\therefore {}^mC_{r-1} + {}^mC_{r+1} = 2 {}^mC_r$$

$$\Rightarrow \frac{m!}{(r-1)!(m-r+1)!} + \frac{m!}{(r+1)!(m-r-1)!} = 2 \frac{m!}{r!(m-r)!}$$

$$\Rightarrow \frac{1}{(m-r+1)(m-r)} + \frac{1}{(r+1)r} = \frac{2}{r(m-r)}$$

9. (a) Since, $2n$ is even, so the middle term in the expansion of $(1+x)^{2n}$ is $\left(\frac{2n}{2} + 1 \right)$ th, i.e. $(n+1)$ th term which is given by

$$T_{n+1} = {}^{2n}C_n (1)^{2n-n} (x)^n = {}^{2n}C_n x^n = \frac{(2n)!}{n!n!} x^n$$

$$= \frac{2n(2n-1)(2n-2)\dots 4 \cdot 3 \cdot 2 \cdot 1}{n!n!} x^n$$

$$= \frac{1 \cdot 2 \cdot 3 \cdot 4 \dots (2n-2)(2n-1)(2n)}{n!n!} x^n$$

$$= \frac{[1 \cdot 3 \cdot 5 \dots (2n-1)] [2 \cdot 4 \cdot 6 \dots (2n)]}{n!n!} x^n$$

$$= \frac{[1 \cdot 3 \cdot 5 \dots (2n-1)] \cdot 2^n [1 \cdot 2 \cdot 3 \dots n]}{n!n!} x^n$$

$$= \frac{[1 \cdot 3 \cdot 5 \dots (2n-1)] n!}{n!n!} 2^n \cdot x^n = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{n!} 2^n \cdot x^n$$

10. (c) For $n = 20$, the middle term is $\left(\frac{20}{2} + 1 \right) = 11$ th term

$$\therefore T_{11} = T_{10+1} = {}^{20}C_{10} \left(\frac{2}{3} x^2 \right)^{20-10} \left(-\frac{3}{2x} \right)^{10} = {}^{20}C_{10} x^{10}$$

11. (a) Since, last term in $(2^{1/3} + 2^{-1/2}y)^n$ is $(n+1)$ th term.

$$\therefore T_{n+1} = {}^nC_n (2^{-1/2}y)^n = \left[\frac{1}{3(9)^{1/3}} \right]^{\log_3 2^3}$$

$$\Rightarrow 2^{-n/2} = [3^{-5/3}]^{\log_3 2^3} \Rightarrow 2^{-n/2} = [3]^{\log_3 2^{3 \times -5/3}}$$

$$\Rightarrow 2^{-n/2} = [3]^{\log_3 2^{-5}} \Rightarrow 2^{-n/2} = 2^{-5} \quad [\because a^{\log_a b} = b]$$

$$\Rightarrow \frac{-n}{2} = -5 \Rightarrow n = 10$$

$$\therefore T_{4+1} = {}^{10}C_4 (2^{1/3})^6 (2^{-1/2})^4 = 210 \cdot (2)^{2-2} = 210$$

12. (c) $\therefore T_{r+1} = {}^{100}C_r [(5)^{1/6}]^{100-r} [(2)^{1/8}]^r$

Since, 5 and 2 are prime numbers, so T_{r+1} is rational, if $\frac{100-r}{6}$ and $\frac{r}{8}$ are integers or $100-r$ is a multiple of 6 and r is a multiple of 8.

So, for r as a multiple of 8, we have

$$r = 0, 8, 16, 24, \dots, 96$$

$$\Rightarrow 100 - r = 100, 92, 84, 76, \dots, 12, 4$$

Also, for r to be divisible by 6, we get the common value from the above $(100-r)$ value as 84, 60, 36, 12 only. So, only four rational terms are possible.

Hence, number of irrational terms = $101 - 4 = 97$

13. (a) Greatest term in the expansion of $(1+x)^n$ is T_{r+1}

$$\text{where, } r = \left[\frac{(n+1)x}{1+x} \right]$$

$$\text{Here, } n = 20 \text{ and } x = \frac{1}{\sqrt{3}}$$

$$\therefore r = \left[\frac{21}{\sqrt{3}+1} \right] = [10.5(\sqrt{3}-1)] = (7.69) \approx 7$$

$$\text{Hence, greatest term is } \sqrt{3} \left(\frac{20}{7} \right) \left(\frac{1}{\sqrt{3}} \right)^7 = \left(\frac{20}{7} \right) \frac{1}{27}.$$

14. (b) The greatest term in $(3 + 5x)^{15} = \frac{(n+1)|5x|}{|3| + |5x|}$

$$= \frac{(15+1)5\left(\frac{1}{5}\right)}{3+5\cdot\frac{1}{5}} = \frac{16 \times 1}{4} = 4$$

So, 4th and 5th terms are the greatest.

$$\therefore T_5 = {}^{15}C_4 \cdot 3^{11}$$

15. (a) The general term of $\left(3x - \frac{2}{x^2}\right)^{15}$ is

$$T_{r+1} = {}^{15}C_r (3x)^{15-r} \left(\frac{-2}{x^2}\right)^r = {}^{15}C_r (3)^{15-r} (-2)^r x^{15-3r}$$

For independent term of x ,

$$\text{put } 15 - 3r = 0 \Rightarrow r = 5$$

$\therefore$ The term independent of x

$$= {}^{15}C_5 (3)^{15-5} (-2)^5 = -3003 (3^{10}) (2^5)$$

16. (c) **Hint** Middle term, $T_5 = {}^8C_4 (p/2)^{8-4} (2^4) = 1120$

$$17. (d) \left(1 + x + \frac{2}{x}\right)^6 = 1 + \binom{6}{1} \left(x + \frac{2}{x}\right) + \binom{6}{2} \left(x + \frac{2}{x}\right)^2 + \dots + \binom{6}{6} \left(x + \frac{2}{x}\right)^6$$

$$\therefore \text{Constant term} = 1 + \binom{6}{2} \binom{2}{1} 2^1 + \binom{6}{4} \binom{4}{2} 2^2 + \binom{6}{6} \binom{6}{3} 2^3$$

$$= 1 + 60 + 360 + 160 = 581$$

18. (a) General term is $T_{r+1} = {}^{21}C_r \left(\sqrt[3]{\frac{a}{b}}\right)^{21-r} \left(\sqrt[3]{\frac{b}{a}}\right)^r$
- $$= {}^{21}C_r a^{7-\frac{r}{2}} b^{\frac{2r}{3}-\frac{7}{2}}$$

$\therefore$ Power of a = Power of b

$$\therefore 7 - \frac{r}{2} = \frac{2}{3}r - \frac{7}{2} \Rightarrow r = 9$$

19. (b) $T_8 = {}^nC_7 (2)^{n-7} \left(\frac{x}{3}\right)^7 = {}^nC_7 \frac{(2)^{n-7}}{3^7} x^7$

$$\text{and } T_9 = {}^nC_8 (2)^{n-8} \left(\frac{x}{3}\right)^8 = {}^nC_8 \frac{(2)^{n-8}}{3^8} x^8$$

$$\text{Therefore, } {}^nC_7 \frac{(2)^{n-7}}{3^7} = {}^nC_8 \frac{(2)^{n-8}}{3^8} \Rightarrow \frac{n!}{7!(n-7)!} \times \frac{8!(n-8)!}{n!}$$

$$= \frac{(2)^{n-8}}{3^8} \cdot \frac{3^7}{(2)^{n-7}} \Rightarrow \frac{8}{n-7} = \frac{1}{6} \therefore n = 55$$

20. (c) Let the three consecutive terms in the expansion of $(1+a)^n$ be $(r-1)$ th, r th and $(r+1)$ th terms.

$$\therefore (r-1)\text{th term is } T_{(r-2)+1} = {}^nC_{r-2} a^{r-2}$$

$$\text{Similarly, } T_{(r-1)+1} = {}^nC_{r-1} a^{r-1} \text{ and } T_{r+1} = {}^nC_r a^r$$

$$\text{But } \frac{{}^nC_{r-2}}{{}^nC_{r-1}} = \frac{1}{7} \Rightarrow n - 8r + 9 = 0 \quad \dots(i)$$

$$\text{and } \frac{{}^nC_{r-1}}{{}^nC_r} = \frac{7}{42} \Rightarrow n - 7r + 1 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $n = 55$

21. (b) On putting $x = 1$ in $(1 - 3x + 10x^2)^n$ and $(1 + x^2)^n$, the required sum of coefficients are

$$\alpha = (1 - 3 + 10)^n = 8^n = (2^n)^3 \text{ and } \beta = (1 + 1)^n = 2^n$$

so, $\alpha = \beta^3$ is correct.

22. (c) Let $S = {}^nC_0^2 + {}^nC_1^2 + {}^nC_2^2 + \dots + (n+1){}^nC_n^2 \quad \dots(i)$

Writing S in the reverse order and using ${}^nC_r = {}^nC_{n-r}$, we get

$$S = (n+1){}^nC_0^2 + {}^nC_1^2 + (n-1){}^nC_2^2 + \dots + {}^nC_n^2 \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2S = (n+2) \{ {}^nC_0^2 + {}^nC_1^2 + \dots + {}^nC_n^2 \} \Rightarrow S = \left(\frac{n}{2} + 1\right) 2^n {}^nC_n$$

23. (a) Let a_1, a_2, a_3 and a_4 be the coefficients of four consecutive terms $T_{r+1}, T_{r+2}, T_{r+3}$ and T_{r+4} , respectively.

$$\text{Then, } \frac{a_1}{a_1 + a_2} = \frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}} = \frac{{}^nC_r}{{}^{n+1}C_{r+1}}$$

$$[\because {}^nC_r + {}^nC_{r+1} = {}^{n+1}C_{r+1}]$$

$$= \frac{n!}{r!(n-r)!} \times \frac{(r+1)!(n-r)!}{(n+1)!} = \left(\frac{r+1}{n+1}\right)$$

$$\text{Similarly, } \frac{a_3}{a_3 + a_4} = \frac{{}^nC_{r+2}}{{}^nC_{r+2} + {}^nC_{r+3}} = \frac{{}^nC_{r+2}}{{}^{n+1}C_{r+3}} = \frac{r+3}{n+1}$$

$$\text{Hence, } \frac{a_1}{a_1 + a_2} + \frac{a_3}{a_3 + a_4} = \frac{r+1}{n+1} + \frac{r+3}{n+1} = \frac{2r+4}{n+1}$$

$$\text{and } \frac{2a_2}{a_2 + a_3} = \frac{2({}^nC_{r+1})}{{}^nC_{r+1} + {}^nC_{r+2}} = \frac{2({}^nC_{r+1})}{{}^{n+1}C_{r+2}}$$

$$= \frac{2n!}{(r+1)!(n-r-1)!} \times \frac{(r+2)!(n-r-1)!}{(n+1)!}$$

$$= \frac{2(r+2)}{n+1}$$

$$\therefore \frac{a_1}{a_1 + a_2} + \frac{a_3}{a_3 + a_4} = \frac{2a_2}{a_2 + a_3}$$

24. (d) $T_{r+1} = {}^{15}C_r (x^2)^{15-r} \cdot \left(\frac{2}{x}\right)^r = {}^{15}C_r x^{30-2r} \cdot 2^r \cdot x^{-r}$
- $$= {}^{15}C_r \cdot x^{30-3r} \cdot 2^r$$

For coefficient of x^{15} ,

$$\text{put } 30 - 3r = 15 \Rightarrow 3r = 15 \Rightarrow r = 5$$

$$\therefore \text{Coefficient of } x^{15} = {}^{15}C_5 \cdot 2^5$$

For coefficient of independent of x i.e. x^0 put $30 - 3r = 0$

$$\Rightarrow r = 10$$

$$\therefore \text{Coefficient of } x^0 = {}^{15}C_{10} \cdot 2^{10}$$

$$\text{Hence, their ratio} = \frac{{}^{15}C_5 \cdot 2^5}{{}^{15}C_{10} \cdot 2^{10}} = \frac{{}^{15}C_{10} \cdot 2^5}{{}^{15}C_{10} \cdot 2^{10}} = 1:32$$

25. (c) **Hint** $\left[\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{x-1}{x - x^{1/2}} \right]^{10}$
- $$= \left[\frac{(x^{1/3})^3 + 1^3}{x^{2/3} - x^{1/3} + 1} - \frac{\{(\sqrt{x})^2 - 1\}}{\sqrt{x}(\sqrt{x} - 1)} \right]^{10}$$
- $$= \left[(x^{1/3} + 1) - \frac{(\sqrt{x} + 1)}{\sqrt{x}} \right]^{10} = (x^{1/3} - x^{-1/2})^{10}$$

$$T_{r+1} = {}^{10}C_r (x^{1/3})^{10-r} (-x^{-1/2})^r = {}^{10}C_r (-1)^r x^{\frac{10-r}{3} - \frac{r}{2}}$$

For independent of x , put

$$\frac{10-r}{3} - \frac{r}{2} = 0$$

26. (b) Here, $(1-x-x^2+x^3)^6 = \{(1-x)-x^2(1-x)\}^6$

$$\begin{aligned} &= \{(1-x)(1-x^2)\}^6 = (1-x)^6 \cdot (1-x^2)^6 \\ &= \left\{ \sum_{r=0}^6 (-1)^r {}^6C_r \cdot x^r \right\} \left\{ \sum_{s=0}^6 (-1)^s {}^6C_s \cdot x^{2s} \right\} \\ &= \sum_{r=0}^6 \sum_{s=0}^6 (-1)^{r+s} \cdot {}^6C_r \cdot {}^6C_s \cdot x^{r+2s} \end{aligned}$$

For coefficient of x^7 , $r+2s=7$

i.e. $(s=1, r=5)$ or $(s=2, r=3)$ or $(s=3, r=1)$

$\therefore$ Coefficient of x^7

$$\begin{aligned} &= \{(-1)^{5+1} \cdot {}^6C_5 \cdot {}^6C_1\} + \{(-1)^{3+2} \cdot {}^6C_3 \cdot {}^6C_2\} \\ &\quad + \{(-1)^{1+3} \cdot {}^6C_1 \cdot {}^6C_3\} \end{aligned}$$

$$= 36 - (20)(15) + 6(20) = 36 - 300 + 120 = -144$$

27. (a) **Hint** ${}^{50}C_4 + {}^{55}C_3 + {}^{54}C_3 + {}^{53}C_3 + {}^{52}C_3 + {}^{51}C_3 + {}^{50}C_3$
 $= ({}^{50}C_3 + {}^{50}C_4) + {}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$
 $= ({}^{51}C_4 + {}^{51}C_3) + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

28. (b) **Hint** $\binom{n}{r+1} \div \binom{n}{r} = \frac{56}{28} \Rightarrow \frac{n-r}{r+1} = 2$

$$\text{and } \binom{n}{r} \div \binom{n}{r-1} = \frac{28}{8} \Rightarrow \frac{n-r+1}{r} = \frac{7}{2}$$

29. (a) On putting $x=1$ and $x=-1$ respectively, we get

$$0 = 1 + a_1 + a_2 + \dots + a_{12} \quad \text{and} \quad 64 = 1 - a_1 + a_2 - \dots + a_{12}$$

On adding, we get

$$64 = 2(1 + a_2 + a_4 + \dots + a_{12})$$

$$\therefore a_2 + a_4 + \dots + a_{12} = 31$$

30. (c) Given, $\binom{n-1}{3} + \binom{n-1}{4} > \binom{n}{3}$

$$\Rightarrow \binom{n}{4} > \binom{n}{3} \Rightarrow \frac{\binom{n}{4}}{\binom{n}{3}} > 1$$

$$\Rightarrow \frac{n-4+1}{4} > 1 \Rightarrow n > 7$$

31. (a) Since, $(1+x)^{10} = C_0 + C_1x + C_2x^2 + \dots + C_{10}x^{10}$

$$\text{and } \left(1 + \frac{1}{x}\right)^{10} = C_0 + \frac{C_1}{x} + \frac{C_2}{x^2} + \dots + \frac{C_{10}}{x^{10}}$$

So, $C_0C_1 + C_1C_2 + C_2C_3 + \dots + C_9C_{10}$ is the coefficient of x

$$\text{in the product } (1+x)^{10} \left(1 + \frac{1}{x}\right)^{10} = \frac{(1+x)^{20}}{x^{10}}$$

or the coefficient of x^{11} in $(1+x)^{20}$ is

$$\binom{20}{11} = \binom{20}{9}$$

32. (b) **Case I** $121^n - 25^n = (96+25)^n - 25^n$ is divisible by 96.
 and $1900^n - (-4)^n = (1904-4)^n - (-4)^n$ is divisible by 1904.
 Hence, both are divisible by 16.

Case II $121^n - (-4)^n = (125-4)^n - (-4)^n$ is divisible by 125 and $1900^n - 25^n = (1875+25)^n - 25^n$ is divisible by 1875.

Hence, both are divisible by 125.

So, given number is divisible by 16×125 i.e. 2000.

33. (b) We have, $8^{2n} - (62)^{2n+1} = (1+63)^n - (63-1)^{2n+1}$
 $= (1+63)^n + (1-63)^{2n+1}$
 $= [1 + {}^nC_1 \cdot 63 + {}^nC_2 (63)^2 + \dots + (63)^n]$
 $+ [1 - {}^{(2n+1)}C_1 \cdot 63 + {}^{(2n+1)}C_2 (63)^2 - \dots + (-1) (63)^{(2n+1)}]$
 $= 2 + 63 [{}^nC_1 + {}^nC_2 (63) + \dots + (63)^{n-1}$
 $- {}^{(2n+1)}C_1 + {}^{(2n+1)}C_2 (63) - \dots - (63)^{(2n)}]$

So, the remainder is 2.

34. (c) Since, $7 - 4\sqrt{3} = \frac{1}{7 + 4\sqrt{3}}$

$$\therefore 0 < 7 - 4\sqrt{3} < 1 \Rightarrow 0 < (7 - 4\sqrt{3})^{2n} < 1$$

$$\text{Let } F = (7 - 4\sqrt{3})^{2n}$$

$$\begin{aligned} \text{Then, } x + F &= (7 + 4\sqrt{3})^{2n} + (7 - 4\sqrt{3})^{2n} \\ &= 2[{}^{2n}C_0 + {}^{2n}C_2 7^{2n-2} (4\sqrt{3})^2 \\ &\quad + {}^{2n}C_4 7^{2n-4} (4\sqrt{3})^4 + \dots + {}^{2n}C_{2n} (4\sqrt{3})^{2n}] \\ &= 2m \end{aligned}$$

where, m is some positive integer.

$$\Rightarrow [x] + f + F = 2m \Rightarrow f + F = 2m - [x]$$

Since, $0 \leq f < 1$ and $0 < F < 1$, so we get $0 < f + F < 2$.

Also, $f + F$ is an integer, so we must have $f + F = 1$.

$$\begin{aligned} \text{Thus, } x(1-f) &= xF = (7 + 4\sqrt{3})^{2n} (7 - 4\sqrt{3})^{2n} \\ &= (49 - 48)^{2n} = 1^{2n} = 1 \end{aligned}$$

35. (a) For $n=1$, $n^3 + 3n^2 + 5n + 3 = 12$

which is divisible by 3 and 4.

$$\text{For } n=2, n^3 + 3n^2 + 5n + 3 = 33$$

which is divisible by 3 only.

36. (b) We know that,

$$(1+x)^{20} = {}^{20}C_0 + {}^{20}C_1x + \dots + {}^{20}C_{10}x^{10} + \dots + {}^{20}C_{20}x^{20}$$

On putting $x=-1$ in the above expansion, we get

$$\begin{aligned} 0 &= {}^{20}C_0 - {}^{20}C_1 + \dots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_{11} + \dots + {}^{20}C_{20} \\ \Rightarrow 0 &= {}^{20}C_0 - {}^{20}C_1 + \dots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_{11} + \dots + {}^{20}C_{20} \\ \Rightarrow 0 &= 2({}^{20}C_0 - {}^{20}C_1 + \dots - {}^{20}C_9) + {}^{20}C_{10} \\ \Rightarrow {}^{20}C_{10} &= 2({}^{20}C_0 - {}^{20}C_1 + \dots + {}^{20}C_{10}) \\ \Rightarrow {}^{20}C_0 - {}^{20}C_1 + \dots + {}^{20}C_{10} &= \frac{1}{2} {}^{20}C_{10} \end{aligned}$$

37. (a) $\therefore (a+b+c)^n = [a+(b+c)]^n = a^n + {}^nC_1 a^{n-1}(b+c)^1$
 $+ {}^nC_2 a^{n-2}(b+c)^2 + \dots + {}^nC_n (b+c)^n$

So, T_1 has 1 term, T_2 has 2 terms and T_3 has 3 terms.

$$\begin{aligned} \text{Similarly, total number of terms} &= 1 + 2 + 3 + \dots + (n+1) \\ &= \frac{(n+1)(n+2)}{2} \end{aligned}$$

$$38. (a) \text{ Hint } \sum_{r=0}^{n-1} \frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}} = \sum_{r=0}^{n-1} \frac{{}^nC_r}{{}^{n+1}C_{r+1}} = \sum_{r=0}^{n-1} \frac{r+1}{n+1}$$

$$39. (d) \text{ Hint General term, } T_{r+1} = {}^{10}C_r (2^{1/2})^{10-r} (3^{1/5})^r \\ = {}^{10}C_r 2^{\left(5-\frac{r}{2}\right)} \cdot 3^{r/5}$$

Clearly, T_{r+1} will be independent of radical sign, if $r/2$ and $r/5$ are integers, where $0 \leq r \leq 10$.

$$\therefore r = 0, 10$$

$$40. (a) \text{ Coefficient of } x^r = {}^nC_r = a$$

$$\text{Coefficient of } x^{n-r} = {}^nC_{n-r} = b$$

$$\text{Since, } {}^nC_r = {}^nC_{n-r}$$

$$\therefore a = b$$

$$41. (a) \text{ Hint } (\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n} = 2[{}^{2n}C_1(\sqrt{3})^{2n-1} \\ + {}^{2n}C_3(\sqrt{3})^{2n-3} + {}^{2n}C_5(\sqrt{3})^{2n-5} + \dots + {}^{2n}C_{2n-1}(\sqrt{3})^{2n-(2n-1)}]$$

which is most certainly an irrational number because of odd powers of $\sqrt{3}$ in each of the terms.

$$42. (a) \text{ } n\text{th term will be } \frac{n}{3(4n+3)}$$

$$\text{For } n=1, \text{ LHS} = \frac{1}{3 \cdot 7} = \frac{1}{21} \text{ and RHS} = \frac{1}{3(4+3)} = \frac{1}{21}$$

$$\therefore \text{ LHS} = \text{RHS}$$

Thus, the given result is true for $n=1$, let the given result be true for $n=m \in N$.

$$\therefore \frac{1}{3 \cdot 7} + \frac{1}{7 \cdot 11} + \frac{1}{11 \cdot 14} + \dots + \frac{1}{(4m-1)(4m+3)} = \frac{m}{3(4m+3)}$$

Now, for $n=m+1$,

$$\text{LHS} = \left[\frac{1}{3 \cdot 7} + \frac{1}{7 \cdot 11} + \frac{1}{11 \cdot 14} + \dots + \frac{1}{(4m-1)(4m+3)} \right] \\ + \frac{1}{(4m+3)(4m+7)}$$

$$= \frac{m}{3(4m+3)} + \frac{1}{(4m+3)(4m+7)} = \frac{m(4m+7)+3}{3(4m+3)(4m+7)}$$

$$= \frac{4m^2 + 7m + 3}{3(4m+3)(4m+7)} = \frac{(m+1)(4m+3)}{3(4m+3)(4m+7)}$$

$$\text{LHS} = \frac{m+1}{3(4m+7)} = \frac{m+1}{3[4(m+1)+3]}$$

which is same result as given one with n replaced by $m+1$. Hence, result is true.

$$43. (d) \therefore T_{r+1} = {}^{15}C_r (x^3)^{15-r} \left(\frac{-1}{x^2}\right)^r \\ = {}^{15}C_r x^{45-3r} \cdot \frac{(-1)^r \cdot 1}{x^{2r}} = {}^{15}C_r x^{45-3r-2r} \cdot (-1)^r$$

For constant term, $45 - 3r - 2r = 0$

$$\Rightarrow 45 = 5r \Rightarrow r = 9$$

$$\therefore T_{9+1} = {}^{15}C_9 (-1)^9 = -{}^{15}C_9$$

$$44. (a) \text{ Given, } s_n = \sum_{r=0}^n \frac{1}{{}^nC_r} \Rightarrow s_n = \sum_{r=0}^n \frac{1}{{}^nC_{n-r}} \quad [\because {}^nC_r = {}^nC_{n-r}]$$

$$\Rightarrow ns_n = \sum_{r=0}^n \frac{n}{{}^nC_{n-r}} \Rightarrow ns_n = \sum_{r=0}^n \left(\frac{n-r}{{}^nC_{n-r}} + \frac{r}{{}^nC_{n-r}} \right)$$

$$\Rightarrow ns_n = \sum_{r=0}^n \frac{n-r}{{}^nC_{n-r}} + \sum_{r=0}^n \frac{r}{{}^nC_r}$$

$$\Rightarrow ns_n = \left(\frac{n}{{}^nC_n} + \frac{n-1}{{}^nC_{n-1}} + \dots + \frac{1}{{}^nC_1} \right) + \sum_{r=0}^n \frac{r}{{}^nC_r}$$

$$\Rightarrow ns_n = t_n + t_n \quad \left[\because t_n = \sum_{r=0}^n \frac{r}{{}^nC_r}, \text{ given} \right]$$

$$\Rightarrow ns_n = 2t_n \Rightarrow \frac{t_n}{s_n} = \frac{n}{2}$$

$$45. (a) \text{ We have, } (1+5\sqrt{2}x)^{19} + (1-5\sqrt{2}x)^{19} \\ = 2[{}^{19}C_0 + {}^{19}C_2(5\sqrt{2}x)^2 + \dots + {}^{19}C_{18}(5\sqrt{2}x)^{18}]$$

So, it has only 10 terms.

BITSAT Archives

$$1. (c) \text{ Let } P(n) = 2^{3n} - 7n - 1$$

$$\Rightarrow P(1) = 0, P(2) = 49$$

$P(1)$ and $P(2)$ are divisible by 49.

$$\text{Let } P(k) = 2^{3k} - 7k - 1 = 49I$$

$$\text{Then, } P(k+1) = 2^{3k+3} - 7k - 8$$

$$= 8(49I + 7k + 1) - 7k - 8$$

$$= 49(8I) + 49k = 49\lambda$$

where, $\lambda = 8I + k$, which is an integer.

$$2. (d) \text{ Let } P(n) = n^3 + 2n$$

$$\text{Then, } P(1) = 1 + 2 = 3$$

$$P(2) = 8 + 4 = 12$$

$$\text{and } P(3) = 27 + 6 = 33$$

Clearly, we see that all these numbers are divisible by 3.

$$3. (c) \text{ Using binomial theorem,}$$

$$(5x - 4y)^n = {}^nC_0(5x)^n + {}^nC_1(5x)^{n-1}(-4y) \\ + {}^nC_2(5x)^{n-2}(-4y)^2 + \dots + {}^nC_n(-4y)^n$$

$\therefore$ Sum of coefficients

$$= {}^nC_0 5^n + {}^nC_1 5^{n-1}(-4) + {}^nC_2 5^{n-2}(-4)^2 + \dots + {}^nC_n(-4)^n \\ = (5 - 4)^n = 1^n = 1$$

$$4. (a) \text{ We have, } a = \sum_{n=0}^{\infty} \frac{x^{3n}}{(3n)!}, b = \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!}$$

$$\text{and } c = \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$$

$$\text{Now, } a + b + c = \sum_{n=0}^{\infty} \frac{x^{3n}}{3n!} + \sum_{n=1}^{\infty} \frac{x^{3n-2}}{(3n-2)!} + \sum_{n=1}^{\infty} \frac{x^{3n-1}}{(3n-1)!}$$

$$= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots = e^x$$

$$\therefore a + b\omega + c\omega^2 = 1 + \omega x + \frac{\omega^2 x^2}{2!} + \frac{\omega^3 x^3}{3!} + \dots = e^{\omega x}$$

and $a + b\omega^2 + c\omega = e^{\omega^2 x}$, where ω is imaginary cube root of unity.

$$\text{Now, } a^3 + b^3 + c^3 - 3abc$$

$$= (a + b + c)(a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$$

$$= e^x \cdot e^{\omega x} \cdot e^{\omega^2 x} = e^{x(1 + \omega + \omega^2)} = e^{0 \cdot x} = 1$$

5. (c) For $n = 1$, $10^n + 3 \cdot 4^{n+2} + 5 = 10 + 3 \cdot 4^3 + 5 = 207$, which is divisible by 9.

So, by induction, the result is divisible by 9.

$$\begin{aligned} 6. (b) \log_e \left(\frac{1}{1+x+x^2+x^3} \right) &= \log_e \left(\frac{1-x}{1-x^4} \right) \\ &= \log_e(1-x) - \log_e(1-x^4) = -\sum_{r=1}^{\infty} \frac{x^r}{r} + \sum_{r=1}^{\infty} \frac{x^{4r}}{r} \end{aligned}$$

When n is odd, there is no term in the second series containing x^n , therefore the coefficient x^n is zero in the second series and in the first series, the coefficient of x^n is $-1/n$.

Hence, when n is odd, then the coefficient of x^n in the whole expansion is $-\frac{1}{n} + 0 = -\frac{1}{n}$.

$$\begin{aligned} 7. (d) \frac{{}^8C_0}{6} - {}^8C_1 + {}^8C_2 \cdot 6 - {}^8C_3 \cdot 6^2 + {}^8C_4 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^7 \\ = \frac{1}{6} [{}^8C_0 - {}^8C_1 \cdot 6 + {}^8C_2 \cdot 6^2 - {}^8C_3 \cdot 6^3 + \dots + {}^8C_8 \cdot 6^8] \\ = \frac{1}{6} (1-6)^8 = \frac{1}{6} \times (-5)^8 = \frac{5^8}{6} \end{aligned}$$

$$8. (a) \text{ Since, } T_2 = {}^nC_1 \text{ and } T_3 = {}^nC_2 x, T_4 = {}^nC_3 x^2$$

Also, T_2, T_3, T_4 are in AP.

$$\therefore \frac{{}^nC_1 + {}^nC_3}{2} = {}^nC_2 \Rightarrow {}^nC_1 + {}^nC_3 = 2 \cdot {}^nC_2$$

$$\Rightarrow \frac{n!}{(n-1)!(1)!} + \frac{n!}{(n-3)!3!} = \frac{2n!}{2!(n-2)!}$$

$$\Rightarrow \frac{1}{(n-1)(n-2)} + \frac{1}{3!} = \frac{1}{(n-2)}$$

$$\Rightarrow 1 + \frac{(n-1)(n-2)}{6} = (n-1)$$

$$\Rightarrow 6 + n^2 - 3n + 2 = 6n - 6 \Rightarrow n^2 - 3n - 6n + 8 + 6 = 0$$

$$\Rightarrow n^2 - 9n + 14 = 0 \Rightarrow (n-7)(n-2) = 0$$

$$\Rightarrow n = 7 \text{ or } 2 \quad \therefore n = 7 \quad [\because n \neq 2]$$

$$9. (d) \text{ Given, } (1+x)^n = C_0 + C_1 x + C_2 x^2 + \dots + C_n x^n$$

Put $x = -1$, we get

$$C_0 - C_1 + C_2 - \dots + (-1)^n \cdot C_n = 0$$

$$\begin{aligned} 10. (b) \text{ We have, } (\sqrt{5} + 1)^5 - (\sqrt{5} - 1)^5 \\ = 2\{ {}^5C_1(\sqrt{5})^4 + {}^5C_3(\sqrt{5})^2 + {}^5C_5 \cdot 1 \} \\ = 2\{ 5 \times 25 + 50 + 1 \} = 2(176) = 352 \end{aligned}$$

11. (d) The general term in the expansion of

$$(2-x+3x^2)^6 = \frac{6!}{r!s!t!} 2^r (-x)^s (3x^2)^t, \text{ where } r+s+t=6$$

$$= \frac{6!}{r!s!t!} 2^r \times (-1)^s \times 3^t \times x^{s+2t}$$

For the coefficient of x^5 , we must have $s+2t=5$.

$$\text{But } r+s+t=6$$

$$\therefore s=5-2t \text{ and } r=1+t$$

where, $0 \leq r, s, t \leq 6$

Now, for $t=0$; $r=1, s=5$

For $t=1$; $r=2, s=3$

and for $t=2$; $r=3, s=1$

Thus, there are three terms containing x^5 and coefficient of x^5

$$\begin{aligned} &= \frac{6!}{1!5!0!} \times 2 \times (-1)^5 \times 3^0 + \frac{6!}{2!3!1!} \times 2^2 \times (-1)^3 \times 3 \\ &\quad + \frac{6!}{3!1!2!} \times 2^3 \times (-1) \times 3^2 \\ &= -12 - 720 - 4320 = -5052 \end{aligned}$$

12. (b) Since,

$$(1+x)^n = {}^nC_0 + {}^nC_1 x + {}^nC_2 x^2 + {}^nC_3 x^3 + \dots + {}^nC_n x^n \quad \dots(i)$$

On differentiating Eq. (i) w.r.t. x , we get

$$n(1+x)^{n-1} = {}^nC_1 + 2 \cdot {}^nC_2 x + 3 \cdot {}^nC_3 x^2 + \dots + n \cdot {}^nC_n x^{n-1} \quad \dots(ii)$$

On putting $x=1$ in Eq. (ii), we get

$$\begin{aligned} n(1+1)^{n-1} &= {}^nC_1 + 2 \cdot {}^nC_2 + 3 \cdot {}^nC_3 + \dots + n \cdot {}^nC_n \\ \Rightarrow {}^nC_1 + 2 \cdot {}^nC_2 + 3 \cdot {}^nC_3 + \dots + n \cdot {}^nC_n &= n \cdot 2^{n-1} \end{aligned}$$

13. (a) We have, $101^{50} - 99^{50} = (100+1)^{50} - (100-1)^{50}$

$$\begin{aligned} &= 100^{50} \left(1 + \frac{1}{100} \right)^{50} - 100^{50} \left(1 - \frac{1}{100} \right)^{50} \\ &= 100^{50} \left[2 \left\{ {}^{50}C_1 \cdot \frac{1}{100} + {}^{50}C_3 \left(\frac{1}{100} \right)^3 + \dots \right\} \right] \\ &= \frac{101^{50} - 99^{50}}{100^{50}} = 1 + 2 \left\{ {}^{50}C_3 \left(\frac{1}{100} \right)^3 + \dots \right\} \end{aligned}$$

$$\Rightarrow \frac{101^{50} - 99^{50}}{100^{50}} = 1 + (\text{positive quantity}) > 1$$

$$\Rightarrow 101^{50} - 99^{50} > 100^{50} \Rightarrow 101^{50} > 100^{50} + 99^{50}$$

14. (a) We have, $\frac{1}{n!} + \frac{1}{2!(n-2)!} + \frac{1}{4!(n-4)!} + \dots$

$$= \frac{1}{n!} ({}^nC_0 + {}^nC_2 + {}^nC_4 + \dots) = \frac{2^{n-1}}{n!}$$

15. (c)

16. (b) The general term in the expansion of $\left(x - \frac{1}{x}\right)^{18}$ is given

$$\text{by } T_{r+1} = {}^{18}C_r (x)^{18-r} \left(-\frac{1}{x}\right)^r$$

$$\text{Here, } n = 18$$

So, the middle term is T_{9+1} , where $r = 9$.

$$\therefore T_{9+1} = {}^{18}C_9 (-1)^9 x^{18-2 \cdot 9} = -{}^{18}C_9 x^{18-18} = -{}^{18}C_9$$

7

Matrices

Matrix

In Mathematics, a **matrix** (plural matrices) is a rectangular array of numbers, symbols or expressions, arranged in rows and columns. The individuals in a matrix, are called its **elements** or **entries**. Generally, matrix is, written in following way

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} = [a_{ij}]_{m \times n}$$

The order of a matrix A is $m \times n$, where m is the number of rows and n is the number of columns.

NOTE Here, $m \times n$ does not indicate multiplication.

Types of Matrices

The matrices are of following types :

- (i) **Row Matrix** A matrix which have only one row and any number of columns, is called a row matrix.
- (ii) **Column Matrix** A matrix is said to be a column matrix, if it has only one column and any number of rows.
- (iii) **Null Matrix or Zero Matrix** A matrix of order $m \times n$ whose all elements are zero, is called a null matrix of order $m \times n$. It is denoted by O .
- (iv) **Square Matrix** It is a matrix in which number of rows is equal to number of columns. Thus, $m \times n$ matrix is said to be a square matrix, if $m = n$ and is known as a square matrix of order n .
- (v) **Diagonal Matrix** A square matrix is called a diagonal matrix, if all its non-diagonal elements are zero and diagonal elements are not all equal.
- (vi) **Scalar Matrix** A square matrix $A = [a_{ij}]$ is said to be scalar matrix, if
 - (a) $a_{ij} = 0, \forall i \neq j$
 - (b) $a_{ij} = k, \forall i = j$, where $k \neq 0$i.e. a diagonal matrix is said to be a scalar matrix, if the elements of principal diagonal are same.

(vii) **Identity Matrix or Unit Matrix** A square matrix $A = [a_{ij}]$ is said to be a unit or identity matrix, if

(a) $a_{ij} = 0, \forall i \neq j$

(b) $a_{ij} = 1, \forall i = j$

i.e. a diagonal matrix whose elements of principal diagonal are equal to 1 and all remaining elements are zero, is known as unit or identity matrix. It is denoted by I .

(viii) **Upper Triangular Matrix** A square matrix $A = (a_{ij})_{n \times n}$ if $a_{ij} = 0$ for $i > j$ i.e. all elements below the leading diagonal are zero, is called upper triangular matrix.

(ix) **Lower Triangular Matrix** A square matrix $A = (a_{ij})_{n \times n}$, if $a_{ij} = 0$ for $i < j$ i.e. all elements above the leading diagonal are zero, is called lower triangular matrix.

(x) **Trace of a Matrix** The sum of diagonal elements of a square matrix A is called the trace of A and is denoted by $\text{tr}(A)$.

(a) $\text{tr}(\lambda A) = \lambda \text{tr}(A)$ (b) $\text{tr}(A) = \text{tr}(A')$

(c) $\text{tr}(AB) = \text{tr}(BA)$

(xi) **Equal Matrices** Two matrices are said to be equal, if

(a) they have same number of rows and columns.

(b) The elements in the first matrix corresponding the elements of second matrix are equal.

e.g. Let $A = (a_{ij})_{m \times n}$ and $B = (b_{ij})_{m \times n}$

then, $A = B$, if $a_{ij} = b_{ij}, \forall i, j$

Algebra of Matrices

1. Addition of Matrices

Let $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ be two matrices of same order, then

$$A + B = [a_{ij} + b_{ij}], \forall i = 1, 2, \dots, m \text{ and } j = 1, 2, \dots, n$$

Properties of Addition of Matrices

Let A, B and C be three matrices of same order, then the properties of addition of matrices are given below :

(i) **Commutative** $A + B = B + A$

(ii) **Associative** $(A + B) + C = A + (B + C)$

(iii) **Additive Identity** $A + O = A = O + A$

(iv) **Additive Inverse** $A + (-A) = O = (-A) + A$

(v) **Cancellation Laws**

(a) $A + B = A + C \Rightarrow B = C$ [left cancellation law]

(b) $B + A = C + A \Rightarrow B = C$ [right cancellation law]

2. Subtraction of Matrices

Let A and B be two matrices of same order $m \times n$, then

$$A - B = [a_{ij} - b_{ij}]_{m \times n}$$

3. Multiplication of a Matrix by a Scalar

Let $A = [a_{ij}]$ be an $m \times n$ matrix and k be any scalar. Then, the matrix obtained by multiplying each element of A by k is called the scalar multiple of A by k .

Properties of Multiplication of a Matrix by a Scalar

Let A and B be two matrices of same order, then the properties of multiplication of a matrix by scalar are

(i) $k(A + B) = kA + kB$

(ii) $(k_1 + k_2)A = k_1A + k_2A$

4. Multiplication of Matrices

Let $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{n \times p}$ be two matrices such that number of columns of A is equal to the number of rows of B , then the product matrix is $C = [c_{ij}]$ of order $m \times p$

$$\text{where, } c_{ij} = \sum_{k=1}^n a_{ik} b_{kj}$$

Properties of Multiplication of Matrices

Let A, B and C be three matrices of order $m \times n, n \times p$ and $n \times k$, then the properties of multiplication of matrices are given below :

(i) **Non-commutative** $AB \neq BA$

(ii) **Associative** $(AB)C = A(BC)$

(iii) **Multiplicative Identity** $IA = A = AI$

(iv) **Multiplicative Distributive** $A(B + C) = AB + AC$

Elementary Operation (Transformation) of a Matrix

Two matrices A and B are said to be equivalent, if one is obtained from the other by one or more elementary operations and we write $A \sim B$.

Following elementary operations are given below:

(i) Interchanging any two rows or columns is indicated by

$$R_i \leftrightarrow R_j$$

or $C_i \leftrightarrow C_j$

(ii) Multiplication of the elements of any row or column by a non-zero scalar quantity is indicated by

$$R_i \leftrightarrow kR_i$$

or $C_i \leftrightarrow kC_i$

(iii) Addition of constant multiple of the elements of any row or column to the corresponding element of any other row, is indicated by

$$R_i \rightarrow R_i + kR_j$$

or $C_i \rightarrow C_i + kC_j$

Special Types of Matrices

1. Transpose of a Matrix

Let A be $m \times n$ matrix. Then, $n \times m$ matrix obtained by interchanging the rows and columns of A is called the transpose of A and is denoted by A' or A^C or A^T .

Important Results

- If A and B are two matrices of order $m \times n$, then $(A \pm B)' = A' \pm B'$
- If k is a scalar, then $(kA)' = kA'$
- $(A')' = A$ $(AB)' = B'A'$ $(A^n)' = (A')^n$

2. Idempotent Matrix

A square matrix A is called an idempotent matrix, if it satisfies the relation $A^2 = A$. If A and B are idempotent matrices, then $A + B$ is an idempotent iff $AB = BA$.

3. Nilpotent Matrix

A square matrix A is called nilpotent matrix, if it satisfies the relation $A^k = O$ and $A^{k+1} \neq O$.

4. Orthogonal Matrix

A square matrix A is called an orthogonal matrix, if it satisfies the relation important Results $AA' = I$.

Important Results

- If A and B are orthogonal matrices, then AB is also an orthogonal matrix.
- Every orthogonal matrix is invertible.

5. Involutory Matrix

A square matrix A is called an involutory matrix, if it satisfies the relation $A^2 = I$.

6. Symmetric Matrix

A square matrix A is called symmetric matrix, if it satisfies the relation $A' = A$.

Important Results

- If A and B are symmetric matrices of the same order, then
 - (i) AB is symmetric if and only if $AB = BA$.
 - (ii) $A \pm B$, $AB + BA$ are also symmetric matrices.
- If A is symmetric matrix, then A^{-1} will also be symmetric matrix.

7. Skew-symmetric Matrix

A square matrix A is called skew-symmetric matrix, if it satisfies the relation $A' = -A$. Every square matrix can be uniquely expressed as the sum of symmetric and skew-symmetric matrix.

$$\text{i.e.} \quad A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A')$$

Important Results

- If A and B are two skew-symmetric matrices, then
 - (i) $A \pm B$, $AB - BA$ are skew-symmetric matrices.
 - (ii) $AB + BA$ is a symmetric matrix.
- Determinant of skew-symmetric matrix of odd order is zero.

Adjoint of a Matrix

Let $A = [a_{ij}]_{m \times n}$ be a square matrix of order n and C_{ij} be the cofactor of a_{ij} in the determinant $|A|$. Then, the adjoint of A is defined as the transpose of the cofactor matrix and is denoted by $\text{adj}(A)$.

Properties of Adjoint of a Matrix

Let A be a matrix of order n , then

- (i) $(\text{adj } A)A = A(\text{adj } A) = |A| \cdot I_n$
- (ii) $|\text{adj } A| = |A|^{n-1}$, if $|A| \neq 0$
- (iii) $\text{adj}(AB) = (\text{adj } B)(\text{adj } A)$
- (iv) If $|A| = 0$, then $(\text{adj } A)A = A(\text{adj } A) = O$
- (v) $\text{adj}(A^T) = (\text{adj } A)^T$
- (vi) $|\text{adj}(\text{adj } A)| = |A|^{(n-1)^2}$
- (vii) Adjoint of a diagonal matrix is a diagonal matrix.
- (viii) $\text{adj}(\text{adj } A) = |A|^{n-2}A$

Singular and Non-singular Matrix

If A is a square matrix such that $|A| = 0$, then matrix A is singular. However, if $|A| \neq 0$, then the matrix A is called non-singular.

Inverse of a Matrix

Let A be a non-singular (where, $|A| \neq 0$) square matrix. Then, a square matrix B such that $AB = BA = I$ is called inverse of A i.e. $A^{-1} = \frac{1}{|A|} \text{adj}(A)$.

Properties of Inverse of a Matrix

Let A and B be square matrices of same order, then

- (i) A square matrix is invertible if and only if it is non-singular.
 (ii) $(A')^{-1} = (A^{-1})'$ (iii) $(AB)^{-1} = B^{-1}A^{-1}$ (iv) $|A^{-1}| = |A|^{-1}$

Solution of a System of Linear Equations

Let system of linear equations in three variables be

$$a_1x + b_1y + c_1z = d_1, a_2x + b_2y + c_2z = d_2$$

$$\text{and } a_3x + b_3y + c_3z = d_3$$

It can be written in the matrix form as

$$\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix} \Rightarrow AX = B \Rightarrow X = A^{-1}B$$

Test of Consistency

Non-homogeneous Equations ($B \neq O$)

- If $|A| \neq 0$, then the system of equations is **consistent** and has a unique solution given by $X = A^{-1}B$.
- If $|A| = 0$ and $(\text{adj } A) \cdot B \neq O$, then the system of equations is inconsistent and has no solution.
- If $|A| = 0$ and $(\text{adj } A) \cdot B = O$, then the system of equations is consistent and has infinite number of solutions.

Homogeneous Equations ($B = O$)

- If $|A| \neq 0$, then system of equations has only trivial solution and has one solution.
- If $|A| = 0$, then system of equations has non-trivial solution and has infinite number of solutions.
- If number of equations is less than number of unknowns, then it has non-trivial solution.
- A homogeneous system of equations is never inconsistent.

Practice Exercise

1. If $A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$, then which of the following is correct?

- a. $(A+B) \cdot (A-B) = A^2 + B^2$ b. $(A+B) \cdot (A-B) = A^2 - B^2$
 c. $(A+B) \cdot (A-B) = I$ d. None of these

2. If $A = \begin{bmatrix} 0 & -\tan \frac{\alpha}{2} \\ \tan \frac{\alpha}{2} & 0 \end{bmatrix}$ and I is the identity matrix of order 2, then $(I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$ is equal to

- a. A b. I
 c. $I + A$ d. None of these

3. If $A = \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix}$, then $I + 2A + 3A^2 + \dots$ is equal to

- a. $\begin{bmatrix} 4 & 1 \\ -4 & 0 \end{bmatrix}$ b. $\begin{bmatrix} 3 & 1 \\ -4 & -1 \end{bmatrix}$
 c. $\begin{bmatrix} 5 & 2 \\ -8 & -3 \end{bmatrix}$ d. $\begin{bmatrix} 5 & 2 \\ -3 & -8 \end{bmatrix}$

4. If $A = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix}$, then the value of $A^3 - 6A^2 + 7A + 2I$ is

- a. I b. O
 c. $-2I$ d. $2I$

5. If $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$, then A^n is equal to

- a. $2^{n-1}A - (n-1)I$ b. $nA - (n-1)I$
 c. $2^{n-1}A + (n-1)I$ d. $nA + (n-1)I$

6. If $A = \begin{bmatrix} 4 & 6 & -1 \\ 3 & 0 & 2 \\ 1 & -2 & 5 \end{bmatrix}$, $B = \begin{bmatrix} 2 & 4 \\ 0 & 1 \\ -1 & 2 \end{bmatrix}$ and $C = \begin{bmatrix} 3 \\ 1 \\ 2 \end{bmatrix}$, then the expression which is not defined, is

- a. $A^2 + 2B - 2A$ b. CC'
 c. $B'C$ d. AB

7. If p, q, r are 3 real numbers satisfying the matrix equation, $[p \ q \ r] \begin{bmatrix} 3 & 4 & 1 \\ 3 & 2 & 3 \\ 2 & 0 & 2 \end{bmatrix} = [3 \ 0 \ 1]$, then $2p + q - r$ is equal to

- a. -3 b. -1 c. 4 d. 2

8. If $A = \begin{bmatrix} \alpha & 2 \\ 2 & \alpha \end{bmatrix}$ and $\det(A^3) = 125$, then α is equal to

- a. ± 1 b. ± 2 c. ± 3 d. ± 5

9. If $f(x) = \begin{bmatrix} \cos x & -\sin x & 0 \\ \sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix}$ and $g(y) = \begin{bmatrix} \cos y & 0 & \sin y \\ 0 & 1 & 0 \\ -\sin y & 0 & \cos y \end{bmatrix}$, then $[f(x)g(y)]^{-1}$ is equal to

- a. $f(-x)g(-y)$ b. $f(x^{-1})g(y^{-1})$
 c. $g(-y)f(-x)$ d. $g(y^{-1})f(x^{-1})$

10. The trace of the matrix $A = \begin{bmatrix} 2 & 5 & 9 \\ 7 & -5 & 3 \\ 2 & 6 & 8 \end{bmatrix}$ is equal to

- a. 6
b. 5
c. 3
d. None of these

11. If $A = \begin{bmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{bmatrix}$, then $\det \{\text{adj}(A)\}$ equals

- a. $(14)^2$
b. $(13)^2$
c. $(14)^3$
d. $(13)^3$

12. If A and B are square matrices such that $A^2 = A$, $B^2 = B$ and A, B commute, then

- a. $(AB)^2 = I$
b. $(AB)^2 = AB$
c. $(AB)^2 = O$
d. None of these

13. If $A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$ and $A^{-1} = \frac{1}{10} \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 1 \end{bmatrix}$, then α

is equal to

- a. -2
b. 5
c. 2
d. -1

14. If $3A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ x & 2 & y \end{bmatrix}$ and $A^T A = AA^T = I$, then xy is

equal to

- a. -1
b. 1
c. 2
d. -2

15. If A and B are 3×3 matrices such that $A^2 - B^2 = (A - B)(A + B)$, then

- a. either A or B is zero matrix
b. either A or B is unit matrix
c. $A = B$
d. $AB = BA$

16. If $x = cy + bz$, $y = az + cx$ and $z = bx + ay$, where x, y and z are not all zero, then $a^2 + b^2 + c^2$ is equal to

- a. $1 + 2abc$
b. $1 - 2abc$
c. $1 + abc$
d. $abc - 1$

17. If $A = \frac{1}{3} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ is an orthogonal matrix, then

- a. $a = 1, b = 2$
b. $a = -2, b = 1$
c. $a = 3, b = -1$
d. $a = -2, b = -1$

18. The matrix $\begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ -1 & -2 & -3 \end{bmatrix}$ is

- a. idempotent
b. nilpotent
c. involutory
d. orthogonal

19. If $A = \begin{bmatrix} \cos a & -\sin a \\ \sin a & \cos a \end{bmatrix}$ and $A + A' = I$, then the value of a is

- a. $\frac{\pi}{6}$
b. $\frac{\pi}{3}$
c. π
d. $\frac{3\pi}{2}$

20. If $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$, then A^{-1} is equal to

- a. A
b. A^2
c. A^3
d. A^4

21. Let $A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$ and $10B = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$. If B is

the inverse of matrix A , then α equals

- a. -2
b. 1
c. 2
d. 5

22. If A is skew-symmetric and $B = (I - A)^{-1}(I + A)$, then B is

- a. singular
b. symmetric
c. skew-symmetric
d. orthogonal

23. Let a, b, c be positive real numbers. The following of equation $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,$

$-\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ has

- a. no solution
b. unique solution
c. infinitely many solutions
d. finitely many solutions

24. The equations $x + 2y + 3z = 1$, $x - y + 4z = 0$ and $2x + y + 7z = 1$ has

- a. only one solution
b. only two solutions
c. no solution
d. infinitely many solutions

25. If the equations $a(y + z) = x$, $b(z + x) = y$ and $c(x + y) = z$ have non-trivial solution, then $\frac{1}{1+a} + \frac{1}{1+b} + \frac{1}{1+c}$ is equal to

- a. 1
b. 2
c. -1
d. -2

26. The value of λ such that the system $x - 2y + z = -4$, $2x - y + 2z = 2$ and $x + y + \lambda z = 4$ has no solution, is

- a. 0
b. 1
c. $\neq 1$
d. 3

27. If the system of equations $x - ky - z = 0$, $kx - y - z = 0$ and $x + y - z = 0$ has a non-zero solution, then k is equal to

- a. 0, 1
b. 1 - 1
c. -1, 2
d. 2, -2

BITSAT Archives

1. If $\omega (\neq 1)$ is a cube root of unity of

$$A = \begin{bmatrix} 1 + 2\omega^{100} + \omega^{200} & \omega^2 & 1 \\ 1 & 1 + 2\omega^{100} + \omega^{200} & \omega \\ \omega & \omega^2 & 2 + \omega^{100} + 2\omega^{200} \end{bmatrix},$$

then [2014]

- a. A is singular b. $|A| \neq 0$
c. A is symmetric d. None of these

2. If $A = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix}$, then A is [2013]

- a. idempotent b. nilpotent c. involutory d. None

3. If $A = \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then the correct statement is [2011]

- a. $A^2 + 5A - 7I = O$ b. $-A^2 + 5A + 7I = O$
c. $A^2 - 5A + 7I = O$ d. $A^2 + 5A + 7I = O$

4. If $A = (a_{ij})_{2 \times 2}$, where $a_{ij} = i + j$, then A is equal to [2009]

- a. $\begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix}$ b. $\begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix}$ c. $\begin{bmatrix} 1 & 4 \\ 3 & 3 \end{bmatrix}$ d. $\begin{bmatrix} 2 & 3 \\ 3 & 4 \end{bmatrix}$

5. If $A = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix}$ and $f(t) = t^2 - 3t + 7$, then $f(A) + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix}$ is equal to [2008]

- a. $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ b. $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$ c. $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ d. $\begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$

6. If $A = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$ and I is the unit matrix of order 2, then A^2 equals [2007]

- a. $4A - 3I$ b. $3A - 4I$ c. $A - I$ d. $A + I$

7. Let A be orthogonal and non-singular matrix of order n , then the determinant of matrix $(A - I_n)$ is equal to

- a. $|I_n - A|$ b. $|A| |I_n - A|$ [2007]
c. $|A|$ d. $(-1)^n |A| |I_n - A|$

8. The inverse of the matrix $\begin{bmatrix} 5 & -2 \\ 3 & 1 \end{bmatrix}$ is [2006]

- a. $\frac{1}{11} \begin{bmatrix} 1 & 2 \\ -3 & 5 \end{bmatrix}$ b. $\begin{bmatrix} 1 & 2 \\ -3 & 5 \end{bmatrix}$
c. $\frac{1}{13} \begin{bmatrix} -2 & 5 \\ 1 & 3 \end{bmatrix}$ d. $\begin{bmatrix} 1 & 3 \\ -2 & 5 \end{bmatrix}$

Answer with Solutions

Practice Exercise

1. (a) Here, $A + B = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} + \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 2 & 1 \end{bmatrix}$

and $A - B = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} - \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 2 \\ 0 & 1 \end{bmatrix}$

Now, $A^2 = A \cdot A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 + 1 & 0 + 1 \\ 0 + 1 & 1 + 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}$

and $B^2 = B \cdot B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$

$\therefore A^2 - B^2 = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} - \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 2 & 1 \\ 1 & 3 \end{bmatrix}$

$A^2 + B^2 = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$

and $(A + B)(A - B) = \begin{bmatrix} 0 & 0 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 0 & 2 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 + 0 & 0 + 0 \\ 0 + 0 & 4 + 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 5 \end{bmatrix}$

Hence, $(A + B)(A - B) \neq A^2 - B^2$

and $(A + B)(A - B) \neq A^2 + B^2$

2. (c) Here, $A = \begin{bmatrix} 0 & -t \\ t & 0 \end{bmatrix}$, where $t = \tan\left(\frac{\alpha}{2}\right)$

Now, $\cos \alpha = \frac{1 - \tan^2\left(\frac{\alpha}{2}\right)}{1 + \tan^2\left(\frac{\alpha}{2}\right)} = \frac{1 - t^2}{1 + t^2}$

and $\sin \alpha = \frac{2 \tan\left(\frac{\alpha}{2}\right)}{1 + \tan^2\left(\frac{\alpha}{2}\right)} = \frac{2t}{1 + t^2}$

Now, we have $(I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$

$$= \begin{bmatrix} 1 & t \\ -t & 1 \end{bmatrix} \begin{bmatrix} \frac{1-t^2}{1+t^2} & \frac{-2t}{1+t^2} \\ \frac{2t}{1+t^2} & \frac{1-t^2}{1+t^2} \end{bmatrix} = \begin{bmatrix} \frac{1-t^2+2t^2}{1+t^2} & \frac{-2t+t(1-t^2)}{1+t^2} \\ \frac{-t(1-t^2)+2t}{1+t^2} & \frac{2t^2+1-t^2}{1+t^2} \end{bmatrix}$$

$$= \begin{bmatrix} \frac{1+t^2}{1+t^2} & \frac{-t(1+t^2)}{1+t^2} \\ \frac{t(1+t^2)}{1+t^2} & \frac{1+t^2}{1+t^2} \end{bmatrix} = \begin{bmatrix} 1 & -t \\ t & 1 \end{bmatrix}$$

Now, $I + A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & -t \\ t & 0 \end{bmatrix} = \begin{bmatrix} 1 & -t \\ t & 1 \end{bmatrix}$

$\therefore (I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} = I + A$

3. (c) $\therefore A^2 = \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$

$\therefore I + 2A + 3A^2 + \dots = I + 2A$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 4 & 2 \\ -8 & -4 \end{bmatrix} = \begin{bmatrix} 5 & 2 \\ -8 & -3 \end{bmatrix}$$

4. (c) **Hint** Here, $A^2 = A \times A = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix}$

$$= \begin{bmatrix} 5 & 0 & 8 \\ 2 & 4 & 5 \\ 8 & 0 & 13 \end{bmatrix}$$

and $A^3 = A^2 \times A = \begin{bmatrix} 5 & 0 & 8 \\ 2 & 4 & 5 \\ 8 & 0 & 13 \end{bmatrix} \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} = \begin{bmatrix} 21 & 0 & 34 \\ 12 & 8 & 23 \\ 34 & 0 & 55 \end{bmatrix}$

5. (b) Here, $A^2 = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$

$$A^3 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix}$$

$$\vdots \quad \vdots \quad \vdots$$

$$A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix} - \begin{bmatrix} n-1 & 0 \\ 0 & n-1 \end{bmatrix}$$

$$= nA - (n-1)I$$

6. (a) By inspection, matrices A^2 and A are of order 3×3 , while matrix B is of order 3×2 . Therefore, $A^2 + 2B - 2A$ is not defined.

7. (a) $[3p + 3q + 2r \quad 4p + 2q + 0 \quad p + 3q + 2r] = [3 \quad 0 \quad 1]$

$$\Rightarrow 3p + 3q + 2r = 3, 4p + 2q = 0, p + 3q + 2r = 1$$

$$\Rightarrow p = 1, q = -2, r = 3$$

$$\therefore 2p + q - r = 2 - 2 - 3 = -3$$

8. (c) $125 = \det(A^3) = (\det A)^3 = (\alpha^2 - 4)^3$

$$\Rightarrow \alpha^2 - 4 = 5 \Rightarrow \alpha^2 = 9 \Rightarrow \alpha = \pm 3$$

9. (c) We have, $[f(x)g(y)]^{-1} = [g(y)]^{-1}[f(x)]^{-1} = g(-y)f(-x)$

10. (b) $\text{tr}(A) = \text{Sum of principal diagonal elements}$
 $= 2 + (-5) + 8 = 5$

11. (a) $\therefore |\text{adj}(A)| = |A|^{n-1}$ and $\det(A) = 14$

$$\therefore \det\{\text{adj}(A)\} = (14)^2$$

12. (b) $(AB)^2 = (AB) \cdot (AB) = A(BA)B = A(AB)B \quad [\because AB = BA]$
 $= (A \cdot A)(B \cdot B) = A^2 \cdot B^2 = AB$

13. (b) Here, $AA^{-1} = I$

If R_1 of A is multiplied by C_3 of A^{-1} , we get

$$2 - \alpha + 3 = 0 \Rightarrow \alpha = 5$$

14. (c) Since, A is orthogonal. So, each row is orthogonal to the other rows.

$$\therefore R_1 \cdot R_3 = 0$$

$$\Rightarrow x + 4 + 2y = 0$$

and $R_2 \cdot R_3 = 0$

$$\Rightarrow 2x + 2 - 2y = 0$$

On solving, we get $x = -2, y = -1$

$$\therefore xy = 2$$

15. (d) $\therefore A^2 - B^2 = (A - B)(A + B) = A^2 + AB - BA - B^2$

$$\therefore AB = BA$$

16. (b) Given, $-x + cy + bz = 0$

$$cx - y + az = 0$$

and $bx + ay - z = 0$

Then, $\begin{vmatrix} -1 & c & b \\ c & -1 & a \\ b & a & -1 \end{vmatrix} = 0$

$$\therefore a^2 + b^2 + c^2 = 1 - 2abc$$

17. (d) **Hint** $AA^T = I$

$$\Rightarrow \frac{1}{3} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix} \cdot \frac{1}{3} \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 9 & 0 & a + 4 + 2b \\ 0 & 9 & 2a + 2 - 2b \\ a + 4 + 2b & 2a + 2 - 2b & a^2 + 4 + b^2 \end{bmatrix} = \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$$

18. (b) Let $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ -1 & -2 & -3 \end{bmatrix}$, then $A^2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = O$

Hence, A is nilpotent matrix of index 2.

19. (b) **Hint** $A + A' = I$

$$\Rightarrow \begin{bmatrix} \cos a & -\sin a \\ \sin a & \cos a \end{bmatrix} + \begin{bmatrix} \cos a & \sin a \\ -\sin a & \cos a \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

20. (c) **Hint** $|A| = 3(-3 + 4) + 3(2 - 0) + 4(-2 + 0)$

$$= 3 \times 1 + 3 \times 2 + 4 \times -2 = 1$$

and $\text{adj}(A) = \begin{bmatrix} 1 & -2 & -2 \\ -1 & 3 & 3 \\ 0 & -4 & -3 \end{bmatrix}^T = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix}$

$$\therefore A^{-1} = \frac{1}{1} \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} \text{ and } A^3 = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix}$$

$$21. (d) \text{ Hint } 10A^{-1} = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \quad [\because B = A^{-1}]$$

$$\Rightarrow 10A^{-1}A = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} A$$

$$\Rightarrow 10I = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$$

$$22. (d) \text{ Here, } BB^T = (I - A)^{-1}(I + A)(I + A)^T[(I - A)^{-1}]^T \\ = (I - A)^{-1}(I + A)(I - A)(I + A)^{-1} \\ = (I - A)^{-1}(I - A)(I + A)(I + A)^{-1} = I \cdot I = I$$

Hence, B is an orthogonal matrix.

$$23. (b) \text{ Let } \frac{x^2}{a^2} = X, \frac{y^2}{b^2} = Y \text{ and } \frac{z^2}{c^2} = Z. \text{ Then, the given system of equations reduces to}$$

$$X + Y - Z = 1, X - Y + Z = 1, -X + Y + Z = 1$$

$$\text{The coefficient matrix is } A = \begin{bmatrix} 1 & 1 & -1 \\ 1 & -1 & 1 \\ -1 & 1 & 1 \end{bmatrix}$$

Clearly $|A| \neq 0$, so the given system of equations has a unique solution.

$$24. (d) \text{ Here, } |A| = \begin{vmatrix} 1 & 2 & 3 \\ 1 & -1 & 4 \\ 2 & 1 & 7 \end{vmatrix} = \begin{vmatrix} 1 & 2 & 3 \\ 0 & -3 & 1 \\ 0 & -3 & 1 \end{vmatrix} = 0$$

$$[\text{applying } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - 2R_1]$$

$$\text{Again, } \text{adj}(A) = \begin{bmatrix} -11 & 1 & 3 \\ -11 & 1 & 3 \\ -11 & -1 & -3 \end{bmatrix} = \begin{bmatrix} -11 & -11 & -11 \\ 1 & 1 & -1 \\ 3 & 3 & -3 \end{bmatrix}$$

$$\text{adj}(A)B = \begin{bmatrix} -11 & -11 & -11 \\ 1 & 1 & -1 \\ 3 & 3 & -3 \end{bmatrix} \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} = O$$

So, the given system is consistent and has infinitely many solutions.

$$25. (b) \text{ Here, } \begin{vmatrix} -1 & a & a \\ b & -1 & b \\ c & c & -1 \end{vmatrix} = 0$$

On applying, $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\begin{vmatrix} -1 & a+1 & a+1 \\ b & -(b+1) & 0 \\ c & 0 & -(1+c) \end{vmatrix} = 0$$

On applying $R_1 \rightarrow \frac{R_1}{a+1}$, $R_2 \rightarrow \frac{R_2}{b+1}$, $R_3 \rightarrow \frac{R_3}{c+1}$, we get

$$\begin{vmatrix} -\frac{1}{a+1} & 1 & 1 \\ \frac{b}{b+1} & -1 & 0 \\ \frac{c}{c+1} & 0 & -1 \end{vmatrix} = 0$$

$$\Rightarrow -\frac{1}{a+1} + \frac{b}{b+1} + \frac{c}{c+1} = 0$$

$$\Rightarrow -\frac{1}{a+1} + 1 - \frac{1}{b+1} + 1 - \frac{1}{c+1} = 0$$

$$\Rightarrow \frac{1}{a+1} + \frac{1}{b+1} + \frac{1}{c+1} = 2$$

$$26. (c) \text{ For no solution, } \begin{vmatrix} 1 & -2 & 1 \\ 2 & -1 & 2 \\ 1 & 1 & \lambda \end{vmatrix} \neq 0$$

$$\Rightarrow \lambda \neq 1$$

$$27. (b) \text{ For non-zero solution, } \begin{vmatrix} 1 & -k & -1 \\ k & -1 & -1 \\ 1 & 1 & -1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & -k & -1 \\ k-1 & k-1 & 0 \\ 0 & k+1 & 0 \end{vmatrix} = 0$$

$$[\text{applying } R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1]$$

$$\Rightarrow k^2 - 1 = 0$$

$$\Rightarrow k = 1, -1$$

BITSAT Archives

$$1. (d) \text{ Hint } A = \begin{bmatrix} 1+2\omega+\omega^2 & \omega^2 & 1 \\ 1 & 1+\omega^2+2\omega & \omega \\ \omega & \omega^2 & 2+\omega+2\omega^2 \end{bmatrix}$$

$$\therefore |A| = \begin{vmatrix} \omega & \omega^2 & 1 \\ 1 & \omega & \omega \\ \omega & \omega^2 & 1+\omega^2 \end{vmatrix}$$

$$2. (c) \text{ Hint Now, } A^2 = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix} \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$3. (c) \text{ Here, } A^2 = \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} 8 & 5 \\ -5 & 3 \end{bmatrix}$$

$$\therefore A^2 - 5A + 7I$$

$$= \begin{bmatrix} 8 & 5 \\ -5 & 3 \end{bmatrix} - \begin{bmatrix} 15 & 5 \\ -5 & 10 \end{bmatrix} + \begin{bmatrix} 7 & 0 \\ 0 & 7 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$4. (d) A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

$$= \begin{bmatrix} 1+1 & 1+2 \\ 2+1 & 2+2 \end{bmatrix} = \begin{bmatrix} 2 & 3 \\ 3 & 4 \end{bmatrix}$$

5. (b) Given that, $A = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix}$

and $f(t) = t^2 - 3t + 7$

Then, $A^2 = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix} = \begin{bmatrix} -7 & -12 \\ 24 & 17 \end{bmatrix}$

Now, $f(A) = A^2 - 3A + 7$

$$= \begin{bmatrix} -7 & -12 \\ 24 & 17 \end{bmatrix} - 3 \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix} + 7 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} -3 & -6 \\ 12 & 9 \end{bmatrix}$$

$$\therefore f(A) + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix} = \begin{bmatrix} -3 & -6 \\ 12 & 9 \end{bmatrix} + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

6. (a) Here, $A^2 = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$

$$= \begin{bmatrix} 4+1 & -2-2 \\ -2-2 & 1+4 \end{bmatrix} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}$$

Now, $4A - 3I = 4 \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} - \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}$

$\therefore A^2 = 4A - 3I$

7. (b) We know that, $A \cdot A^T = I_n$

$\therefore A - I_n = A - AA^T = A(I_n - A^T)$

$\Rightarrow |A - I_n| = |A(I_n - A^T)|$

$$= |A| |I_n - A^T|$$

$$= |A| |I_n - A|$$

8. (a) Let $A = \begin{bmatrix} 5 & -2 \\ 3 & 1 \end{bmatrix}$

$|A| = 5 + 6 = 11$

Now, $\text{adj}(A) = \begin{bmatrix} 1 & 2 \\ -3 & 5 \end{bmatrix}$

$\therefore A^{-1} = \frac{1}{|A|} (\text{adj } A) = \frac{1}{11} \begin{bmatrix} 1 & 2 \\ -3 & 5 \end{bmatrix}$

8

Determinants

Introduction

Every square matrix $A = [a_{ij}]$ of order n can be associated to an expression or a number which is called its determinant. It is denoted by $|A|$ or $\det A$ or Δ . If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then determinant of A is written as

$$|A| = \begin{vmatrix} a & b \\ c & d \end{vmatrix} = \det(A)$$

NOTE

- For matrix A , $|A|$ is read as determinant of A not modulus of A .
- Only square matrices have determinant.

Determinant of a Square Matrix of Order 1

Let $A = [a_{11}]$ be a 1×1 matrix, then the determinant of A is the number a_{11} itself i.e. $|A| = a_{11}$.

Determinant of a Square Matrix of Order 2

Let $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ be a matrix of order 2×2 , then

$$\det(A) \text{ or } |A| \text{ or } \Delta = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11} a_{22} - a_{21} a_{12}$$

Determinant of Matrix of Order 3

Let $[A] = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ be a square matrix of order 3.

$$\begin{aligned} \text{Then, } |A| &= \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \Rightarrow |A| = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix} \\ &= a_{11}(a_{22}a_{33} - a_{23}a_{32}) - a_{12}(a_{21}a_{33} - a_{23}a_{31}) + a_{13}(a_{21}a_{32} - a_{22}a_{31}) \end{aligned}$$

Minors and Cofactors of a Determinant

Minors and cofactors of determinant can be defined in following ways:

Minor of an Element

Minor of an element is the determinant obtained by deleting the row and column in which that element lies. It is denoted by M_{ij} .

e.g. Given, a 3×3 determinant

$$\begin{vmatrix} a_{31} & a_{32} & a_{33} \\ a_{41} & a_{42} & a_{43} \\ a_{51} & a_{52} & a_{53} \end{vmatrix}$$

Minor of a_{31} is $M_{31} = \begin{vmatrix} a_{42} & a_{43} \\ a_{52} & a_{53} \end{vmatrix}$

and minor of a_{32} is $M_{32} = \begin{vmatrix} a_{41} & a_{43} \\ a_{51} & a_{53} \end{vmatrix}$

Similarly, it can be calculated for other elements of a determinant.

Cofactor of an Element

Let $A = \{a_{ij}\}$ be an n order square matrix. Then, the cofactor C_{ij} of a_{ij} for A will be $(-1)^{i+j}$ times of M_{ij} (minor of an element of a determinant). It means $C_{ij} = (-1)^{i+j} M_{ij}$.

$$C_{ij} = \begin{cases} -M_{ij} & \text{when } i+j \text{ is odd} \\ M_{ij} & \text{when } i+j \text{ is even} \end{cases}$$

e.g. Cofactor of a_{31} in 3×3 determinant $\begin{vmatrix} a_{31} & a_{32} & a_{33} \\ a_{41} & a_{42} & a_{43} \\ a_{51} & a_{52} & a_{53} \end{vmatrix}$ will

be C_{31} .

i.e. $C_{31} = (-1)^{3+1} \begin{vmatrix} a_{42} & a_{43} \\ a_{52} & a_{53} \end{vmatrix}$

Properties of Determinants

1. If each element of a row (column) is a zero, then $\Delta = 0$.
2. If two rows (columns) are proportional, then $\Delta = 0$.
3. If any two rows (columns) are interchanged odd times, then Δ becomes $-\Delta$.
4. If the rows and columns are interchanged, then Δ is unchanged i.e. $|A^T| = |A|$.
5. If each element of a row (column) of a determinant is multiplied by a constant k , then the value of the new determinant is k times the value of the original determinant.

i.e. $\begin{vmatrix} ka & kb & kc \\ p & q & r \\ u & v & w \end{vmatrix} = k \begin{vmatrix} a & b & c \\ p & q & r \\ u & v & w \end{vmatrix}$

6. $\begin{vmatrix} a_1 + a_2 & b & c \\ p_1 + p_2 & q & r \\ u_1 + u_2 & v & w \end{vmatrix} = \begin{vmatrix} a_1 & b & c \\ p_1 & q & r \\ u_1 & v & w \end{vmatrix} + \begin{vmatrix} a_2 & b & c \\ p_2 & q & r \\ u_2 & v & w \end{vmatrix}$

7. If a scalar multiple of any row (column) is added to another row (column), then Δ is unchanged.

i.e. $\begin{vmatrix} a & b & c \\ p & q & r \\ u & v & w \end{vmatrix} = \begin{vmatrix} a & b & c \\ p + ka & q + kb & r + kc \\ u & v & w \end{vmatrix}$

8. Let $\Delta(x)$ be a 3rd order determinant having polynomials as its elements.

- (i) If $\Delta(a)$ has two rows (columns) proportional, then $(x-a)$ is a factor of $\Delta(x)$.
- (ii) If $\Delta(a)$ has three rows (columns) proportional, then $(x-a)^2$ is a factor of $\Delta(x)$.

9. Product of two determinants

i.e. $|AB| = |A||B| = |BA| = |AB^T| = |A^T B| = |A^T B^T|$

10. If $\Delta(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ a & b & c \end{vmatrix}$, then

(i) $\sum_{x=1}^n \Delta(x) = \begin{vmatrix} \sum_{x=1}^n f_1(x) & \sum_{x=1}^n f_2(x) & \sum_{x=1}^n f_3(x) \\ \sum_{x=1}^n g_1(x) & \sum_{x=1}^n g_2(x) & \sum_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$

(ii) $\prod_{x=1}^n \Delta(x) = \begin{vmatrix} \prod_{x=1}^n f_1(x) & \prod_{x=1}^n f_2(x) & \prod_{x=1}^n f_3(x) \\ \prod_{x=1}^n g_1(x) & \prod_{x=1}^n g_2(x) & \prod_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$

11. $\det(kA) = k^n \det(A)$, if A is of order $n \times n$.
12. $\det(A^n) = (\det A)^n$, if $n \in I^+$.
13. $|A^T| = |A|$, where A^T is a transpose of a matrix.

Symmetric Determinant

$$\begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix} = abc + 2fgh - af^2 - bg^2 - ch^2$$

Skew-symmetric Determinant

$$\begin{vmatrix} 0 & h & -g \\ -h & 0 & f \\ g & -f & 0 \end{vmatrix} = 0$$

In skew-symmetric matrix of odd order, the value of determinant is zero.

Product of Determinants

Generally, the product of determinants can be calculated by row column multiplication rule and it is same as the rule of multiplication of two matrices.

$$\text{e.g. Let } \Delta_1 = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ and } \Delta_2 = \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix}$$

be two determinants, then

$$\Delta_1 \Delta_2 = \begin{vmatrix} a_1\alpha_1 + b_1\alpha_2 + c_1\alpha_3 & a_1\beta_1 + b_1\beta_2 + c_1\beta_3 & a_1\gamma_1 + b_1\gamma_2 + c_1\gamma_3 \\ a_2\alpha_1 + b_2\alpha_2 + c_2\alpha_3 & a_2\beta_1 + b_2\beta_2 + c_2\beta_3 & a_2\gamma_1 + b_2\gamma_2 + c_2\gamma_3 \\ a_3\alpha_1 + b_3\alpha_2 + c_3\alpha_3 & a_3\beta_1 + b_3\beta_2 + c_3\beta_3 & a_3\gamma_1 + b_3\gamma_2 + c_3\gamma_3 \end{vmatrix}$$

Cyclic Determinant

A circulant matrix is one in which each row vector is rotated one element to the right relative to the preceding row vector.

$$1. \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = (x-y)(y-z)(z-x)$$

$$2. \begin{vmatrix} 1 & x & x^3 \\ 1 & y & y^3 \\ 1 & z & z^3 \end{vmatrix} = (x-y)(y-z)(z-x)(x+y+z)$$

$$3. \begin{vmatrix} 1 & x^2 & x^3 \\ 1 & y^2 & y^3 \\ 1 & z^2 & z^3 \end{vmatrix} = (x-y)(y-z)(z-x)(xy+yz+zx)$$

$$4. \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = -(a+b+c)(a^2+b^2+c^2-ab-bc-ca)$$

$$= -(a^3+b^3+c^3-3abc)$$

$$5. \begin{vmatrix} a & bc & abc \\ b & ca & abc \\ c & ab & abc \end{vmatrix} = \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix}$$

$$= abc(a-b)(b-c)(c-a)$$

$$6. \begin{vmatrix} \cos(A-P) & \cos(A-Q) & \cos(A-R) \\ \cos(B-P) & \cos(B-Q) & \cos(B-R) \\ \cos(C-P) & \cos(C-Q) & \cos(C-R) \end{vmatrix} = 0$$

$$7. \begin{vmatrix} 1 & \cos(\beta-\alpha) & \cos(\gamma-\alpha) \\ \cos(\alpha-\beta) & 1 & \cos(\gamma-\beta) \\ \cos(\alpha-\gamma) & \cos(\beta-\gamma) & 1 \end{vmatrix} = 0$$

$$8. \begin{vmatrix} (a_1-b_1)^2 & (a_1-b_2)^2 & (a_1-b_3)^2 \\ (a_2-b_1)^2 & (a_2-b_2)^2 & (a_2-b_3)^2 \\ (a_3-b_1)^2 & (a_3-b_2)^2 & (a_3-b_3)^2 \end{vmatrix} = 0$$

$$= 2(a_1-a_2)(a_2-a_3)(a_3-a_1)(b_1-b_2)(b_2-b_3)(b_3-b_1)$$

Area of Triangles using Determinants

If three vertices of a triangle are (x_1, y_1) , (x_2, y_2) and (x_3, y_3) , then the area of the triangle can be calculated as

$$\frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \frac{1}{2} |\{x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)\}|$$

NOTE Condition for three points to be collinear, is given by

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Solution of System of Linear Equations

For the solution of system of non-homogeneous equation in two or three variables.

$$\text{Let } a_1x + b_1y + c_1z = d_1,$$

$$a_2x + b_2y + c_2z = d_2 \text{ and } a_3x + b_3y + c_3z = d_3$$

be a system of linear equations.

Then, the set of values of variables x, y and z which simultaneously satisfy these three equations, is called a **solution**.

Consistent

If the system of equations has a unique solution or infinite many solutions, then the system of equations is known as consistent.

Inconsistent

If the system of equations has no solution, then the system of equations is known as inconsistent.

Cramer's Rule

A system of simultaneous linear equations can be solved by Cramer's rule, named after the Swiss Mathematician Gabriel Cramer.

(i) **In Two Variables** Let we have two equations

$$a_1x + b_1y = c_1 \text{ and } a_2x + b_2y = c_2$$

Then, its solution will be

$$x = \frac{D_1}{D} \text{ and } y = \frac{D_2}{D}$$

$$\text{where, } D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}, D_1 = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$$

$$\text{and } D_2 = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}, \text{ provided that } D \neq 0.$$

(ii) **In Three Variables** Let we have three equations

$$a_1x + b_1y + c_1z = d_1$$

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

Then, its solution will be

$$x = \frac{D_1}{D}, y = \frac{D_2}{D}$$

and

$$z = \frac{D_3}{D}$$

$$\text{where, } D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}, D_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}$$

$$D_2 = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix},$$

$$D_3 = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix},$$

provided that $D \neq 0$.

Conditions for Consistency

Non-homogeneous System

The following cases arise while solving linear equations in two or three variables :

- If $D \neq 0$, then system will be consistent for a unique solution.
- If $D = 0$ and atleast one of D_1, D_2 and D_3 is non-zero, then given system is inconsistent i.e. no solution.
- If $D = 0$ and $D_1 = D_2 = D_3 = 0$, then given system is consistent with infinite many solutions or is inconsistent.

Homogeneous System

The following cases arise while solving linear equations in two or three variables :

- When $D \neq 0$, then system has trivial solution.
i.e. $x = y = z = 0$
- When $D = 0$, then system has non-trivial solution
i.e. infinitely many solutions.

Practice Exercise

1. If $A = \begin{bmatrix} 23 & 1+i & -i \\ 1-i & -31 & 4-5i \\ i & 4+5i & 17 \end{bmatrix}$, then $\det(A)$ is

- complex number with positive real part
- complex number with negative imaginary part
- pure imaginary
- real

2. Let $A_a = \begin{bmatrix} \cos a & -\sin a & 0 \\ \sin a & \cos a & 0 \\ 0 & 0 & 1 \end{bmatrix}$, then

- $A_{a+\beta} = A_a A_\beta$
- $A_a^{-1} = A_a$
- $A_a^{-1} = -A_a$
- $A_a^2 = -I$

3. The value of third order determinant is 11, then the value of the square of the determinant formed by the cofactors will be

- 11
- 121
- 1331
- 14641

4. If $\begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix} = k \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$, then k is equal

to

- 0
- 1
- 2
- 3

5. $\begin{vmatrix} xp+y & x & y \\ yp+z & y & z \\ 0 & xp+y & yp+z \end{vmatrix} = 0$, if

- x, y and z are in AP
- x, y and z are in GP
- x, y and z are in HP
- xy, yz and zx are in AP

6. If $\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = k(a+b+c)^3$,

then k is equal to

- 0
- 1
- 2
- 3

7. If a, b and c are cube roots of unity, then

$\begin{vmatrix} e^a & e^{2a} & e^{3a}-1 \\ e^b & e^{2b} & e^{3b}-1 \\ e^c & e^{2c} & e^{3c}-1 \end{vmatrix}$ is equal to

- 0
- e
- e^2
- e^3

8. If $\begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix} = 0$ and the vectors $(1, a, a^2)$, $(1, b, b^2)$

and $(1, c, c^2)$ are non-coplanar, then abc is equal to

- a. 2 b. -1
c. 1 d. 0

9. If $px^4 + qx^3 + rx^2 + sx + t = \begin{vmatrix} x^2 + 3x & x-1 & x+3 \\ x+1 & -2x & x-4 \\ x-3 & x+4 & 3x \end{vmatrix}$,

where p, q, r, s and t are constants, then t is equal to

- a. 0 b. 1
c. 2 d. -1

10. If $a_1, a_2, a_3, \dots$ are in GP, then

$\begin{vmatrix} \log a_n & \log a_{n+1} & \log a_{n+2} \\ \log a_{n+3} & \log a_{n+4} & \log a_{n+5} \\ \log a_{n+6} & \log a_{n+7} & \log a_{n+8} \end{vmatrix}$ is equal to

- a. 0 b. 1
c. 2 d. 4

11. If $f(y) = \begin{vmatrix} a & -1 & 0 \\ ay & a & -1 \\ ay^2 & ay & a \end{vmatrix}$, then $f(2y) - f(y)$ is divisible by

- a. y^3 b. 0 c. $2a + 3y$ d. y^2

12. Suppose $\begin{vmatrix} x+1 & 3 & 5 \\ 2 & x+2 & 5 \\ 2 & 3 & x+4 \end{vmatrix} = 0$, then the value of x

is equal to

- a. 1, 9 b. -1, 9 c. -1, -9 d. 1, -9

13. If $a + b + c = 0$, then one root of

$\begin{vmatrix} a-n & c & b \\ c & b-n & a \\ b & a & c-n \end{vmatrix} = 0$ is

- a. $n = 1$ b. $n = 2$
c. $n = a^2 + b^2 + c^2$ d. $n = 0$

14. Let $A = \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix}$. If $|A^2| = 25$, then $|\alpha|$ equals

- a. 5^2 b. 1 c. $\frac{1}{5}$ d. 5

15. If $D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$ for $x \neq 0, y \neq 0$, then D is

- a. divisible by neither x nor y
b. divisible by both x and y
c. divisible by x but not y
d. divisible by y but not x

16. In $\triangle ABC$, $\begin{vmatrix} 1 & 1 \\ 1+\sin A & 1+\sin B \\ \sin A + \sin^2 A & \sin B + \sin^2 B \end{vmatrix} \begin{vmatrix} 1 \\ 1+\sin C \\ \sin C + \sin^2 C \end{vmatrix} = 0$,

then $\triangle ABC$ is a/an

- a. right angled triangle b. equilateral triangle
c. isosceles triangle d. scalene triangle

17. If $\Delta = \begin{vmatrix} a+bx & c+dx & p+qx \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix}$, then using properties

of determinant, Δ is equal to

a. $\begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$ b. $\begin{vmatrix} a & c & p \\ d & b & q \\ w & v & u \end{vmatrix}$
c. $(1-x^2) \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$ d. $(x^2-1) \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$

18. If $1, \omega, \omega^2$ are the cube roots of unity, then

$\begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$ is equal to

- a. 0 b. 1 c. ω d. ω^2

19. If a, b and c are positive and not all equal, then the

value of the determinant $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ is

- a. > 0 b. ≥ 0 c. < 0 d. ≤ 0

20. $\begin{vmatrix} n & n+1 & n+2 \\ {}^nP_n & {}^{(n+1)}P_{(n+1)} & {}^{(n+2)}P_{(n+2)} \\ {}^nC_n & {}^{(n+1)}C_{(n+1)} & {}^{(n+2)}C_{(n+2)} \end{vmatrix}$ is equal to

- a. $n(n!)$ b. $(n+1)(n+1)!$
c. $(n+2)(n+2)!$ d. $(n^2+n+1)n!$

21. If the determinant $\begin{vmatrix} \cos 2x & \sin^2 x & \cos 4x \\ \sin^2 x & \cos 2x & \cos^2 x \\ \cos 4x & \cos^2 x & \cos 2x \end{vmatrix}$ is

expanded in powers of $\sin x$, then the constant term is

- a. 0 b. 1 c. -1 d. 2

22. If $f(x) = \begin{vmatrix} 1 & x & x+1 \\ 2x & x(x-1) & (x+1)x \\ 3x(x-1) & x(x-1)(x-2) & (x+1)x(x-1) \end{vmatrix}$,

then $f(50)$ is equal to

- a. 0 b. 50 c. 1 d. -50

23. If ω is an imaginary cube root of unity, then the value

$$\begin{vmatrix} a & b\omega^2 & a\omega \\ b\omega & c & b\omega^2 \\ c\omega^2 & a\omega & c \end{vmatrix}$$

- a. $a^3 + b^3 + c^2 - 3abc$ b. $a^2b - b^2c$
c. 0 d. $a^2 + b^2 + c^2$

24. The number of distinct real roots of the equation

$$\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0 \text{ in } \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \text{ is}$$

- a. 0 b. 1 c. 2 d. 3

25. If x, y and z are positive, then $\begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix}$

is equal to

- a. 0 b. 1 c. -1 d. None

26. If $\begin{vmatrix} 1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$, then θ is

equal to

- a. $\frac{7\pi}{24}, \frac{11\pi}{24}$ b. $\frac{5\pi}{24}, \frac{7\pi}{24}$ c. $\frac{11\pi}{24}, \frac{\pi}{24}$ d. $\frac{\pi}{24}, \frac{7\pi}{24}$

27. If α, β and γ are the roots of the equation $x^3 + px + q = 0$, then the value of the determinant

$$\begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix}$$

- a. 0 b. -2 c. 2 d. 4

28. If $a^2 + b^2 + c^2 = -2$ and

$$f(x) = \begin{vmatrix} 1 + a^2x & (1 + b^2)x & (1 + c^2)x \\ (1 + a^2)x & 1 + b^2x & (1 + c^2)x \\ (1 + a^2)x & (1 + b^2)x & 1 + c^2x \end{vmatrix}, \text{ then } f(x) \text{ is a}$$

polynomial of degree

- a. 0 b. 1 c. 2 d. 3

29. If α, β, γ are the roots of $x^3 + ax^2 + b = 0$, then the

$$\text{value of } \begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} \text{ is equal to}$$

- a. $-a^3$ b. $a^3 - ab$ c. a^3 d. $a^2 - 3b$

30. The parameter, on which the value of the determinant

$$\begin{vmatrix} 1 & a & a^2 \\ \cos(p-d)x & \cos px & \cos(p+d)x \\ \sin(p-d)x & \sin px & \sin(p+d)x \end{vmatrix}$$

does not

- depend, is

- a. a b. p c. d d. x

31. If $e^{i\theta} = \cos \theta + i \sin \theta$, $A + B + C = \pi$ and

$$z = \begin{vmatrix} e^{2iA} & e^{-iC} & e^{-iB} \\ e^{-iC} & e^{2iB} & e^{-iA} \\ e^{-iB} & e^{-iA} & e^{2iC} \end{vmatrix}, \text{ then}$$

- a. $\operatorname{Re}(z) = 4$
b. $\operatorname{Im}(z) = 0$
c. $\operatorname{Re}(z) = -4$
d. $\operatorname{Im}(z) = -1$

32. The value of $\begin{vmatrix} 1 & \cos(\beta - \alpha) & \cos(\gamma - \alpha) \\ \cos(\alpha - \beta) & 1 & \cos(\gamma - \beta) \\ \cos(\alpha - \gamma) & \cos(\beta - \gamma) & 1 \end{vmatrix}$ is

- a. $\begin{vmatrix} \cos \alpha & \sin \alpha & 1 \\ \cos \beta & \sin \beta & 1 \\ \cos \gamma & \sin \gamma & 1 \end{vmatrix}^2$ b. $\begin{vmatrix} \sin \alpha & \cos \alpha & 0 \\ \sin \beta & \cos \beta & 0 \\ \sin \gamma & \cos \gamma & 0 \end{vmatrix}^2$
c. $\begin{vmatrix} \cos \alpha & \sin \alpha & 0 \\ \sin \beta & 0 & \cos \beta \\ 0 & \cos \gamma & \sin \gamma \end{vmatrix}^2$ d. None of these

33. If A, B and C are angles of a triangle, then the

$$\text{determinant } \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix} \text{ is equal to}$$

- a. 0 b. -1
c. 1 d. None of these

34. If $\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix} = (a^3 + b^3 + c^3 + kabc)^2$, then the value of k is

- a. 3 b. -3
c. 4 d. 0

35. If $\alpha, \beta \neq 0$ and $f(n) = \alpha^n + \beta^n$ and

$$\begin{vmatrix} 3 & 1 + f(1) & 1 + f(2) \\ 1 + f(1) & 1 + f(2) & 1 + f(3) \\ 1 + f(2) & 1 + f(3) & 1 + f(4) \end{vmatrix} = k(1 - \alpha)^2(1 - \beta)^2(\alpha - \beta)^2,$$

then k is equal to

- a. $\alpha\beta$ b. $\frac{1}{\alpha\beta}$
c. 1 d. -1

36. Using the factor theorem, it is found that $b + c, c + a$ and $a + b$ are three factors of the determinant

$$\begin{vmatrix} -2a & a + b & a + c \\ b + a & -2b & b + c \\ c + a & c + b & -2c \end{vmatrix}.$$

The constant value of the

determinant, is

- a. 4 b. 2
c. $a + b + c$ d. None of these

37. If the coordinates of the vertices of an equilateral triangle with sides of length a are (x_1, y_1) , (x_2, y_2) and

(x_3, y_3) , then $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2$ is equal to

- a. $\frac{3a^4}{4}$ b. $\frac{3a^5}{4}$
 c. $\frac{3a^2}{2}$ d. $\frac{3a^2}{4}$
38. The equations $\lambda x - y = 2$, $2x - 3y = -\lambda$ and $3x - 2y = -1$ are consistent for
 a. $\lambda = -4$ b. $\lambda = -1, 4$
 c. $\lambda = -1$ d. $\lambda = 1, -4$
39. If the equations are $x + y - 3 = 0$
 $(1 + \beta)x + (2 + \beta)y - 8 = 0$ and $x - (1 + \beta)y + (2 + \beta) = 0$, then the value of β for the consistent solution, is
 a. 2 b. $\frac{16}{3}$
 c. $-\frac{5}{3}$ d. $\frac{5}{3}$
40. If $a > b > c$ and the system of equations $ax + by + cz = 0$, $bx + cy + az = 0$, $cx + ay + bz = 0$ has a non-trivial solution, then both the roots of the quadratic equation $at^2 + bt + c = 0$ are
 a. non-real b. of opposite sign
 c. positive d. complex

41. If the system of these equations

$$m^3x + (m+1)^3y + (m+2)^3z = 0$$

$$m + (m+1)y + (m+2)z = 0$$

$$x + y + z = 0$$

has non-zero solution, then the value of m is equal to

- a. -1 b. 2 c. 3 d. -2
42. The number of values of k for which the linear equations $4x + ky + 2z = 0$, $kx + 4y + z = 0$ and $2x + 2y + z = 0$ possess a non-zero solution, is
 a. 2 b. 1 c. 0 d. 3
43. If the trivial solution is the only solution of the system of equations

$$x - ky + z = 0$$

$$kx + 3y - kz = 0$$

$$3x + y - z = 0$$

Then, the set of all values of k is

- a. $(2, -3)$ b. $R - \{2, -3\}$
 c. $R - \{2\}$ d. $R - \{-3\}$
44. Consider the system of linear equations

$$x_1 + 2x_2 + x_3 = 3$$

$$2x_1 + 3x_2 + x_3 = 3$$

$$3x_1 + 5x_2 + 2x_3 = 1$$

Then, the system has

- a. infinite number of solutions
 b. exactly 3 solutions
 c. a unique solution
 d. no solution

BITSAT Archives

1. The system of equations $x - y + 3z = 4$, $x + z = 2$
 $x + y - z = 0$ has [2013]
 a. a unique solution b. finitely many solutions
 c. infinitely many solutions d. None of these
2. If $\begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = k(a-b)(b-c)(c-a)$, then k is equal to [2012]
 a. -2 b. 1 c. 2 d. abc
3. $\begin{vmatrix} a+b & a & b \\ a & a+c & c \\ b & c & b+c \end{vmatrix}$ is equal to [2012]
 a. $4abc$ b. abc c. $a^2b^2c^2$ d. $4a^2bc$
4. The system $x + 4y - 2z = 3$, $3x + y + 5z = 7$ [2012]
 and $2x + 3y + z = 5$ has
 a. infinite number of solutions
 b. unique solution
 c. trivial solution
 d. no solution
5. If the three points $(k, 2k)$, $(2k, 3k)$, $(3, 1)$ are collinear, then k is equal to [2012]
 a. -2 b. 1 c. $\frac{1}{2}$ d. $-\frac{1}{2}$
6. The value of the determinant $\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$ will be [2011, 08]
 a. $(a-b-c)(a^2 + b^2 + c^2)$
 b. $(a+b+c)^3$
 c. $(a+b+c)(ab+bc+ca)$
 d. None of the above
7. If ω is a cube root of unity, then $\begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix}$ is equal to [2011, 06]
 a. 1 b. ω
 c. ω^2 d. 0

8. For the equations $x + 2y + 3z = 1$, $2x + y + 3z = 2$ and $5x + 5y + 9z = 4$, [2011]
 a. there is only one solution
 b. there exists infinitely many solutions
 c. there is no solution
 d. None of the above
9. If $C = 2 \cos \theta$, then the value of the determinant $\Delta = \begin{vmatrix} C & 1 & 0 \\ 1 & C & 1 \\ 6 & 1 & C \end{vmatrix}$ is [2007]
 a. $\frac{2 \sin^2 2\theta}{\sin \theta}$
 b. $8 \cos^3 \theta - 4 \cos \theta + 6$
 c. $\frac{2 \sin 2\theta}{\sin \theta}$
 d. $8 \cos^3 \theta + 4 \cos \theta + 6$
10. The solutions of the equation $\begin{vmatrix} x & 2 & -1 \\ 2 & 5 & x \\ -1 & 2 & x \end{vmatrix} = 0$ are [2006]
 a. 3, -1 b. -3, 1 c. 3, 1 d. -3, -1
11. $\begin{vmatrix} 1 + \sin^2 \theta & \sin^2 \theta & \sin^2 \theta \\ \cos^2 \theta & 1 + \cos^2 \theta & \cos^2 \theta \\ 4 \sin 4\theta & 4 \sin 4\theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$, then $\sin 4\theta$ equals to [2005]
 a. $\frac{1}{2}$ b. 1 c. $-\frac{1}{2}$ d. -1
12. Let the homogeneous system of linear equations $px + y + z = 0$, $x + qy + z = 0$ and $x + y + rz = 0$, where $p, q, r \neq 1$, have a non-zero solution, then the value of $\frac{1}{1-p} + \frac{1}{1-q} + \frac{1}{1-r}$ is [2005]
 a. -1 b. 0
 c. 2 d. 1
13. Let the determinant of a 3×3 matrix A be 6, then B is a matrix defined by $B = 5A^2$. Then, determinant of B is [2005]
 a. 180 b. 100
 c. 80 d. None of these

Answer with Solutions

Practice Exercise

1. (d) $\bar{A} = \begin{bmatrix} 23 & 1-i & i \\ 1+i & -31 & 4+5i \\ -i & 4-5i & 17 \end{bmatrix}$
 $(\bar{A})^T = A \Rightarrow \det(\bar{A})^T = \det(A)$
 $\Rightarrow \det(\bar{A}) = \det(A) \Rightarrow \overline{\det(A)} = \det(A)$
 So, $\det(A)$ is real.
2. (a) $|A_a| = 1$
 $A_a^c = \begin{bmatrix} \cos a & -\sin a & 0 \\ \sin a & \cos a & 0 \\ 0 & 0 & 1 \end{bmatrix}$
 $\text{adj}(A_a) = (A_a^c)^T = \begin{bmatrix} \cos a & \sin a & 0 \\ -\sin a & \cos a & 0 \\ 0 & 0 & 1 \end{bmatrix}$
 $\Rightarrow A_a^{-1} = \frac{\text{adj } A_a}{|A_a|} = \begin{bmatrix} \cos a & \sin a & 0 \\ -\sin a & \cos a & 0 \\ 0 & 0 & 1 \end{bmatrix} \neq A_a$
 Now, $A_a A_\beta = \begin{bmatrix} \cos a & -\sin a & 0 \\ \sin a & \cos a & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos \beta & -\sin \beta & 0 \\ \sin \beta & \cos \beta & 0 \\ 0 & 0 & 1 \end{bmatrix}$
 $= \begin{bmatrix} \cos(a+\beta) & -\sin(a+\beta) & 0 \\ \sin(a+\beta) & \cos(a+\beta) & 0 \\ 0 & 0 & 1 \end{bmatrix} = A_{a+\beta}$
3. (d) Required determinant $= |\text{adj } A|^2 = (11^2)^2 = 14641$
4. (c) Let $\Delta = \begin{vmatrix} b & c & a \\ c & a & b \\ a & b & c \end{vmatrix} + \begin{vmatrix} c & a & b \\ a & b & c \\ b & c & a \end{vmatrix}$
 $= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} + \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 2 \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$
 $\therefore k = 2$
5. (b) Applying $C_1 \rightarrow C_1 - pC_2 - C_3$,
 $\begin{vmatrix} 0 & x & y \\ 0 & y & z \\ -(xp^2 + 2yp + z) & xp + y & yp + z \end{vmatrix} = 0$
 $\Rightarrow 0 = (xp^2 + 2yp + z)(y^2 - xz)$
 $\therefore y^2 = xz$
 So, x, y and z are in GP.
6. (b) Applying $R_1 \rightarrow R_1 + R_2 + R_3$ and then taking common from R_1 , we get
 $\Delta = (a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$
 Applying $C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1$, we get
 $\Delta = (a+b+c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & -(a+b+c) & 0 \\ 2c & 0 & -(a+b+c) \end{vmatrix}$
 $= (a+b+c)^3 \Rightarrow k = 1$

$$\begin{aligned}
 7. (a) \Delta &= \begin{vmatrix} e^a & e^{2a} & e^{3a} \\ e^b & e^{2b} & e^{3b} \\ e^c & e^{2c} & e^{3c} \end{vmatrix} - \begin{vmatrix} e^a & e^{2a} & 1 \\ e^b & e^{2b} & 1 \\ e^c & e^{2c} & 1 \end{vmatrix} \\
 &= e^a \cdot e^b \cdot e^c \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix} + \begin{vmatrix} e^a & 1 & e^{2a} \\ e^b & 1 & e^{2b} \\ e^c & 1 & e^{2c} \end{vmatrix} \\
 &= 0 \quad [\because a+b+c=0 \Rightarrow e^{a+b+c}=1]
 \end{aligned}$$

$$\begin{aligned}
 8. (b) \text{ Hint } \begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix} &= \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix} + \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix} \\
 &= \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} + abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix}
 \end{aligned}$$

9. (a) Put $x = 0$ in the given equation, we get

$$t = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 0 & -4 \\ -3 & 4 & 0 \end{vmatrix} = -12 + 12 = 0$$

10. (a) $a_n = ar^{n-1}$, where r is the common ratio.

$$\therefore \log a_n = \log a_1 + (n-1) \log r$$

Applying $R_2 \rightarrow R_2 - R_1$, $R_3 \rightarrow R_3 - R_1$ in given determinant.

$$\Rightarrow \begin{vmatrix} \log a_n & \log a_{n+1} & \log a_{n+2} \\ 3 \log r & 3 \log r & 3 \log r \\ 6 \log r & 6 \log r & 6 \log r \end{vmatrix} = 0$$

[since, R_2 and R_3 are proportional]

11. (c) Applying $R_3 \rightarrow R_3 - yR_2$ and $R_2 \rightarrow R_2 - yR_1$, we get

$$f(y) = \begin{vmatrix} a & -1 & 0 \\ 0 & a+y & -1 \\ 0 & 0 & a+y \end{vmatrix} = a(a+y)^2$$

$$\therefore f(2y) - f(y) = a[(a+2y)^2 - (a+y)^2]$$

$$= a(a+2y-a-y)(a+2y+a+y) = ay(2a+3y)$$

Hence, $f(2y) - f(y)$ is divisible by $(2a+3y)$.

$$12. (d) \text{ Clearly, we can take } \begin{vmatrix} x+1 & 3 & 5 \\ 2 & x+2 & 5 \\ 2 & 3 & x+4 \end{vmatrix} = 0$$

Now, applying $C_1 \rightarrow C_1 + (C_2 + C_3)$ and then taking common from C_1 , we get

$$(x+9) \begin{vmatrix} 1 & 3 & 5 \\ 1 & x+2 & 5 \\ 1 & 3 & x+4 \end{vmatrix} = 0$$

Also, applying $R_2 \rightarrow R_2 - R_1$, $R_3 \rightarrow R_3 - R_1$, we get

$$(x+9) \begin{vmatrix} 1 & 3 & 5 \\ 0 & x-1 & 0 \\ 0 & 0 & x-1 \end{vmatrix} = 0$$

$$\text{Thus, } (x+9)(x-1)(x-1) = 0 \Rightarrow x = -9, 1, 1$$

$$13. (d) \text{ We have, } \begin{vmatrix} a-n & c & b \\ c & b-n & a \\ b & a & c-n \end{vmatrix} = 0$$

Now, applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{aligned}
 &\begin{vmatrix} a+b+c-n & c & b \\ a+b+c-n & b-n & a \\ b+a+c-n & a & c-n \end{vmatrix} = 0 \\
 \Rightarrow &\begin{vmatrix} -n & c & b \\ -n & b-n & a \\ -n & a & c-n \end{vmatrix} = 0 \quad [\because a+b+c=0] \\
 \Rightarrow &-n \begin{vmatrix} 1 & c & b \\ 1 & b-n & a \\ 1 & a & c-n \end{vmatrix} = 0
 \end{aligned}$$

Now, applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\begin{vmatrix} 1 & c & b \\ -n & 0 & b-n-c & a-b \\ 0 & a-c & c-b-n \end{vmatrix} = 0$$

$$\Rightarrow -n\{(b-n-c)(c-b-n) - (a-b)(a-c)\} = 0$$

So, $n = 0$ is a root of the given determinant.

$$\begin{aligned}
 14. (c) \text{ Hint } A^2 &= \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix} \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix} \\
 &= \begin{bmatrix} 25 & 25\alpha + 5\alpha^2 & 10\alpha + 25\alpha^2 \\ 0 & \alpha^2 & 5\alpha^2 + 25\alpha \\ 0 & 0 & 25 \end{bmatrix}
 \end{aligned}$$

$$15. (b) \text{ Given, } D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$,

$$= \begin{vmatrix} 1 & 0 & 0 \\ 1 & x & 0 \\ 1 & 0 & y \end{vmatrix} = xy$$

Hence, D is divisible by both x and y .

$$\begin{aligned}
 16. (c) \text{ Let } \Delta &= \begin{vmatrix} 1 & 1 & 1 \\ 1+\sin A & 1+\sin B & 1+\sin C \\ \sin A + \sin^2 A & \sin B + \sin^2 B & \sin C + \sin^2 C \end{vmatrix} \\
 &= - \begin{vmatrix} 1 & 1 & 1 \\ 1+\sin A & 1+\sin B & 1+\sin C \\ \cos^2 A & \cos^2 B & \cos^2 C \end{vmatrix}
 \end{aligned}$$

[applying $R_3 \rightarrow R_3 - R_2$]

$$= - \begin{vmatrix} 1 & 0 & 0 \\ 1+\sin A & \sin B - \sin A & \sin C - \sin B \\ \cos^2 A & \cos^2 B - \cos^2 A & \cos^2 C - \cos^2 B \end{vmatrix}$$

[applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$]

Expanding along R_1 , we get

$$\Delta = (\sin B - \sin A)(\sin^2 C - \sin^2 B) - (\sin C - \sin B)(\sin^2 B - \sin^2 A)$$

$$= (\sin B - \sin A)(\sin C - \sin B)(\sin C - \sin A) = 0$$

[$\because \Delta = 0$, given]

So, we get $A = B$

or $B = C$

or $C = A$

Hence, ΔABC is an isosceles.

17. (c) Applying $R_1 \rightarrow R_1 - x R_2$ to Δ , we get

$$\Delta = \begin{vmatrix} a(1-x^2) & c(1-x^2) & p(1-x^2) \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix}$$

$$= (1-x^2) \begin{vmatrix} a & c & p \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - xR_1$, we get

$$\Delta = (1-x^2) \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$$

18. (a) Given, $\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$

$$= 1(\omega^{3n} - 1) - \omega^n(\omega^{2n} - \omega^{2n}) + \omega^{2n}(\omega^n - \omega^{4n})$$

$$= 1(1 - 1) - 0 + \omega^{2n}(\omega^n - \omega^n) \quad [\because \omega^3 = 1]$$

$$= 0$$

19. (c) Expanding by the first row, we get

$$a(bc - a^2) - b(b^2 - ca) + c(ab - c^2) = 3abc - a^3 - b^3 - c^3$$

$$= -(a+b+c)(a^2 + b^2 + c^2 - ab - bc - ca)$$

$$= -\frac{(a+b+c)}{2}[(a-b)^2 + (b-c)^2 + (c-a)^2]$$

which is negative.

20. (d) Let $\Delta = \begin{vmatrix} n & n+1 & n+2 \\ n! & (n+1)! & (n+2)! \\ 1 & 1 & 1 \end{vmatrix}$

$$= \begin{vmatrix} n & 1 & 1 \\ n! & n \cdot n! & (n+1)(n+1)! \\ 1 & 0 & 0 \end{vmatrix}$$

[applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$]

$$= (n+1)(n+1)! - n \cdot n!$$

$$= [(n+1)^2 - n]n! = (n^2 + n + 1) \cdot n!$$

21. (c) Put $x = 0$, we get $\begin{vmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = -1$

22. (a) Taking common factors x from C_2 , $(x+1)$ from C_3 and $(x-1)$ from R_3 , we get

$$f(x) = x(x^2 - 1) \begin{vmatrix} 1 & 1 & 1 \\ 2x & x-1 & x \\ 3x & x-2 & x \end{vmatrix}$$

$$= x(x^2 - 1) \begin{vmatrix} 1 & 0 & 0 \\ 2x & -(x+1) & 1 \\ 3x & -2(x+1) & 2 \end{vmatrix} = 0$$

[applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$]

$\therefore f(50) = 0$

23. (c) $\Delta = \begin{vmatrix} a(1+\omega) & b\omega^2 & a\omega \\ b(\omega+\omega^2) & c & b\omega^2 \\ c(\omega^2+1) & a\omega & c \end{vmatrix}$ [applying $C_1 \rightarrow C_1 + C_3$]

$$= \begin{vmatrix} -a\omega^2 & b\omega^2 & a\omega \\ -b & c & b\omega^2 \\ -c\omega & a\omega & c \end{vmatrix}$$

$$= \omega^2 \cdot \omega \begin{vmatrix} -a & b & a\omega^2 \\ -b & c & b\omega^2 \\ -c & a & c\omega^2 \end{vmatrix} = -\omega^3 \begin{vmatrix} a & b & a \\ b & c & b \\ c & a & c \end{vmatrix} = 0$$

24. (b) Applying $C_1 \rightarrow C_1 + C_2 + C_3$ and taking common from C_1 ,

$$\Rightarrow (\sin x + 2 \cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 1 & \sin x & \cos x \\ 1 & \cos x & \sin x \end{vmatrix} = 0$$

Applying $R_2 \rightarrow R_2 - R_1$, $R_3 \rightarrow R_3 - R_1$,

$$\Rightarrow (\sin x + 2 \cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 0 & (\sin x - \cos x) & 0 \\ 0 & 0 & (\sin x - \cos x) \end{vmatrix}$$

$$= 0$$

$$\Rightarrow (\sin x + 2 \cos x)(\sin x - \cos x)^2 = 0$$

$$\Rightarrow \tan x = 1$$

$$\therefore x = \frac{\pi}{4}$$

25. (a) $\begin{vmatrix} \frac{\log x}{\log x} & \frac{\log y}{\log x} & \frac{\log z}{\log x} \\ \frac{\log x}{\log y} & \frac{\log y}{\log y} & \frac{\log z}{\log y} \\ \frac{\log x}{\log z} & \frac{\log y}{\log z} & \frac{\log z}{\log z} \end{vmatrix}$

By taking common factors from the columns and the rows, we get

$$\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = 0$$

26. (a) Applying $R_1 \rightarrow R_1 - R_3$ and $R_2 \rightarrow R_2 - R_3$

$$\begin{vmatrix} 1 & 0 & -1 \\ 0 & 1 & -1 \\ \sin^2 \theta & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$$

$$\Rightarrow \sin^2 \theta + \cos^2 \theta + 1 + 4 \sin 4\theta = 0 \quad [\text{expanding along } R_3]$$

$$\Rightarrow \sin 4\theta = -\frac{1}{2} \Rightarrow \theta = \frac{7\pi}{24}, \frac{11\pi}{24}$$

27. (a) Since, $\alpha + \beta + \gamma = 0$

Applying $C_1 \rightarrow C_1 + C_2 + C_3$ in the given determinant,

$$\Delta = \begin{vmatrix} \alpha + \beta + \gamma & \beta & \gamma \\ \alpha + \beta + \gamma & \gamma & \alpha \\ \alpha + \beta + \gamma & \alpha & \beta \end{vmatrix} = \begin{vmatrix} 0 & \beta & \gamma \\ 0 & \gamma & \alpha \\ 0 & \alpha & \beta \end{vmatrix} = 0$$

28. (c) Applying $C_1 \rightarrow C_1 + C_2 + C_3$

and put $a^2 + b^2 + c^2 = -2$

$$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 1 & 1+b^2x & (1+c^2)x \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - R_1$, $R_3 \rightarrow R_3 - R_1$,

$$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 0 & 1-x & 0 \\ 0 & 0 & 1-x \end{vmatrix} = (x-1)^2$$

29. (c) Since α, β, γ are the roots of the given equation.

$$\therefore \alpha + \beta + \gamma = -a, \alpha\beta + \beta\gamma + \gamma\alpha = 0$$

and $\alpha\beta\gamma = -b$

$$\begin{aligned} \text{Now, } \begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} &= -(\alpha + \beta + \gamma)(\alpha^2 + \beta^2 + \gamma^2 - \alpha\beta - \beta\gamma - \gamma\alpha) \\ &= -(\alpha + \beta + \gamma)\{(\alpha + \beta + \gamma)^2 - 3(\alpha\beta + \beta\gamma + \gamma\alpha)\} \\ &= (a)\{a^2 - 0\} = a^3 \end{aligned}$$

30. (b) Let $\Delta = \begin{vmatrix} 1 & a & a^2 \\ \cos(p-d)x & \cos px & \cos(p+d)x \\ \sin(p-d)x & \sin px & \sin(p+d)x \end{vmatrix}$

Applying $C_1 \rightarrow C_1 + C_3$

$$\begin{aligned} \Delta &= \begin{vmatrix} 1+a^2 & a & a^2 \\ \cos(p-d)x + \cos(p+d)x & \cos px & \cos(p+d)x \\ \sin(p-d)x + \sin(p+d)x & \sin px & \sin(p+d)x \end{vmatrix} \\ \Rightarrow \Delta &= \begin{vmatrix} 1+a^2 & a & a^2 \\ 2\cos px \cos dx & \cos px & \cos(p+d)x \\ 2\sin px \cos dx & \sin px & \sin(p+d)x \end{vmatrix} \end{aligned}$$

Applying $C_1 \rightarrow C_1 - 2(\cos dx)C_2$

$$\Rightarrow \Delta = \begin{vmatrix} 1+a^2-2a\cos dx & a & a^2 \\ 0 & \cos px & \cos(p+d)x \\ 0 & \sin px & \sin(p+d)x \end{vmatrix}$$

Expanding along C_1 , we get

$$\begin{aligned} \Delta &= (1+a^2-2a\cos dx)[\sin(p+d)x \cos px \\ &\quad - \sin px \cos(p+d)x] \\ &= (1+a^2-2a\cos dx)[\sin\{(p+d)x - px\}] \\ &= (1+a^2-2a\cos dx)[\sin dx] \end{aligned}$$

which is independent if p.

31. (c) $z = e^{iA} \cdot e^{iB} \cdot e^{iC} \begin{vmatrix} e^{iA} & e^{-i(C+A)} & e^{-i(B+A)} \\ e^{-i(C+B)} & e^{iB} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{-i(A+C)} & e^{iC} \end{vmatrix}$

$$= -1 \begin{vmatrix} e^{iA} & -e^{iB} & -e^{iC} \\ -e^{iA} & e^{iB} & -e^{iC} \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

Because we know that,

$$e^{i(A+B+C)} = e^{i\pi} = \cos \pi + i \sin \pi = -1$$

$$= -1 \begin{vmatrix} 0 & -2e^{iB} & 0 \\ -2e^{iA} & 0 & 0 \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 + R_3$ and $R_2 \rightarrow R_2 + R_3$]

$$\begin{aligned} &= -[-2e^{iB}\{+2e^{i(A+C)}\}] \\ &= [4e^{i(A+B+C)}] = 4e^{i\pi} = -4 \end{aligned}$$

32. (b) $\Delta = \begin{vmatrix} \cos \alpha & \sin \alpha & 0 \\ \cos \beta & \sin \beta & 0 \\ \cos \gamma & \sin \gamma & 0 \end{vmatrix} \begin{vmatrix} \cos \alpha & \sin \alpha & 0 \\ \cos \beta & \sin \beta & 0 \\ \cos \gamma & \sin \gamma & 0 \end{vmatrix}$

33. (a) Given, A, B and C are the angles of a triangle.

$$\therefore A + B + C = \pi \Rightarrow A + B = \pi - C$$

Now, let $\cos(A+B) = \cos(\pi - C) = -\cos C$

$$\Rightarrow \cos A \cos B - \sin A \sin B = -\cos C$$

$$\Rightarrow \cos A \cos B + \cos C = \sin A \sin B \quad \dots(i)$$

$$\text{Similarly, } \cos A \cos C + \cos B = \sin A \sin C \quad \dots(ii)$$

$$\text{and } \sin(B+C) = \sin(\pi - A) = \sin A \quad \dots(iii)$$

Now, let $\Delta = \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$

Expanding along R_1 , we get

$$\begin{aligned} \Delta &= -1(1 - \cos^2 A) + \cos C(\cos C + \cos A \cos B) \\ &\quad + \cos B(\cos B + \cos A \cos C) \\ &= -\sin^2 A + \cos C(\sin A \sin B) + \cos B(\sin A \sin C) \\ &\quad [\text{using Eqs. (i) and (ii) and } \cos^2 A + \sin^2 A = 1] \\ &= -\sin^2 A + \sin A(\sin B \cos C + \cos B \sin C) \\ &= -\sin^2 A + \sin A \sin(B+C) \\ &\quad [\because \sin(x+y) = \sin x \cos y + \cos x \sin y] \\ &= -\sin^2 A + \sin^2 A = 0 \quad [\text{using Eq. (iii)}] \end{aligned}$$

34. (b) We have, $\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$

$$= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \times \begin{vmatrix} -a & c & b \\ -b & a & c \\ -c & b & a \end{vmatrix}$$

$$= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}^2$$

$$= [a(bc - a^2) + b(ac - b^2) + c(ab - c^2)]^2$$

$$= [a^3 + b^3 + c^3 - 3abc]^2$$

$$\therefore k = -3$$

35. (c) Use the property that, two determinants can be multiplied row-to-row or row-to-column, to write the given determinant as the product of two determinants and then expand.

$$\text{Given, } f(n) = \alpha^n + \beta^n$$

$$f(1) = \alpha + \beta, f(2) = \alpha^2 + \beta^2,$$

$$f(3) = \alpha^3 + \beta^3, f(4) = \alpha^4 + \beta^4$$

$$\text{Let } \Delta = \begin{vmatrix} 3 & 1+f(1) & 1+f(2) \\ 1+f(1) & 1+f(2) & 1+f(3) \\ 1+f(2) & 1+f(3) & 1+f(4) \end{vmatrix}$$

$$\Rightarrow \Delta = \begin{vmatrix} 3 & 1+\alpha+\beta & 1+\alpha^2+\beta^2 \\ 1+\alpha+\beta & 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 \\ 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 & 1+\alpha^4+\beta^4 \end{vmatrix}$$

$$= \begin{vmatrix} 1 \cdot 1 + 1 \cdot 1 + 1 \cdot 1 & 1 \cdot 1 + 1 \cdot \alpha + 1 \cdot \beta & 1 \cdot 1 + 1 \cdot \alpha^2 + 1 \cdot \beta^2 \\ 1 \cdot 1 + 1 \cdot \alpha + 1 \cdot \beta & 1 \cdot 1 + \alpha \cdot \alpha + \beta \cdot \beta & 1 \cdot 1 + \alpha \cdot \alpha^2 + \beta \cdot \beta^2 \\ 1 \cdot 1 + 1 \cdot \alpha^2 + 1 \cdot \beta^2 & 1 \cdot 1 + \alpha^2 \cdot \alpha + \beta^2 \cdot \beta & 1 \cdot 1 + \alpha^2 \cdot \alpha^2 + \beta^2 \cdot \beta^2 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix}^2$$

On expanding, we get

$$\Delta = (1-\alpha)^2(1-\beta)^2(\alpha-\beta)^2$$

$$\text{But given, } \Delta = k(1-\alpha)^2(1-\beta)^2(\alpha-\beta)^2$$

$$\text{Hence, } k(1-\alpha)^2(1-\beta)^2(\alpha-\beta)^2 = (1-\alpha)^2(1-\beta)^2(\alpha-\beta)^2$$

$$\therefore k = 1$$

36. (a) Let $\begin{vmatrix} -2a & a+b & a+c \\ b+a & -2b & b+c \\ c+a & c+b & -2c \end{vmatrix} = k(b+c)(c+a)(a+b)$

Putting $a = b = c = \lambda$, we get

$$\begin{vmatrix} -2\lambda & 2\lambda & 2\lambda \\ 2\lambda & -2\lambda & 2\lambda \\ 2\lambda & 2\lambda & -2\lambda \end{vmatrix} = k(2\lambda)(2\lambda)(2\lambda)$$

$$\therefore k = \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix}$$

$$= -1(0) - 1(-2) + 1(2) = 4$$

37. (a) If (x_1, y_1) , (x_2, y_2) and (x_3, y_3) are the vertices of a triangle, then

$$\text{Area} = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \quad \dots(i)$$

Also, we know that, if a is the length of an equilateral triangle, then

$$\text{Area} = \frac{\sqrt{3}}{4} a^2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{\sqrt{3}}{4} a^2 = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$\Rightarrow \frac{\sqrt{3}}{2} a^2 = \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$\Rightarrow \frac{3}{4} a^4 = \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2$$

38. (b) Hint $\begin{vmatrix} \lambda & -1 & -2 \\ 2 & -3 & \lambda \\ 3 & -2 & 1 \end{vmatrix} = 0$

39. (c) $\Delta = 0$ [for consistent solution]

$$\therefore \begin{vmatrix} 1 & 1 & -3 \\ 1+\beta & 2+\beta & -8 \\ 1 & -1-\beta & 2+\beta \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & 0 & 0 \\ 1+\beta & 1 & -5+3\beta \\ 1 & -2-\beta & 5+\beta \end{vmatrix} = 0$$

[applying $C_2 \rightarrow C_2 - C_1$, $C_3 \rightarrow C_3 + 3C_1$]

$$\Rightarrow (5+\beta) + (2+\beta)(-5+3\beta) = 0$$

$$\Rightarrow 3\beta^2 + 2\beta - 5 = 0$$

$$\Rightarrow (\beta-1)(3\beta+5) = 0 \Rightarrow \beta = 1, -\frac{5}{3}$$

40. (b) $\therefore a > b > c$ and given equations are

$$ax + by + cz = 0, bx + cy + az = 0 \text{ and } cx + ay + bz = 0$$

$$\text{For non-trivial solution, } \Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 0$$

$$\Rightarrow 3abc - (a^3 + b^3 + c^3) = 0$$

If α and β are the roots of $at^2 + bt + c = 0$, then

$$\alpha + \beta = -\frac{b}{a} \text{ and } \alpha\beta = \frac{c}{a}$$

$$b^2 - 4ac = (-a-c)^2 - 4ac = (a-c)^2 > 0$$

For opposite sign, $|\alpha - \beta| > 0$

$$\Rightarrow (\alpha + \beta)^2 - 4\alpha\beta > 0 \Rightarrow \frac{b^2}{a^2} - \frac{4c}{a} > 0$$

$$\Rightarrow b^2 - 4ac > 0$$

$$\Rightarrow (-a-c)^2 - 4ac > 0$$

$$\Rightarrow (a-c)^2 > 0, \text{ which is true.}$$

Hence, roots are real and have opposite sign.

41. (a) We know that, they have non-zero solution, if

$$\Delta = \begin{vmatrix} m^3 & (m+1)^3 & (m+2)^3 \\ m & (m+1) & (m+2) \\ 1 & 1 & 1 \end{vmatrix} = 0$$

Now, applying $C_2 \rightarrow C_2 - C_1$, $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = \begin{vmatrix} m^3 & 3m^2 + 3m + 1 & 8 + 6m^2 + 12m \\ m & 1 & 2 \\ 1 & 0 & 0 \end{vmatrix} = 0$$

$$\Rightarrow 6m^2 + 6m + 2 - 8 - 6m^2 - 12m = 0$$

$$\Rightarrow -6(m+1) = 0$$

$$\Rightarrow m = -1$$

42. (a) Hint $\Delta = 0$

43. (b) Hint $\begin{vmatrix} 1 & -k & 1 \\ k & 3 & -k \\ 3 & 1 & -1 \end{vmatrix} \neq 0$

BITSAT Archives

1. (c) Let $D = \begin{vmatrix} 1 & -1 & 3 \\ 1 & 0 & 1 \\ 1 & 1 & -1 \end{vmatrix}$

$$= 1(0-1) - 1(1+1) + 3(1)$$

$$= -1 - 2 + 3 = 0$$

$$D_1 = \begin{vmatrix} 4 & -1 & 3 \\ 2 & 0 & 1 \\ 0 & 1 & -1 \end{vmatrix}$$

$$= 4(0-1) - 1(0+2) + 3(2)$$

$$= -4 - 2 + 6 = 0$$

$$D_2 = \begin{vmatrix} 1 & 4 & 3 \\ 1 & 2 & 1 \\ 1 & 0 & -1 \end{vmatrix}$$

$$= 1(-2) + 4(1+1) + 3(0-2)$$

$$= -2 + 8 - 6 = 0$$

$$D_3 = \begin{vmatrix} 1 & -1 & 4 \\ 1 & 0 & 2 \\ 1 & 1 & 0 \end{vmatrix}$$

$$= 1(0-2) - 1(2-0) + 4(1-0)$$

$$= -2 - 2 + 4 = 0$$

Hence, the given system of equations has infinitely many solutions.

2. (b) $\Delta = \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = \begin{vmatrix} 1 & a & a^2 \\ 0 & b-a & b^2-a^2 \\ 0 & c-a & c^2-a^2 \end{vmatrix}$

[applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$]

$$= (b-a)(c-a) \begin{vmatrix} 1 & a & a^2 \\ 0 & 1 & b+a \\ 0 & 1 & c+a \end{vmatrix}$$

$$= (b-a)(c-a)(c+a-b-a)$$

$$\Rightarrow (b-a)(c-a)(c-b)$$

$$= k(a-b)(b-c)(c-a) \quad [\text{given}]$$

$$\Rightarrow k = 1$$

44. (d) The given system of linear equations can be put in the matrix form as

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 3 & 1 \\ 3 & 5 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ 3 \\ 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 1 & 2 & 1 \\ 0 & -1 & -1 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ -3 \\ -8 \end{bmatrix} \quad \left[\begin{array}{l} \text{applying } R_2 \rightarrow R_2 - 2R_1, \\ \text{and } R_3 \rightarrow R_3 - 3R_1 \end{array} \right]$$

$$\Rightarrow \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ -3 \\ -5 \end{bmatrix} \quad [\text{applying } R_3 \rightarrow R_3 - R_2]$$

Clearly, the given system of equations has no solution.

3. (a) $\begin{vmatrix} a+b & a & b \\ a & a+c & c \\ b & c & b+c \end{vmatrix} = \begin{vmatrix} b & -c & b-c \\ a & a+c & c \\ b & c & b+c \end{vmatrix}$

[applying $R_1 \rightarrow R_1 - R_2$]

$$= \begin{vmatrix} 2b & 0 & 2b \\ a & a+c & c \\ b & c & b+c \end{vmatrix} \quad [\text{applying } R_1 \rightarrow R_1 + R_3]$$

$$= \begin{vmatrix} 2b & 0 & 0 \\ a & a+c & c-a \\ b & c & c \end{vmatrix} \quad [\text{applying } C_3 \rightarrow C_3 - C_1]$$

$$= 2b(ac + c^2 - c^2 + ac) = 4abc$$

4. (d) Given system of equations are

$$x + 4y - 2z = 3, 3x + y + 5z = 7 \text{ and } 2x + 3y + z = 5$$

$$\therefore \Delta = \begin{vmatrix} 1 & 4 & -2 \\ 3 & 1 & 5 \\ 2 & 3 & 1 \end{vmatrix} = 1(1-15) - 4(3-10) - 2(9-2)$$

$$= -14 + 28 - 14 = 0$$

$$\text{and } \Delta_2 = \begin{vmatrix} 1 & 3 & -2 \\ 3 & 7 & 5 \\ 2 & 5 & 1 \end{vmatrix} = 1 \neq 0$$

$\therefore$ No solution will exist.

5. (a) Area of triangle $= \frac{1}{2} \begin{vmatrix} k & 2k & 1 \\ 2k & 3k & 1 \\ 3 & 1 & 1 \end{vmatrix} = 0$

[applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$]

$$\Rightarrow \begin{vmatrix} k & 2k & 1 \\ k & k & 0 \\ 3-k & 1-2k & 0 \end{vmatrix} = 0$$

$$\Rightarrow 1[k(1-2k) - k(3-k)] = 0$$

$$\Rightarrow k - 2k^2 - 3k + k^2 = 0$$

$$\Rightarrow -k^2 - 2k = 0$$

$$\Rightarrow -k(k+2) = 0 \Rightarrow k = 0, -2$$

6. (b) Applying $R_1 \rightarrow R_1 + R_2 + R_3$ and taking common from R_1 , we get

$$\Delta = (a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$

$$\Delta = (a+b+c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & -(a+b+c) & 0 \\ 2c & 0 & -(a+b+c) \end{vmatrix}$$

$$= (a+b+c)^3$$

7. (d) Applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix} = \begin{vmatrix} 1+\omega+\omega^2 & \omega & \omega^2 \\ \omega+\omega^2+1 & \omega^2 & 1 \\ \omega^2+\omega+1 & 1 & \omega \end{vmatrix}$$

$$= \begin{vmatrix} 0 & \omega & \omega^2 \\ 0 & \omega^2 & 1 \\ 0 & 1 & \omega \end{vmatrix} = 0 \quad [\because 1+\omega+\omega^2=0]$$

8. (a) The determinant of the coefficient matrix of given system of equation is

$$\begin{vmatrix} 1 & 2 & 3 \\ 2 & 1 & 3 \\ 5 & 5 & 9 \end{vmatrix} = 1(9-15) - 2(18-5) + 3(10-5)$$

$$= 3 \neq 0$$

Hence, the system of given equation has unique solution.

9. (b) Given that,

$$\Delta = \begin{vmatrix} C & 1 & 0 \\ 1 & C & 1 \\ 6 & 1 & C \end{vmatrix} = C(C^2-1) - 1(C-6)$$

$$\Rightarrow \Delta = 2 \cos \theta (4 \cos^2 \theta - 1) - (2 \cos \theta - 6)$$

$$[\because C = 2 \cos \theta, \text{ given}]$$

$$= 8 \cos^3 \theta - 4 \cos \theta + 6$$

10. (a) Hint $\begin{vmatrix} x & 2 & -1 \\ 2 & 5 & x \\ -1 & 2 & x \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} x & 2 & -1 \\ 2 & 5 & x \\ -3 & -3 & 0 \end{vmatrix} = 0$$

11. (c) Let $A \equiv \begin{vmatrix} 1+\sin^2 \theta & \sin^2 \theta & \sin^2 \theta \\ \cos^2 \theta & 1+\cos^2 \theta & \cos^2 \theta \\ 4 \sin 4\theta & 4 \sin 4\theta & 1+4 \sin 4\theta \end{vmatrix} = 0$

Applying $R_1 \rightarrow R_1 + R_2$

$$\begin{vmatrix} 2 & 2 & 1 \\ \cos^2 \theta & 1+\cos^2 \theta & \cos^2 \theta \\ 4 \sin 4\theta & 4 \sin 4\theta & 1+4 \sin 4\theta \end{vmatrix} = 0$$

Applying $C_1 \rightarrow C_1 - 2C_3, C_2 \rightarrow C_2 - 2C_3$

$$\begin{vmatrix} 0 & 0 & 1 \\ -\cos^2 \theta & 1-\cos^2 \theta & \cos^2 \theta \\ -2-4 \sin 4\theta & -2-4 \sin 4\theta & 1+\sin 4\theta \end{vmatrix} = 0$$

$$\Rightarrow \cos^2 \theta (2+4 \sin 4\theta) + (1-\cos^2 \theta) (2+4 \sin 4\theta) = 0$$

$$\Rightarrow [2 \cos^2 \theta + 4 \cos^2 \theta \sin 4\theta + 2 + 4 \sin 4\theta - 2 \cos^2 \theta - 4 \cos^2 \theta \sin 4\theta] = 0$$

$$\Rightarrow 2 + 4 \sin 4\theta = 0 \Rightarrow \sin 4\theta = -\frac{1}{2}$$

12. (d) Given equations are

$$px + y + z = 0, x + qy + z = 0, x + y + rz = 0$$

Since, the system have a non-zero solution, then

$$\begin{vmatrix} p & 1 & 1 \\ 1 & q & 1 \\ 1 & 1 & r \end{vmatrix} = 0$$

Applying $C_1 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_2$

$$\begin{vmatrix} p & 1-q & 0 \\ 1 & q-1 & 1-q \\ 1 & 0 & r-1 \end{vmatrix} = 0$$

$$\Rightarrow (1-q)(1-q)(1-r) \begin{vmatrix} \frac{p}{1-q} & 1 & 0 \\ \frac{1}{1-q} & -1 & 1 \\ \frac{1}{1-r} & 0 & -1 \end{vmatrix} = 0$$

$$\Rightarrow (1-p)(1-q)(1-r) \left[\frac{p}{1-q} (1) - 1 \left(-\frac{1}{1-q} - \frac{1}{1-r} \right) \right] = 0$$

Since, $p, q, r \neq 1$

$$\therefore \frac{p}{1-p} + \frac{1}{1-q} + \frac{1}{1-r} = 0$$

$$\Rightarrow \frac{1}{1-p} - 1 + \frac{1}{1-q} + \frac{1}{1-r} = 0$$

$$\Rightarrow \frac{1}{1-p} + \frac{1}{1-q} + \frac{1}{1-r} = 1$$

13. (a) Given that, $\det(A) = 6$... (i)

Now,

$$B = 5A^2$$

$$\Rightarrow \det(B) = \det 5A^2 = 5 \det(A^2) = 5 \det(A)^2$$

$$\Rightarrow = 5(6^2) \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \det(B) = 180$$

9

Sets, Relations and Functions

Sets

A set is a well-defined collection of distinct objects. Here, the term ‘well-defined’ means, it must be possible to decide whether or not the object belongs to the set and the term ‘distinct’ means object should not be repeated. The object in the set is called its **member** or **element**. A set is represented by $\{ \}$. Generally, the sets are denoted by capital letters $A, B, C, \dots$ and its elements are denoted by small letters $a, b, c, \dots$.

If X is any non-empty set and x is a member of X (or belongs to X), then it is expressed as $x \in X$. If x is not a member of X or does not belong to X , then it is expressed as $x \notin X$. e.g. Let A be the set of all vowels in English alphabets. Then, a, e, i, o and u are members of A and we can say that $a \in A, e \in A, i \in A, O \in A$ and $u \in A$.

Representation of Sets

There are two methods to represent a set

- (i) **Roster Method** In this method, elements are listed and put within a the braces $\{ \}$ and separated by commas. This method is also known as **tabular method** or **listing method**.
- (ii) **Set Builder Method** In this method, we list the property or properties satisfied by the elements of set and write it as

$$A = \{x : P(x)\} \text{ or } \{x | P(x)\}$$

It is read as ‘ A is the set of all members x such that x has the property $P(x)$ ’. The symbol ‘:’ or ‘|’ stands for ‘such that’.

This method is also known as **rule method** or **property method**.

e. g. $A = \{1, 2, 3, 4, 5\} = \{x : x \in N \text{ and } x \leq 5\}$

NOTE The order of elements in a set has no importance. e.g. $\{1, 2, 3\}$ and $\{3, 2, 1\}$ are same sets. In a set, repetition of elements is not allowed.

Finite and Infinite Sets Sets containing finite number of elements are called finite sets. e.g. $A = \{a, e, i, o, u\}$

A set containing infinite number of elements is called infinite set. e.g. $A =$ Set of points on a line.

Order of a Finite Set The number of elements in a finite set is called the order of the set A and is denoted by $n(A)$. It is also called cardinal number of the set.

e.g. $A = \{2, 4, 6, 8\}$
 $n(A) = 4$

Null Set or Empty Set A set which contains no element, is called an empty set or null set. It is also called a void set. The null set is denoted by the symbols ϕ .

$\therefore \phi = \{x : x \text{ is an integer between 2 and 3}\}$

NOTE $\{0\}$ is not a null set. Since, it contains 0 as its element.

Singleton Set A set consisting of a single element is called a singleton set.

$A = \{a\}$ is a singleton.

Subset If each element of a set A is also an element of a set B , A is called a subset of B . We write it as $A \subseteq B$. Then, B is called superset of A and we write as $B \supseteq A$.

NOTE (i) Every set is a subset of itself.
 (ii) Empty set is a subset of itself.

Proper Subset of a Set The set A is called the proper subset of B , if and only if each element of A is the element of B and there is atleast one element of B which is not an element of the set A , i.e. A is proper subset of B , if $A \subset B$ and $A \neq B$.

Power Set Elements of a set can also be some sets. Such sets are called power sets of set.

e.g. $\{\phi, \{1\}, \{2\}, \{1, 2\}\}$ is a set whose elements are four sets $\phi, \{1\}, \{2\}$ and $\{1, 2\}$. The set of all subsets of a given set X is called the power set of X and is denoted by $P(X)$.

NOTE If a finite set S has n elements. Then, power set of S has 2^n elements.

Universal Set A set which is such that all the sets under consideration are its subsets, is called the universal set or universe and is denoted by U .

e.g. If $A = \{2, 4, 6, 8\}, B = \{1, 3, 5, 7\}$

Then, $U = \{1, 2, 3, 4, 5, 6, 7, 8\}$

Complement of a Set with Respect to the Universal Set Complement of a set A is the set which contains all those elements of the universal set which are not in A . It is denoted by A' or $\bar{A}$.

e.g. $U = \{1, 2, 3, 4, 5, 6, 7\}$ and $A = \{2, 4, 5\}$

$A' = \{1, 3, 6, 7\}$

Disjoint Sets Two sets A and B are said to be disjoint or mutually exclusive, if and only if there is no element common to A and B , i.e. $A \cap B = \phi$.

If $A \cap B \neq \phi$, then A and B are said to be intersecting or overlapping sets.

Difference of Sets If A and B are two given sets, then the set of all elements which belongs to A but do not belong to B is called the difference of sets A and B and is denoted by $A - B$.

Thus, $A - B = \{x : x \in A \text{ and } x \notin B\}$

e.g. If $A = \{2, 3, 4, 5, 6, 7\}, B = \{3, 5, 7, 9, 11\}$

Then, $A - B = \{2, 4, 6\}$

Equality of Two Sets Two sets A and B are said to be equal, iff $A \subseteq B$ and $B \subseteq A$.

$\Rightarrow A = B$, i.e. every element of A is an element of B and also every element of B is an element of A .

e.g. If $A = \{1, 2, 4\}, B = \{1, 4, 2, 2, 4, 1\}$, then $A = B$

Equivalent Sets Two sets are said to be equivalent, if they contain the same number of elements, i.e. $n(A) = n(B)$, then sets A and B are equivalent.

NOTE Equal sets are equivalent but equivalent sets are not equal sets.

Comparable Sets and Non-comparable Sets Two sets A and B are comparable, if $A \subseteq B$ or $B \subseteq A$.

If neither $A \subseteq B$ nor $B \subseteq A$, then A, B are not comparable.

Venn Diagram

The combination of rectangles and circles is called **Venn Euler diagram** or Venn diagram.

In Venn diagram, the universal set is represented by a rectangular region and a set is represented by circle on some closed geometrical figure, where A is the set and U is the universal set.

Operations on Sets

1. Union

Let A and B be two sets. The union of A and B is the set of all elements which are in set A or in B or both A and B .

i.e. $A \cup B = \{x : x \in A \text{ or } x \in B\}$

If $A_1, A_2, \dots, A_n$ is a finite family of sets.

Then, union of sets is denoted by

$$\bigcup_{i=1}^n A_i \text{ or } A_1 \cup A_2 \cup \dots \cup A_n$$

2. Intersection

The intersection of A and B is the set of all those elements that belongs to both A and B .

i.e. $A \cap B = \{x : x \in A \text{ and } x \in B\}$

If $A_1, A_2, \dots, A_n$ is a finite family of sets.

Then, their intersection of sets is

denoted by $\bigcap_{i=1}^n A_i$ or $A_1 \cap A_2 \cap A_3 \cap \dots \cap A_n$.

3. Difference

The difference of sets A and B , i.e. $A - B$ is the set of all those elements of A which do not belong to B .

i.e. $A - B = \{x : x \in A \text{ and } x \notin B\}$

and $B - A = \{x : x \in B \text{ and } x \notin A\}$

4. Symmetric Difference

The symmetric difference of sets A and B is the set $(A - B) \cup (B - A)$ and is denoted by $A \Delta B$.

$A \Delta B = (A - B) \cup (B - A)$

5. Complement

Let U be the universal set and A be a set such that $A \subset U$.

Then, complement of A with respect to U is denoted by A' or A^c or $C(A)$ or $U - A$. It is defined as the set of all those elements of U which are not in A .

Laws of Algebra of Sets

If A, B and C are any three sets, then

1. Idempotent Laws

(i) $A \cup A = A$

(ii) $A \cap A = A$

2. Identity Laws

(i) $A \cup \phi = A$

(ii) $A \cap U = A$

3. Distributive Laws

(i) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

(ii) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

4. De-Morgan's Law

(i) $(A \cup B)' = A' \cap B'$

(ii) $(A \cap B)' = A' \cup B'$

(iii) $A - (B \cap C) = (A - B) \cup (A - C)$

(iv) $A - (B \cup C) = (A - B) \cap (A - C)$

5. Associative Laws

(i) $(A \cup B) \cup C = A \cup (B \cup C)$

(ii) $A \cap (B \cap C) = (A \cap B) \cap C$

Cartesian Product of Sets

The set consisting of all distinct ordered pairs (a, b) , where $a \in A$ and $b \in B$ is called the cartesian product of the sets A and B and is denoted by $A \times B$.

Symbolically,

$$A \times B = \{(a, b) : a \in A \text{ and } b \in B\}$$

$$B \times A = \{(b, a) : b \in B \text{ and } a \in A\}$$

NOTE Cartesian product of a finite number of sets $A_1, A_2, A_3, \dots, A_n$ is denoted by

$$A_1 \times A_2 \times A_3 \times \dots \times A_n = \prod_{i=1}^n A_i$$

Some Important Properties

1. $A - (B \cup C) = (A - B) \cap (A - C)$

2. $A - (B \cap C) = (A - B) \cup (A - C)$

3. $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

4. $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

5. $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

6. $n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$

7. $(A')' = A$

8. $A \subseteq B \Leftrightarrow B' \subseteq A'$

9. $n(A \times B) = n(A) \times n(B)$

10. $A \times (B \cup C) = (A \times B) \cup (A \times C)$

11. $A \times (B \cap C) = (A \times B) \cap (A \times C)$

12. $(A \times B) \cap (C \times D) = (A \cap C) \times (B \cap D)$

13. $n(A - B) = n(A) - n(A \cap B)$

14. $n(A \Delta B) = n(A) + n(B) - 2n(A \cap B)$

15. $n(A^c \cap B^c) = n(A \cup B)^c = n(U) - n(A \cup B)$

16. $n(A^c \cup B^c) = n(A \cap B)^c = n(U) - n(A \cap B)$

Relations

If A and B are two non-empty sets, then a relation from A to B is a subset of the product set $A \times B$.

Let $R \subseteq A \times B$ and $(a, b) \in R$

Then, we say that, a is related to b by the relation R and we write it as ${}_aR_b$.

e.g. If R denotes 'is less than' and $A = \{1, 3, 5\}$ and $B = \{1, 4\}$, then R from A to B is ${}_aR_b$ iff $a < b, \forall a \in A, b \in B$

Then, $R = \{(1, 4), (3, 4)\}$

Domain and Range of a Relation

Let R be the relation defined from A to B , i.e. R is a subset of $A \times B$, then

Domain of $R = \{a : a \in A, (a, b) \in R \text{ for some } b \in B\}$

Range of $R = \{b : b \in B, (a, b) \in R \text{ for some } a \in A\}$

It is obvious that $D \subseteq A$ and $R \subseteq B$

Composition of Relations

Let $R \subseteq A \times B, S \subseteq B \times C$ be two relations, then compositions of the relation R and S is denoted by $SoR \subseteq A \times C$ and is defined by, $(a, c) \in (SoR)$, iff there exists $b \in B$ such that $(a, b) \in R, (b, c) \in S$.

Relation in a Set

A relation in a set A is a subset of the cartesian product $A \times A$.

- 1. Identity Relation** Let A be a set, then the relation $I_A = \{(x, y) : x \in A, y \in R, x = y\}$ is called the identity relation in A , i.e. the identity relation in a set A is the set of all ordered pairs (x, y) of $A \times A : x = y$.

If $A = \{1, 2, 3, 4, 5, 6\}$, then

$$I_A = \{(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (6, 6)\}$$

- 2. Universal Relation** Let A be any set and $R = A \times R$, then R is called the universal relation in A .
- 3. Void Relation in a Set** Consider the set $A \times A$, then every subset of $A \times A$ is a relation in A . Again, the null set ϕ is a subset of $A \times A$. Therefore, the null set ϕ is also a relation in A . This relation is called the void relation in A .
- 4. Inverse Relation** If R is a relation from a set A to a set B , then the relation R^{-1} from set B to the set A is defined as the inverse relation R . Symbolically,

$$R^{-1} = \{(y, x) : (x, y) \in R\}$$

e.g. $R = \{(2, 4), (2, 6), (3, 4), (3, 6)\}$

$$R^{-1} = \{(4, 2), (6, 2), (4, 3), (6, 3)\}$$

Properties of Relation

- 1. Reflexive Relation** A relation R in a set A is a reflexive, if every element of A is related to itself.

i.e. ${}_aR_a, \forall a \in A$

- 2. Symmetric Relation** A relation R is symmetric, if whenever a is related to b , then b is also related to a .

$$(a, b) \in R \Rightarrow (b, a) \in R$$

i.e. ${}_aR_b \Rightarrow {}_bR_a$

The necessary and sufficient condition that a relation R in A be symmetric is that $R = R^{-1}$.

- 3. Anti-symmetric Relations** R is called an anti-symmetric relation, if $(a, b) \in R$ and $(b, a) \in R$.

$$\Rightarrow a = b$$

If $a \neq b$, then a may be related to b and b may be related to a , then both can never be related to each other at a time.

- 4. Transitive Relation** A relation R is transitive, if

$$(a, b) \in R \text{ and } (b, c) \in R \Rightarrow (a, c) \in R$$

i.e. ${}_aR_b \text{ and } {}_bR_c \Rightarrow {}_aR_c$

- 5. Equivalence Relation** A relation on a set A which is reflexive, symmetric and transitive is called an equivalence relation.

$${}_aR_a, {}_aR_b \Rightarrow {}_bR_a \text{ and } {}_aR_b, {}_bR_c \Rightarrow {}_aR_c$$

Some Results on Relations

- The intersection of two equivalence relations on a set is a equivalence relation on the set.
- The union of two equivalence relations on a set is not necessarily an equivalence relation on the set.
- The inverse of an equivalence relation is an equivalence relation.

Binary Operations

A binary operation $*$ on S is a rule that associates with every ordered pair (a, b) of $S \times S$, a unique element $a * b = c \in S$

Thus, if a binary operation on S is denoted by $*$, then the image of $(a, b) \in S \times S$ under the binary operation $*$ is generally written as $a * b$.

e.g. On the set of real numbers, the operation of addition is binary because $\forall a, b \in R, a + b$ is a real number c .

Functions or Mapping

A function f from A to B written as $f : A \rightarrow B$ is a relation in which to every element of A corresponds a unique element of B .

Alternatively Let A and B be two non-empty sets. A function from A to B is a subset of $A \times B$, such that no different ordered pairs in f have the same first element.

Symbolically: $f: A \rightarrow B$, i.e. f is a function A to B .

Domain, Codomain and Range of a Function The set A is called the domain of f , denoted by $\text{dom } f$ and the set B is called the codomain of f . The set of all second elements of the pairs (a, b) of the function f is the range of the function f , so range is a subset of codomain.

Image and Pre-image of a Function

The variable x of the pair (x, y) which takes on values in the domain is usually called independent variable or x as pre-image of y and y which takes on values in the range is called the dependent variable or y as image of x .

Different Types of Function

1. One-One Function (Injection)

A function $f: A \rightarrow B$ is said to be a one-one function or an injection, if different elements of A have different images in B . Thus, $f: A \rightarrow B$ is one-one, if there exist $a, b \in A$, such that

$$a \neq b \Rightarrow f(a) \neq f(b), \forall a, b \in A$$

$$\text{or } f(a) = f(b) \Rightarrow a = b, \forall a, b \in A$$

Graphically Any line parallel to X -axis cuts the graph of the function at most at one point.

- NOTE**
- The number of functions from a finite set A into finite set $B = \{n(B)\}^{n(A)}$.
 - The number of one-one function that can be defined from a finite set A into finite set B is $\begin{cases} {}^{n(B)}P_{n(A)}, & \text{if } n(B) \geq n(A) \\ 0, & \text{otherwise} \end{cases}$
 - Any function which is entirely increasing or decreasing in the whole of a domain is one-one function.

Methods to Check One-One Function

Method 1 If $f(x) = f(y) \Rightarrow x = y$, then f is one-one.

Method 2 A function is one-one, iff no line parallel to X -axis meets the graph of function at more than one point.

Method 3 If $f'(x) \leq 0$ or $f'(x) \geq 0, \forall x \in \text{domain}$, then f is one-one.

2. Many-One Function

A function $f: A \rightarrow B$ is said to be a many-one function, if two or more elements of set A have the same image in B . Thus, $f: A \rightarrow B$ is a many-one function, if there exist $a, b \in A$, such that $a \neq b$ but $f(a) = f(b)$.

i.e. $f: A \rightarrow B$ is a many-one function, if it is not a one-one function.

Graphically Any line parallel to X -axis, cuts the graph of the function atleast at two points. In three consecutive quadrants, trigonometrical functions are always many-one functions.

3. Onto Function (Surjection)

A function $f: A \rightarrow B$ is said to be an onto, if each element of B has its pre-image in A .

$\therefore$ If $f^{-1}(y) \in A, \forall y \in B$, then function is onto, where f^{-1} is an inverse of f Range of $f = \text{Codomain of } f$.

- NOTE**
- The number of onto functions that can be defined from a finite set A containing n elements onto a finite set B containing 2 elements $= 2^n - 2$.
 - The number of onto functions that can be defined from a finite set A out a finite set $B = \text{Number of ways of dividing } n(A) \text{ things into } n(B) \text{ groups. So, that no group is empty, if } n(A) \geq n(B) \text{ and is } 0, \text{ otherwise.}$

Method to Check Onto Function

Find the range $y = f(x)$ and show that range $f(x) = \text{Codomain of } f(x)$.

4. Into Function

A function $f: A \rightarrow B$ is said to be an into function, if there exists atleast one element in B having no pre-image in A , i.e. $f: A \rightarrow B$ is an into function, if it is not an onto function.

5. One-One and Onto Function (Bijection)

A function $f: A \rightarrow B$ is said to be a bijection, if it is one-one as well as onto. Thus, $f: A \rightarrow B$ is a bijection, if

- it is one-one, i.e. $f(x) = f(y) \Rightarrow x = y, \forall x, y \in A$.
- it is onto i.e. $\forall y \in B$, there exists $x \in A$, such that $f(x) = y$.

6. Inverse Function

Let f be defined a function from A to B such that for every element of B , there exists an image. Let y be an arbitrary element of B .

Then, f being onto, there exists an element $x \in A$, such that $f(x) = y$. Also, f being one-one, this x must be unique.

Thus, for each $y \in B$, there exists a unique element $x \in A$, such that $f(x) = y$. So, we may define a function,

$$f^{-1}: B \rightarrow A$$

$$\therefore f^{-1}(y) = x \Leftrightarrow f(x) = y$$

The above function f^{-1} is called the inverse of f .

- Inverse of bijective function is also bijective function.
- If the inverse of f exist, then f is called an invertible function, i.e. a function f is invertible if and only if f is one-one onto.

7. Composite Function

If $f: A \rightarrow B$ and $g: B \rightarrow C$ are two functions, then the composite function of f and g i.e.

$g \circ f: A \rightarrow C$ will be defined as, $g \circ f(x) = g[f(x)]$, $\forall x \in A$.

Generally, $g \circ f \neq f \circ g$.

Practice Exercise

- The number of proper subsets of $\{1, 2, 3\}$ is
a. 8 b. 7 c. 6 d. 5
- Which one of the following is $(A - B) \cup (B - A)$?
a. $(A \cup B) \cup (A - B)$ b. $(A \cup B) \cup (A \cap B)$
c. $(A \cup B) - (A \cap B)$ d. $(A - B) \cap (B - A)$
- Let $A = \{x: x \text{ is a prime factor of } 240\}$, $B = \{x: x \text{ is the sum of any two prime factors of } 240\}$, then
a. $5 \notin A \cap B$ b. $7 \in A \cap B$ c. $8 \in A \cap B$ d. $8 \in A \cup B$
- If $A = \{x: x \text{ is a multiple of } 4 \text{ and } x \in N\}$ and $B = \{x: x \text{ is a multiple of } 6 \text{ and } x \in N\}$, then $A \cap B$ consists of all multiples of
a. 16 b. 12 c. 8 d. 4
- Let A and B be two sets. Then, $(A \cup B)' \cup (A' \cap B)$ is
a. A' b. A
c. B d. None of these
- If $X = \{8^n - 7n - 1; n \in N\}$ and $Y = \{49(n - 1); n \in N\}$, then
a. $X \subset Y$ b. $Y \subset X$
c. $X = Y$ d. None of these
- In a town of 10000 families, it was found that 40% families buy newspaper A , 20% families buy newspaper B , 10% families buy newspaper C , 5% families buy A and B , 3% families buy B and C and 4% by A and C . If 2% families buy all the three newspapers, then the number of families which buy A only is
a. 3100 b. 3300 c. 2900 d. 1400
- If X and Y are two sets, then $X \cap (Y \cup X)'$ equals
a. X b. Y
c. ϕ d. None of these
- Which of the following cannot be the number of elements in the power set of any finite set?
a. 26 b. 32 c. 64 d. 128
- If $A = \{x: x^2 = 1\}$ and $B = \{x: x^4 = 1\}$, then $A \Delta B$ is equal to
a. $\{-i, i\}$ b. $\{-1, 1\}$ c. $\{-1, 1, i, -i\}$ d. $\{1, 1\}$
- A survey shows that 63% of the Americans like cheese where 76% like apples. If $x\%$ of the Americans like both cheese and apples, then
a. $x = 39$ b. $x = 63$
c. $39 \leq x \leq 63$ d. None of these
- Two finite sets have m and n elements. The total number of subsets of first set is 56 more than the total number of subsets of the second set. The values of m and n are
a. 7, 6 b. 6, 3 c. 5, 1 d. 8, 7
- Let X be the universal set for sets A and B . If $n(A) = 200$, $n(B) = 300$ and $n(A \cap B) = 100$, then $n(A' \cap B')$ is equal to 300 provided $n(X)$ is equal to
a. 600 b. 700 c. 800 d. 900
- Let A and B be two sets such that $A \cap X = B \cap X = \phi$ and $A \cup X = B \cup X$ for same set X . Then,
a. $A = B$ b. $A = X$ c. $B = X$ d. $A \cup B = X$
- If $f(x) = \cos(\log_e x)$, then $f(x)f(y) - \frac{1}{2}[f(x/y) + f(xy)]$ is equal to
a. 0 b. $\frac{1}{2}f(x)f(y)$ c. $f(x + y)$ d. $f(x - y)$
- Let U be the universal set and $A \cup B \cup C = U$. Then, $\{(A - B) \cup (B - C) \cup (C - A)\}'$ is equal to
a. $A \cup B \cup C$ b. $A \cup (B \cap C)$
c. $A \cap B \cap C$ d. $A \cap (B \cup C)$

17. If $A = \{1, 2, 3\}$ and $B = \{3, 6, 8\}$, then $(A \cap B) \times A$ is equal to
 a. $\{(1, 3), (2, 3), (3, 3)\}$ b. $\{(3, 1), (3, 2), (3, 3)\}$
 c. $\{(1, 3), (3, 1), (3, 2)\}$ d. None of these
18. Let R be a relation defined by $R = \{(1, 3), (2, 4), (5, 1)\}$ on the set of natural numbers N . Then, R^{-1} is equal to
 a. $\{(3, 1), (4, 2), (1, 5)\}$ b. $\{(5, 1), (4, 2), (1, 3)\}$
 c. $\{(5, 1), (2, 4), (1, 3)\}$ d. None of these
19. Let A and B be two finite sets having m and n elements, respectively. Then, the total number of mapping from A to B is
 a. mn b. 2^{mn} c. m^n d. n^m
20. The function $f: N \rightarrow N$, where N is the set of natural numbers, defined by $f(x) = 2x + 3$, is
 a. surjective b. not surjective
 c. injective d. None of these
21. Let R be the real line. Consider the following subsets of the plane $R \times R$
 $S = \{(x, y) : y = x + 1 \text{ and } 0 < x < 2\}$ and
 $T = \{(x, y) : x - y \text{ is an integer}\}$. Which one of the following is true?
 a. T is an equivalence relation on R but S is not
 b. Neither S nor T is an equivalence relation on R
 c. Both S and T are equivalence relations on R
 d. S is an equivalence relation on R but T is not
22. A natural number a is said to be related to another natural number b , if $|a - b| < 4$. The relation is
 a. reflexive and symmetric
 b. reflexive and transitive
 c. symmetric and transitive
 d. None of the above
23. If $A = \{0, 1, 2, 3, 4, 5\}$ and a relation R is defined by ${}_xR_y$, when $2x + y = 10$. Then, R^{-1} is
 a. $\{(3, 4), (4, 2), (5, 0)\}$ b. $\{(4, 3), (4, 2), (5, 0)\}$
 c. $\{(4, 3), (2, 4), (5, 0)\}$ d. $\{(4, 3), (2, 4), (0, 5)\}$
24. Given that relation $R = \{(1, 2), (2, 3)\}$ on the set $A = \{1, 2, 3\}$, the minimum number of ordered pairs which when added to R make it an equivalence relation, is
 a. 5 b. 6 c. 7 d. 8
25. Let $A = \{1, 2, 3, 4, 5\}$ and R be a relation defined by $R = \{(x, y) : x, y \in A, x + y = 5\}$. Then, R is
 a. reflexive and symmetric but not transitive
 b. an equivalence relation
 c. symmetric but neither reflexive nor transitive
 d. neither reflexive nor symmetric but transitive
26. If a relation R is defined on the set Z of integers as $R = \{(a, b) : a^2 + b^2 = 25\}$. Then, domain of R is
 a. $\{3, 4, 5\}$ b. $\{0, 3, 4, 5\}$
 c. $\{0, \pm 3, \pm 4, \pm 5\}$ d. None of these
27. The domain of the function $f(x) = \frac{1}{\log_{10}(1-x)} + \sqrt{x+2}$ is equal to
 a. $[-3, -2.5) \cup (-2.5, 2]$ b. $[-2, 0) \cup (0, 1]$
 c. $[0, 1]$ d. None of these
28. The range of the function $f(x) = \frac{x-2}{2-x}$, when $x \neq 2$, is
 a. R b. $R - \{1\}$ c. $\{-1\}$ d. $R - \{-1\}$
29. The function $f(x) = \log \frac{1+x}{1-x}$ satisfies the equation
 a. $f(x_1) \cdot f(x_2) = f(x_1 + x_2)$
 b. $f(x+2) - 2f(x+1) + f(x) = 0$
 c. $f(x) + f(x+1) = f(x^2 + x)$
 d. $f(x_1) + f(x_2) = f\left(\frac{x_1 + x_2}{1 + x_1 x_2}\right)$
30. Let $f: R \rightarrow R$ be a function defined by $f(x) = \frac{x-m}{x-n'}$, where $m \neq n$. Then,
 a. f is one-one and onto b. f is one-one and not onto
 c. f is many-one and onto d. f is many-one and into
31. If $f: [1, \infty) \rightarrow [2, \infty)$ is given by $f(x) = x + \frac{1}{x}$, then $f^{-1}(x)$ equals
 a. $\frac{x + \sqrt{x^2 - 4}}{2}$ b. $\frac{x}{1 + x^2}$ c. $\frac{x - \sqrt{x^2 - 4}}{2}$ d. $1 + \sqrt{x^2 - 4}$
32. The mapping $f: N \rightarrow N$ given by $f(n) = 1 + n^2, n \in N$ where N is the set of natural numbers is
 a. one-one and onto b. onto but not one-one
 c. one-one but not onto d. Neither one-one nor onto
33. If $f: R \rightarrow R, f(x) = x^2$, then f is
 a. injective but not surjective
 b. surjective but not injective
 c. bijective
 d. None of the above
34. Let $g(x) = x^2 - 4x - 5$, then
 a. g is one-one on R
 b. g is one-one on $(-\infty, 2)$
 c. g is not one-one on $(-\infty, 4)$
 d. None of the above
35. The number of surjections from $A = \{1, 2, \dots, n\}, n \geq 2$, onto $B = \{a, b\}$, is
 a. nP_2 b. $2^n - 2$
 c. $2^n - 1$ d. None of these
36. If $f(x) = \log \left(\frac{1+x}{1-x} \right)$ and $g(x) = \frac{3x + x^3}{1 + 3x^2}$, then $f \circ g(x)$ equals
 a. $-f(x)$ b. $3f(x)$
 c. $[f(x)]^3$ d. None of these

37. Let $f(x) = (x+1)^2 - 1$, ($x \geq -1$). Then, the set $S = \{x : f(x) = f^{-1}(x)\}$ is
 a. $\left\{0, -1, \frac{-3 + i\sqrt{3}}{2}, \frac{-3 - i\sqrt{3}}{2}\right\}$
 b. $\{0, 1, -1\}$
 c. $\{0, -1\}$
 d. empty
38. If a real valued function $f(x)$ satisfies the functional equation $f(x-y) = f(x)f(y) - f(a-x)f(a+y)$, where a is a given constant and $f(0) = 1$, then $f(2a-x)$ is equal to
 a. $f(-x)$
 b. $f(a) + f(a-x)$
 c. $f(x)$
 d. $-f(x)$
39. If the function $f : [1, \infty) \rightarrow [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$, then $f^{-1}(x)$ is
 a. $\left(\frac{1}{2}\right)^{x(x-1)}$
 b. $\frac{1}{2}(1 + \sqrt{1 + 4 \log_2 x})$
 c. $\frac{1}{2}(1 - \sqrt{1 - 4 \log_2 x})$
 d. Not defined
40. If $f : R \rightarrow (-\infty, 1)$, such that $f(x) = 1 - 2^{-x}$, then $f^{-1}(x)$ is
 a. $1 + \log_2(-x)$
 b. $1 - \log_2(-x)$
 c. $\log_2(1-x)$
 d. $-\log_2(1-x)$
41. Let a binary operation $*$ on Q (set of all rational numbers) be defined by $a * b = a + 2b$ for all $a, b \in Q$. Then,
 a. Q is closed under the given operation
 b. the given operation is commutative
 c. the given operation is associative
 d. Q is not closed under the given operation
42. Let Z be the set of integers and $*$ be a binary operation of Z defined as $a * b = a + b - ab$ for all $a, b \in Z$. The inverse of an element $a(a \neq 1) \in Z$ is
 a. $\frac{a}{a-1}$
 b. $\frac{a}{1-a}$
 c. $\frac{a-1}{a}$
 d. None of the above

BITSAT Archives

1. If $f(x)$ is an odd periodic function with period 2, then $f(4)$ equals [2014]
 a. -4 b. 4 c. 2 d. 0
2. Let $R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set $A = \{3, 6, 9, 12\}$. Then, the relation is [2014]
 a. an equivalence relation
 b. reflexive and symmetric
 c. reflexive and transitive
 d. only reflexive
3. The total number of subsets of a finite set A has 56 more elements than the total number of subsets of another finite set B . What is the number of elements in the set A ? [2014]
 a. 5 b. 6 c. 7 d. 8
4. Let R be the relation on the set R of all real numbers, defined by aRb iff $|a - b| \leq 1$. Then, R is [2013]
 a. reflexive and symmetric only
 b. reflexive and transitive only
 c. equivalence
 d. None of the above
5. If $A = \{x \in C : x^4 - 1 = 0\}$
 $B = \{x \in C : x^2 - 1 = 0\}$
 $C = \{x \in C : x^2 + 1 = 0\}$
 where, C is complex plane. Then, [2013]
 a. $A = B \cup C$ b. $C = A \cap B$
 c. $B = A \cap C$ d. $A = B \cap C$
6. Function $f : (-\infty, -1] \rightarrow (0, e^5]$ defined by $f(x) = e^{x^3 - 3x + 2}$ is [2011]
 a. many-one and onto b. many-one and into
 c. one-one and onto d. one-one and into
7. If the domain of the function $f(x) = x^2 - 6x + 7$ is $(-\infty, \infty)$, then the range of function is [2011, 09]
 a. $(-\infty, \infty)$ b. $[-2, \infty)$ c. $(-2, 3)$ d. $(-\infty, -2)$
8. Let $f : R \rightarrow R$, $g : R \rightarrow R$ be two functions given by $f(x) = 2x - 3$, $g(x) = x^3 + 5$. Then, $(fog)^{-1}$ is equal to [2010]
 a. $\left(\frac{x+7}{2}\right)^{1/3}$ b. $\left(x - \frac{7}{2}\right)^{1/3}$
 c. $\left(\frac{x-2}{7}\right)^{1/3}$ d. $\left(\frac{x-7}{2}\right)^{1/3}$
9. Inverse of function $f(x) = \frac{10^x - 10^{-x}}{10^x + 10^{-x}}$ is [2010]
 a. $\log_{10}(2-x)$ b. $\frac{1}{2} \log_{10} \left(\frac{1+x}{1-x} \right)$
 c. $\frac{1}{2} \log_{10}(2x-1)$ d. $\frac{1}{4} \log_{10} \left(\frac{2x}{2-x} \right)$
10. If $n(U) = 700$, $n(A) = 200$, $n(B) = 300$, $n(A \cap B) = 100$, then $n(A' \cap B')$ is equal to [2009]
 a. 300 b. 350
 c. 400 d. 500

11. Let f be a function with domain $[-3, 5]$ and let $g(x) = |3x + 4|$. Then, the domain of $(fog)(x)$ is [2009]

a. $\left(-3, \frac{1}{3}\right)$ b. $\left[-3, \frac{1}{3}\right)$ c. $\left[-3, \frac{1}{3}\right]$ d. $\left[-3, -\frac{1}{3}\right]$

12. If $f: R \rightarrow R$ and $g: R \rightarrow R$ are defined by $f(x) = |x|$ and $g(x) = (x - 3)$ for $x \in R$, then $\left\{g(f(x)) : -\frac{8}{5} < x < \frac{8}{5}\right\}$ is equal to [2008]

a. $\{0, 1\}$ b. $\{1, 2\}$ c. $\{-3, -2\}$ d. $\{2, 3\}$

13. Let $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$ be a relation on the set $A = \{1, 2, 3, 4\}$. The relation R is [2007]

a. a function b. transitive
c. not symmetric d. reflexive

14. Let $A = [-1, 1]$ and $f: A \rightarrow A$ be defined as $f(x) = x|x|$ for all $x \in A$, then $f(x)$ is [2007]

a. many-one and into function
b. one-one and into function
c. many-one and into function
d. one-one and onto function

15. If universal set, $U = \{x | x^5 - 6x^4 + 11x^3 - 6x^2 = 0\}$
 $A = \{x | x^2 - 5x + 6 = 0\}$

and $B = \{x | x^2 - 3x + 2 = 0\}$

Then, $(A \cap B)'$ is equal to [2006]

a. $\{1, 3\}$ b. $\{1, 2, 3\}$
c. $\{0, 1, 3\}$ d. $\{0, 1, 2, 3\}$

16. Which of the following statements is not correct for the relation R defined by aRb if and only if b lives within one kilometre from a ? [2006]

a. R is reflexive b. R is symmetric
c. R is not anti-symmetric d. None of these

17. Range of the function $f(x) = \frac{x^2}{x^2 + 1}$ is [2005]

a. $(-1, 0)$ b. $(-1, 1)$ c. $[0, 1)$ d. $(1, 1)$

18. $x^2 = xy$ is relation which is [2005]

a. symmetric b. reflexive
c. transitive d. None of these

19. If $f(x) = ax^2 + bx + c$ and $g(x) = px^2 + qx$ with $g(1) = f(1)$, $g(2) - f(2) = 1$, $g(3) - f(3) = 4$, then $g(4) - f(4)$ is [2005]

a. 0 b. 5
c. 6 d. None of these

Answer with Solutions

Practice Exercise

1. (b) Total number of subsets $= 2^n = 2^3 = 8$

These include the subset $\{1, 2, 3\}$ which is not the proper subset. Hence, the number of proper subsets $8 - 1 = 7$.

2. (c) We draw a Venn diagram of $(A - B) \cup (B - A)$.

The shaded region is $(A - B) \cup (B - A)$.

This shaded region can also be expressed as $(A \cup B) - (A \cap B)$.

Thus, $(A - B) \cup (B - A) = (A \cup B) - (A \cap B)$

3. (d) Since, the prime factors of 240 are 2, 3, 5.

Therefore, $A = \{2, 3, 5\}$

and $B = \{5, 8, 7\}$

and $A \cup B = \{2, 3, 5, 7, 8\}$

It can be easily seen that $8 \in A \cup B$.

4. (b) Given that, $A = \{x : x \text{ is a multiple of 4 and } x \in N\}$
 $= \{4, 8, 12, 16, 20, \dots\}$

and $B = \{x : x \text{ is a multiple of 6 and } x \in N\}$
 $= \{6, 12, 18, 24, \dots\}$

$\therefore A \cap B = \{12, 24, \dots\}$
 $= \{x : x \text{ is a multiple of 12 and } x \in N\}$

5. (a) Consider, $(A \cup B)' \cup (A' \cap B) = (A' \cap B') \cup (A' \cap B)$
[using De-Morgan's law]
 $= A' \cap (B' \cup B) - A' \cap U = A'$

6. (a) We have, $8^n - 7n - 1 = (7 + 1)^n - 7n - 1$
 $= ({}^nC_2 7^2 + {}^nC_3 7^3 + \dots + {}^nC_n 7^n)$
 $= 49({}^nC_2 + {}^nC_3 + \dots + {}^nC_n 7^{n-2}), \text{ For } n \geq 2$

For $n = 1$, $8^n - 7n - 1 = 0$

Thus, $8^n - 7n - 1$ is a multiple of 49 for $n \geq 2$ and 0 for $n = 1$. Hence, X consists of all positive integral multiples of 49 of the form $49K_n$,

where $K_n = {}^nC_2 + {}^nC_3 + \dots + {}^nC_n 7^{n-2}$ together with zero.

Therefore, $X \subset Y$.

7. (b) We have, $N = 10000$

$n(A) = 40\% \text{ of } 10000 = 4000, n(B) = 2000$

$n(C) = 1000, n(A \cap B) = 500$

$n(B \cap C) = 300, n(C \cap A) = 400$

$n(A \cap B \cap C) = 200$

We have to find,

$$\begin{aligned} n(A \cap \overline{B} \cap \overline{C}) &= n\{A \cap (B \cap C)^c\} \\ &= n(A) - n[A \cap (B \cup C)] \\ &= n(A) - n[(A \cap B) \cup (A \cap C)] \\ &= n(A) - n\{(A \cap B) \cup (A \cap C) - n(A \cap B \cap C)\} \\ &= 4000 - (500 + 400 - 200) = 3300 \end{aligned}$$

8. (c) $X \cap (Y \cup X)^c = X \cap (Y^c \cap X^c)$
 $= (X \cap X^c) \cap Y^c$
 $= \phi \cap Y^c = \phi$

9. (a) If A is any set having n elements, then the elements in a power set of A are given by 2^n .

Now, here $32 = 2^5$, $128 = 2^7$ and $64 = 2^6$

But 26 cannot be written as some power of 2.

10. (a) Given that, $A = \{x : x^2 = 1\} = \{-1, 1\}$

and $B = \{x : x^4 = 1\} = \{-1, 1, i, -i\}$

Now, $A - B = \phi$ and $B - A = \{-i, i\}$

$\therefore A \Delta B = (A - B) \cup (B - A) = \{-i, i\}$

11. (c) Suppose A refers to the set of Americans who like cheese and B refers those who like apples. Let the population of Americans be 100. So, $n(A) = 63$, $n(B) = 76$

Now, we know that,

$$n(A \cup B) = n(A) + n(B) - n(A \cap B)$$

$$\Rightarrow n(A \cap B) = 139 - n(A \cup B)$$

$$\therefore n(A \cap B) \geq 39 \text{ because } n(A \cup B) \leq 100$$

Further, $A \cap B \subset A$ and $A \cap B \subset B$

$$n(A \cap B) \leq n(A)$$

and $n(A \cap B) \leq n(B)$

i.e. $n(A \cap B) \leq 63$

and $n(A \cap B) \geq 39$

So, $39 \leq n(A \cap B) \leq 63$

Hence, $39 \leq x \leq 63$

12. (b) Since, $2^m - 2^n = 56 = 8 \times 7 = 2^3 \times 7$

$$\Rightarrow 2^n(2^{m-n} - 1) = 2^3 \times 7$$

$$\therefore n = 3 \text{ and } 2^{m-n} - 1 = 8 = 2^3$$

$$\Rightarrow m - n = 3$$

$$\Rightarrow m - 3 = 3 \Rightarrow m = 6$$

$$\therefore m = 6 \text{ and } n = 3$$

13. (b) Given, $n(A) = 200$, $n(B) = 300$, $n(A \cap B) = 100$

We know that, $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$$\therefore n(A \cup B) = 200 + 300 - 100 = 400$$

Also, $n(A' \cap B') = n\{(A \cup B)^c\} = n(X) - n(A \cup B)$

$$\Rightarrow 300 = n(X) - 400$$

$$\Rightarrow n(X) = 700$$

14. (a) Given that, $A \cup X = B \cup X$

$$\Rightarrow A \cap (A \cup X) = A \cap (B \cup X)$$

$$\Rightarrow (A \cap A) \cup (A \cap X) = (A \cap B) \cup (A \cap X)$$

[using distributive law]

$$\Rightarrow A \cup \phi = (A \cap B) \cup \phi \quad [\because A \cap X = \phi]$$

$$\Rightarrow A = A \cap B \quad \dots (i)$$

Again, consider $A \cup X = B \cup X$

$$\Rightarrow B \cap (A \cup X) = B \cap (B \cup X)$$

$$\Rightarrow (B \cap A) \cup (B \cap X) = (B \cap B) \cup (B \cap X)$$

$$\Rightarrow (B \cap A) \cup \phi = B \cup \phi \quad [\because B \cap X = \phi]$$

$$\Rightarrow A \cap B = B \quad \dots (ii)$$

Thus, from Eqs. (i) and (ii), we get

$$A = B$$

15. (a) We have, $f(x) = \cos(\log_e x)$,

$$\therefore f(x)f(y) = \frac{1}{2}[f(x/y) + f(xy)]$$

$$= \cos(\log x) \cos(\log y) = \frac{1}{2}[\cos \log(x/y) + \cos(\log xy)]$$

$$= \cos(\log x) \cos(\log y) = \frac{1}{2}[\cos(\log x - \log y)$$

$$+ \cos(\log x + \log y)]$$

$$= \cos(\log x) \cos(\log y) = \frac{1}{2}[2 \cos(\log x) \cos(\log y)] = 0$$

16. (c)

From the figure, it is clear that

$$\{(A - B) \cup (B - C) \cup (C - A)\}' = A \cap B \cap C$$

17. (b) Here, $A = \{1, 2, 3\}$ and $B = \{3, 6, 8\}$

Now, we first find $A \cap B$.

$$\therefore A \cap B = \{1, 2, 3\} \cap \{3, 6, 8\} = \{3\}$$

$$\therefore (A \cap B) \times A = \{3\} \times \{1, 2, 3\} = \{(3, 1), (3, 2), (3, 3)\}$$

18. (a) Here, R is defined by

$$R = \{(1, 3), (2, 4), (5, 1)\}$$

So, the inverse of R , i.e. R^{-1} is given by

$$R^{-1} = \{(3, 1), (4, 2), (1, 5)\}$$

19. (d) Consider any mapping $f: A \rightarrow B$. The image of any given element in A can be anyone of the n elements in B . Therefore, the m elements in A can be assigned images in $n \times n \times n \times \dots \times n = n^m$ ways. This means that these are exactly n^m distinct mappings from A to B .

20. (b) Given, the function is $f(x) = 2x + 3$

For injective function, $f(x) = f(y)$

$$\Rightarrow a = b \quad [\text{Here, } a, b \in N]$$

$$f(x) = f(y)$$

$$2x + 3 = 2y + 3$$

$$\Rightarrow 2x = 2y \Rightarrow x = y$$

For surjective function, each $y \in B$ and $a \in A$,

such that $f(a) = b$

$$f(x) = 2x + 3$$

$$y = 2x + 3$$

$$x = \frac{y - 3}{2}$$

For $y = 0$, $x = -\frac{3}{2}$ and $-\frac{3}{2} \notin M \Rightarrow f(x)$ is not surjective.

21. (a) Since, $(1, 2) \in S$ but $(2, 1) \notin S$

$\therefore S$ is not symmetric.

Hence, S is not an equivalence relation.

Given, $T = \{(x, y) : (x - y) \in I\}$

Now, $x - x = 0 \in I$, T is reflexive.

Again now, $(x - y) \in I$

$\Rightarrow y - x \in I$, T is symmetric.

Let $x - y = l_1$ and $y - z = l_2$

Now, $x - z = (x - y) + (y - z) = l_1 + l_2 \in I$

$\therefore T$ is transitive.

Hence, T is an equivalence relation.

22. (a) aR_b , if $|a - b| < 4$

(i) aRa because $|a - a| = 0 < 4$

Hence, R is reflexive.

(ii) $aR_b \rightarrow bRa$ because

$$|a - b| < 4 \rightarrow |b - a| < 4$$

Hence, R is symmetric.

(iii) Let $|a - b| < 4$ and $|b - c| < 4$

i.e. aR_b, bR_c

Now, $|a - c| = |(a - b) + (b - c)| \leq |a - b| + |b - c|$

$$\Rightarrow |a - c| \leq 4 + 4 \Rightarrow |a - c| \leq 8$$

$\therefore aR_c$

Hence, R is not transitive.

So, the given relation is reflexive and symmetric.

23. (d) The ordered pairs of R are obtained from the relation $2x + y = 10$

x	3	4	5
y	4	2	0

Thus,

$$R = \{(3, 4), (4, 2), (5, 0)\}$$

$$R^{-1} = \{(4, 3), (2, 4), (0, 5)\}$$

24. (c) R is reflexive, if it contains $(1, 1), (2, 2), (3, 3)$

$\therefore (1, 2) \in R, (2, 3) \in R$

$\therefore R$ is symmetric, if $(2, 1), (3, 2) \in R$

Now, $R = \{(1, 1), (2, 2), (3, 3), (2, 1), (3, 2), (2, 3), (1, 2)\}$

R will be transitive, if $(3, 1), (1, 3) \in R$

Thus, R becomes an equivalence relation by adding $(1, 1)$

$(2, 2) (3, 3) (2, 1) (3, 2) (1, 3) (3, 1)$.

Hence, the total number of ordered pairs is 7.

25. (c) We first write the elements of the set R .

i.e. $R = \{(1, 4), (4, 1), (2, 3), (3, 2)\}$

Since, $(1, 1) \notin R \Rightarrow R$ is not reflexive.

Now, as $(1, 4) \in R \Rightarrow (4, 1) \in R$ and $(2, 3) \in R \Rightarrow (3, 2) \in R$

So, R is symmetric.

Now, $(1, 4) \in R$ and $(4, 1) \in R \nRightarrow (1, 1) \in R$

Thus, R is not transitive.

Hence, R is symmetric but neither reflexive nor transitive.

26. (c) Here, R is defined on the set of integers as

$$R = \{(a, b) : a^2 + b^2 = 25\}$$

Now, consider $a^2 + b^2 = 25$

$$\Rightarrow a = \pm \sqrt{25 - b^2} \quad \dots(i)$$

On substituting $b = 0$ in Eq. (i), we get

$$a = \pm \sqrt{25 - 0} = \pm \sqrt{25} = \pm 5$$

On putting $b = \pm 3$ in Eq. (i), we get

$$a = \pm \sqrt{25 - 9} = \pm \sqrt{16} = \pm 4$$

Also, on putting $b = \pm 4$ in Eq. (i), we get

$$a = \pm \sqrt{25 - 16} = \pm \sqrt{9} = \pm 3$$

Again, on putting $b = \pm 5$ in Eq. (i), we get

$$a = \pm \sqrt{25 - 25} = 0$$

Thus, domain of R is $\{0, \pm 3, \pm 4, \pm 5\}$.

27. (b) Given function is $f(x) = \frac{1}{\log_{10}(1-x)} + \sqrt{x+2}$

Here, $\log_{10}(1-x) \neq 0$

$$(1-x) \neq 0 \Rightarrow x \neq 0$$

Again, $(1-x) > 0$ [$\because$ log of negative is not possible]

$$1 > 0 + x \Rightarrow x < 1$$

$$\therefore 0 < x < 1 \quad \dots(i)$$

$$\text{Taking } \sqrt{x+2} \geq 0 \Rightarrow x \geq -2$$

$$\therefore -2 \leq x < 0 \quad \dots(ii)$$

From Eqs. (i) and (ii), we can say that

$$x \in [-2, 0) \cup (0, 1]$$

28. (c) We have, $f(x) = \frac{x-2}{2-x} = -\frac{x-2}{x-2} = -1$, if $x \neq 2$

$\therefore$ Range of $f(x) = \{-1\}$

29. (d) Hint $f\left(\frac{x_1+x_2}{1+x_1x_2}\right) = \log \left[\frac{1+\frac{x_1+x_2}{1+x_1x_2}}{1-\frac{x_1+x_2}{1+x_1x_2}} \right]$

$$= \log \left(\frac{1+x_1x_2+x_1+x_2}{1+x_1x_2-x_1-x_2} \right)$$

$$= \log \left[\left(\frac{1+x_1}{1-x_1} \right) \times \left(\frac{1+x_2}{1-x_2} \right) \right]$$

30. (b) For any $x, y \in R$, we have

$$f(x) = f(y) \Rightarrow \frac{x-m}{x-n} = \frac{y-m}{y-n} \Rightarrow x = y$$

So, f is one-one.

Let $\alpha \in R$, such that $f(x) = \alpha$

$$\frac{x-m}{x-n} = \alpha, x = \frac{m-n\alpha}{1-\alpha}$$

Clearly, $x \notin R$ for $\alpha = 1$, so f is not onto.

31. (a) Let $y = x + \frac{1}{x}$

$$\Rightarrow x^2 - xy + 1 = 0$$

$$\Rightarrow x = \frac{y \pm \sqrt{y^2 - 4}}{2}$$

$$\therefore x \in (2, \infty)$$

$$\therefore x = \frac{y + \sqrt{y^2 - 4}}{2}$$

$$\text{Hence, } f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2}$$

32. (c) Since,
- $f(n) = 1 + n^2$

For one-one, $1 + n_1^2 = 1 + n_2^2 \Rightarrow n_1^2 - n_2^2 = 0$

$$\Rightarrow n_1 = n_2 \quad [\because n + n_2 \neq 0]$$

$\therefore f(n)$ is one-one.

$\therefore f(n)$ is not onto.

Hence, $f(n)$ is one-one but not onto.

33. (d) Let
- $x_1, x_2 \in R$
- such that

$$f(x_1) = f(x_2)$$

$$\Rightarrow x_1^2 = x_2^2 \Rightarrow x_1 = \pm x_2$$

Hence, f is not injective.

Let $y \in R$ be any real number, such that

$$f(x) = y$$

$$\Rightarrow y = x^2 \Rightarrow x = \sqrt{y}$$

$\therefore$ Range of $f = [0, \infty)$,

Codomain of $f = R$

$\Rightarrow$ Codomain $\neq$ Range

Hence, f is not surjective.

34. (b) Let
- $g(x_1) = g(x_2)$

$$\Rightarrow x_1^2 - 4x_1 - 5 = x_2^2 - 4x_2 - 5$$

$$\Rightarrow x_1^2 - x_2^2 = 4(x_1 - x_2)$$

$$\Rightarrow (x_1 - x_2)(x_1 + x_2 - 4) = 0$$

Either $x_1 = x_2$ or $x_1 + x_2 = 4$

Either $x_1 = x_2$ or $x_1 = 4 - x_2$

$\therefore$ There are two values of x_1 , for which $g(x_1) = g(x_2)$

$\therefore g(x)$ is not one-one, $\forall x \in R$

Graphically,

The function is one-one either on

$$x \in (-\infty, 2) \text{ or } x \in (2, \infty)$$

35. (b)
- $f: A \rightarrow B$
- , where
- A
- has
- n
- elements and
- B
- has 2 elements. Each element of
- A
- can have image 2 in the elements of
- B
- . Hence, there will be
- $2 \cdot 2 \cdot 2 \dots n$
- times
- $= 2^n$
- mappings.

But, if each element of A either goes to a only or goes to b only where, $a, b \in B$, then in these two cases, the mapping will not be surjective.

Hence, the number of surjective mappings are $2^n - 2$.

36. (b) Hint
- $g(x) = \frac{3x + x^3}{1 + 3x^2} = y$
- [say] ... (i)

$$\therefore f[g(x)] = f(y) = \log \left(\frac{1+y}{1-y} \right)$$

37. (c)
- $S = \{x : f(x) = f^{-1}(x)\}$

where, $f(x) = (x+1)^2 - 1, x \geq -1$

We know that, $f(x) = f^{-1}(x)$ can hold only at those point at which $f(x) = x$

$$\text{or } (x+1)^2 - 1 = x \Rightarrow (x+1)^2 - (x+1) = 0$$

$$\text{or } (x+1)(x+1-1) = 0 \Rightarrow x = -1, 0$$

$$S = \{-1, 0\}$$

38. (d) Given,
- $f(x-y) = f(x)f(y) - f(a-x)f(a+y)$

$$\text{Let } x = 0 = y \Rightarrow f(0) = (f(0))^2 - (f(a))^2$$

$$\Rightarrow 1 = 1 - (f(a))^2 \quad [\because f(0) = 1, \text{ given}]$$

$$\Rightarrow f(a) = 0$$

$$\begin{aligned} \therefore f(2a-x) &= f\{a-(x-a)\} \\ &= f(a)f(x-a) - f(a-a)f(x) \\ &= 0 - f(x) \cdot 1 = -f(x) \end{aligned}$$

39. (b) Let
- $y = 2^{x(x-1)}$
- , where
- $y \geq 1$
- as
- $x \geq 1$

Taking $\log_2$ on both sides, we get

$$\log_2 y = \log_2 2^{x(x-1)} \Rightarrow \log_2 y = x(x-1)$$

$$\therefore \log_a a^x = x \Rightarrow x^2 - x - \log_2 y = 0$$

$$\Rightarrow x = \frac{-1 \pm \sqrt{1 + 4 \log_2 y}}{2}$$

$$\text{For } y \geq 1, \log_2 y \geq 0 \Rightarrow 4 \log_2 y \geq 0$$

$$\Rightarrow 1 + 4 \log_2 y \geq 1 \Rightarrow \sqrt{1 + 4 \log_2 y} \geq 1$$

$$\Rightarrow -1 \sqrt{1 + 4 \log_2 y} \leq -1 \Rightarrow 1 - \sqrt{1 + 4 \log_2 y} \leq 0$$

$$\text{But } x \geq 1$$

So, $x = 1 - \sqrt{1 + 4 \log_2 y}$, which is not possible.

$$\text{Therefore, } x = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 y})$$

$$\Rightarrow f^{-1}(y) = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 y}) \quad [\because x = f^{-1}(y)]$$

$$\Rightarrow f^{-1}(x) = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 x})$$

40. (d) Let
- $y = 1 - 2^{-x}, 2^{-x} = 1 - y$

$$\Rightarrow -x = \log_2 (1 - y)$$

$$\Rightarrow x = -\log_2 (1 - y)$$

$$\therefore f^{-1}(x) = -\log_2 (1 - x)$$

41. (a)
- $\left. \begin{aligned} a * b &= a + 2b \\ b * a &= b + 2a \end{aligned} \right\} \Rightarrow a * b \neq b * a$

$$(a * b) * c = (a + 2b) * c = a + 2b + 2c$$

$$\text{Again, } a * (b * c) = a * (b + 2c) = a + 2(b + 2c)$$

$$\therefore a * (b * c) \neq (a * b) * c$$

$\therefore$ Associative law does not hold.

$$a, b \in Q, a + 2b \in Q$$

$\therefore Q$ is closed.

42. (a) Let
- e
- be the identity element for the binary operation
- $*$
- defined on
- z
- given by

$$a * b = a + b - ab$$

$$\text{Then, } a * e = a = e * a, \forall a \in z$$

$$\Rightarrow a + e - ae = a, \forall a \in z$$

$$\Rightarrow e(1 - a) = 0, \forall a \in z \Rightarrow e = 0$$

So, 0 is the identity element for the binary operation $*$ on z .

Let x be the inverse of $a \in z$, then

$$a * x = x * a = 0$$

$$\Rightarrow a + x - ax = 0$$

$$\Rightarrow x(1 - a) = -a \Rightarrow x = \frac{a}{a - 1}$$

BITSAT Archives

1. (d) Since, $f(x)$ is an odd periodic function with period 2.

$$\therefore f(-x) = -f(x)$$

$$\text{and } f(x+2) = f(x)$$

$$\therefore f(2) = f(0+2) = f(0)$$

$$\text{and } f(-2) = f(-2+2) = f(0)$$

$$\text{Now, } f(0) = f(-2) = -f(2) = -f(0)$$

$$\Rightarrow 2f(0) = 0$$

$$\text{i.e. } f(0) = 0$$

$$\therefore f(4) = f(2+2) = f(2) = f(0) = 0$$

$$\text{Thus, } f(4) = 0$$

2. (c) R is reflexive as $(3, 3), (6, 6), (9, 9), (12, 12) \in R$.

R is not symmetric as $(6, 12) \in R$ but $(12, 6) \notin R$.

R is transitive as the only pair which needs verification is $(3, 6)$ and $(6, 12) \in R$.

$$\Rightarrow (3, 12) \in R$$

3. (b) Let sets A and B have m and n elements, respectively.

$$\text{Then, } 2^m - 2^n = 56$$

$$\Rightarrow 2^n(2^{m-n} - 1) = 56 = 8 \times 7 = 2^3 \times 7$$

Comparing both sides, we get

$$2^n = 2^3 \text{ and } 2^{m-n} - 1 = 7$$

$$\Rightarrow n = 3 \text{ and } 2^{m-n} = 8$$

$$\Rightarrow 2^{m-n} = 2^3 \Rightarrow m - n = 3$$

$$\Rightarrow m - 3 = 3 \Rightarrow m = 6$$

So, number of elements in A is 6.

4. (a) Since, $|a - a| = 0 < 1$, so $aRa, \forall a \in R$

$\therefore R$ is reflexive.

$$\text{Now, } aRb \Rightarrow |a - b| \leq 1 \Rightarrow |b - a| \leq 1 \Rightarrow bRa$$

$\therefore R$ is symmetric.

But R is not transitive as

$$1R2, 2R3 \text{ but } 1 \not R 3 \quad [\because |1 - 3| = 2 > 1]$$

5. (a) $A = \{1, -1, i - i\}$

$$B = \{1, -1\}$$

$$C = \{i, i\}$$

$$\text{Now, } B \cup C = \{1, -1, i, -i\} = A$$

6. (d) We have, $f(x) = e^{x^3 - 3x + 2}$

$$\text{Let } h(x) = x^3 - 3x + 2$$

$$\therefore h'(x) = 3x^2 - 3 = 3(x^2 - 1)$$

$$\Rightarrow h'(x) \geq 0 \text{ for } x \in (-\infty, -1]$$

$\therefore f(x)$ is an increasing function.

$\therefore f(x)$ is one-one.

$$\text{Now, range of } f(x) = (0, e^4]$$

$$\text{But codomain of } f(x) = (0, e^5]$$

$\therefore f(x)$ is an into function.

7. (b) Now, $x^2 - 6x + 7 = (x - 3)^2 - 2$

It is obvious that, minimum value is -2 and maximum value is ∞ .

8. (d) Since, $f: R \rightarrow R$ and $g: R \rightarrow R$, given by $f(x) = 2x - 3$ and $g(x) = x^3 + 5$, respectively are bijections, therefore f^{-1} and g^{-1} exist.

$$\text{We have, } f(x) = 2x - 3$$

$$\therefore f(x) = y$$

$$\Rightarrow 2x - 3 = y$$

$$\Rightarrow x = \frac{y+3}{2}$$

$$\Rightarrow f^{-1}(y) = \frac{y+3}{2}$$

Thus, f^{-1} is given by

$$f^{-1}(x) = \frac{x+3}{2}, \forall x \in R$$

$$\text{Similarly, } g^{-1}(x) = (x-5)^{1/3}, \forall x \in R$$

$$\text{Now, } (fog)^{-1}(x) = (g^{-1} \circ f^{-1})(x) = g^{-1}(f^{-1}(x))$$

$$= g^{-1}\left(\frac{x+3}{2}\right)$$

$$= \left(\frac{x+3}{2} - 5\right)^{1/3} = \left(\frac{x-7}{2}\right)^{1/3}$$

9. (b) Let $f(x) = y$, then $\frac{10^x - 10^{-x}}{10^x + 10^{-x}} = y$

$$\Rightarrow \frac{10^{2x} - 1}{10^{2x} + 1} = y$$

$$\Rightarrow 10^{2x} = \frac{1+y}{1-y}$$

$$\Rightarrow x = \frac{1}{2} \log_{10} \left(\frac{1+y}{1-y} \right)$$

$$\Rightarrow f^{-1}(y) = \frac{1}{2} \log_{10} \left(\frac{1+y}{1-y} \right)$$

$$\therefore f^{-1}(x) = \frac{1}{2} \log_{10} \left(\frac{1+x}{1-x} \right)$$

10. (a) $n(A' \cap B') = n(A \cup B)'$

$$= n(U) - n(A \cup B)$$

$$= n(U) - n(A) - n(B) + n(A \cap B)$$

$$= 700 - 200 - 300 + 100$$

$$= 300$$

11. (c) $(fog)(x) = f[g(x)] = f(|3x+4|)$

Since, the domain of f is $[-3, 5]$.

$$\therefore -3 \leq |3x+4| \leq 5$$

$$\Rightarrow |3x+4| \leq 5$$

$$\Rightarrow -5 \leq 3x+4 \leq 5$$

$$\Rightarrow -9 \leq 3x \leq 1$$

$$\Rightarrow -3 \leq x \leq \frac{1}{3}$$

$$\therefore \text{Domain of } fog \text{ is } \left[-3, \frac{1}{3}\right]$$

12. (c) Given that, $f(x) = |x|$

and $g(x) = (x-3)$

For $-\frac{8}{5} < x < \frac{8}{5}$, $0 \leq f(x) < \frac{8}{5}$

Now, for $0 \leq f(x) < 1$,

$$g(f(x)) = [f(x) - 3] \\ = -3 \quad [\because -3 \leq f(x) - 3 < -2]$$

Again, for $1 \leq f(x) < 1.6$ $g(f(x)) = -2$
 $[\because -2 \leq f(x) - 3 < -1.4]$

Hence, required set is $\{-3, -2\}$.

13. (c) Let $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$ be a relation on the set $A = \{1, 2, 3, 4\}$, then

(a) Since, $(2, 4) \in R$ and $(2, 3) \in R$, so R is not a function.

(b) Since, $(1, 3) \in R$ and $(3, 1) \in R$ but $(1, 1) \notin R$, so R is not transitive.

(c) Since, $(2, 3) \in R$ but $(3, 2) \notin R$, so R is not symmetric.

(d) Since, $(1, 1) \notin R$, so R is not reflexive.

14. (d) $f(x) = x|x| = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

Since, $-1 \leq x \leq 1$, therefore $-1 \leq f(x) \leq 1$

$\therefore$ Function is one-one and onto.

15. (c) $U = \{x : x^5 - 6x^4 + 11x^3 - 6x^2 = 0\} = \{0, 1, 2, 3\}$

$$A = \{x : x^2 - 5x + 6 = 0\} = \{2, 3\}$$

and $B = \{x : x^2 - 3x + 2 = 0\} = \{2, 1\}$

$$A \cap B = \{2\}$$

$$\therefore (A \cap B)^c = U - (A \cap B) = \{0, 1, 2, 3\} - \{2\} = \{0, 1, 3\}$$

16. (c) R is not anti-symmetric.

17. (c) Given that, $f(x) = \frac{x^2}{x^2 + 1}$

Since, it is an even function, therefore its value is always greater than or equal to 0 and we know that,

$$x^2 < x^2 + 1 \text{ or } \frac{x^2}{x^2 + 1} < 1$$

$\therefore$ Required range is $[0, 1)$.

18. (c) Given that, $x^2 = xy$

Let $x, y \in R$

$$xRy = x^2 = xy \text{ and } yRz = y^2 = yz$$

Now, $x^2y^2 = xy^2z \Rightarrow x^2 = xz \Rightarrow xRz$

$\therefore$ It is transitive.

19. (b) $\because f(x) = ax^2 + bx + c$ and $g(x) = px^2 + qx$

Since, $g(1) = f(1) \Rightarrow p + q = a + b + c \quad \dots(i)$

and $g(2) - f(2) = 1 \Rightarrow 4p + 2q - 4a - 2b - c = 1 \quad \dots(ii)$

Also, $g(3) - f(3) = 4$

$$\Rightarrow 9p + 3q - 9a - 3b - c = 4 \quad \dots(iii)$$

From Eqs. (i) and (ii), we get

$$2p = 2a - c + 1$$

Now, $g(4) - f(4) = 16p + 4q - 16a - 4b - c$

$$= 12p + 4(p + q) - 16a - 4b - c = 6 - 3c$$

10

Linear Inequality

Inequality

Two real numbers or two algebraic expressions related by the symbols $>$, $<$, $\leq$ or $\geq$ form an inequality.

Linear Inequality

An inequality is said to be linear, if each variable occurs in first degree only and there is no term involving the product of the variables. e.g. $ax + b \leq 0$, $ax + by + c$, $ax \leq 4$.

(i) Linear Inequality in One Variable

A linear inequality which has only one variable, is called linear inequality in one variable.

e.g. $ax + b < 0$, where $a \neq 0$, $4x + 7 \geq 0$

(ii) Linear Inequality in Two Variables

A linear inequality which have only two variables, is called linear inequality in two variables.

e.g. $3x + 11y \leq 0$, $4x + 3y > 0$

Important Results on Inequalities

1. If $a > b$ and $b > c$, then $a > c$. Generally, if $a_1 > a_2$, $a_2 > a_3$, ..., $a_{n-1} > a_n$, then $a_1 > a_n$.

2. If $a > b$, then $a \pm c > b \pm c$, $\forall c \in R$.

3. If $a > b$, then (i) for $m > 0$, $am > bm$, $\frac{a}{m} > \frac{b}{m}$ (ii) for $m < 0$, $am < bm$, $\frac{a}{m} < \frac{b}{m}$

4. (i) If $a > b > 0$, then

(a) $a^2 > b^2$

(b) $|a| > |b|$

(c) $\frac{1}{a} < \frac{1}{b}$

(ii) If $a < b < 0$, then

(a) $a^2 > b^2$

(b) $|a| > |b|$

(c) $\frac{1}{a} > \frac{1}{b}$

5. If $a < 0 < b$, then

(i) $a^2 > b^2$, if $|a| > |b|$ (ii) $a^2 < b^2$, if $|a| < |b|$

6. If $a < x < b$ and a, b are positive real numbers, then $a^2 < x^2 < b^2$.
7. If $a < x < b$, where a is negative number and b is a positive number, then
 (i) $0 \leq x^2 < b^2$, if $|b| > |a|$
 (ii) $0 \leq x^2 \leq a^2$, if $|a| > |b|$
8. If $\frac{a}{b} > 0$, then (i) $a > 0$, if $b > 0$ (ii) $a < 0$, if $b < 0$
9. If $a_i > b_i > 0$, where $i = 1, 2, 3, \dots, n$, then
 $a_1 a_2 a_3 \dots a_n > b_1 b_2 b_3 \dots b_n$
10. If $|x| < a$, then
 (i) a is positive, when $-a < x < a$.
 (ii) a is negative, when $x \in \phi$.
11. If $a_i > b_i$, where $i = 1, 2, 3, \dots, n$, then
 $a_1 + a_2 + a_3 + \dots + a_n > b_1 + b_2 + \dots + b_n$
12. If $0 < a < 1$ and n is a positive rational number, then
 (i) $0 < a^n < 1$
 (ii) $a^{-n} > 1$

Arithmetico-Geometric Mean Inequality

If $a, b > 0$ and $a \neq b$, then

$$\frac{a+b}{2} \geq \sqrt{ab}$$

i.e. arithmetic mean $\geq$ geometric mean

Practice Exercise

1. If x satisfies the inequations $2x - 7 < 11$ and $3x + 4 < -5$, then x lies in the interval
 a. $(-\infty, 3)$ b. $(-\infty, 2)$ c. $(-\infty, -3)$ d. $(-\infty, \infty)$
2. If $-3 \leq 4 - \frac{7x}{2} \leq 18$, then
 a. $x \in (-\infty, -4]$ b. $x \in [-4, \infty)$
 c. $x \in [-4, 2]$ d. $x \in [2, \infty)$
3. The solution set of the inequalities $6 \leq -3(2x - 4) < 12$ is
 a. $(-\infty, 1]$ b. $(0, 1]$
 c. $(0, 1] \cup [1, \infty)$ d. $[1, \infty)$
4. The solution set of the inequalities $3x - 7 > 2(x - 6)$ and $6 - x > 11 - 2x$, is
 a. $(-5, \infty)$ b. $[5, \infty)$
 c. $(5, \infty)$ d. $[-5, \infty)$
5. The set of values of x satisfying $2 \leq |x - 3| < 4$, is
 a. $(-1, 1) \cup [5, 7)$
 b. $-4 \leq x \leq 2$
 c. $-1 < x < 7$ or $x \geq 5$
 d. $x < 7$ or $x \geq 5$
6. The number of pairs of consecutive even positive integers, both of which are larger than 8, such that their sum is less than 25, is
 a. 1 b. 2
 c. 3 d. 4
7. IQ of a person is given by the formula

$$IQ = \frac{MA}{CA} \times 100$$
- where, MA is mental age and CA is chronological age. If $80 \leq IQ \leq 140$ for a group of 12 yr children, then the range of their mental age is
 a. $9.8 \leq MA \leq 16.8$ b. $10 \leq MA \leq 16$
 c. $9.6 \leq MA \leq 16.8$ d. $9.6 \leq MA \leq 16.6$
8. A solution of 8% boric is to be diluted by adding 2% boric acid solution to it. The resulting mixture is to be more than 4% but less than 6% boric acid. If we have 640 L of the 8% solution of the 2% solution will have to be added, is
 a. more than 320 and less than 1000
 b. more than 160 and less than 320
 c. more than 320 and less than 1280
 d. more than 320 and less than 640
9. A solution is to be kept between 68°F and 77°F . The range in temperature in degree Celsius ($^\circ\text{C}$), if the Celsius/Fahrenheit (F) conversion formula is given by $F = \frac{9}{5}C + 32$, is
 a. between 20°C and 22°C
 b. between 20°C and 25°C
 c. between 36°C and 45°C
 d. between 4°C and 5°C
10. If $3 \leq 3t - 18 \leq 18$, then which one of the following is true?
 a. $15 \leq 2t + 1 \leq 20$ b. $8 \leq t < 12$
 c. $8 \leq t + 1 \leq 13$ d. $21 \leq 3t \leq 24$
11. The solution set contained in R of the inequation $3^x + 3^{1-x} - 4 < 0$, is
 a. $(1, 3)$ b. $(0, 1)$
 c. $(1, 2)$ d. $(0, 2)$

12. The minimum value of $f(x) = |3 - x| + 7$ is
 a. 0 b. 6 c. 7 d. 8
13. If $x^2 + 4ax + 2 > 0$ for all values of x , then a lies in the interval
 a. $(-2, 4)$ b. $(1, 2)$
 c. $(-\sqrt{2}, \sqrt{2})$ d. $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$
14. The solution set of the inequation $\frac{x+11}{x-3} > 0$ is
 a. $(-\infty, -11) \cup (3, \infty)$ b. $(-\infty, -10) \cup (2, \infty)$
 c. $(-100, -11) \cup (1, \infty)$ d. $(-5, 0) \cup (3, 7)$
15. For $\frac{|x-1|}{x+2} < 1$, x lies in the interval
 a. $(-\infty, -2) \cup \left(-\frac{1}{2}, \infty\right)$ b. $(-\infty, 1) \cup [2, 3]$
 c. $(-\infty, -4)$ d. $\left[-\frac{1}{2}, 1\right]$
16. If a, b and $c > 0$, then the minimum value of $\frac{a}{b+c} + \frac{b}{c+a} + \frac{c}{a+b}$ is
 a. 1 b. $3/2$ c. 2 d. $5/2$
17. If $a, b, c > 0$ and $abc = 1$, then the value of $a + b + c + ab + bc + ca$ lies in the interval
 a. $(\infty, -6]$ b. $(-6, 0)$ c. $(0, 6)$ d. $(6, \infty)$
18. The number of positive integers satisfying the inequality ${}^{n+1}C_{n-2} - {}^{n+1}C_{n-1} \leq 50$, is
 a. 9 b. 8 c. 7 d. 6
19. The set of admissible values of x such that $\frac{2x+3}{2x-9} < 0$, is
 a. $\left(-\infty, -\frac{3}{2}\right) \cup \left(\frac{9}{2}, \infty\right)$ b. $(-\infty, 0) \cup \left(\frac{9}{2}, \infty\right)$
 c. $\left(-\frac{3}{2}, 0\right)$ d. $\left(-\frac{3}{2}, \frac{9}{2}\right)$
20. The set of values of x for which the inequalities $x^2 - 3x - 10 < 0$ and $10x - x^2 - 16 > 0$ hold simultaneously, is
 a. $(-2, 5)$ b. $(2, 8)$ c. $(-2, 8)$ d. $(2, 5)$
21. The set of values of x satisfying $2 \leq |x-3| < 4$, is
 a. $(-1, 1] \cup [5, 7)$ b. $-4 \leq x \leq 2$
 c. $-1 < x < 7$ or $x \geq 5$ d. $x < 7$ or $x \geq 5$
22. Let $x = \left[\frac{a+2b}{a+b}\right]$ and $y = \frac{a}{b}$, where a and b are positive integers. If $y^2 > 2$, then
 a. $x^2 \leq 2$ b. $x^2 < 2$ c. $x^2 > 2$ d. $x^2 \geq 2$
23. If $\frac{2x}{2x^2+5x+2} > \frac{1}{x+1}$, then
 a. $-2 > x > -1$ b. $-2 \geq x \geq -1$
 c. $-2 < x < -1$ d. $-2 < x \leq -1$
24. If $(x-1)(x^2-5x+7) < (x-1)$, then x belongs to
 a. $(1, 2) \cup (3, \infty)$ b. $(-\infty, 1) \cup (2, 3)$
 c. $(2, 3)$ d. None of these
25. If r is a real number such that $|r| < 1$ and $a = 5(1-r)$, then
 a. $0 < a < 5$ b. $-5 < a < 5$
 c. $0 < a < 10$ d. $0 \leq a < 10$
26. The number of integral solutions of $\frac{x+2}{x^2+1} > \frac{1}{2}$ is
 a. 0 b. 1 c. 2 d. 3
27. The set of all x satisfying the inequality $\frac{4x-1}{3x+1} \geq 1$, is
 a. $\left(-\infty, -\frac{1}{3}\right) \cup \left[\frac{1}{4}, \infty\right)$
 b. $\left(-\infty, -\frac{2}{3}\right) \cup \left[\frac{5}{4}, \infty\right)$
 c. $\left(-\infty, -\frac{1}{3}\right) \cup [2, \infty)$
 d. $\left(-\infty, -\frac{2}{3}\right] \cup [4, \infty)$

BITSAT Archives

1. If p, q, r and s are positive real numbers such that $p + q + r + s = 2$, then $M = (p + q)(r + s)$ satisfies the relation [2014]
 a. $0 < M \leq 1$
 b. $1 \leq M \leq 2$
 c. $2 \leq M \leq 3$
 d. $3 \leq M \leq 4$
2. The set of all real x satisfying the inequality $\frac{3-|x|}{4-|x|} \geq 0$ is [2013]
 a. $[-3, 3] \cup (-\infty, -4) \cup (4, \infty)$
 b. $(-\infty, -4) \cup (4, \infty)$
 c. $(-\infty, -3) \cup (4, \infty)$
 d. $(-\infty, -3) \cup (3, \infty)$

Answer with Solutions

Practice Exercise

1. (c) We have, $2x - 7 < 11$ and $3x + 4 < -5$

Now, $2x - 7 < 11$

Adding 7 on both sides, we get

$$2x < 11 + 7 \Rightarrow 2x < 18$$

Dividing by 2 on both sides, we get

$$x < 9 \quad \dots(i)$$

and $3x + 4 < -5$

Adding (-4) on both sides, we get

$$3x < -5 - 4 \Rightarrow 3x < -9$$

Dividing by 3 on both sides, we get

$$x < -3 \quad \dots(ii)$$

$\therefore$ Solution set is $(-\infty, -3)$.

2. (c) The given inequality is $-3 \leq 4 - \frac{7x}{2} \leq 18$

Adding (-4) to each term, we get

$$-3 - 4 \leq 4 - \frac{7x}{2} - 4 \leq 18 - 4 \Rightarrow -7 \leq -\frac{7x}{2} \leq 14$$

Multiplying by $\left(\frac{-2}{7}\right)$ to each term, we get

$$-7 \times \left(-\frac{2}{7}\right) \geq -\frac{7}{2}x \times \left(-\frac{2}{7}\right) \geq 14 \times \left(-\frac{2}{7}\right)$$

$$\Rightarrow 2 \geq x \geq -4 \Rightarrow -4 \leq x \leq 2$$

$\therefore$ Solution set is $[-4, 2]$.

3. (b) The given inequality is $6 \leq -3(2x - 4) < 12$

$$\Rightarrow 6 \leq -6x + 12 < 12$$

Adding (-12) to each term, we get

$$6 - 12 \leq -6x + 12 - 12 < 12 - 12 \Rightarrow -6 \leq -6x < 0$$

Dividing by (-6) to each term, we get

$$\frac{-6}{-6} \geq \frac{-6x}{-6} > \frac{0}{-6} \Rightarrow 1 \geq x > 0 \Rightarrow 0 < x \leq 1$$

$\therefore$ Solution set is $(0, 1]$.

4. (c) We have, $3x - 7 > 2(x - 6) \Rightarrow 3x - 7 > 2x - 12$

Transferring the term $2x$ to LHS and the term (-7) to RHS,

$$3x - 2x > -12 + 7 \Rightarrow x > -5 \quad \dots(i)$$

and $6 - x > 11 - 2x$

Transferring the term $(-2x)$ to LHS and the term 6 to RHS,

$$-x + 2x > 11 - 6$$

$$\Rightarrow x > 5 \quad \dots(ii)$$

$\therefore$ Solution set is $(5, \infty)$.

5. (a) We have, $2 \leq |x - 3| < 4$

Case I If $x < 3$, then

$$2 \leq |x - 3| < 4$$

$$\Rightarrow 2 \leq -(x - 3) < 4 \Rightarrow 2 \leq -x + 3 < 4$$

Subtracting 3 from both sides, we get

$$-1 \leq -x < 1$$

Multiplying (-1) on both sides, we get

$$-1 < x \leq 1 \Rightarrow x \in (-1, 1]$$

Case II If $x > 3$, then

$$2 \leq |x - 3| < 4 \Rightarrow 2 \leq x - 3 < 4$$

Adding 3 on both sides, we get

$$5 \leq x < 7$$

Hence, the solution set of given inequality is

$$x \in (-1, 1] \cup [5, 7)$$

6. (a) Let x be the smaller of two consecutive even positive integers. Then, the other even integer is $x + 2$.

Given, $x > 8$ and $x + x + 2 < 25$

$$\Rightarrow x > 8 \text{ and } 2x + 2 < 25$$

$$\Rightarrow x > 8 \text{ and } 2x < 23$$

$$\Rightarrow x > 8 \text{ and } x < \frac{23}{2}$$

$$\Rightarrow x = 10$$

Hence, there exists only one pair of even integers $(10, 12)$.

7. (c) We have,

$$IQ = \frac{MA}{CA} \times 100$$

$$\Rightarrow IQ = \frac{MA}{12} \times 100 \quad [\because CA = 12 \text{ yr}]$$

$$= \frac{25}{3} MA$$

$$\text{Given, } 80 \leq IQ \leq 140 \Rightarrow 80 \leq \frac{25}{3} MA \leq 140$$

$$\Rightarrow 240 \leq 25 MA \leq 420$$

Dividing by 25 to each term, we get

$$\frac{240}{25} \leq MA \leq \frac{420}{25}$$

$$\Rightarrow 9.6 \leq MA \leq 16.8$$

8. (c) Let the 2% boric acid solution be x L.

$\therefore$ Mixture = $(640 + x)$ L

Now, according to the question, following two conditions arise

I. 2% of x + 8% of 640 > 4% of $(640 + x)$

II. 2% of x + 8% of 640 < 6% of $(640 + x)$

From condition I,

$$\frac{2}{100} \times x + \frac{8}{100} \times 640 > \frac{4}{100} \times (640 + x)$$

Multiplying both sides by 100, we get

$$100 \times \left[\frac{2x}{100} + \frac{8}{100} \times 640 \right] > \frac{4}{100} \times (640 + x) \times 100$$

$$\Rightarrow 2x + 8 \times 640 > 4 \times 640 + 4x$$

Transferring the term $4x$ to LHS and the term (8×640) to RHS,

$$2x - 4x > 4 \times 640 - 8 \times 640$$

$$\Rightarrow -2x > 640(4 - 8) \Rightarrow -2x > -4 \times 640$$

Dividing both sides by -2 , we get

$$\frac{-2x}{-2} < \frac{-4 \times 640}{-2} \Rightarrow x < 2 \times 640$$

$$\Rightarrow x < 1280 \quad \dots(i)$$

From condition II,

$$\begin{aligned} \frac{2}{100} \times x + \frac{8}{100} \times 640 &< \frac{6}{100} \times (640 + x) \\ \Rightarrow 100 \times \left[\frac{2x}{100} + \frac{8}{100} \times 640 \right] &< [6 \times 640 + 6x] \times \frac{100}{100} \end{aligned}$$

$$\Rightarrow 2x + 8 \times 640 < 6 \times 640 + 6x$$

Transferring the term $6x$ to LHS and the term (8×640) to RHS,

$$2x - 6x < 6 \times 640 - 8 \times 640$$

$$\Rightarrow -4x < 640(6 - 8)$$

$$\Rightarrow -4x < -2 \times 640$$

Dividing both sides by -4 , we get

$$\frac{-4x}{-4} > \frac{-2 \times 640}{-4}$$

$$\Rightarrow x > 320 \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$320 < x < 1280$$

$$\text{i.e. } x \in (320, 1280)$$

Hence, the number of litres to be added should be greater than 320 L and less than 1280 L.

9. (b) Given that, $68^\circ < F < 77^\circ$ $\dots(i)$

Putting $F = \frac{9}{5}C + 32$ in Eq. (i),

$$\Rightarrow 68^\circ < \frac{9}{5}C + 32 < 77^\circ$$

Adding (-32) in each term, we get

$$68^\circ - 32 < \frac{9}{5}C + 32 - 32 < 77^\circ - 32$$

$$\Rightarrow 36^\circ < \frac{9}{5}C < 45^\circ$$

Multiplying by $\left(\frac{5}{9}\right)$ in each term, we get

$$36^\circ \times \frac{5}{9} < \frac{9}{5}C \times \frac{5}{9} < 45^\circ \times \frac{5}{9}$$

$$\Rightarrow 4^\circ \times 5 < C < 5^\circ \times 5$$

$$\Rightarrow 20^\circ < C < 25^\circ$$

$$\text{i.e. } C \in (20, 25)$$

Hence, temperature in degree Celsius lies between 20°C and 25°C .

10. (c) $3 \leq 3t - 18 \leq 18$

$$\Rightarrow 21 \leq 3t \leq 36$$

$$\Rightarrow 7 \leq t \leq 12 \Rightarrow 8 \leq t + 1 \leq 13$$

11. (b) Given, $3^x + \frac{3}{3^x} - 4 < 0$

$$\Rightarrow 3^{2x} + 3 - 4 \cdot 3^x < 0 \Rightarrow (3^x - 1)(3^x - 3) < 0$$

$$\Rightarrow 1 < 3^x < 3 \Rightarrow 0 < x < 1$$

$\therefore$ The solution set is $(0, 1)$.

12. (c) Minimum value of $f(x)$ is attained at $x = 3$

$\therefore$ Minimum value of $f(x) = 7$

13. (d) $x^2 + 4ax + 2 > 0$

$$\therefore (4a)^2 - 4 \times 2 < 0 \quad [\text{if } f(x) > 0, \text{ then } D < 0]$$

$$\Rightarrow 16a^2 < 8 \Rightarrow a^2 < \frac{1}{2}$$

$$\Rightarrow -\frac{1}{\sqrt{2}} < a < \frac{1}{\sqrt{2}}$$

14. (a) $\frac{x+11}{x-3} > 0$

$$\Rightarrow (x-3)(x+11) > 0 \Rightarrow x < -11, x > 3$$

$$\Rightarrow x \in (-\infty, -11) \cup (3, \infty)$$

15. (a) Given, $\frac{|x-1|}{x+2} - 1 < 0$

Case I When $x < 1$, $|x-1| = 1-x$

$$\therefore \frac{1-x}{x+2} - 1 < 0 \Rightarrow \frac{-2x-1}{x+2} < 0$$

$$\Rightarrow \frac{2x+1}{x+2} > 0 \Rightarrow x < -2 \text{ or } x > -\frac{1}{2}$$

But $x < 1$

$$\therefore x \in (-\infty, -2) \cup \left(-\frac{1}{2}, 1\right) \quad \dots(i)$$

Case II When $x \geq 1$, $|x-1| = x-1$

$$\therefore \frac{x-1}{x+2} - 1 < 0 \Rightarrow \frac{-3}{x+2} < 0$$

$$\Rightarrow \frac{3}{x+2} > 0 \Rightarrow x > -2$$

But $x \geq 1$

$$\therefore x \geq 1, \text{ i.e. } x \in [1, \infty) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$x \in (-\infty, -2) \cup \left(-\frac{1}{2}, \infty\right)$$

16. (b) Using $AM \geq GM$

$$\frac{\frac{a}{b+c} + \frac{b}{c+a} + \frac{c}{a+b}}{3} \geq \sqrt[3]{\frac{abc}{(a+b)(b+c)(c+a)}} \quad \dots(i)$$

Again, using $AM \geq GM$

$$\frac{a+b}{2} \geq \sqrt{ab}, \frac{b+c}{2} \geq \sqrt{bc}, \frac{c+a}{2} \geq \sqrt{ca}$$

$$\Rightarrow (a+b)(b+c)(c+a) \geq 8abc$$

$$\Rightarrow \sqrt[3]{\frac{abc}{(a+b)(b+c)(c+a)}} \leq \frac{1}{2}$$

From Eq. (i),

$$\frac{a}{b+c} + \frac{b}{c+a} + \frac{c}{a+b} \geq \frac{3}{2}$$

17. (d) Using $AM > GM$

$$\therefore \frac{a+b+c}{3} > \sqrt[3]{abc}$$

$$\Rightarrow a+b+c > 3 \quad [\because abc = 1, \text{ given}] \dots(i)$$

Also, $GM > HM$

$$\sqrt[3]{abc} > \frac{3}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}$$

$$\Rightarrow (1)^{1/3} > \frac{3abc}{bc + ac + ab}$$

$$\Rightarrow ab + bc + ac > 3$$

From Eqs. (i) and (ii), we get

$$a + b + c + ab + bc + ac > 6$$

18. (b) Given, ${}^{n+1}C_{n-2} - {}^{n+1}C_{n-1} \leq 50$

$$\Rightarrow \frac{(n-1)!}{3!(n-2)!} - \frac{(n+1)!}{2!(n-1)!} \leq 50$$

$$\Rightarrow \frac{(n+1)!}{3!} \left[\frac{1}{(n-2)!} - \frac{3}{(n-1)!} \right] \leq 50$$

$$\Rightarrow (n+1)! \left(\frac{n-1-3}{(n-1)!} \right) \leq 300$$

$$\Rightarrow (n+1)n(n-4) \leq 300$$

For $n = 8$, it satisfies the above inequality.

But for $n = 1$, it does not satisfy the above inequality.

19. (d) Given, $\frac{2x+3}{2x-9} < 0$

$$\Rightarrow 2x+3 < 0 \text{ and } 2x-9 > 0$$

or $2x+3 > 0 \text{ and } 2x-9 < 0 \text{ and } x \neq \frac{9}{2}$

$$\Rightarrow x < -\frac{3}{2} \text{ and } x > \frac{9}{2} \text{ or } x > -\frac{3}{2} \text{ and } x < \frac{9}{2}$$

and $x \neq \frac{9}{2} \Rightarrow x \in \left(-\frac{3}{2}, \frac{9}{2}\right)$

20. (d) Given inequalities are

$$x^2 - 3x - 10 < 0 \text{ and } 10x - x^2 - 16 > 0$$

$$\Rightarrow (x+2)(x-5) < 0 \text{ and } (x-2)(x-8) < 0$$

$$\Rightarrow x \in (-2, 5) \text{ and } x \in (2, 8)$$

$$\therefore x \in (2, 5)$$

21. (a) Since, $2 \leq |x-3| < 4$

$$\Rightarrow 2 \leq x-3 < 4 \text{ or } 2 \leq -(x-3) < 4$$

$$\Rightarrow 5 \leq x < 7 \text{ or } -1 \leq -x < 1$$

$$\Rightarrow 5 \leq x < 7 \text{ or } -1 < x \leq 1$$

$$\therefore x \in (-1, 1] \cup [5, 7)$$

22. (b) Given that, $x = \left[\frac{a+2b}{a+b} \right]$ and $y = \frac{a}{b}$

$$\therefore x = \frac{a+2b}{a+b} = \frac{\frac{a}{b} + 2}{1 + \frac{a}{b}} = 1 + \frac{1}{\frac{a}{b} + 1}$$

$$\Rightarrow x = 1 + \frac{1}{y+1} \quad [\because y = \frac{a}{b} \text{ and } y^2 > 2, \text{ given}]$$

which shows $x^2 < 2$. $\left[\because \frac{1}{y+1} < 1 \text{ as } y > 1 \right]$

23. (c) Given, $\frac{2x}{(2x+1)(x+2)} - \frac{1}{(x+1)} > 0$

$$\Rightarrow \frac{-3x-2}{(x+1)(x+2)(2x+1)} > 0$$

Equating each factor equal to 0, we have

$$x = -2, -1, -\frac{2}{3}, -\frac{1}{2}$$

It is clear that, $-\frac{2}{3} < x < -\frac{1}{2}$ or $-2 < x < -1$

24. (b) Given, $(x-1)(x^2-5x+7) < (x-1)$

$$\Rightarrow (x-1)(x^2-5x+6) < 0$$

$$\Rightarrow (x-1)(x-2)(x-3) < 0$$

$$\Rightarrow x \in (-\infty, 1) \cup (2, 3)$$

25. (c) Since, $|r| < 1 \Rightarrow -1 < r < 1$

Also, $a = 5(1-r)$

$$\Rightarrow 0 < a < 10 \quad \left[\because \text{at } r = -1, a = 10 \right. \\ \left. \text{and at } r = 1, a = 0 \right]$$

26. (d) Given that, $\frac{x+2}{x^2+1} > \frac{1}{2} \Rightarrow x^2 - 2x - 3 < 0$

$$\Rightarrow (x-3)(x+1) < 0 \Rightarrow -1 < x < 3$$

The integral values of x are 0, 1, 2.

$\therefore$ The number of integral solutions are 3.

27. (c) Given, $\frac{4x-1}{3x+1} - 1 \geq 0 \Rightarrow \frac{x-2}{3x+1} \geq 0$

$$\Rightarrow x-2 \geq 0 \text{ and } 3x+1 > 0 \text{ or } x-2 \leq 0 \text{ and } 3x+1 < 0$$

$$\Rightarrow x \geq 2 \text{ and } x > -\frac{1}{3} \text{ or } x \leq 2 \text{ and } x > -\frac{1}{3}$$

$$\Rightarrow x \in \left(-\infty, -\frac{1}{3}\right) \cup [2, \infty)$$

BITSAT Archives

1. (a) Since, $AM \geq GM$, then

$$\frac{(p+q)+(r+s)}{2} \geq \sqrt{(p+q)(r+s)}$$

$$\Rightarrow \frac{2}{2} \geq \sqrt{M} \Rightarrow \sqrt{M} \leq 1 \Rightarrow M \leq 1$$

Also, $(p+q)(r+s) > 0$ $[\because p, q, r, s > 0]$

$$\therefore M > 0$$

Hence, $0 < M \leq 1$

2. (a) Given, $\frac{3-|x|}{4-|x|} \geq 0$

$$\Rightarrow 3-|x| \leq 0 \text{ and } 4-|x| < 0$$

or $3-|x| \geq 0 \text{ and } 4-|x| > 0$

$$\Rightarrow |x| \geq 3 \text{ and } |x| > 4$$

or $|x| \leq 3 \text{ and } |x| < 4$

$$\Rightarrow |x| > 4 \text{ or } |x| \leq 3$$

$$\Rightarrow x \in (-\infty, -4) \cup [-3, 3] \cup (4, \infty)$$

Trigonometry

Measure of Angles

The measure of an angle is the amount of rotation performed to get the terminal side from the initial side. The angle is called positive, if its direction of rotation is anti-clockwise and it is called negative, if its direction of rotation is clockwise.

The point of rotation is called the vertex.

System of Measurement of Angles

There are three systems of measurement, which are given below:

Sexagesimal System

In this system, each angle is divided into 90 equal parts and each part is known as a **degree**.

Thus,

$$\begin{aligned} 1 \text{ right angle} &= 90^\circ && [\text{read as 90 degrees}] \\ 1^\circ &= 60' && [\text{read as 60 min}] \\ 1' &= 60'' && [\text{read as 60 s}] \end{aligned}$$

Centesimal System

In this system, each angle is divided into 100 equal parts and one part is known as a **grade**.

Thus,

$$\begin{aligned} 1 \text{ right angle} &= 100^g && [\text{read as 100 grades}] \\ 1^g &= 100' && [\text{read as 100 min}] \\ 1' &= 100'' && [\text{read as 100 s}] \end{aligned}$$

Circular System

If the angle subtended by an arc of length l to the centre of circle of radius r is θ , then

$$\theta = \frac{l}{r}$$

If the length of arc is equal to the radius of the circle, then the angle subtended at the centre of the circle will be one radian. One radian is denoted by 1^c .

Relation between Different Systems of Measurement of Angles

If measure of an angle is given in degree, then to convert it into radians, multiply the measure of an angle by $\frac{\pi}{180^\circ}$ and if

the measure of an angle is given in radians, then to convert it into degree, write 180° at the place of π .

$$\therefore 1^\circ = \frac{\pi}{180} \text{ rad} = 0.0174 \text{ rad}$$

$$1 \text{ rad} = \frac{180}{\pi} \text{ degree} = 57^\circ 16' 22''$$

Also, $1^g = \frac{\pi}{200} \text{ rad}$

$$1 \text{ rad} = \frac{200}{\pi} \text{ grades}$$

So, if the measure of an angle in degrees, grades and radians, are D , G and C respectively, then

$$D/90 = G/100 = 2C/\pi$$

Trigonometric Ratios

Relation between different sides and angles of a right angled triangle are called trigonometric ratios or T-ratios.

In a right angled $\triangle ABC$, if $\angle CAB = \theta$, then

$$(i) \sin \theta = \frac{BC}{AC} = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

$$(ii) \cos \theta = \frac{AB}{AC} = \frac{\text{Base}}{\text{Hypotenuse}}$$

$$(iii) \tan \theta = \frac{BC}{AB} = \frac{\text{Perpendicular}}{\text{Base}}$$

$$(iv) \operatorname{cosec} \theta = \frac{1}{\sin \theta} = \frac{AC}{BC} = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$(v) \sec \theta = \frac{1}{\cos \theta} = \frac{AC}{AB} = \frac{\text{Hypotenuse}}{\text{Base}}$$

$$(vi) \cot \theta = \frac{1}{\tan \theta} = \frac{AB}{BC} = \frac{\text{Base}}{\text{Perpendicular}}$$

Signs of Trigonometric Functions

The signs of trigonometric functions in different quadrants are given in the following figure:

Trigonometric Ratios of Allied Angles

θ	$\sin \theta$	$\operatorname{cosec} \theta$	$\cos \theta$	$\sec \theta$	$\tan \theta$	$\cot \theta$
$-\theta$	$-\sin \theta$	$-\operatorname{cosec} \theta$	$\cos \theta$	$\sec \theta$	$-\tan \theta$	$-\cot \theta$
$90^\circ - \theta$	$\cos \theta$	$\sec \theta$	$\sin \theta$	$-\operatorname{cosec} \theta$	$\cot \theta$	$\tan \theta$
$90^\circ + \theta$	$\cos \theta$	$\sec \theta$	$-\sin \theta$	$-\operatorname{cosec} \theta$	$-\cot \theta$	$-\tan \theta$
$180^\circ - \theta$	$\sin \theta$	$-\operatorname{cosec} \theta$	$-\cos \theta$	$-\sec \theta$	$-\tan \theta$	$-\cot \theta$
$180^\circ + \theta$	$-\sin \theta$	$-\operatorname{cosec} \theta$	$-\cos \theta$	$-\sec \theta$	$\tan \theta$	$\cot \theta$
$270^\circ - \theta$	$-\cos \theta$	$-\sec \theta$	$-\sin \theta$	$-\operatorname{cosec} \theta$	$\cot \theta$	$\tan \theta$
$270^\circ + \theta$	$-\cos \theta$	$-\sec \theta$	$\sin \theta$	$\operatorname{cosec} \theta$	$-\cot \theta$	$-\tan \theta$
$360^\circ - \theta$	$-\sin \theta$	$-\operatorname{cosec} \theta$	$\cos \theta$	$\sec \theta$	$-\tan \theta$	$-\cot \theta$

Trigonometric Ratios of Some Useful Angles between 0° and 90°

Angle	$0^\circ/0$	$15^\circ/\frac{\pi}{12}$	$18^\circ/\frac{\pi}{10}$	$22.5^\circ/\frac{\pi}{8}$	$30^\circ/\frac{\pi}{6}$	$36^\circ/\frac{\pi}{5}$	$45^\circ/\frac{\pi}{4}$	$54^\circ/\frac{3\pi}{10}$	$60^\circ/\frac{\pi}{3}$	$67.5^\circ/\frac{3\pi}{8}$	$72^\circ/\frac{2\pi}{5}$	$75^\circ/\frac{5\pi}{12}$	$90^\circ/\frac{\pi}{2}$
$\sin \theta$	0	$\frac{\sqrt{3}-1}{2\sqrt{2}}$	$\frac{\sqrt{5}-1}{4}$	$\frac{\sqrt{2}-\sqrt{2}}{2}$	$\frac{1}{2}$	$\frac{\sqrt{10-2\sqrt{5}}}{4}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{5}+1}{4}$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}+\sqrt{2}}{2}$	$\frac{\sqrt{10+2\sqrt{5}}}{4}$	$\frac{\sqrt{3}+1}{2\sqrt{2}}$	1
$\cos \theta$	1	$\frac{\sqrt{3}+1}{2\sqrt{2}}$	$\frac{\sqrt{10+2\sqrt{5}}}{4}$	$\frac{\sqrt{2}+\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{5}+1}{4}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{10-2\sqrt{5}}}{4}$	$\frac{1}{2}$	$\frac{\sqrt{2}-\sqrt{2}}{2}$	$\frac{\sqrt{5}-1}{4}$	$\frac{\sqrt{3}-1}{2\sqrt{2}}$	0
$\tan \theta$	0	$\frac{\sqrt{3}-1}{\sqrt{3}+1}$	$\frac{\sqrt{5}-1}{\sqrt{10+2\sqrt{5}}}$	$\sqrt{2}-1$	$\frac{1}{\sqrt{3}}$	$\frac{\sqrt{5}+1}{\sqrt{10-2\sqrt{5}}}$	1	$\frac{\sqrt{5}+1}{\sqrt{10-2\sqrt{5}}}$	$\sqrt{3}$	$\sqrt{2}+1$	$\frac{\sqrt{10+2\sqrt{5}}}{\sqrt{5}-1}$	$\frac{\sqrt{3}+1}{\sqrt{3}-1}$	∞

$\sec \theta$	1	$\frac{2\sqrt{2}}{\sqrt{3}+1}$	$\frac{4}{10+2\sqrt{5}}$	$\sqrt{4-2\sqrt{2}}$	$\frac{2}{\sqrt{3}}$	$\sqrt{5}-1$	$\sqrt{2}$	$\frac{4}{\sqrt{10-2\sqrt{5}}}$	2	$\sqrt{4+2\sqrt{2}}$	$\sqrt{5}+1$	$\frac{2\sqrt{2}}{\sqrt{3}-1}$	∞
$\operatorname{cosec} \theta$	∞	$\frac{2\sqrt{2}}{\sqrt{3}-1}$	$\sqrt{5}+1$	$\sqrt{4+2\sqrt{2}}$	2	$\frac{4}{\sqrt{10-2\sqrt{5}}}$	$\sqrt{2}$	$\sqrt{5}-1$	$\frac{2}{\sqrt{3}}$	$\sqrt{4-2\sqrt{2}}$	$\frac{4}{\sqrt{10+2\sqrt{5}}}$	$\frac{2\sqrt{2}}{\sqrt{3}+1}$	1

Some Important Formulae

- (i) $\sin 15^\circ + \cos 15^\circ = \sqrt{\frac{3}{2}} = \sin 75^\circ + \cos 75^\circ$
(ii) $\cos 15^\circ - \sin 15^\circ = \frac{1}{\sqrt{2}} = \sin 75^\circ - \cos 75^\circ$
(iii) $\tan 15^\circ + \cot 15^\circ = 4 = \tan 75^\circ + \cot 75^\circ$
(iv) $\cot 15^\circ - \tan 15^\circ = 2\sqrt{3} = \tan 75^\circ - \cot 75^\circ$

Trigonometric Functions

Trigonometric ratios are defined for acute angles as the ratio of the sides of a right angled triangle. The extension of trigonometric ratios to any angle in terms of radian measure (real numbers), are known as trigonometric functions which are given in the following table.

Behaviour of Trigonometric Functions

	I quadrant	II quadrant	III quadrant	IV quadrant
$\sin \theta$	increases from 0 to 1	decreases from 1 to 0	decreases from 0 to -1	increases from -1 to 0
$\cos \theta$	decreases from 1 to 0	decreases from 0 to -1	increases from -1 to 0	increases from 0 to 1
$\tan \theta$	increases from 0 to ∞	increases from $-\infty$ to 0	increases from 0 to ∞	increases from $-\infty$ to 0
$\cot \theta$	decreases from ∞ to 0	decreases from 0 to $-\infty$	decreases from ∞ to 0	decreases from 0 to $-\infty$
$\sec \theta$	increases from 1 to ∞	increases from $-\infty$ to -1	decreases from -1 to $-\infty$	decreases from ∞ to 1
$\operatorname{cosec} \theta$	decreases from ∞ to 1	increases from 1 to ∞	increases from $-\infty$ to -1	decreases from -1 to $-\infty$

Graphs of Trigonometric Functions

Graph of $\sin x$

Facts related to $\sin x$

- (a) Domain = R
(b) Range = $[-1, 1]$
(c) Period = 2π
(d) Graph of $\sin x$ is continuous for all real values of x .

Graph of $\cos x$

Facts related to $\cos x$

- (a) Domain = R
- (b) Range = $[-1, 1]$
- (c) Period = 2π
- (d) Graph of $\cos x$ is continuous for all real values of x .

Graph of $\tan x$ **Facts related to $\tan x$**

- (a) Domain = $R - (2n + 1)\frac{\pi}{2}, n \in I$
- (b) Range = $(-\infty, \infty)$
- (c) Period = π
- (d) Graph of $\tan x$ is discontinuous at $x = \frac{m\pi}{2}$, where m is an odd integer.

Graph of $\cot x$ **Facts related to $\cot x$**

- (a) Domain = $R - n\pi, n \in I$
- (b) Range = $(-\infty, \infty)$
- (c) Period = π
- (d) Graph of $\cot x$ is discontinuous at $x = m\pi$, where m is an integer.

Graph of $\sec x$ **Facts related to $\sec x$**

- (a) Domain = $R - (2n + 1)\frac{\pi}{2}, n \in I$
- (b) Range = $(-\infty, -1] \cup [1, \infty)$
- (c) Period = 2π
- (d) Graph of $\sec x$ is discontinuous at $x = \frac{m\pi}{2}$, where m is an odd integer.

Graph of $\operatorname{cosec} x$ **Facts related to $\operatorname{cosec} x$**

- (a) Domain = $R - n\pi, n \in I$
- (b) Range = $(-\infty, -1] \cup [1, \infty)$
- (c) Period = 2π
- (d) Graph of $\operatorname{cosec} x$ is discontinuous at $x = m\pi$, where m is an integer.

Trigonometric Identities

An equation involving trigonometric functions which is true for all those angles for which the functions are defined, is called trigonometric identity. Some identities are given below:

- (i) $\sin^2 \theta + \cos^2 \theta = 1$
- (ii) $\sec^2 \theta - \tan^2 \theta = 1$
- (iii) $\operatorname{cosec}^2 \theta - \cot^2 \theta = 1$

Trigonometric Ratios between Two Angles**1. Compound Angles**

- (i) $\sin(A + B) = \sin A \cos B + \cos A \sin B$
- (ii) $\sin(A - B) = \sin A \cos B - \cos A \sin B$
- (iii) $\cos(A + B) = \cos A \cos B - \sin A \sin B$
- (iv) $\cos(A - B) = \cos A \cos B + \sin A \sin B$
- (v) $\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$

$$(vi) \tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$$

$$(vii) \cot(A + B) = \frac{\cot A \cot B - 1}{\cot A + \cot B}$$

$$(viii) \cot(A - B) = \frac{\cot A \cot B + 1}{\cot B - \cot A}$$

2. Transformation Formulae

$$(i) 2 \sin A \cos B = \sin(A + B) + \sin(A - B)$$

$$(ii) 2 \cos A \sin B = \sin(A + B) - \sin(A - B)$$

$$(iii) 2 \cos A \cos B = \cos(A + B) + \cos(A - B)$$

$$(iv) 2 \sin A \sin B = \cos(A - B) - \cos(A + B)$$

3. Multiple Angles

$$(i) \sin 2A = 2 \sin A \cos A = \frac{2 \tan A}{1 + \tan^2 A}$$

$$(ii) \cos 2A = \cos^2 A - \sin^2 A = \frac{1 - \tan^2 A}{1 + \tan^2 A}$$

$$= 2 \cos^2 A - 1 = 1 - 2 \sin^2 A$$

$$(iii) 1 + \sin 2A = (\sin A + \cos A)^2$$

$$(iv) 1 - \sin 2A = (\sin A - \cos A)^2$$

$$(v) \tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$$

$$(vi) \sin 3A = 3 \sin A - 4 \sin^3 A$$

$$(vii) \cos 3A = 4 \cos^3 A - 3 \cos A$$

$$(viii) \tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A}$$

$$(ix) (a) \frac{1 + \tan A}{1 - \tan A} = \tan \left(\frac{\pi}{4} + A \right)$$

$$(b) \frac{1 - \tan A}{1 + \tan A} = \tan \left(\frac{\pi}{4} - A \right)$$

4. Sum or Difference into Product

$$(i) \sin C + \sin D = 2 \sin \frac{C + D}{2} \cos \frac{C - D}{2}$$

$$(ii) \sin C - \sin D = 2 \cos \frac{C + D}{2} \sin \frac{C - D}{2}$$

$$(iii) \cos C + \cos D = 2 \cos \frac{C + D}{2} \cos \frac{C - D}{2}$$

$$(iv) \cos C - \cos D = -2 \sin \frac{C + D}{2} \sin \frac{C - D}{2}$$

$$(v) \sin(A + B) \sin(A - B) = \sin^2 A - \sin^2 B$$

$$(vi) \cos(A + B) \cos(A - B) = \cos^2 A - \sin^2 B$$

$$(vii) \sin(60^\circ - A) \sin(60^\circ + A) = \frac{\sin 3A}{4 \sin A}$$

$$(viii) \cos(60^\circ - A) \cos(60^\circ + A) = \frac{\cos 3A}{4 \cos A}$$

$$(ix) \tan(60^\circ - A) \tan(60^\circ + A) = \frac{\tan 3A}{\tan A}$$

Conditional Identities

- $A + B + C = 180^\circ$
- $\sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C$
- $\cos 2A + \cos 2B + \cos 2C = -1 - 4 \cos A \cos B \cos C$
- $\sin A + \sin B + \sin C = 4 \cos \frac{A}{2} \cos \frac{B}{2} \cos \frac{C}{2}$
- $\cos A + \cos B + \cos C = 1 + 4 \sin \frac{A}{2} \sin \frac{B}{2} \sin \frac{C}{2}$
- $\tan A + \tan B + \tan C = \tan A \tan B \tan C$
- $\tan \frac{A}{2} \tan \frac{B}{2} + \tan \frac{B}{2} \tan \frac{C}{2} + \tan \frac{C}{2} \tan \frac{A}{2} = 1$

Other Important Identities

$$(i) \sin \alpha + \sin(\alpha + \beta) + \sin(\alpha + 2\beta) + \dots + \sin[\alpha + (n - 1)\beta]$$

$$= \frac{\sin \left[\alpha + (n - 1) \frac{\beta}{2} \right] \cdot \sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}} \quad [\text{here, angles are in AP}]$$

$$(ii) \cos \alpha + \cos(\alpha + \beta) + \cos(\alpha + 2\beta)$$

$$+ \dots + \cos[\alpha + (n - 1)\beta]$$

$$= \frac{\cos \left[\alpha + (n - 1) \frac{\beta}{2} \right] \cdot \sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}} \quad [\text{here, angles are in AP}]$$

Trigonometric Equations

An equation involving one or more trigonometrical ratios of unknown angle is called a **trigonometrical equation**.

e.g. $\sin \theta + \cos^2 \theta = 0$

Principal Solution

The solutions of a trigonometric equations for which $0 \leq \theta < 2\pi$, are known as principal solutions. Numerically, least general values of angle is called principal value.

NOTE The principal angle range for $\sin, \cos, \tan$ and $\cot$ are $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, $[0, \pi]$, $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and $[0, \pi]$ respectively. This can be seen from the graph of these functions.

General Solution

General solution is the complete set of values of the unknown angle satisfying the equation.

The general solutions of trigonometric equations are

- (i) If $\sin x = 0$, then $x = n\pi$, where $n \in \mathbb{Z}$.
 (ii) If $\cos x = 0$, then $x = (2n+1)\frac{\pi}{2}$, where $n \in \mathbb{Z}$.
 (iii) If $\tan x = 0$, then $x = n\pi$, where $n \in \mathbb{Z}$.
 (iv) If $\cot x = 0$, then $x = (2n+1)\frac{\pi}{2}$, where $n \in \mathbb{Z}$.
 (v) If $\sin x = \sin y$, then $x = n\pi + (-1)^n y$, where $n \in \mathbb{Z}$.
 (vi) If $\cos x = \cos y$, then $x = 2n\pi \pm y$, where $n \in \mathbb{Z}$.
 (vii) If $\tan x = \tan y$, then $x = n\pi + y$, where $n \in \mathbb{Z}$.
 (viii) If $\sin^2 x = \sin^2 y$ or $\cos^2 x = \cos^2 y$ or $\tan^2 x = \tan^2 y$, then $x = n\pi \pm y$, where $n \in \mathbb{Z}$.

NOTE

- $\sin \theta = \begin{cases} 1, & \text{if } n \text{ is even} \\ -1, & \text{if } n \text{ is odd} \end{cases}$, where $\theta = (2n+1)\frac{\pi}{2}$
- $\cos \theta = \begin{cases} 1, & \text{if } n \text{ is even} \\ -1, & \text{if } n \text{ is odd} \end{cases}$, where $\theta = n\pi$
- $\sec \theta$ and $\tan \theta$ are not defined for $\theta = (2n+1)\frac{\pi}{2}$, $n \in \mathbb{Z}$.
- $\operatorname{cosec} \theta$ and $\cot \theta$ are not defined for $\theta = n\pi$, $n \in \mathbb{Z}$.

Maximum and Minimum (Greater and Least) Value of $a\sin\theta + b\cos\theta$

For the solution of such equation, we put $a = r \cos \alpha$ and $b = r \sin \alpha$, so that $r^2 = a^2 + b^2$ and $\tan \alpha = \frac{b}{a}$

Now, we get equation in the form
 $r(\sin \theta \cdot \cos \alpha + \cos \theta \cdot \sin \alpha) = c$

$$\Rightarrow \sin(\theta + \alpha) = \frac{c}{r}$$

$$\text{Since, } -1 \leq \sin(\theta + \alpha) \leq 1$$

$$\therefore -1 \leq \frac{c}{r} \leq 1$$

$$\Rightarrow -r \leq c \leq r$$

which is the solution of the given equation.

Hence, maximum value of the equation is

$$a \sin \theta + b \cos \theta = \sqrt{a^2 + b^2}$$

and minimum value of the equation is

$$a \sin \theta + b \cos \theta = -\sqrt{a^2 + b^2}$$

where, a and b are constants.

Inverse Trigonometric Functions

Trigonometric functions are not one-one and onto on their natural domains and ranges, so their inverse do not exist in all values but their inverse may exist in some interval of their domains and ranges.

Thus, we can say that inverse of trigonometric functions are defined within restricted domains of corresponding trigonometric functions. Inverse of f is denoted by f^{-1} .

Let $y = f(x) = \sin x$ be a function.

Then, its inverse is $x = \sin^{-1} y$.

$$\text{i.e. } \sin x \xrightarrow{\text{Inverse}} \sin^{-1} x,$$

NOTE

- $\sin^{-1} y \neq (\sin y)^{-1}$
- $\sin^{-1} y \neq \sin\left(\frac{1}{y}\right)$
- $(\sin^{-1} x) \neq \left(\frac{1}{\sin x}\right)$

Principal Value

The value of an inverse trigonometric function which is numerically least, is called principal value and the set of least values for which the domain is uniquely defined, is called the principal value branch of the function.

Domain and Range of Inverse Trigonometric Functions

Function	Domain	Range	Principal value branch
$\sin^{-1} x$	$[-1, 1]$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$	$-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$, where $y = \sin^{-1} x$
$\cos^{-1} x$	$[-1, 1]$	$[0, \pi]$	$0 \leq y \leq \pi$, where $y = \cos^{-1} x$
$\tan^{-1} x$	$\mathbb{R}$	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$	$-\frac{\pi}{2} < y < \frac{\pi}{2}$, where $y = \tan^{-1} x$
$\operatorname{cosec}^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$	$-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$, where, $y = \operatorname{cosec}^{-1} x$, $y \neq 0$
$\sec^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[0, \pi] - \left[\frac{\pi}{2}\right]$	$0 \leq y \leq \pi$, where $y = \sec^{-1} x$, $y \neq \frac{\pi}{2}$
$\cot^{-1} x$	$\mathbb{R}$	$(0, \pi)$	$0 < y < \pi$, where $y = \cot^{-1} x$

Properties of Inverse Trigonometric Functions

Some properties of inverse trigonometric functions are given below:

Property 1 Self Adjusting Properties

- $\sin(\sin^{-1} x) = x, \forall x \in [-1, 1]$
- $\cos(\cos^{-1} x) = x, \forall x \in [-1, 1]$
- $\tan(\tan^{-1} x) = x, \forall x \in \mathbb{R}$
- $\operatorname{cosec}(\operatorname{cosec}^{-1} x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- $\sec(\sec^{-1} x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- $\cot(\cot^{-1} x) = x, \forall x \in \mathbb{R}$
- $\sin^{-1}(\sin x) = x, \forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

$$(viii) \cos^{-1}(\cos x) = x, \forall x \in [0, \pi]$$

$$(ix) \tan^{-1}(\tan x) = x, \forall x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

$$(x) \operatorname{cosec}^{-1}(\operatorname{cosec} x) = x, \forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$$

$$(xi) \sec^{-1}(\sec x) = x, \forall x \in [0, \pi] - \left\{\frac{\pi}{2}\right\}$$

$$(xii) \cot^{-1}(\cot x) = x, \forall x \in (0, \pi)$$

Property 2 Negative Arguments

$$(i) \sin^{-1}(-x) = -\sin^{-1} x, \forall x \in [-1, 1]$$

$$(ii) \cos^{-1}(-x) = \pi - \cos^{-1} x, \forall x \in [-1, 1]$$

$$(iii) \tan^{-1}(-x) = -\tan^{-1} x, \forall x \in R$$

$$(iv) \operatorname{cosec}^{-1}(-x) = -\operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$(v) \sec^{-1}(-x) = \pi - \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$(vi) \cot^{-1}(-x) = \pi - \cot^{-1} x, \forall x \in R$$

Property 3 Reciprocal Arguments

$$(i) \sin^{-1}\left(\frac{1}{x}\right) = \operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$(ii) \cos^{-1}\left(\frac{1}{x}\right) = \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$(iii) \tan^{-1}\left(\frac{1}{x}\right) = \begin{cases} \cot^{-1} x, & \text{for } x > 0 \\ -\pi + \cot^{-1} x, & \text{for } x < 0 \end{cases}$$

Property 4 Inverse Sum Identities

$$(i) \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}, \forall x \in [-1, 1]$$

$$(ii) \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}, \forall x \in R$$

$$(iii) \sec^{-1} x + \operatorname{cosec}^{-1} x = \frac{\pi}{2}, \forall x \in (-\infty, -1] \cup [1, \infty)$$

Property 5 Conversion of One Inverse to Another Inverse Trigonometric Function

$$(i) \sin^{-1} x = \cos^{-1} \sqrt{1-x^2}$$

$$= \tan^{-1} \frac{x}{\sqrt{1-x^2}} = \cot^{-1} \frac{\sqrt{1-x^2}}{x}$$

$$= \sec^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right) = \operatorname{cosec}^{-1} \left(\frac{1}{x} \right)$$

$$(ii) \cos^{-1} x = \sin^{-1} \sqrt{1-x^2} = \tan^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right)$$

$$= \cot^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right)$$

$$= \sec^{-1} \left(\frac{1}{x} \right)$$

$$= \operatorname{cosec}^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right)$$

$$(iii) \tan^{-1} x = \sin^{-1} \left(\frac{x}{\sqrt{1+x^2}} \right) = \cos^{-1} \left(\frac{1}{\sqrt{1+x^2}} \right)$$

$$= \cot^{-1} \frac{1}{x} = \sec^{-1} \sqrt{1+x^2}$$

$$= \operatorname{cosec}^{-1} \left(\frac{\sqrt{1+x^2}}{x} \right)$$

Property 6 Sum and Difference of Inverse Trigonometric Functions

$$(i) \sin^{-1} x + \sin^{-1} y$$

$$= \begin{cases} \sin^{-1}(x\sqrt{1-y^2} + y\sqrt{1-x^2}), & \text{if } x \geq 0, y \geq 0 \\ & \text{and } x^2 + y^2 \leq 1 \end{cases}$$

$$(ii) \sin^{-1} x - \sin^{-1} y$$

$$= \begin{cases} \sin^{-1}\{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, \\ & \text{if } -1 \leq x, y \leq 1 \text{ and } x^2 + y^2 \leq 1 \\ & \text{or if } xy > 0 \text{ and } x^2 + y^2 > 1 \end{cases}$$

$$(iii) \cos^{-1} x + \cos^{-1} y = \begin{cases} \cos^{-1}(xy - \sqrt{1-x^2} \cdot \sqrt{1-y^2}), \\ & \text{if } -1 \leq x, y \leq 1 \text{ and } x + y \geq 0 \end{cases}$$

$$(iv) \cos^{-1} x - \cos^{-1} y = \begin{cases} \cos^{-1}(xy + \sqrt{1-x^2} \cdot \sqrt{1-y^2}), \\ & \text{if } -1 \leq x, y \leq 1 \text{ and } x \leq y \end{cases}$$

$$(v) \tan^{-1} x + \tan^{-1} y = \begin{cases} \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } xy < 1 \end{cases}$$

$$(vi) \tan^{-1} x - \tan^{-1} y = \begin{cases} \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } xy > -1 \end{cases}$$

Property 7 Inverse Trigonometric Ratios of Multiple Angles

$$(i) 2 \sin^{-1} x = \begin{cases} \sin^{-1}(2x\sqrt{1-x^2}), & \text{if } -\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}} \end{cases}$$

$$(ii) 3 \sin^{-1} x = \begin{cases} \sin^{-1}(3x - 4x^3), & \text{if } -\frac{1}{2} \leq x \leq \frac{1}{2} \end{cases}$$

$$(iii) 2\cos^{-1}x = \{\cos^{-1}(2x^2 - 1), \text{ if } 0 \leq x \leq 1$$

$$(iv) 3\cos^{-1}x = \begin{cases} \cos^{-1}(4x^3 - 3x), & \text{if } \frac{1}{2} \leq x \leq 1 \end{cases}$$

$$(v) 2\tan^{-1}x = \begin{cases} \tan^{-1}\left(\frac{2x}{1-x^2}\right), & \text{if } -1 < x < 1 \end{cases}$$

$$(vi) 3\tan^{-1}x = \begin{cases} \tan^{-1}\left(\frac{3x-x^3}{1-3x^2}\right), & \text{if } -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}} \end{cases}$$

$$(vii) 2\tan^{-1}x = \begin{cases} \sin^{-1}\left(\frac{2x}{1+x^2}\right), & \text{if } -1 \leq x \leq 1 \end{cases}$$

$$(viii) 2\tan^{-1}x = \begin{cases} \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right), & \text{if } 0 \leq x < \infty \end{cases}$$

Important Results on Inverse Trigonometric Functions

(i) If $\sin^{-1}x + \sin^{-1}y + \sin^{-1}z = \pi$, then

$$x\sqrt{1-x^2} + y\sqrt{1-y^2} + z\sqrt{1-z^2} = 2xyz$$

(ii) If $\sin^{-1}x + \sin^{-1}y + \sin^{-1}z = 3\pi/2$, then

$$xy + yz + zx = 3$$

(iii) If $\sin^{-1}x + \sin^{-1}y = \theta$, then $\cos^{-1}x + \cos^{-1}y = \pi - \theta$

(iv) If $\cos^{-1}x + \cos^{-1}y + \cos^{-1}z = \pi$, then

$$x^2 + y^2 + z^2 + 2xyz = 1$$

(v) If $\cos^{-1}x + \cos^{-1}y = \theta$, then $\sin^{-1}x + \sin^{-1}y = \pi - \theta$

(vi) If $\cos^{-1}\frac{x}{a} + \cos^{-1}\frac{y}{b} = \theta$, then

$$\frac{x^2}{a^2} - \frac{2xy}{ab}\cos\theta + \frac{y^2}{b^2} = \sin^2\theta$$

Important Result

- If $\tan^{-1}x + \tan^{-1}y + \tan^{-1}z = \pi$, then $x + y + z = xyz$
- If $\tan^{-1}x + \tan^{-1}y + \tan^{-1}z = \frac{\pi}{2}$, then $xy + yz + zx = 1$
- If $\cos^{-1}x + \cos^{-1}y + \cos^{-1}z = 3\pi$, then $xy + yz + zx = 3$
- If $\sin^{-1}x + \sin^{-1}y + \sin^{-1}z = \frac{\pi}{2}$, then $x^2 + y^2 + z^2 + 2xyz = 1$

Triangle and Its Properties

A triangle has six components, three sides and three angles. The three angles of a $\triangle ABC$ are denoted by letters A, B and C and the sides opposite to these angles by letters a, b and c , respectively.

Following are some well known relations for a $\triangle ABC$

(i) $A + B + C = 180^\circ$ (or π), i.e. sum of all the three angles of a triangle is 180° .

(ii) $a + b > c$, $b + c > a$, $c + a > b$, i.e. in any triangle, the greatest side is always less than the sum of other two sides.

(iii) $|a - b| < c$, $|b - c| < a$ and $|c - a| < b$, i.e. in any triangle, the smallest side is always greater than the difference of other two sides.

Relations between the Sides and Angles of Triangle

Here are some relations between the sides and trigonometrical ratios of the angles of a triangle.

(i) Sine Rule

In $\triangle ABC$, the lengths of the sides are proportional to the sines of the opposite angle.

$$\text{i.e. } \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = 2R$$

where, R is the radius of triangle's circumcircle.

(ii) Cosine Rule

The square of one side of a triangle equals the sum of the squares of the other two sides minus twice their product times the cosine of their included angle.

In a $\triangle ABC$,

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc} \text{ or } a^2 = b^2 + c^2 - 2bc\cos A$$

$$\cos B = \frac{c^2 + a^2 - b^2}{2ca} \text{ or } b^2 = c^2 + a^2 - 2ca\cos B$$

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} \text{ or } c^2 = a^2 + b^2 - 2ab\cos C$$

(iii) Projection Formula

In $\triangle ABC$ with sides $a = BC, b = CA$ and $c = BA$, the projection formula is

$$a = c \cos B + b \cos C$$

$$b = a \cos C + c \cos A$$

$$c = a \cos B + b \cos A$$

(iv) Napier's Formula (Napier's Analogy)

$$\text{In } \triangle ABC, \quad \tan\left(\frac{B-C}{2}\right) = \frac{b-c}{b+c} \cot \frac{A}{2}$$

$$\tan\left(\frac{A-B}{2}\right) = \frac{a-b}{a+b} \cot \frac{C}{2} \Rightarrow \tan\left(\frac{C-A}{2}\right) = \frac{c-a}{c+a} \cot \frac{B}{2}$$

(v) Half-angle Formulae

In $\triangle ABC$, if the sides of the triangle are a, b, c and corresponding angles are A, B and C respectively and s is the semi-perimeter, then

$$(a) \sin \frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}} \quad (b) \sin \frac{B}{2} = \sqrt{\frac{(s-c)(s-a)}{ca}}$$

$$(c) \sin \frac{C}{2} = \sqrt{\frac{(s-a)(s-b)}{ab}} \quad (d) \cos \frac{A}{2} = \sqrt{\frac{s(s-a)}{bc}}$$

$$(e) \cos \frac{B}{2} = \sqrt{\frac{s(s-b)}{ac}} \quad (f) \cos \frac{C}{2} = \sqrt{\frac{s(s-c)}{ab}}$$

$$(g) \tan \frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} \quad (h) \tan \frac{B}{2} = \sqrt{\frac{(s-c)(s-a)}{s(s-b)}}$$

$$(i) \tan \frac{C}{2} = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}$$

Area of Triangle

From the figure given below, area of $\triangle ABC$ can be calculated in the following ways.

- (i) When two sides and angle between them is known, then

$$\Delta = \frac{1}{2} \times AD \times BC = \frac{1}{2} \times c \sin B \times a$$

$$\Rightarrow \Delta = \frac{1}{2} ac \sin B$$

$$\text{Similarly, } \Delta = \frac{1}{2} ab \sin C$$

$$\text{and } \Delta = \frac{1}{2} bc \sin A$$

- (ii) When all the three sides are known, then

$$\Delta = \sqrt{s(s-a)(s-b)(s-c)},$$

which is also known as Heron's formula.

- (iii) By using sine rule,

$$\sin A = \frac{a}{2R}$$

$$\Rightarrow a = 2R \sin A$$

$$\therefore \Delta = \frac{abc}{4R}$$

$$\therefore \Delta = \frac{(2R \sin A)(2R \sin B)(2R \sin C)}{4R}$$

$$\Rightarrow \Delta = 2R^2 \sin A \sin B \sin C$$

Circles Connected with Triangles

Circles can be connected with the triangles in the following ways.

1. Circumcircle of a Triangle

A circle which passes through the vertices of a $\triangle ABC$, is called circumcircle.

**Circumcentre (O)**

The centre of circumcircle is the point of intersection of the perpendicular bisectors of the sides and is called the circumcentre. Its radius is denoted R .

$$(i) R = \frac{a}{2 \sin A} = \frac{b}{2 \sin B} = \frac{c}{2 \sin C} \quad (ii) R = \frac{abc}{4\Delta}$$

NOTE Circumcentre of a right angled triangle is the mid-point of the hypotenuse.

2. Incircle or Inscribed Circle of a Triangle

The circle that can be inscribed within a triangle so as to touch each of its sides, is called inscribed circle or incircle.

**Incentre (I)**

The centre of incircle is the point of intersection of bisectors of the angles of the triangle. It is denoted by I .

Inradius (r)

The radius of inscribed circle of a triangle is called the inradius. It is denoted by r and is given by

$$(i) r = \frac{\Delta}{s}, \text{ where } \Delta = \frac{1}{2} r (a + b + c)$$

$$(ii) r = (s-a) \tan \frac{A}{2}, r = (s-b) \tan \frac{B}{2}, r = (s-c) \tan \frac{C}{2}$$

$$(iii) r = \frac{a \sin \frac{B}{2} \cdot \sin \frac{C}{2}}{\cos \frac{A}{2}}, r = \frac{b \sin \frac{C}{2} \cdot \sin \frac{A}{2}}{\cos \frac{B}{2}}, r = \frac{c \sin \frac{A}{2} \cdot \sin \frac{B}{2}}{\cos \frac{C}{2}}$$

$$(iv) r = 4R \sin \frac{A}{2} \cdot \sin \frac{B}{2} \cdot \sin \frac{C}{2}$$

3. Escribed Circle

The circle touches BC and the two sides AB and AC produced of $\triangle ABC$ externally, is called the escribed circle opposite A . Its radius is denoted by r_1 .

Similarly, r_2 and r_3 denote the radii of the escribed circles opposite angles B and C , respectively. Hence, r_1, r_2 and r_3 are called the exradius of $\triangle ABC$. Here,

$$(i) \quad r_1 = \frac{\Delta}{s-a} = s \tan \frac{A}{2} = 4R \sin \frac{A}{2} \cos \frac{B}{2} \cos \frac{C}{2}$$

$$= \frac{a \cos \frac{B}{2} \cos \frac{C}{2}}{\cos \frac{A}{2}}$$

$$(ii) \quad r_2 = \frac{\Delta}{s-b} = s \tan \frac{B}{2} = 4R \sin \frac{B}{2} \cos \frac{C}{2} \cos \frac{A}{2}$$

$$= \frac{b \cos \frac{C}{2} \cos \frac{A}{2}}{\cos \frac{B}{2}}$$

$$(iii) \quad r_3 = \frac{\Delta}{s-c} = s \tan \frac{C}{2} = 4R \sin \frac{C}{2} \cos \frac{A}{2} \cos \frac{B}{2}$$

$$= \frac{c \cos \frac{A}{2} \cos \frac{B}{2}}{\cos \frac{C}{2}}$$

Regular Polygon

A polygon which has all its sides as well as its angles equal, is known as regular polygon. If the polygon has n sides, then

Sum of the internal angle $= (n-2)\pi$

and each angle $= \frac{(n-2)\pi}{n}$

NOTE In the regular polygon, the circumcentre and the incentre are same.

Radii of the Inscribed and Circumscribing Circles of a Regular Polygon

Let the point O be both the incentre and circumcentre of polygon as shown in figure.

Now, if $OB = OC = R$, $OL = r$

and a = Length of side of polygon

Then, $R = \frac{a}{2} \operatorname{cosec} \left(\frac{\pi}{n} \right)$

and $r = \frac{a}{2} \cot \left(\frac{\pi}{n} \right)$

$\therefore$ Area of regular polygon

$$= \frac{1}{4} n a^2 \cdot \cot \left(\frac{\pi}{n} \right)$$

$$= n r^2 \cdot \tan \frac{\pi}{n} = \frac{n}{2} R^2 \sin \frac{2\pi}{n}$$

Solution of Triangle

If three elements including atleast one side is known, then remaining three elements can be uniquely determined. This is known as solution of triangle.

Solution of Right Angled Triangle

Given elements	Required elements
1. $a, b, \angle C = 90^\circ$	(i) $\tan A = \frac{a}{b}, \sin A = \frac{a}{c}, \cos A = \frac{b}{c}$
	(ii) $B = 90^\circ - A$
	(iii) $c = \frac{a}{\sin A}$ or $c^2 = a^2 + b^2$
2. $a, \angle A = \text{Acute angle}$ and $\angle C = 90^\circ$	(i) $B = 90^\circ - A$
	(ii) $b = a \cot A$
	(iii) $c = \frac{a}{\sin A}$
3. $c, \angle A, \angle C = 90^\circ$	(i) $B = 90^\circ - A$
	(ii) $b = c \cos A$
	(iii) $a = \sqrt{c^2 - b^2}$ or $a = c \sin A$

Solution of Oblique Triangle

$\triangle ABC$ is called oblique triangle, if none of its angles is right angle.

Given elements	Required elements
1. Three sides a, b, c	(i) $\Delta = \sqrt{s(s-a)(s-b)(s-c)}$ where, $2s = a + b + c$
	(ii) $\sin A = \frac{2\Delta}{bc}, \sin B = \frac{2\Delta}{ac}, \sin C = \frac{2\Delta}{ab}$
	(iii) $\tan \frac{A}{2} = \frac{\Delta}{s(s-a)}, \tan \frac{B}{2} = \frac{\Delta}{s(s-b)},$ $\tan \frac{C}{2} = \frac{\Delta}{s(s-c)}$
	(iv) $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$ $\cos B = \frac{a^2 + c^2 - b^2}{2ac}$ $\cos C = \frac{a^2 + b^2 - c^2}{2ab}$

Given elements	Required elements
2. When two sides a, b and included $\angle C$ are given	(i) $\Delta = \frac{1}{2}ab \sin C$ (ii) $\tan\left(\frac{A-B}{2}\right) = \frac{a-b}{a+b} \cot \frac{C}{2}$ (iii) $c = \frac{a \sin C}{\sin A}$
3. When one side a and two angles A and B are given	(i) $\angle C = 180^\circ - (\angle A + \angle B)$ (ii) $b = \frac{a \sin B}{\sin A}$ and $c = \frac{a \sin C}{\sin A}$ (iii) $\Delta = \frac{1}{2}ac \sin B$
4. When two sides a, b and $\angle A$ opposite to one side are given	$\sin B = \frac{b}{a} \sin A$ (i) If $\angle A$ is acute and $a < b \sin A$, then $\sin B > 1$. No triangle is possible. (ii) If $\angle A$ is acute, $a = b \sin A$, $\sin B = 1$, $\angle B = 90^\circ$, then triangle is possible right angled at B . (iii) If A is acute, $a > b \sin A$, $\sin B < 1$, then two values of $\angle B$ say B_1 and B_2 such that $B_1 + B_2 = 180^\circ$, side c can be obtained as $c = \frac{a \sin C}{\sin A}$
5. When exradius r_1, r_2, r_3 of ΔABC are given	Use the formulae $r_1 = \frac{\Delta}{s-a}, r_2 = \frac{\Delta}{s-b}, r_3 = \frac{\Delta}{s-c}$

Heights and Distance

The problems related with heights and distance are solved by using the properties of triangles.

Some terms which are used in heights and distance, are given below:

- (i) **Angle of elevation** Let P be an object and OX be a horizontal line. An observer at O to perceive the object P has to elevate his eye from the direction OX to the direction OP .

So, $\angle XOP$ is the angle of elevation of P at O .

- (ii) **Angle of depression** Let P be an object and OX be a horizontal line. An observer at O to perceive the object P has to depress his eye from the direction OX to the direction OP .

So, $\angle XOP$ is the angle of depression of P at O .

Practice Exercise

- Find the degree measure of the angle subtended at the centre of a circle of radius 100 cm by an arc of length 22 cm. (Use $\pi = \frac{22}{7}$)
 a. $11^\circ 36'$ b. $12^\circ 36'$ c. $12^\circ 30'$ d. $12^\circ 34'$
- If the three angles of a quadrilateral are $60^\circ, 60^\circ$ and $\frac{5\pi}{6}$ radian. Then, the fourth angle is
 a. 60° b. 96°
 c. 96° d. None of these
- Which of the following is correct?
 a. $\sin 1^\circ > \sin 1$ b. $\sin 1^\circ < \sin 1$
 c. $\sin 1^\circ = \sin 1$ d. $\sin 1^\circ = \frac{\pi}{18^\circ} \sin 1$
- Given, a right angled ΔABC , whose base is 6 and perpendicular height is 8. Find the trigonometric ratios of $\sin A, \cos A$ and $\tan A$, respectively.
 a. $\frac{4}{5}, \frac{3}{5}, \frac{4}{3}$ b. $\frac{2}{5}, \frac{3}{5}, \frac{4}{5}$
 c. $\frac{4}{5}, \frac{1}{5}, \frac{2}{3}$ d. None of these
- The value of $\tan 9^\circ - \tan 27^\circ - \tan 63^\circ + \tan 81^\circ$ is
 a. 2 b. 3
 c. 4 d. None of these
- The value of $\log_3 \tan 1^\circ + \log_3 \tan 2^\circ + \dots + \log_3 \tan 89^\circ$ is
 a. 3 b. 1
 c. 2 d. 0
- If the angle of elevation of the top of a hill from each of the vertices A, B and C of a horizontal triangle is α . Then, the height of the hill is
 a. $\frac{1}{2}b \tan \alpha \sec B$ b. $\frac{1}{2}b \tan \alpha \operatorname{cosec} A$
 c. $\frac{1}{2}c \tan \alpha \sin C$ d. $\frac{1}{2}a \tan \alpha \operatorname{cosec} A$

8. If $\cos A = \tan B$, $\cos B = \tan C$ and $\cos C = \tan A$, then $\sin A$ is equal to
 a. $\sin 18^\circ$ b. $2 \sin 18^\circ$ c. $2 \cos 18^\circ$ d. $2 \cos 36^\circ$
9. If $\sin 18^\circ = \frac{\sqrt{5}-1}{4}$, then $\sin 81^\circ$ is equal to
 a. $\frac{\sqrt{5}+1}{4}$ b. $\frac{\sqrt{3+\sqrt{5}}+\sqrt{5-\sqrt{5}}}{4}$
 c. $\frac{\sqrt{10+2\sqrt{5}}}{4}$ d. None of these
10. $\sec^2 \theta = \frac{4xy}{(x+y)^2}$ is true, if
 a. $x+y \neq 0$ b. $x=y, x \neq 0$
 c. $x=y$ d. $x \neq 0, y=0$
11. The value of $(1+\tan 1^\circ)(1+\tan 44^\circ)(1+\tan 2^\circ)(1+\tan 43^\circ) \dots (1+\tan 22^\circ)(1+\tan 23^\circ)$ is
 a. 1 b. 2^{22} c. 3^8 d. 2^{11}
12. The value of $\tan 10^\circ + \tan 35^\circ + \tan 10^\circ \tan 35^\circ$ is
 a. 0 b. $\frac{1}{2}$ c. -1 d. 1
13. If $\alpha + \beta = \frac{\pi}{2}$ and $\beta + \gamma = \alpha$, then $\tan \alpha$ is equal to
 a. $2(\tan \beta + \tan \gamma)$ b. $\tan \beta + \tan \gamma$
 c. $\tan \beta + 2 \tan \gamma$ d. $2 \tan \beta + \tan \gamma$
14. If $2 \cos x + 2 \cos 3x = \cos y$ and $2 \sin x + 2 \sin 3x = \sin y$, then the value of $\cos 2x$ is
 a. $-\frac{7}{8}$ b. $\frac{1}{8}$ c. $-\frac{1}{8}$ d. $\frac{7}{8}$
15. If $\cos 5\theta = a \cos \theta + b \cos^3 \theta + c \cos^5 \theta + d$, then
 a. $a=20$ b. $b=-30$
 c. $a+b+c=2$ d. $a+b+c+d=1$
16. If $\sin \alpha + \sin \beta = l$, $\cos \alpha + \cos \beta = m$ and $\tan \frac{\alpha}{2} \tan \frac{\beta}{2} = n (n \neq 1)$, then $\frac{1+n}{1-n}$ is equal to
 a. $\frac{l^2 - m^2}{2m}$ b. $\frac{l^2 + m^2}{2m}$
 c. $\frac{l^2 + m^2}{m}$ d. None of these
17. Let n be an odd integer. If $\sin n\theta = \sum_{r=0}^n b_r \sin^r \theta$ for every value of θ , then
 a. $b_0 = 1, b_1 = 3$ b. $b_0 = 0, b_1 = n$
 c. $b_0 = -1, b_1 = n$ d. $b_0 = 0, b_1 = n^2 - n + 3$
18. The value of $3 \left[\sin^4 \left(\frac{3\pi}{2} - \alpha \right) + \sin^4 (3\pi + \alpha) \right] - 2 \left[\sin^6 \left(\frac{\pi}{2} + \alpha \right) + \sin^6 (5\pi - \alpha) \right]$ is
 a. 0 b. 1
 c. 3 d. $\sin 4\alpha + \sin 6\alpha$
19. $\cot \theta + \cot \left(\theta + \frac{\pi}{3} \right) + \cot \left(\theta + \frac{2\pi}{3} \right)$ is equal to
 a. $-\cot 3\theta$ b. $\cot 3\theta$
 c. $2 \cot 3\theta$ d. $3 \cot 3\theta$
20. $\sin^4 \frac{\pi}{8} + \sin^4 \frac{3\pi}{8} + \sin^4 \frac{5\pi}{8} + \sin^4 \frac{7\pi}{8}$ is equal to
 a. 1 b. $\frac{3}{2}$ c. 2 d. $\frac{1}{4}$
21. $\cos \frac{\pi}{11} + \cos \frac{3\pi}{11} + \cos \frac{5\pi}{11} + \cos \frac{7\pi}{11} + \cos \frac{9\pi}{11}$ equals
 a. 0 b. 1
 c. $1/2$ d. $-1/2$
22. The angle of elevation of a stationary cloud from a point 2500 m above a lake is 15° and the angle of depression of its reflection in the lake is 45° . The height of the cloud above the lake level is
 a. $2500\sqrt{3}$ m b. $2500\sqrt{2}$ m c. 1500 m d. $1500\sqrt{3}$ m
23. If $x = \cos 10^\circ \cos 20^\circ \cos 40^\circ$, then x is equal to
 a. $\frac{1}{4} \tan 10^\circ$ b. $\frac{1}{8} \cot 10^\circ$
 c. $\frac{1}{8} \operatorname{cosec} 10^\circ$ d. $\frac{1}{8} \sec 10^\circ$
24. The value of $\tan A + 2 \tan 2A + 4 \tan 4A + 8 \cot 8A$ is
 a. $\cot A$ b. $\tan A$ c. $\cos A$ d. $\sin A$
25. The value of $\sin 6^\circ \sin 42^\circ \sin 66^\circ \sin 78^\circ$ is
 a. $\frac{1}{13}$ b. $\frac{1}{14}$ c. $\frac{1}{15}$ d. $\frac{1}{16}$
26. $\cos 2\theta \cos 2\phi + \sin^2(\theta - \phi) - \sin^2(\theta + \phi)$ is equal to
 a. $\sin 2(\theta + \phi)$ b. $\cos 2(\theta + \phi)$
 c. $\sin 2(\theta - \phi)$ d. $\cos 2(\theta - \phi)$
27. The value of $\cos 12^\circ + \cos 84^\circ + \cos 156^\circ + \cos 132^\circ$ is
 a. $1/2$ b. 1 c. $-1/2$ d. $1/8$
28. If $\cos(\theta + \phi) = m \cos(\theta - \phi)$, then $\frac{1-m}{1+m} \cot \phi$ equals
 a. $\tan \theta$ b. $-\tan \theta$
 c. $2 \tan \theta$ d. None of these
29. The value of $\cos^4 \frac{\pi}{8} + \cos^4 \frac{3\pi}{8} + \cos^4 \frac{5\pi}{8} + \cos^4 \frac{7\pi}{8}$ is
 a. $\frac{1}{2}$ b. 2 c. 3 d. $\frac{3}{2}$
30. If $\cos x + \cos y - \cos(x+y) = 3/2$, then
 a. $x+y=0$ b. $x=2y$
 c. $x=y$ d. $\cos^2 \left(\frac{x-y}{2} \right) < 1$

31. The expression $\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A}$ can be written as

- a. $\sin A \cos A + 1$ b. $\sec A \operatorname{cosec} A + 1$
c. $\tan A + \cot A$ d. $\sec A + \operatorname{cosec} A$

32. If $\cos(\alpha + \beta) = \frac{4}{5}$ and $\sin(\alpha - \beta) = \frac{5}{13}$, where $0 \leq \alpha$

$\beta \leq \frac{\pi}{4}$, then $\tan 2\alpha$ is equal to

- a. $\frac{25}{16}$ b. $\frac{56}{33}$ c. $\frac{19}{12}$ d. $\frac{20}{7}$

33. If A and B are acute positive angles satisfying the equations $3 \sin^2 A + 2 \sin^2 B = 1$ and $3 \sin 2A - 2 \sin 2B = 0$, then $A + 2B$ is equal to

- a. zero b. $\frac{\pi}{2}$ c. $\frac{\pi}{4}$ d. $\frac{\pi}{3}$

34. If the shadow of a pole of height $(\sqrt{3} + 1)$ m standing on the ground is found to be 2 m longer, when the elevation is 30° than when elevation was α , then α is equal to

- a. 15° b. 30° c. 45° d. 75°

35. The number of roots of the equation $3 \sin^2 x = 8 \cos x$ in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ is

- a. 1 b. 2 c. 3 d. 4

36. The number of distinct roots of

$$\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0 \text{ in } \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \text{ is}$$

- a. 0 b. 1 c. 2 d. 3

37. If $a \cos 2\theta + b \sin 2\theta = c$ has α and β as its roots, then $\tan \alpha + \tan \beta$ is equal to

- a. $-\frac{2b}{a+c}$ b. $\frac{2b}{a+c}$
c. $\frac{3b}{a+c}$ d. None of these

38. If $2 \sin^2 \theta = 3 \cos \theta$, where $0 \leq \theta \leq 2\pi$, then find the value of θ .

- a. $\frac{2\pi}{3}, \frac{5\pi}{3}$ b. $\frac{\pi}{3}, \frac{5\pi}{3}$
c. $\frac{5\pi}{3}, \frac{4\pi}{3}$ d. None of these

39. If the angles of a triangle are in the ratio 4:1:1, then find the ratio of the longest side to the perimeter of the triangle.

- a. $2\sqrt{3} - 3$ b. $2\sqrt{3} + 3$ c. $3\sqrt{2} + 3$ d. $3\sqrt{2} + 2$

40. If $0 < \theta < 2\pi$, then the intervals of values of θ for which $2 \sin^2 \theta - 5 \sin \theta + 2 > 0$, is

- a. $\left(0, \frac{\pi}{6}\right) \cup \left(\frac{5\pi}{6}, 2\pi\right)$ b. $\left(\frac{\pi}{8}, \frac{5\pi}{6}\right)$
c. $\left(0, \frac{\pi}{8}\right) \cup \left(\frac{\pi}{6}, \frac{5\pi}{6}\right)$ d. $\left(\frac{41\pi}{48}, \pi\right)$

41. The values of θ in $\left(0, \frac{\pi}{2}\right)$ satisfying

$$\begin{vmatrix} 1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0, \text{ are}$$

a. $\frac{7\pi}{24}$ b. $\frac{5\pi}{24}$ c. $\frac{13\pi}{24}$ d. $\frac{\pi}{24}$

42. In $\triangle ABC$, $a^3 \cos(B - C) + b^3 \cos(C - A) + c^3 \cos(A - B)$ is equal to

- a. $3abc$ b. $2abc$ c. abc d. $5abc$

43. The number of distinct solutions of $\sec x + \tan x = \sqrt{3}$, where $0 \leq x \leq 3\pi$, is

- a. 1 b. 2 c. 3 d. 4

44. The general solution of $\sec 4x - \sec 2x = 2$ is

- a. $\frac{(2n+1)\pi}{10}, \frac{(2m+1)\pi}{2}; n, m \in I$
b. $\frac{(2n+1)\pi}{5}, \frac{(2m+1)\pi}{5}; n, m \in I$
c. $\frac{(2n+2)\pi}{10}, \frac{(2m+4)\pi}{2}; n, m \in I$
d. None of the above

45. If $\sin 3x = 4 \sin x \sin(y + x) \sin(y - x)$, where $0 < x < \pi$, then the number of solutions of this equation in each quadrant, is

- a. 10 b. 5 c. 1 d. 0

46. The general solution of

$$\sin x - 3 \sin 2x + \sin 3x = \cos x - 3 \cos 2x + \cos 3x \text{ is}$$

- a. $n\pi + \frac{\pi}{8}$ b. $\frac{n\pi}{2} + \frac{\pi}{8}$
c. $(-1)^n \frac{n\pi}{2} + \frac{\pi}{8}$ d. $2n\pi + \cos^{-1} \frac{3}{2}$

47. The value of x for $\sin x + \sqrt{3} \cos x = \sqrt{2}$, is

- a. $2n\pi - \frac{5\pi}{12}$ b. $2n\pi - \frac{6\pi}{12}$
c. $2n\pi - \frac{\pi}{12}$ d. $2n\pi + \frac{\pi}{12}$

48. The maximum and minimum values of $6 \sin x \cos x + 4 \cos 2x$ are respectively

- a. 5, 5 b. -5, 5 c. 5, -5 d. -4, 4

49. If $A = \sin^2 \theta + \cos^4 \theta$, then for all real values of θ ,

- a. $1 \leq A \leq 2$ b. $\frac{3}{4} \leq A \leq 1$
c. $\frac{13}{16} \leq A \leq 1$ d. $\frac{3}{4} \leq A \leq \frac{13}{16}$

50. The minimum value of the expression $\sin \alpha + \sin \beta + \sin \gamma$, where α, β, γ are the real numbers satisfying $\alpha + \beta + \gamma = \pi$, is
 a. positive b. zero c. negative d. -3
51. The maximum value of $(\sec^{-1} x)^2 + (\operatorname{cosec}^{-1} x)^2$ is
 a. $\frac{\pi^2}{2}$ b. $\frac{5\pi^2}{4}$
 c. π^2 d. None of these
52. If $x + \frac{1}{x} = 2$, then the principal value of $\sin^{-1} x$ is
 a. $\frac{\pi}{6}$ b. $\frac{\pi}{2}$ c. π d. $\frac{3\pi}{2}$
53. If $x = \sin(2 \tan^{-1} 2)$ and $y = \sin\left(\frac{1}{2} \tan^{-1} \frac{4}{3}\right)$, then
 a. $x > y$ and $y^2 = 1 - x$ b. $x < y$
 c. $x > y$ and $y^2 = x$ d. $y^2 = 1 + x$
54. The numerical value of $\tan\left[2 \tan^{-1}\left(\frac{1}{5}\right) - \frac{\pi}{4}\right]$ is
 a. $\frac{7}{17}$ b. $-\frac{7}{17}$ c. $\frac{17}{7}$ d. $-\frac{17}{7}$
55. The root of the equation $\tan^{-1}\left(\frac{x-1}{x+1}\right) + \tan^{-1}\left(\frac{2x-1}{2x+1}\right) = \tan^{-1}\left(\frac{23}{36}\right)$ is
 a. $-\frac{3}{8}$ b. $-\frac{1}{2}$ c. $\frac{3}{4}$ d. $\frac{4}{3}$
56. If $x^2 + y^2 + z^2 = r^2$, then the value of $\tan^{-1} \frac{xy}{zr} + \tan^{-1} \frac{yz}{xr} + \tan^{-1} \frac{zx}{yr}$ is
 a. π b. $\frac{\pi}{2}$
 c. 0 d. None of these
57. The root of the equation $17x^2 + 17x \tan\left[2 \tan^{-1}\left(\frac{1}{5}\right) - \frac{\pi}{4}\right] - 10 = 0$ is
 a. $\frac{10}{17}$ b. -1 c. $-\frac{7}{17}$ d. 1
58. In $\triangle ABC$, if $2s = a + b + c$, then the value of $\frac{s(s-a)}{bc} - \frac{(s-b)(s-c)}{bc}$ is
 a. $\sin A$ b. $\cos A$
 c. $\tan A$ d. None of these
59. If $\cot^{-1} \sqrt{\cos \alpha} - \tan^{-1} \sqrt{\cos \alpha} = x$, then $\sin x$ equals
 a. $\tan^2\left(\frac{\alpha}{2}\right)$ b. $\cot^2\left(\frac{\alpha}{2}\right)$ c. $\tan \alpha$ d. $\cot\left(\frac{\alpha}{2}\right)$
60. If $\sin^{-1}\left(x - \frac{x^2}{2} + \frac{x^3}{4} - \dots\right) + \cos^{-1}\left(x^2 - \frac{x^4}{2} + \frac{x^6}{4} - \dots\right) = \frac{\pi}{2}$ where, $0 < |x| < \sqrt{2}$, then x is equal to
 a. $\frac{1}{2}$ b. 1 c. $-\frac{1}{2}$ d. -1
61. If $\sin^{-1}\left(\frac{4x}{x^2+4}\right) + 2 \tan^{-1}\left(-\frac{x}{2}\right)$ is independent of x , then the value of x is
 a. $-3 \leq x \leq 3$ b. $-2 \leq x \leq 2$
 c. $-1 \leq x \leq 1$ d. $0 \leq x \leq 1$
62. The angular elevation of a tower OP at a point A due South of it is 60° and at a point B due West of A , the elevation is 30° . If $AB = 3$ m, then the height of the tower is
 a. $3\sqrt{3}$ m b. $3\sqrt{14}$ m c. $\frac{3\sqrt{3}}{4}$ m d. $\frac{3\sqrt{6}}{4}$ m
63. The value of $\sin^{-1}\left\{\cos\left(\frac{43\pi}{5}\right)\right\}$ is
 a. $\frac{3\pi}{5}$ b. $-\frac{7\pi}{5}$ c. $\frac{\pi}{10}$ d. $-\frac{\pi}{10}$
64. If $3 \tan^{-1} x + \cot^{-1} x = \pi$, then x is equal to
 a. 0 b. 1 c. -1 d. $\frac{1}{2}$
65. If $(\tan^{-1} x)^2 + (\cot^{-1} x)^2 = \frac{5\pi^2}{8}$, then the value of x is
 a. -2 b. -3 c. -1 d. 2
66. The value of $\tan\left\{\cos^{-1}\left(-\frac{2}{7}\right) - \frac{\pi}{2}\right\}$ is
 a. $\frac{2}{3\sqrt{5}}$ b. $\frac{2}{3}$ c. $\frac{1}{\sqrt{5}}$ d. $\frac{4}{5}$
67. If $\tan^{-1}(x+3) - \tan^{-1}(x-3) = \sin^{-1}\left(\frac{3}{5}\right)$, then the value of x is
 a. 3 b. 14 c. ± 4 d. 7
68. In $\triangle ABC$, if $\Delta = a^2 - (b-c)^2$, then the value of $\tan A$ is
 a. $\frac{8}{14}$ b. $\frac{8}{13}$ c. $\frac{8}{15}$ d. $\frac{8}{17}$
69. The value of $\sin^{-1} \frac{8}{17} + \sin^{-1} \frac{3}{5}$ is
 a. $\tan^{-1} \frac{77}{35}$ b. $\tan^{-1} \frac{77}{36}$ c. $\tan^{-1} \frac{77}{37}$ d. $\tan^{-1} \frac{77}{26}$
70. If $\alpha = \sin^{-1}\{\cos(\sin^{-1} x)\}$ and $\beta = \cos^{-1}[\sin(\cos^{-1} x)]$, then the value of $\tan \alpha \tan \beta$ is
 a. 1 b. 2 c. 3 d. 4
71. The solution of $\tan\left(\sin^{-1} \frac{3}{5} + \cot^{-1} \frac{3}{2}\right)$ is
 a. $\frac{17}{6}$ b. $\frac{17}{7}$ c. $\frac{17}{5}$ d. $\frac{17}{4}$
72. If $\sin\left(\sin^{-1} \frac{1}{5} + \cos^{-1} x\right) = 1$, then the value of x is
 a. $\frac{1}{4}$ b. $\frac{1}{3}$ c. $\frac{1}{5}$ d. $\frac{1}{2}$

73. The value of $\tan \left\{ \frac{1}{2} \sin^{-1} \left(\frac{2x}{1+x^2} \right) + \frac{1}{2} \cos^{-1} \left(\frac{1-y^2}{1+y^2} \right) \right\}$ is
 a. $\frac{x-y}{1-xy}$ b. $\frac{x-y}{1+xy}$ c. $\frac{x+y}{1+xy}$ d. $\frac{x+y}{1-xy}$
74. The sum of the radii of the circles, which are respectively inscribed and circumscribed about a polygon of n sides, whose side length is a , is
 a. $\frac{1}{2} a \tan \left(\frac{\pi}{2n} \right)$ b. $\frac{1}{2} a \cot \left(\frac{\pi}{2n} \right)$
 c. $\frac{1}{2} \cot \left(\frac{\pi}{3n} \right)$ d. $\frac{1}{2} \cot \left(\frac{\pi}{2n} \right)$
75. If $2 \tan^{-1}(\cos x) = \tan^{-1}(2 \operatorname{cosec} x)$, then the value of x is
 a. $\frac{2\pi}{3}$ b. $\frac{\pi}{4}$ c. $\frac{3\pi}{4}$ d. $\frac{3\pi}{2}$
76. The real solutions of $\tan^{-1} \sqrt{x(x+1)} + \sin^{-1} \sqrt{x^2+x+1} = \frac{\pi}{2}$ is
 a. 2, 3 b. 1, 0 c. -1, 0 d. 3, 1
77. In $\triangle ABC$, if $r_1 = r_2 + r_3 + r$, then triangle is
 a. right angled triangle b. equilateral triangle
 c. isosceles triangle d. None of these
78. The value of $\cot \left(\operatorname{cosec}^{-1} \frac{5}{3} + \tan^{-1} \frac{2}{3} \right)$ is
 a. $\frac{5}{17}$ b. $\frac{6}{17}$
 c. $\frac{3}{17}$ d. $\frac{4}{17}$
79. If $\sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$, then the value of x is
 a. 1 b. 3
 c. 4 d. 5
80. If $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$, then $4x^2 - 4xy \cos \alpha + y^2$ is equal to
 a. $-4 \sin^2 \alpha$ b. $4 \sin^2 \alpha$ c. 4 d. $2 \sin 2\alpha$
81. In $\triangle ABC$, if $\frac{\cos A}{a} = \frac{\cos B}{b} = \frac{\cos C}{c}$, then the triangle is
 a. right angled b. obtuse angled
 c. equilateral d. isosceles
82. In $\triangle ABC$, if $\angle A : \angle B : \angle C = 3 : 5 : 4$, then $a + b + \sqrt{2}c$ is equal to
 a. $2b$ b. $2c$ c. $3b$ d. $2a$
83. In $\triangle ABC$, if $\angle A = 30^\circ$, $\angle B = 45^\circ$ and $a = 1$, then the values of b and c are respectively
 a. $\sqrt{2}, \frac{\sqrt{3}+1}{\sqrt{2}}$ b. $\sqrt{2}, \frac{\sqrt{3}-1}{\sqrt{2}}$
 c. $\sqrt{3}, \frac{\sqrt{3}-1}{\sqrt{2}}$ d. $\sqrt{2}, \frac{\sqrt{3}+2}{\sqrt{2}}$
84. If $\angle A = 75^\circ$ and $\angle B = 45^\circ$, then $b + c\sqrt{2}$ is equal to
 a. $2a$ b. $2a + 1$ c. $3a$ d. $2a - 1$
85. If a^2, b^2 and c^2 are in AP, then $\cot A, \cot B$ and $\cot C$ are in
 a. AP b. GP c. HP d. AGP
86. In $\triangle ABC$, $\left(\frac{b}{c} + \frac{c}{b} \right) \cos A + \left(\frac{a}{b} + \frac{b}{a} \right) \cos C + \left(\frac{a}{c} + \frac{c}{a} \right) \cos B$ is equal to
 a. 4 b. 5 c. 3 d. 2
87. In $\triangle ABC$, if the tangent of half the difference of two angles is one-third the tangent of half the sum of the angles. Then, the ratio of the sides opposite to the angles is
 a. 2 : 1 b. 1 : 2 c. 3 : 1 d. 1 : 1

BITSAT Archives

1. The number of roots of the equation $|\sin x \cos x| + \sqrt{2 + \tan^2 x + \cot^2 x} = \sqrt{3}$, where $x \in [0, 4\pi]$, is [2014]
 a. 1 b. 2
 c. 3 d. None of these
2. The greatest and least values of $(\sin^{-1} x)^2 + (\cos^{-1} x)^2$ are respectively [2014]
 a. $\frac{\pi^2}{4}$ and 0 b. $\frac{\pi}{2}$ and $-\frac{\pi}{2}$
 c. $\frac{5\pi^2}{4}$ and $\frac{\pi^2}{8}$ d. $\frac{\pi^2}{4}$ and $-\frac{\pi^2}{4}$
3. The number of solutions of $\cos x = |1 + \sin x|$, $0 \leq x \leq 3\pi$, is [2013]
 a. 1 b. 2 c. 3 d. 4
4. The value of the expression $\sin [\cot^{-1} \{ \cos(\tan^{-1} 1) \}]$ is [2013]
 a. 0 b. 1 c. $\frac{1}{\sqrt{3}}$ d. $\frac{\sqrt{2}}{\sqrt{3}}$
5. An object is observed from the points A, B and C lying in a horizontal straight line which passes directly underneath the object. The angular elevation at B is twice that at A and at C three times that at A . If $AB = a, BC = b$, then the height of the object is [2013]

- a. $\frac{3a}{2b} \sqrt{(a+b)(3b-a)}$ b. $\frac{3b}{2a} \sqrt{(a+b)(3a-b)}$
 c. $\frac{a}{2b} \sqrt{(a+b)(3b-a)}$ d. None of these
6. If $\tan 20^\circ = p$, then $\frac{\tan 160^\circ - \tan 110^\circ}{1 + \tan 160^\circ \tan 110^\circ}$ is equal to [2012]
 a. $\left(\frac{1-p^2}{2p}\right)$ b. $\left(\frac{2p}{1+p^2}\right)$ c. $\left(\frac{1+p}{2p}\right)$ d. $\left(\frac{1-p}{2p}\right)$
7. If the angles of a triangle are in AP and the least angle is 30° . Then, the greatest angle (in radian) is [2012]
 a. $\frac{7\pi}{12}$ b. $\frac{2\pi}{3}$ c. $\frac{5\pi}{6}$ d. $\frac{\pi}{2}$
8. If $A + B + C = 180^\circ$, then $\frac{\cot A + \cot B + \cot C}{\cot A \cot B \cot C}$ is equal to [2012]
 a. 1 b. $\cot A \cos B \cot C$
 c. -1 d. 0
9. In $\triangle ABC$, if $a = 2, b = 3$ and $\sin A = \frac{2}{3}$. Then, $\cos C$ is equal to [2012]
 a. $\frac{1}{2}$ b. $\frac{2}{3}$ c. $\frac{2}{\sqrt{13}}$ d. $\frac{1}{\sqrt{13}}$
10. If $4 \sin^{-1} x + \cos^{-1} x = \pi$, then x is equal to [2012]
 a. $\frac{1}{2}$ b. 2 c. 1 d. $\frac{1}{3}$
11. If $\tan \theta = \frac{1}{2}$ and $\tan \phi = \frac{1}{3}$, then the value of $\theta + \phi$ is [2011]
 a. $\frac{\pi}{6}$ b. π c. 0 d. $\frac{\pi}{4}$
12. If $\sin \theta = \frac{1}{2}$ and $\tan \theta = \frac{1}{\sqrt{3}}, \forall n \in I$, then most general values of θ is [2011]
 a. $2n\pi + \frac{\pi}{6}, \forall n \in I$ b. $2n\pi + \frac{\pi}{4}, \forall n \in I$
 c. $2n\pi + \frac{\pi}{3}, \forall n \in I$ d. $2n\pi + \frac{\pi}{3}, \forall n \in I$
13. The function $\sin x + \cos x$ is maximum, when x is equal to [2011]
 a. $\frac{\pi}{6}$ b. $\frac{\pi}{4}$ c. $\frac{\pi}{3}$ d. $\frac{\pi}{2}$
14. The principal value of $\sin^{-1}\left(-\frac{\sqrt{3}}{2}\right)$ is [2011]
 a. $-\frac{2\pi}{3}$ b. $-\frac{\pi}{3}$ c. $\frac{4\pi}{3}$ d. $\frac{5\pi}{3}$
15. If angles A, B and C are in AP, then $\frac{a+C}{b}$ is equal to [2011]
 a. $2 \sin\left(\frac{A-C}{2}\right)$ b. $2 \cos\left(\frac{A-C}{2}\right)$
 c. $\cos\left(\frac{A-C}{2}\right)$ d. $\sin\left(\frac{A-C}{2}\right)$
16. $\left(1 + \cos \frac{\pi}{8}\right)\left(1 + \cos \frac{3\pi}{8}\right)\left(1 + \cos \frac{5\pi}{8}\right)\left(1 + \cos \frac{7\pi}{8}\right)$ is equal to [2010]
 a. $\frac{1}{2}$ b. $\frac{1}{8}$
 c. $\cos \frac{\pi}{8}$ d. $\frac{1+\sqrt{2}}{2\sqrt{2}}$
17. The solution of the equation $\sec \theta - \operatorname{cosec} \theta = \frac{4}{3}$ is [2010]
 a. $\frac{1}{2} \left[n\pi + (-1)^n \sin^{-1} \frac{3}{4} \right]$ b. $\frac{n\pi}{2} + (-1)^n \sin^{-1} \frac{3}{4}$
 c. $n\pi + (-1)^n \sin^{-1} \frac{3}{4}$ d. None of these
18. The minimum value of $9 \tan^2 \theta + 4 \cot^2 \theta$ is [2010]
 a. 13 b. 9
 c. 6 d. 12
19. If $a \leq \sin^{-1} x + \cos^{-1} x + \tan^{-1} x \leq b$, then [2010]
 a. $a = 0, b = \pi$ b. $a = 0, b = \frac{\pi}{2}$
 c. $a = \frac{\pi}{2}, b = \pi$ d. None of these
20. If $\sin^{-1} x + \sin^{-1} y = \frac{2\pi}{3}$ and $\cos^{-1} x - \cos^{-1} y = \frac{\pi}{3}$. Then, (x, y) is equal to [2010]
 a. (0, 1) b. $(1/2, 1)$
 c. $(1, 1/2)$ d. $(\sqrt{3}/2, 1)$
21. The sum of inradius and circumradius of incircle and circumcircle of a regular polygon of side n is [2010]
 a. $\frac{a}{4} \cot \frac{\pi}{2n}$ b. $a \cot \frac{\pi}{n}$
 c. $\frac{a}{2} \cot \frac{\pi}{2n}$ d. $a \cot \frac{\pi}{2n}$
22. In $\triangle ABC$, if $\angle A = \frac{\pi}{2}$, then $\cos^2 B + \cos^2 C$ equals [2009]
 a. -2 b. -1
 c. 1 d. 0
23. In $\triangle ABC$, if $\frac{\cos A}{a} = \frac{\cos B}{b} = \frac{\cos C}{c}$ and $a = 2$, then area of the triangle is [2009]
 a. 1 sq unit b. 2 sq units
 c. $\frac{\sqrt{3}}{2}$ sq units d. $\sqrt{3}$ sq units
24. A longer side of a parallelogram is 10 cm and the shorter is 6 cm. If the longer diagonal makes an angle 30° with the longer side, then the length of the longer diagonal (in cm) is [2009]
 a. $5\sqrt{3} + \sqrt{11}$
 b. $4\sqrt{3} + \sqrt{11}$
 c. $5\sqrt{3} + \sqrt{13}$
 d. $5\sqrt{3} - 11$

25. $\sqrt{3} \operatorname{cosec} 20^\circ - \sec 20^\circ$ is equal to [2008]
 a. 2 b. $2 \sin 20^\circ \cdot \operatorname{cosec} 40^\circ$
 c. 4 d. $4 \sin 20^\circ \cdot \operatorname{cosec} 40^\circ$
26. If $\tan \theta + \tan\left(\theta + \frac{\pi}{3}\right) + \tan\left(\theta + \frac{2\pi}{3}\right) = 3$, then which of the following is equal to 1? [2008]
 a. $\tan 2\theta$ b. $\tan 3\theta$
 c. $\tan^2 \theta$ d. $\tan^3 \theta$
27. $\{x \in R: \cos 2x + 2 \cos^2 x = 2\}$ is equal to [2008]
 a. $\left\{2n\pi + \frac{\pi}{3}: n \in Z\right\}$ b. $\left\{n\pi \pm \frac{\pi}{6}: n \in Z\right\}$
 c. $\left\{n\pi + \frac{\pi}{3}: n \in Z\right\}$ d. $\left\{2n\pi - \frac{\pi}{3}: n \in Z\right\}$
28. If $\sin^{-1}\left(\frac{3}{x}\right) + \sin^{-1}\left(\frac{4}{x}\right) = \frac{\pi}{2}$, then x equal to [2008]
 a. 3 b. 5
 c. 7 d. 11
29. In $\triangle ABC$, if $\frac{1}{b+c} + \frac{1}{c+a} = \frac{3}{a+b+c}$, then C is equal to [2008]
 a. 90° b. 60°
 c. 45° d. 30°
30. In a triangle, if $r_1 = 2r_2 = 3r_3$ then $\frac{a}{b} + \frac{b}{c} + \frac{c}{a}$ is equal to [2008]
 a. $\frac{75}{60}$ b. $\frac{155}{60}$
 c. $\frac{176}{60}$ d. $\frac{191}{60}$
31. From the top of a hill h metre high, the angles of depressions of the top and the bottom of a pillar are α and β , respectively. The height (in metres) of the pillar is [2008]
 a. $\frac{h(\tan \beta - \tan \alpha)}{\tan \beta}$ b. $\frac{h(\tan \alpha - \tan \beta)}{\tan \alpha}$
 c. $\frac{h(\tan \beta + \tan \alpha)}{\tan \beta}$ d. $\frac{h(\tan \beta + \tan \alpha)}{\tan \alpha}$
32. The number of solutions of the equation $1 + \sin x \sin^2 \frac{x}{2} = 0$ in $[-\pi, \pi]$ is [2007]
 a. zero b. one
 c. two d. three
33. The solution set of the equation $\sin^{-1} x = 2 \tan^{-1} x$ is [2007]
 a. $\{1, 2\}$ b. $\{-1, 2\}$
 c. $\{-1, 1, 0\}$ d. $\left\{1, \frac{1}{2}, 0\right\}$
34. If $\sin A + \cos B = a$ and $\sin B + \cos A = b$, then $\sin(A+B)$ is equal to [2007]
 a. $\frac{a^2 + b^2}{2}$ b. $\frac{a^2 - b^2 + 2}{2}$
 c. $\frac{a^2 + b^2 - 2}{2}$ d. None of these
35. In $\triangle ABC$, $(a-b)^2 \cos^2 \frac{C}{2} + (a+b)^2 \sin^2 \frac{C}{2}$ is equal to [2007]
 a. a^2 b. b^2
 c. c^2 d. None of these
36. The horizontal distance between two towers is 60 m and the angle of depression of the top of the first tower as seen from the top to the second is 30° . If the height of the second tower is 150 m, then the height of the first tower is [2007]
 a. 90 m
 b. $(150 - 60\sqrt{3})$ m
 c. $(150 + 20\sqrt{3})$ m
 d. None of the above
37. If $12 \cot^2 \theta - 31 \operatorname{cosec} \theta + 32 = 0$, then the value of $\sin \theta$ is [2006]
 a. $\frac{3}{5}$ or 1 b. $\frac{2}{3}$ or $-\frac{2}{3}$
 c. $\frac{4}{5}$ or $\frac{3}{4}$ d. $\pm \frac{1}{2}$
38. The general solution of $\sin x - \cos x = \sqrt{2}$, for any integer n , is [2006]
 a. $n\pi$ b. $2n\pi + \frac{3\pi}{4}$
 c. $2n\pi$ d. $(2n+1)\pi$
39. In $\triangle ABC$, if the sides are $a=3$, $b=5$ and $c=4$, then $\sin \frac{B}{2} + \cos \frac{B}{2}$ is equal to [2006]
 a. $\sqrt{2}$ b. $\frac{\sqrt{3}+1}{2}$
 c. $\frac{\sqrt{3}-1}{2}$ d. 1
40. If $\sin^{-1}(1-x) - 2 \sin^{-1} x = \pi/2$, then x equals [2005]
 a. $\{0, -1/2\}$ b. $\{1/2, 0\}$
 c. $\{0\}$ d. $\{-1, 0\}$
41. If θ is an acute angle and $\sin \frac{\theta}{2} = \sqrt{\frac{x-1}{2x}}$, then $\tan \theta$ is equal to [2005]
 a. $x^2 - 1$ b. $\sqrt{x^2 - 1}$
 c. $\sqrt{x^2 + 1}$ d. $x^2 + 1$

Answer with Solutions

Practice Exercise

1. (b) Here, $l = 22$ cm and $r = 100$ cm

Using the formula $\theta = \frac{l}{r}$, we get

$$\begin{aligned}\theta &= \frac{22}{100} = \frac{11}{50} \text{ radian} \\ &= \left(\frac{11}{50} \times \frac{180}{\pi} \right)^\circ = \left(\frac{11 \times 18 \times 7}{5 \times 22} \right)^\circ = \left(\frac{63}{5} \right)^\circ = 12^\circ + \left(\frac{3}{5} \right)^\circ \\ &= 12^\circ + \frac{3}{5} \times 60' \quad [\because 1^\circ = 60'] \\ &= 12^\circ 36'\end{aligned}$$

2. (b) $\therefore$ First angle = 60°

$$\text{Second angle} = 60^\circ = 60 \times \frac{90}{100} = 54^\circ$$

$$\text{and third angle} = \frac{5\pi}{6} \text{ radian} = \frac{5 \times 180^\circ}{6} = 150^\circ$$

$$\begin{aligned}\therefore \text{Fourth angle} &= 360^\circ - (60^\circ + 54^\circ + 150^\circ) \\ &= 360^\circ - 264^\circ = 96^\circ\end{aligned}$$

3. (b) $\therefore 1 \text{ radian} = \frac{180^\circ}{\pi} = 57^\circ 30'$ (approx.)

[since, $\sin \theta$ is increasing from 0 to 90°]

$$\therefore \sin 1 > \sin 1^\circ$$

4. (a) By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2 = 6^2 + 8^2 = 36 + 64 = 100$$

$$\Rightarrow AC = 10$$

$$\therefore \sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{8}{10} = \frac{4}{5}$$

$$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{6}{10} = \frac{3}{5}$$

$$\text{and } \tan A = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB} = \frac{8}{6} = \frac{4}{3}$$

5. (c) We have, $\tan 9^\circ - \tan 27^\circ - \tan 63^\circ + \tan 81^\circ$

$$\begin{aligned}&= (\tan 9^\circ + \tan 81^\circ) - (\tan 27^\circ + \tan 63^\circ) \\ &= \frac{1}{\cos 9^\circ \cos 81^\circ} - \frac{1}{\cos 27^\circ \cos 63^\circ} \\ &= \frac{1}{\sin 9^\circ \cos 9^\circ} - \frac{1}{\sin 27^\circ \cos 27^\circ} \\ &= \frac{2}{\sin 18^\circ} - \frac{2}{\sin 54^\circ} = 2 \left\{ \frac{\sin 54^\circ - \sin 18^\circ}{\sin 18^\circ \sin 54^\circ} \right\} \\ &= 2 \left[\frac{2 \cos 36^\circ \sin 18^\circ}{\sin 18^\circ \cos 36^\circ} \right] = 4\end{aligned}$$

6. (d) $\log_3 \tan 1^\circ + \log_3 \tan 2^\circ + \dots + \log_3 \tan 89^\circ$

$$= \log_3 \tan 1^\circ \tan 2^\circ \dots \tan 89^\circ$$

$$= \log_3 (\tan 1^\circ \tan 2^\circ \dots \tan 45^\circ)$$

$$(\tan 46^\circ \tan 47^\circ \dots \tan 89^\circ)$$

$$\begin{aligned}&= \log_3 (\tan 1^\circ \tan 2^\circ \dots \tan 45^\circ) \times \cot 44^\circ \\ &\quad \times \cot 43^\circ \dots \cot 1^\circ \\ &= \log_3 (\tan 1^\circ \tan 2^\circ \dots \tan 44^\circ) \times \tan 45^\circ \\ &\quad \times \frac{1}{\tan 44^\circ \tan 43^\circ \dots \tan 1^\circ} \\ &= \log_3 (1) = 0\end{aligned}$$

7. (d) Since, the distance of the foot from each vertex is $h \cot \alpha$.

So the foot is at the circumcentre of triangle.

$$\therefore R = h \cot \alpha$$

$$\Rightarrow h = R \tan \alpha = \frac{a}{2 \sin A} \tan \alpha = \frac{1}{2} a \tan \alpha \cdot \operatorname{cosec} A$$

8. (b) Let $\sin A = x$

$$\text{Then, } \cos A = \tan B$$

$$\Rightarrow \sqrt{1 - \sin^2 A} = \tan B$$

$$\Rightarrow \sqrt{1 - x^2} = \tan B$$

$$\text{Now, } \cos B = \tan C \Rightarrow \frac{1}{\sqrt{1 + \tan^2 B}} = \tan C$$

$$\Rightarrow \frac{1}{\sqrt{2 - x^2}} = \tan C$$

$$\Rightarrow \cos C = \frac{1}{\sqrt{1 + \tan^2 C}} = \sqrt{\frac{2 - x^2}{3 - x^2}}$$

$$\text{Now, } \cos C = \tan A \Rightarrow \sqrt{\frac{2 - x^2}{3 - x^2}} = \frac{x}{1 - x^2}$$

$$\Rightarrow x^2 = \frac{(1 \pm \sqrt{5})^2}{4} \Rightarrow x = \frac{\sqrt{5} - 1}{2} = 2 \sin 18^\circ$$

9. (b) Given, $\sin 18^\circ = \frac{\sqrt{5} - 1}{4}$

$$\begin{aligned}\text{Then, } \cos 18^\circ &= \sqrt{1 - \left(\frac{\sqrt{5} - 1}{4} \right)^2} = \sqrt{\frac{16 - (5 + 1 - 2\sqrt{5})}{16}} \\ &= \frac{\sqrt{10 + 2\sqrt{5}}}{4}\end{aligned}$$

$$\therefore \sin 81^\circ = \sin(90^\circ - 9^\circ) = \cos 9^\circ$$

$$\begin{aligned}\sqrt{\frac{1 + \cos 18^\circ}{2}} &= \sqrt{\frac{1 + \frac{\sqrt{10 + 2\sqrt{5}}}{4}}{2}} = \sqrt{\frac{4 + \sqrt{10 + 2\sqrt{5}}}{8}} \\ &= \sqrt{\frac{8 + 2\sqrt{10 + 2\sqrt{5}}}{16}} = \sqrt{\frac{8 + 2\sqrt{(3 + \sqrt{5})(5 - \sqrt{5})}}{16}} \\ &\quad [\because 10 + 2\sqrt{5} = (3 + \sqrt{5})(5 - \sqrt{5})] \\ &= \sqrt{\frac{\sqrt{(3 + \sqrt{5})^2} + \sqrt{(5 - \sqrt{5})^2} + 2\sqrt{(3 + \sqrt{5})(5 - \sqrt{5})}}{16}} \\ &= \frac{\sqrt{3 + \sqrt{5}} + \sqrt{5 - \sqrt{5}}}{4}\end{aligned}$$

$$10. (c) \cos^2 \theta = \frac{(x+y)^2}{4xy}$$

$$\text{Since, } \cos^2 \theta \leq 1$$

$$\therefore \frac{(x+y)^2}{4xy} \leq 1$$

$$\Rightarrow (x+y)^2 \leq 4xy \Rightarrow (x-y)^2 \leq 0$$

$$\Rightarrow x=y=0 \Rightarrow x=y$$

$$11. (b) \therefore \tan(A+B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

$$\therefore (1 - \tan A \tan B) = \frac{\tan A + \tan B}{\tan(A+B)}$$

$$\text{If } (A+B) = 45^\circ, \text{ then } \tan(A+B) = 1$$

$$\text{So, for such case, } 1 - \tan A \tan B = \tan A + \tan B$$

$$\Rightarrow \tan A + \tan B + \tan A \tan B = 1$$

$$\Rightarrow 1 + \tan A + \tan B + \tan A \tan B = 1 + 1$$

$$\Rightarrow (1 + \tan A)(1 + \tan B) = 2$$

$$\therefore (1 + \tan 1^\circ)(1 + \tan 44^\circ)(1 + \tan 2^\circ)(1 + \tan 43^\circ) \\ + \dots + (1 + \tan 22^\circ)(1 + \tan 23^\circ) = 2^{22}$$

$$12. (d) \tan 45^\circ = \tan(10^\circ + 35^\circ)$$

$$1 = \frac{\tan 10^\circ + \tan 35^\circ}{1 - \tan 10^\circ \tan 35^\circ}$$

$$\Rightarrow 1 - \tan 10^\circ \tan 35^\circ = \tan 10^\circ + \tan 35^\circ$$

$$\Rightarrow \tan 10^\circ + \tan 35^\circ + \tan 10^\circ \tan 35^\circ = 1$$

$$13. (c) \text{ Given, } \alpha + \beta = \frac{\pi}{2} \Rightarrow \alpha = \frac{\pi}{2} - \beta$$

Taking tan on both sides, we get

$$\tan \alpha = \tan\left(\frac{\pi}{2} - \beta\right)$$

$$\Rightarrow \tan \alpha = \cot \beta \Rightarrow \tan \alpha \tan \beta = 1$$

$$\text{Again, } \beta + \gamma = \alpha$$

$$\Rightarrow \gamma = (\alpha - \beta)$$

$$\Rightarrow \tan \gamma = \tan(\alpha - \beta)$$

$$\Rightarrow \tan \gamma = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

$$\Rightarrow \tan \gamma = \frac{\tan \alpha - \tan \beta}{1 + 1}$$

$$2 \tan \gamma = \tan \alpha - \tan \beta$$

$$\tan \alpha = \tan \beta + 2 \tan \gamma$$

$$14. (a) \text{ Given, } 2 \cos x + 2 \cos 3x = \cos y$$

$$\Rightarrow \cos x + \cos 3x = \frac{1}{2} \cos y \quad \dots(i)$$

$$\text{and } 2 \sin x + 2 \sin 3x = \sin y$$

$$\Rightarrow \sin x + \sin 3x = \frac{1}{2} \sin y \quad \dots(ii)$$

On squaring and adding Eqs. (i) and (ii), we get

$$\cos^2 x + \cos^2 3x + \sin^2 x + \sin^2 3x + 2 \cos 3x \cos x$$

$$+ 2 \sin 3x \sin x = \frac{1}{4} (\cos^2 y + \sin^2 y)$$

$$\Rightarrow \cos^2 x + \sin^2 x + \cos^2 3x + \sin^2 3x + 2(\cos 3x \cos x \\ + \sin 3x \sin x) = \frac{1}{4} (\cos^2 y + \sin^2 y)$$

$$\Rightarrow 1 + 1 + 2 \cos(3x - x) = \frac{1}{4}$$

$$\Rightarrow 2 \cos 2x = \frac{1}{4} - 2 = -\frac{7}{4}$$

$$\Rightarrow \cos 2x = -\frac{7}{4 \times 2}$$

$$\Rightarrow \cos 2x = -\frac{7}{8}$$

$$15. (d) \text{ We have, } \cos 5\theta = \cos(3\theta + 2\theta)$$

$$= \cos 3\theta \cos 2\theta - \sin 3\theta \sin 2\theta$$

$$= (4 \cos^3 \theta - 3 \cos \theta)(2 \cos^2 \theta - 1)$$

$$- (3 \sin \theta - 4 \sin^3 \theta) 2 \sin \theta \cos \theta$$

$$= 8 \cos^5 \theta - 10 \cos^3 \theta + 3 \cos \theta$$

$$- 2 \sin^2 \theta (3 - 4 \sin^2 \theta) \cos \theta$$

$$= 8 \cos^5 \theta - 10 \cos^3 \theta + 3 \cos \theta$$

$$- 2 \cos \theta (1 - \cos^2 \theta) [3 - 4 + 4 \cos^2 \theta]$$

$$= 8 \cos^5 \theta - 10 \cos^3 \theta + 3 \cos \theta$$

$$- 2 \cos \theta (4 \cos^2 \theta - 1)(1 - \cos^2 \theta)$$

$$= 8 \cos^5 \theta - 10 \cos^3 \theta + 3 \cos \theta$$

$$- 2 \cos \theta [4 \cos^2 \theta - 4 \cos^4 \theta - 1 + \cos^2 \theta]$$

$$= 16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta$$

$$= a \cos \theta + b \cos^3 \theta + c \cos^5 \theta + d \quad [\text{given}]$$

$$\therefore a = 5, b = -20, c = 16, d = 0$$

$$\text{Hence, } a + b + c + d = 5 - 20 + 16 + 0 = 1$$

$$16. (b) \frac{1+n}{1-n} = \frac{1 + \tan \frac{\alpha}{2} \tan \frac{\beta}{2}}{1 - \tan \frac{\alpha}{2} \tan \frac{\beta}{2}} \\ = \frac{\cos \frac{\alpha}{2} \cos \frac{\beta}{2} + \sin \frac{\alpha}{2} \sin \frac{\beta}{2}}{\cos \frac{\alpha}{2} \cos \frac{\beta}{2} - \sin \frac{\alpha}{2} \sin \frac{\beta}{2}} = \frac{\cos\left(\frac{\alpha - \beta}{2}\right)}{\cos\left(\frac{\alpha + \beta}{2}\right)}$$

$$\text{Also, } l^2 + m^2 = (\sin \alpha + \sin \beta)^2 + (\cos \alpha + \cos \beta)^2 \\ = 1 + 1 + 2(\cos \alpha \cos \beta + \sin \alpha \sin \beta) \\ = 2 + 2 \cos(\alpha - \beta) = 2[1 + \cos(\alpha - \beta)] \\ = 2 \cdot 2 \cos^2\left(\frac{\alpha - \beta}{2}\right) = 4 \cos^2\left(\frac{\alpha - \beta}{2}\right)$$

$$\text{Also, } m = 2 \cos\left(\frac{\alpha + \beta}{2}\right) \cos\left(\frac{\alpha - \beta}{2}\right)$$

$$\therefore \frac{l^2 + m^2}{2m} = \frac{4 \cos^2\left(\frac{\alpha - \beta}{2}\right)}{2 \cdot 2 \cos\left(\frac{\alpha + \beta}{2}\right) \cos\left(\frac{\alpha - \beta}{2}\right)} \\ = \frac{\cos\left(\frac{\alpha - \beta}{2}\right)}{\cos\left(\frac{\alpha + \beta}{2}\right)} = \frac{1+n}{1-n}$$

17. (b) $\sin n\theta = \sum_{r=0}^n b_r \sin^r \theta$, for every value of θ .

Putting $\theta = 0$, we get $b_0 = 0$

Putting $n = 1$, we get

$$\sin \theta = b_0 + b_1 \sin \theta = 0 + b_1 \sin \theta$$

$$\therefore b_1 = 1$$

Putting $n = 3$, we get

$$\sin 3\theta = b_0 + b_1 \sin \theta + b_2 \sin^2 \theta + b_3 \sin^3 \theta$$

$$\Rightarrow 3 \sin \theta - 4 \sin^3 \theta = b_1 \sin \theta + b_2 \sin^2 \theta + b_3 \sin^3 \theta$$

$$\Rightarrow 3 - 4 \sin^2 \theta = b_1 + b_2 \sin \theta + b_3 \sin^2 \theta$$

Putting $\theta = 0$, we get $b_1 = 3$

Similarly, for $n = 5$, $b_1 = 5$

Hence, $b_1 = n$ and $b_0 = 0$

18. (b) We have, $3 \left[\sin^4 \left(\frac{3\pi}{2} - \alpha \right) + \sin^4 (3\pi + \alpha) \right]$
 $- 2 \left[\sin^6 \left(\frac{\pi}{2} + \alpha \right) + \sin^6 (5\pi - \alpha) \right]$
 $= 3 [(-\cos \alpha)^4 + (-\sin \alpha)^4] - 2 [\cos^6 \alpha + \sin^6 \alpha]$
 $= 3 [(\cos^2 \alpha + \sin^2 \alpha)^2 - 2 \sin^2 \alpha \cos^2 \alpha]$
 $- 2 [(\cos^2 \alpha + \sin^2 \alpha)^3 - 3 \cos^2 \alpha \sin^2 \alpha (\cos^2 \alpha + \sin^2 \alpha)]$
 $= 3 - 6 \sin^2 \alpha \cos^2 \alpha - 2 + 6 \sin^2 \alpha \cos^2 \alpha = 3 - 2 = 1$

19. (d) Let $t = \tan \theta$

$$\therefore \cot \theta + \cot \left(\theta + \frac{\pi}{3} \right) + \cot \left(\theta + \frac{2\pi}{3} \right)$$

$$= \cot \theta + \frac{\cot \theta \cot \frac{\pi}{3} - 1}{\cot \theta + \cot \frac{\pi}{3}} + \frac{\cot \theta \cot \frac{2\pi}{3} - 1}{\cot \theta + \cot \frac{2\pi}{3}}$$

$$= \frac{1}{t} + \frac{1 - \sqrt{3}t}{t + \sqrt{3}} + \frac{1 + \sqrt{3}t}{t - \sqrt{3}} = \frac{3(1 - 3t^2)}{t(3 - t^2)} = \frac{3}{\tan 3\theta}$$

$$= 3 \cot 3\theta$$

20. (b) $\sin^4 \frac{\pi}{8} + \sin^4 \frac{3\pi}{8} = \sin^4 \frac{\pi}{8} + \cos^4 \frac{\pi}{8} = 1 - \frac{1}{2} \sin^2 \frac{\pi}{4} = \frac{3}{4}$

$$\text{Similarly, } \sin^4 \frac{7\pi}{8} + \sin^4 \frac{5\pi}{8} = \frac{3}{4}$$

$$\therefore \sin^4 \frac{\pi}{8} + \sin^4 \frac{3\pi}{8} + \sin^4 \frac{5\pi}{8} + \sin^4 \frac{7\pi}{8} = \frac{3}{2}$$

21. (c) On multiplying numerator and denominator by $2 \sin \frac{\pi}{11}$, we get

$$\frac{1}{2 \sin \frac{\pi}{11}} \left[\sin \frac{2\pi}{11} + \left(\sin \frac{4\pi}{11} - \sin \frac{2\pi}{11} \right) \right]$$

$$+ \dots + \left(\sin \frac{10\pi}{11} - \sin \frac{8\pi}{11} \right)$$

$$= \frac{\sin \frac{10\pi}{11}}{2 \sin \frac{\pi}{11}} = \frac{1}{2}$$

22. (a) In $\triangle ABC$, $\tan 15^\circ = \frac{H-h}{AB}$

$$\Rightarrow AB = (H-h) \cot 15^\circ \quad \dots(i)$$

In $\triangle ABD$,

$$\tan 45^\circ = \frac{H+h}{AB}$$

$$\Rightarrow AB = (H+h) \cot 45^\circ \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$(H-h) \cot 15^\circ = (H+h) \cot 45^\circ$$

$$\Rightarrow H(\cot 15^\circ - \cot 45^\circ) = h(\cot 15^\circ + \cot 45^\circ)$$

$$\Rightarrow H = \frac{h(\cot 15^\circ + 1)}{(\cot 15^\circ - 1)}$$

Given that, $h = 2500$ m and we know that,

$$\cot 15^\circ = 2 + \sqrt{3}$$

$$\therefore H = \frac{2500(2 + \sqrt{3} + 1)}{2 + \sqrt{3} - 1}$$

$$\Rightarrow H = 2500\sqrt{3} \text{ m}$$

23. (b) Given, $x = \cos 10^\circ \cos 20^\circ \cos 40^\circ$

$$\therefore 2x \sin 10^\circ = 2 \sin 10^\circ \cos 10^\circ \cos 20^\circ \cos 40^\circ$$

$$= \sin 20^\circ \cos 20^\circ \cos 40^\circ$$

$$= \frac{1}{2} (2 \sin 20^\circ \cos 20^\circ) \cos 40^\circ$$

$$= \frac{1}{2} (\sin 40^\circ) \cos 40^\circ = \frac{1}{4} (2 \sin 40^\circ \cos 40^\circ)$$

$$= \frac{1}{4} (\sin 80^\circ)$$

$$\therefore x = \frac{1}{8} \cdot \frac{\sin 80^\circ}{\sin 10^\circ} = \frac{\sin(90^\circ - 10^\circ)}{8 \sin 10^\circ} = \frac{1}{8} \cdot \frac{\cos 10^\circ}{\sin 10^\circ} = \frac{1}{8} \cot 10^\circ$$

24. (a) $\tan A + 2 \tan 2A + 4 \tan 4A + 8 \left(\frac{1 - \tan^2 4A}{2 \tan 4A} \right)$
- $$= \tan A + 2 \tan 2A + \left(\frac{4 \tan^2 4A + 4 - 4 \tan^2 4A}{\tan 4A} \right)$$
- $$= \tan A + 2 \tan 2A + 4 \cot 4A$$
- $$= \tan A + 2 \tan 2A + 4 \left(\frac{1 - \tan^2 2A}{2 \tan 2A} \right)$$
- $$= \tan A + \left[\frac{2 \tan^2 2A + 2 - 2 \tan^2 2A}{\tan 2A} \right]$$

$$= \tan A + 2 \cot 2A = \tan A + 2 \left(\frac{1 - \tan^2 A}{2 \tan A} \right)$$

$$= \frac{\tan^2 A + 1 - \tan^2 A}{\tan A} = \cot A$$

25. (d) $\sin 6^\circ \sin 42^\circ \sin 66^\circ \sin 78^\circ$

$$= \sin 6^\circ \cos 48^\circ \cos 24^\circ \cos 12^\circ$$

$$= \sin 6^\circ \frac{2^3 \sin 12^\circ \cos 12^\circ \cos 24^\circ \cos 48^\circ}{2^3 \sin 12^\circ}$$

$$= \sin 6^\circ \cdot \frac{\sin 96^\circ}{2^3 \sin 12^\circ} \quad [\because \sin 2A = 2 \sin A \cos A]$$

$$= \frac{2 \sin 6^\circ \cos 6^\circ}{2^4 \sin 12^\circ} = \frac{\sin 12^\circ}{2^4 \sin 12^\circ} = \frac{1}{16}$$

26. (b) $\cos 2\theta \cos 2\phi + \sin^2(\theta - \phi) - \sin^2(\theta + \phi)$

$$= \cos 2\theta \cos 2\phi + \sin(\theta - \phi + \theta + \phi) \sin\{\theta - \phi - (\theta + \phi)\}$$

$$[\because \sin^2 A - \sin^2 B = \sin(A + B) \sin(A - B)]$$

$$= \cos 2\theta \cos 2\phi + \sin 2\theta \sin(-2\phi)$$

$$= \cos 2\theta \cos 2\phi - \sin 2\theta \sin 2\phi$$

$$= \cos(2\theta + 2\phi) = \cos 2(\theta + \phi)$$

27. (c) $\cos 12^\circ + \cos 84^\circ + \cos 156^\circ + \cos 132^\circ$

$$= \cos 156^\circ + \cos 84^\circ + \cos 132^\circ + \cos 12^\circ$$

$$= 2 \cos \left(\frac{156^\circ + 84^\circ}{2} \right) \cos \left(\frac{156^\circ - 84^\circ}{2} \right)$$

$$+ 2 \cos \left(\frac{132^\circ + 12^\circ}{2} \right) \cos \left(\frac{132^\circ - 12^\circ}{2} \right)$$

$$= 2 \cos 120^\circ \cos 36^\circ + 2 \cos 72^\circ \cos 60^\circ$$

$$= 2 \left(-\frac{1}{2} \right) \cos 36^\circ + 2 \cos 72^\circ \times \frac{1}{2}$$

$$= -\cos 36^\circ + \cos 72^\circ = -\frac{\sqrt{5} + 1}{4} + \frac{\sqrt{5} - 1}{4} = -\frac{1}{2}$$

28. (a) We have, $\frac{1}{m} = \frac{\cos(\theta - \phi)}{\cos(\theta + \phi)}$

On applying componendo and dividendo rule, we get

$$\frac{1 - m}{1 + m} = \frac{\cos(\theta - \phi) - \cos(\theta + \phi)}{\cos(\theta - \phi) + \cos(\theta + \phi)}$$

$$= \frac{2 \sin \theta \sin \phi}{2 \cos \theta \cos(-\phi)} = \tan \theta \tan \phi$$

$$\therefore \left(\frac{1 - m}{1 + m} \right) \cot \phi = \tan \theta$$

29. (d) Hint $\cos \frac{7\pi}{8} = \cos \left(\pi - \frac{\pi}{8} \right)$ and

$$\cos \frac{5\pi}{8} = \cos \left(\pi - \frac{3\pi}{8} \right)$$

$$\Rightarrow \cos \frac{7\pi}{8} = -\cos \frac{\pi}{8} \text{ and } \cos \frac{5\pi}{8} = -\cos \frac{3\pi}{8}$$

$$\text{Now, } \cos^4 \frac{\pi}{8} + \cos^4 \frac{3\pi}{8} + \cos^4 \frac{3\pi}{8} + \cos^4 \frac{\pi}{8}$$

$$= 2 \cos^4 \frac{\pi}{8} + 2 \cos^4 \frac{3\pi}{8} = 2 \left[\cos^2 \frac{\pi}{8} \right]^2 + 2 \left[\cos^2 \frac{3\pi}{8} \right]^2$$

$$= \frac{2}{4} \left[1 + \cos \frac{\pi}{4} \right]^2 + \frac{2}{4} \left[1 + \cos \frac{3\pi}{4} \right]^2$$

30. (c) Given, $\cos x + \cos y - \cos(x + y) = \frac{3}{2}$

$$\Rightarrow 2 \cos \left(\frac{x + y}{2} \right) \cos \left(\frac{x - y}{2} \right) - 2 \cos^2 \left(\frac{x + y}{2} \right) + 1 = \frac{3}{2}$$

$$\Rightarrow 2 \cos^2 \left(\frac{x + y}{2} \right) - 2 \cos \left(\frac{x + y}{2} \right) \cos \left(\frac{x - y}{2} \right) + \frac{1}{2} = 0$$

Now, $\cos \left(\frac{x + y}{2} \right)$ is always real, then discriminant ≥ 0

$$\Rightarrow 4 \cos^2 \left(\frac{x - y}{2} \right) - 4 \geq 0 \Rightarrow \cos^2 \left(\frac{x - y}{2} \right) \geq 1$$

$$\Rightarrow \cos^2 \left(\frac{x - y}{2} \right) = 1 \Rightarrow \frac{x - y}{2} = 0$$

$$\Rightarrow x = y$$

31. (b) Given expression is

$$\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A} = \frac{\sin A}{\cos A} \times \frac{\sin A}{\sin A - \cos A}$$

$$+ \frac{\cos A}{\sin A} \times \frac{\cos A}{\cos A - \sin A}$$

$$= \frac{1}{\sin A - \cos A} \left\{ \frac{\sin^3 A - \cos^3 A}{\cos A \sin A} \right\}$$

$$= \frac{\sin^2 A + \sin A \cos A + \cos^2 A}{\sin A \cos A}$$

$$= \frac{1 + \sin A \cos A}{\sin A \cos A} = 1 + \sec A \operatorname{cosec} A$$

32. (b) Given, $\cos(\alpha + \beta) = \frac{4}{5} \Rightarrow \alpha + \beta \in 1^{\text{st}} \text{ quadrant}$

and $\sin(\alpha - \beta) = \frac{5}{13} \Rightarrow \alpha - \beta \in 1^{\text{st}} \text{ quadrant}$

$$\Rightarrow 2\alpha = (\alpha + \beta) + (\alpha - \beta)$$

$$\therefore \tan 2\alpha = \frac{\tan(\alpha + \beta) + \tan(\alpha - \beta)}{1 - \tan(\alpha + \beta) \tan(\alpha - \beta)} = \frac{\frac{3}{4} + \frac{5}{12}}{1 - \frac{3}{4} \cdot \frac{5}{12}} = \frac{56}{33}$$

33. (b) We have, $3 \sin^2 A + 2 \sin^2 B = 1$

$$\Rightarrow \cos 2B = 3 \sin^2 A$$

$$\therefore \cos(A + 2B) = \cos A \cos 2B - \sin A \sin 2B$$

$$= \cos A \cdot 3 \sin^2 A - \sin A \cdot \frac{3}{2} \sin 2A = 0$$

$$[\because 3 \sin 2A - 2 \sin 2B = 0]$$

$$\Rightarrow A + 2B = \frac{\pi}{2}$$

34. (c) Let OP be a tower with height $(\sqrt{3} + 1)$ m and

$$AB = 2 \text{ m,}$$

In $\triangle AOP$,

$$\tan 30^\circ = \frac{\sqrt{3} + 1}{OA} \Rightarrow OA = (\sqrt{3} + 1) \sqrt{3}$$

In $\triangle BOP$, $\tan \alpha = \frac{\sqrt{3} + 1}{OB}$

$$\Rightarrow OB = (\sqrt{3} + 1) \cot \alpha$$

Now, $OA - OB = (3 + \sqrt{3}) - (\sqrt{3} + 1) \cot \alpha$

$$\Rightarrow 2 = 3 + \sqrt{3} - (\sqrt{3} + 1) \cot \alpha \Rightarrow \cot \alpha = 1$$

$$\therefore \alpha = 45^\circ$$

35. (b) $\therefore 3 \cos^2 x + 8 \cos x - 3 = 0$

$$\therefore (3 \cos x - 1)(\cos x + 3) = 0$$

$$\Rightarrow \cos x = \frac{1}{3} \quad [\because \cos x \neq -3]$$

Hence, two solutions exist in a given interval.

36. (b) Expanding the given determinant, we get

$$\sin x (\sin^2 x - \cos^2 x) - \cos x (\cos x \sin x - \cos^2 x) + \cos x (\cos^2 x - \sin^2 x) = 0$$

$$\Rightarrow \sin^3 x - 3 \sin x \cos^2 x + 2 \cos^3 x = 0$$

$$\Rightarrow (\sin x - \cos x)^2 (\sin x + 2 \cos x) = 0$$

$$\Rightarrow \sin x + 2 \cos x = 0$$

$$\Rightarrow \tan x = -2, x \in \left[-\frac{\pi}{4}, \frac{\pi}{4} \right]$$

$$\Rightarrow \sin x - \cos x = 0 \Rightarrow x = \frac{\pi}{4}$$

37. (b) Given, $a \cos 2\theta + b \sin 2\theta = c$

$$\therefore a \left(\frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} \right) + b \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right) = c$$

$$\Rightarrow a - a \tan^2 \theta + 2b \tan \theta = c (1 + \tan^2 \theta)$$

$$\Rightarrow \tan^2 \theta (a + c) - 2b \tan \theta + c - a = 0$$

Since, α and β are the roots of the above equation.

$$\therefore \tan \alpha + \tan \beta = \frac{2b}{a + c}$$

38. (b) Given, $2 \sin^2 \theta = 3 \cos \theta$

$$\therefore 2(1 - \cos^2 \theta) = 3 \cos \theta$$

$$\Rightarrow 2 \cos^2 \theta + 3 \cos \theta - 2 = 0$$

$$\Rightarrow (\cos \theta + 2)(2 \cos \theta - 1) = 0$$

$$\Rightarrow \cos \theta = -2, \cos \theta = \frac{1}{2}$$

But $\cos \theta \in [-1, 1]$

$$\therefore \cos \theta \neq -2$$

Now, $\cos \theta = \frac{1}{2}$

As $\theta \in [0, 2\pi]$

$$\therefore \theta = \frac{\pi}{3}, \frac{5\pi}{3}$$

39. (a) Given, $A : B : C = 4 : 1 : 1$

$$\therefore A + B + C = 180^\circ$$

$$\therefore A = 120^\circ, B = 30^\circ \text{ and } C = 30^\circ$$

Using sine rule,

$$a : b : c = \sin A : \sin B : \sin C = \frac{\sqrt{3}}{2} : \frac{1}{2} : \frac{1}{2} = \sqrt{3} : 1 : 1$$

$\therefore$ Ratio of longest side to the perimeter of triangle

$$= \frac{a}{a + b + c} = \frac{\sqrt{3}}{\sqrt{3} + 1 + 1} = 2\sqrt{3} - 3$$

40. (a) $2 \sin^2 \theta - 5 \sin \theta + 2 = (\sin \theta - 2)(2 \sin \theta - 1) > 0$

$$\Rightarrow \sin \theta < \frac{1}{2} \Rightarrow \theta \in \left(0, \frac{\pi}{6} \right) \cup \left(\frac{5\pi}{6}, 2\pi \right)$$

41. (a) Applying $C_1 \rightarrow C_1 + C_2$

$$\begin{vmatrix} 2 & \cos^2 \theta & 4 \sin 4\theta \\ 2 & 1 + \cos^2 \theta & 4 \sin 4\theta \\ 1 & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$$

Applying $R_2 \rightarrow R_2 - R_1$,

$$\begin{vmatrix} 2 & \cos^2 \theta & 4 \sin 4\theta \\ 0 & 1 & 0 \\ 1 & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$$

$$\Rightarrow 2 + 4 \sin 4\theta = 0$$

$$\Rightarrow \sin 4\theta = -\frac{1}{2} = \sin \left(-\frac{\pi}{6} \right)$$

$$\therefore 4\theta = n\pi + (-1)^n \left(-\frac{\pi}{6} \right)$$

When $n = 1 \Rightarrow \theta = \frac{7\pi}{24}$

When $n = 2 \Rightarrow \theta = \frac{11\pi}{24}$

42. (a) By sine rule, $a = 2R \sin A$

$$\therefore a^2 (2R \sin A) \cos (B - C) + b^2 (2R \sin B) \cos (C - A) + c^2 (2R \sin C) \cos (A - B)$$

$$= a^2 [2R \sin(B + C) \cos(B - C)] + b^2 [2R \sin(A + C) \cos(C - A)] + c^2 [2R \sin(A + B) \cos(A - B)]$$

$$[\because A = 180^\circ - (B + C)]$$

$$= a^2 R [\sin 2B + \sin 2C] + b^2 R [\sin 2A + \sin 2C] + c^2 R [\sin 2A + \sin 2B]$$

$$= a^2 R (2 \sin B \cdot \cos B + 2 \sin C \cdot \cos C)$$

$$+ b^2 R (2 \sin A \cdot \cos A + 2 \sin C \cdot \cos C)$$

$$+ c^2 R (2 \sin A \cdot \cos A + 2 \sin B \cdot \cos B)$$

$$= a^2 (b \cos B + c \cos C) + b^2 (c \cos C + a \cos A)$$

$$+ c^2 (a \cos A + b \cos B)$$

$$= ab (a \cos B + b \cos A) + bc (b \cos C + c \cos B)$$

$$+ ac (c \cos A + a \cos C)$$

$$= abc + abc + abc = 3abc$$

43. (b) Given, $\sec x + \tan x = \sqrt{3}$

$$\Rightarrow 1 + \sin x = \sqrt{3} \cos x \Rightarrow \sqrt{3} \cos x - \sin x = 1$$

On dividing both sides by $\sqrt{a^2 + b^2}$, i.e. $\sqrt{4} = 2$, we get

$$\Rightarrow \frac{\sqrt{3}}{2} \cos x - \frac{1}{2} \sin x = \frac{1}{2}$$

$$\Rightarrow \cos \frac{\pi}{6} \cos x - \sin \frac{\pi}{6} \sin x = \frac{1}{2}$$

$$\Rightarrow \cos \left(x + \frac{\pi}{6} \right) = \cos \left(\frac{\pi}{3} \right) \Rightarrow x + \frac{\pi}{6} = 2m\pi \pm \frac{\pi}{3}$$

$$\Rightarrow x = 2n\pi + \frac{\pi}{6}, 2n\pi - \frac{\pi}{2}$$

When $x = 2n\pi + \frac{\pi}{6}$, there are solutions for $n = 0, 1$

and when $x = 2n\pi - \frac{\pi}{2}$, it does not satisfy the equations.

$\therefore$ Total number of solutions is 2.

$$44. (a) \text{ Given, } \sec 4x - \sec 2x = 2 \Rightarrow \frac{1}{\cos 4x} - \frac{1}{\cos 2x} = 2$$

$$\Rightarrow \cos 2x - \cos 4x = 2 \cos 2x \cos 4x$$

$$[\because \cos 2x \neq 0, \cos 4x \neq 0]$$

$$\Rightarrow \cos 2x - \cos 4x = \cos(4x + 2x) + \cos(4x - 2x)$$

$$= \cos 6x + \cos 2x$$

$$\Rightarrow \cos 6x + \cos 4x = 0 \Rightarrow 2 \cos 5x \cos x = 0$$

$$\text{Either } \cos 5x = 0 \text{ or } \cos x = 0$$

$$\Rightarrow 5x = n\pi + \frac{\pi}{2} \text{ or } x = m\pi + \frac{\pi}{2} \quad [\because n, m \in I]$$

$$\Rightarrow x = \frac{(2n+1)\pi}{10} \text{ or } x = \frac{(2m+1)\pi}{2}$$

$$45. (c) \because 3 \sin x - 4 \sin^3 x = 4 \sin x (\sin^2 y - \sin^2 x)$$

$$\therefore 3 \sin x = 4 \sin x (\sin^2 y - \sin^2 x) + 4 \sin^3 x$$

$$= 4 \sin x (\sin^2 y - \sin^2 x + \sin^2 x) = 4 \sin x \sin^2 y$$

$$\Rightarrow \sin^2 y = \frac{3}{4} \Rightarrow \sin y = \pm \frac{\sqrt{3}}{2}$$

$$\Rightarrow x = n\pi \pm \frac{\pi}{3} \quad [\because n \in I]$$

So, the given equation has only one solution in each quadrant.

$$46. (b) \text{ We have,}$$

$$\sin x - 3 \sin 2x + \sin 3x = \cos x - 3 \cos 2x + \cos 3x$$

$$\Rightarrow \sin x + \sin 3x - 3 \sin 2x = \cos x + \cos 3x - 3 \cos 2x$$

$$\Rightarrow 2 \sin 2x \cos x - 3 \sin 2x - 2 \cos 2x \cos x + 3 \cos 2x = 0$$

$$\Rightarrow \sin 2x (2 \cos x - 3) - \cos 2x (2 \cos x - 3) = 0$$

$$\Rightarrow (\sin 2x - \cos 2x) (2 \cos x - 3) = 0$$

$$\Rightarrow \sin 2x = \cos 2x \quad \left[\because \cos x \neq \frac{3}{2} \right]$$

$$\Rightarrow 2x = 2n\pi \pm \left(\frac{\pi}{2} - 2x \right)$$

$$\therefore x = \frac{n\pi}{2} + \frac{\pi}{8} \quad [\because \text{neglect -ve sign}]$$

$$47. (c) \text{ Hint } \sqrt{3} \cos x + \sin x = \sqrt{2}$$

$$\Rightarrow \frac{\sqrt{3}}{2} \cos x + \frac{1}{2} \sin x = \frac{\sqrt{2}}{2} = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \cos \left(x - \frac{\pi}{6} \right) = \cos \left(\frac{\pi}{4} \right)$$

$$48. (c) \because 6 \sin x \cos x + 4 \cos 2x = 3 \sin 2x + 4 \cos 2x$$

$$\therefore -\sqrt{3^2 + 4^2} \leq 3 \sin 2x + 4 \cos 2x \leq \sqrt{3^2 + 4^2}$$

$$\Rightarrow -5 \leq 3 \sin 2x + 4 \cos 2x \leq 5$$

Thus, maximum and minimum value of

$6 \sin x \cos x + 4 \cos 2x$ are 5 and -5, respectively.

$$49. (b) A = \sin^2 \theta + \cos^4 \theta$$

$$= 1 - \cos^2 \theta + \cos^4 \theta = 1 - \cos^2 \theta (1 - \cos^2 \theta)$$

$$= 1 - \cos^2 \theta \sin^2 \theta = 1 - \frac{4 \sin^2 \theta \cos^2 \theta}{4}$$

$$= 1 - \frac{(2 \sin \theta \cos \theta)^2}{4}$$

$$A = 1 - \frac{1}{4} \sin^2 2\theta$$

For maximum value of A ,

$$A = 1 - 0 \quad [\because \text{minimum value of } \sin^2 2\theta = 0]$$

$$\therefore A = 1$$

For minimum value of A ,

$$A = 1 - \frac{1}{4} = \frac{3}{4} \quad [\because \text{minimum value of } \sin^2 2\theta = 1]$$

$$\Rightarrow \frac{3}{4} \leq A \leq 1$$

$$50. (c) \sin x \geq -1, \text{ for any real } x, \text{ then } \sin \alpha + \sin \beta + \sin \gamma \geq -3, \text{ for any real } \alpha, \beta \text{ and } \gamma.$$

α, β, γ are real numbers (they may not be the angles of a triangle) and $\alpha + \beta + \gamma = \pi$.

Then, on taking $\alpha = -\frac{\pi}{2}, \beta = -\frac{\pi}{2}$ and $\gamma = 2\pi$, we get

$$\sin \alpha + \sin \beta + \sin \gamma = -2$$

Thus, minimum value of expression is negative.

$$51. (b) \text{ Let } I = (\sec^{-1} x)^2 + (\operatorname{cosec}^{-1} x)^2$$

$$= (\sec^{-1} x + \operatorname{cosec}^{-1} x)^2 - 2 \sec^{-1} x \operatorname{cosec}^{-1} x$$

$$= \frac{\pi^2}{4} - 2 \sec^{-1} x \left(\frac{\pi}{2} - \sec^{-1} x \right)$$

$$= \frac{\pi^2}{4} + 2 \left[(\sec^{-1} x)^2 - \frac{\pi}{2} (\sec^{-1} x) + \frac{\pi^2}{16} - \frac{\pi^2}{16} \right]$$

$$= \frac{\pi^2}{8} + 2 \left[\left(\sec^{-1} x - \frac{\pi}{4} \right)^2 \right]$$

$$\therefore I_{\max} = \frac{\pi^2}{8} + 2 \left[\frac{9\pi^2}{16} \right] = \frac{5\pi^2}{4}$$

$$52. (b) \text{ Given, } x + \frac{1}{x} = 2 \Rightarrow \left(\sqrt{x} - \frac{1}{\sqrt{x}} \right)^2 = 0$$

$$\Rightarrow \frac{x-1}{\sqrt{x}} = 0 \Rightarrow x = 1$$

So, the principal value of $\sin^{-1} x$ is $\frac{\pi}{2}$.

$$53. (a) 2 \tan^{-1} x = \sin^{-1} \frac{2x}{1+x^2}$$

$$\Rightarrow 2 \tan^{-1} 2 = \sin^{-1} \frac{4}{5} \therefore x = \frac{4}{5}$$

$$\text{RHS} = \sin \left(\frac{\theta}{2} \right)$$

$$\text{where, } \theta = \tan^{-1} \frac{4}{3} \Rightarrow \text{Then, } \tan \theta = \frac{4}{3}$$

$$\therefore \cos \theta = \frac{3}{5}$$

$$\Rightarrow 2 \sin^2 \frac{\theta}{2} = 1 - \cos \theta = \frac{2}{5}$$

$$\therefore \sin \theta = \frac{1}{\sqrt{5}} = y$$

$$\text{Clearly, } x > y \text{ and } 1 - x = 1 - \frac{4}{5} = \frac{1}{5} = y^2$$

$$\begin{aligned} 54. (b) \text{ Hint } \tan \left[2 \tan^{-1} \left(\frac{1}{5} \right) - \frac{\pi}{4} \right] &= \tan \left[2 \tan^{-1} \left(\frac{1}{5} \right) - \tan^{-1}(1) \right] \\ &= \tan \left[\tan^{-1} \frac{2 \times \frac{1}{5}}{1 - \left(\frac{1}{5} \right)^2} - \tan^{-1}(1) \right] \end{aligned}$$

$$55. (d) \tan^{-1} \left[\frac{\frac{x-1}{x+1} + \frac{2x-1}{2x+1}}{1 - \left(\frac{x-1}{x+1} \right) \left(\frac{2x-1}{2x+1} \right)} \right] = \tan^{-1} \left(\frac{23}{36} \right)$$

$$\Rightarrow \frac{2x^2 - 1}{3x} = \frac{23}{36} \Rightarrow 24x^2 - 12 - 23x = 0$$

$$\Rightarrow x = \frac{4}{3}, -\frac{3}{8}$$

But x cannot be negative.

$$\therefore x = \frac{4}{3}$$

$$56. (b) \therefore \tan^{-1} \frac{yz}{xr} + \tan^{-1} \frac{zx}{yr} = \tan^{-1} \frac{\frac{z}{r} \left(\frac{y}{x} + \frac{x}{y} \right)}{1 - \frac{z^2}{r^2}}$$

$$= \tan^{-1} \left(\frac{zr}{xy} \cdot \frac{x^2 + y^2}{x^2 + y^2} \right) = \cot^{-1} \left(\frac{xy}{zr} \right)$$

$$\therefore \tan^{-1} \frac{xy}{zr} + \cot^{-1} \frac{xy}{zr} = \frac{\pi}{2}$$

$$57. (d) \text{ Now, } \tan \left\{ 2 \tan^{-1} \left(\frac{1}{5} \right) \right\} = \frac{2 \times \frac{1}{5}}{1 - \frac{1}{25}} = \frac{5}{12}$$

Given equation can be rewritten as

$$17x^2 - 17x \tan \left\{ \frac{\pi}{4} - 2 \tan^{-1} \left(\frac{1}{5} \right) \right\} - 10 = 0$$

$$\therefore 17x^2 - 17x \cdot \frac{1 - \frac{5}{12}}{1 + \frac{5}{12}} - 10 = 0$$

$$\Rightarrow 17x^2 - 7x - 10 = 0 \Rightarrow (x-1)(17x+10) = 0$$

Hence, $x = 1$ is a root of the given equation.

$$\begin{aligned} 58. (b) \text{ We have, } \frac{s(s-a)}{bc} - \frac{(s-b)(s-c)}{bc} &= \cos^2 \frac{A}{2} - \sin^2 \frac{A}{2} \\ &= \cos \frac{2A}{2} = \cos A \end{aligned}$$

$$59. (a) \therefore x = \frac{\pi}{2} - 2 \tan^{-1} \sqrt{\cos \alpha}$$

$$\begin{aligned} \therefore \sin x &= \sin \left(\frac{\pi}{2} - 2 \tan^{-1} \sqrt{\cos \alpha} \right) = \cos (2 \tan^{-1} \sqrt{\cos \alpha}) \\ &= \cos \left(\tan^{-1} \frac{2 \sqrt{\cos \alpha}}{1 - \cos \alpha} \right) = \frac{1 - \cos \alpha}{1 + \cos \alpha} = \tan^2 \left(\frac{\alpha}{2} \right) \end{aligned}$$

$$60. (b) \text{ Here, } x - \frac{x^2}{2} + \frac{x^3}{4} - \dots = \frac{x}{1 + \frac{x}{2}} = \frac{2x}{2+x}$$

$$\text{and } x^2 - \frac{x^4}{2} + \frac{x^6}{4} - \dots = \frac{x^2}{1 + \frac{x^2}{2}} = \frac{2x^2}{2+x^2}$$

$$\therefore \sin^{-1} \alpha + \cos^{-1} \alpha = \frac{\pi}{2}$$

$$\therefore \frac{2x}{2+x} = \frac{2x^2}{2+x^2}, x \neq 0$$

$$\Rightarrow 2+x^2 = 2x+x^2$$

$$\therefore x = 1$$

$$61. (b) \text{ Given, } \sin^{-1} \left(\frac{4x}{x^2+4} \right) + 2 \tan^{-1} \left(-\frac{x}{2} \right)$$

$$= \sin^{-1} \left(\frac{2 \times \frac{x}{2}}{\left(\frac{x}{2} \right)^2 + 1} \right) - 2 \tan^{-1} \frac{x}{2} = 2 \tan^{-1} \frac{x}{2} - 2 \tan^{-1} \frac{x}{2} = 0$$

$$\Rightarrow \left| \frac{x}{2} \right| \leq 1 \Rightarrow |x| \leq 2$$

$$\therefore -2 \leq x \leq 2$$

62. (d) Let OP be the tower of height h .

In $\triangle AOP$ and $\triangle BOP$,

$$\tan 60^\circ = \frac{h}{OA} \text{ and } \tan 30^\circ = \frac{h}{OB}$$

$$\Rightarrow OA = \frac{h}{\sqrt{3}}$$

$$\text{and } OB = h\sqrt{3}$$

$$\therefore OB^2 = OA^2 + AB^2$$

$$\Rightarrow 3h^2 = \frac{h^2}{3} + 9$$

$$\therefore h = \frac{3\sqrt{6}}{4} \text{ m}$$

$$\begin{aligned}
 63. (d) \text{ Given, } \sin^{-1}\left(\cos \frac{40\pi + 3\pi}{5}\right) &= \sin^{-1}\cos\left(8\pi + \frac{3\pi}{5}\right) \\
 &= \sin^{-1}\left(\cos \frac{3\pi}{5}\right) = \sin^{-1}\left\{\sin\left(\frac{\pi}{2} - \frac{3\pi}{5}\right)\right\} \\
 &= \sin^{-1}\left\{\sin\left(-\frac{\pi}{10}\right)\right\} = -\frac{\pi}{10}
 \end{aligned}$$

$$\begin{aligned}
 64. (b) \text{ Hint } 2 \tan^{-1} x + (\tan^{-1} x + \cot^{-1} x) &= \pi \\
 \Rightarrow 2 \tan^{-1} x + \frac{\pi}{2} &= \pi
 \end{aligned}$$

$$\begin{aligned}
 65. (c) \text{ Given, } (\tan^{-1} x)^2 + (\cot^{-1} x)^2 &= \frac{5\pi^2}{8} \\
 \Rightarrow (\tan^{-1} x + \cot^{-1} x)^2 - 2 \tan^{-1} x \cdot \cot^{-1} x &= \frac{5\pi^2}{8} \\
 \Rightarrow \left(\frac{\pi}{2}\right)^2 - 2 \tan^{-1} x \left(\frac{\pi}{2} - \tan^{-1} x\right) &= \frac{5\pi^2}{8} \\
 \Rightarrow \left[\because \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}\right] \\
 \Rightarrow \frac{\pi^2}{4} - 2 \cdot \frac{\pi}{2} \tan^{-1} x + 2 (\tan^{-1} x)^2 &= \frac{5\pi^2}{8} \\
 \Rightarrow 2 (\tan^{-1} x)^2 - \pi \tan^{-1} x - \frac{3\pi^2}{8} &= 0 \\
 \Rightarrow \tan^{-1} x = -\frac{\pi}{4}, \frac{3\pi}{4} \Rightarrow \tan^{-1} x = -\frac{\pi}{4} \Rightarrow x = -1 \\
 \left[\text{neglecting } \tan^{-1} x = \frac{3\pi}{4} \text{ as } \tan^{-1} x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]\right]
 \end{aligned}$$

$$\begin{aligned}
 66. (a) \tan \left\{ \cos^{-1} \left(-\frac{2}{7} \right) - \frac{\pi}{2} \right\} &= \tan \left\{ \pi - \cos^{-1} \left(\frac{2}{7} \right) - \frac{\pi}{2} \right\} \\
 &= \tan \left\{ \frac{\pi}{2} - \cos^{-1} \left(\frac{2}{7} \right) \right\} = \tan \left\{ \sin^{-1} \left(\frac{2}{7} \right) \right\} \\
 &= \tan \left\{ \tan^{-1} \left(\frac{2}{3\sqrt{5}} \right) \right\} = \frac{2}{3\sqrt{5}}
 \end{aligned}$$

$$\begin{aligned}
 67. (c) \text{ Given, } \tan^{-1}(x+3) - \tan^{-1}(x-3) &= \sin^{-1}\left(\frac{3}{5}\right) \\
 \Rightarrow \tan^{-1} \left[\frac{(x+3) - (x-3)}{1 + (x+3)(x-3)} \right] &= \tan^{-1}\left(\frac{3}{5}\right) \\
 \Rightarrow \frac{6}{1+x^2-9} = \frac{3}{4} \Rightarrow x^2 = 16 \\
 \Rightarrow x = \pm 4
 \end{aligned}$$

$$\begin{aligned}
 68. (c) \text{ Given, } \Delta = a^2 - (b-c)^2 &= (a+b-c)(a-b+c) \\
 \Rightarrow \Delta &= [4(s-b)(s-c)] \\
 \Rightarrow s(s-a)(s-b)(s-c) &= 16(s-b)^2(s-c)^2 \\
 \Rightarrow \frac{(s-b)(s-c)}{s(s-a)} &= \frac{1}{16} \\
 \Rightarrow \tan \frac{A}{2} &= \frac{1}{4} \\
 \text{Now, } \tan A &= \frac{2 \tan \frac{A}{2}}{1 - \tan^2 \frac{A}{2}} = \frac{2 \cdot \left(\frac{1}{4}\right)}{1 - \frac{1}{16}} = \frac{8}{15}
 \end{aligned}$$

$$\begin{aligned}
 69. (b) \text{ Consider, } \sin^{-1}\left(\frac{8}{17}\right) + \sin^{-1}\left(\frac{3}{5}\right) \\
 &= \sin^{-1} \left[\frac{8}{17} \sqrt{1 - \left(\frac{3}{5}\right)^2} + \frac{3}{5} \sqrt{1 - \left(\frac{8}{17}\right)^2} \right] \\
 &\quad [\because \sin^{-1} x + \sin^{-1} y = \sin^{-1} (x \sqrt{1-y^2} + y \sqrt{1-x^2})] \\
 &= \sin^{-1} \left(\frac{8}{17} \times \frac{4}{5} + \frac{3}{5} \times \frac{15}{17} \right) = \sin^{-1} \left(\frac{77}{85} \right) \\
 &= \tan^{-1} \left[\frac{\frac{77}{85}}{\sqrt{1 - \left(\frac{77}{85}\right)^2}} \right] \quad \left[\because \sin^{-1} x = \tan^{-1} \frac{x}{\sqrt{1-x^2}} \right] \\
 &= \tan^{-1} \left[\frac{77}{85} \times \frac{85}{36} \right] = \tan^{-1} \frac{77}{36}
 \end{aligned}$$

$$\begin{aligned}
 70. (a) \text{ Given, } \alpha &= \sin^{-1}[\cos(\sin^{-1} x)] \\
 \text{and } \beta &= \cos^{-1}[\sin(\cos^{-1} x)] = \cos^{-1} \left[\sin \left(\frac{\pi}{2} - \sin^{-1} x \right) \right] \\
 \Rightarrow \beta &= \cos^{-1}[\cos(\sin^{-1} x)] \\
 \Rightarrow \alpha + \beta &= \frac{\pi}{2} \quad \left[\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \right] \\
 \Rightarrow \tan \alpha &= \cot \beta \Rightarrow \tan \alpha \cdot \tan \beta = 1
 \end{aligned}$$

$$\begin{aligned}
 71. (a) \tan \left(\sin^{-1} \frac{3}{5} + \cot^{-1} \frac{3}{2} \right) \\
 &= \tan \left[\tan^{-1} \frac{\frac{3}{5}}{\sqrt{1 - \left(\frac{3}{5}\right)^2}} + \tan^{-1} \frac{2}{3} \right] \\
 &\quad \left[\because \sin^{-1} x = \tan^{-1} \frac{x}{\sqrt{1-x^2}} \text{ and } \cot^{-1} \frac{x}{y} = \tan^{-1} \frac{y}{x} \right] \\
 &= \tan \left[\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right] = \tan \left[\tan^{-1} \frac{\left(\frac{3}{4} + \frac{2}{3}\right)}{1 - \frac{3}{4} \times \frac{2}{3}} \right] \\
 &\quad \left[\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right) \right] \\
 &= \tan \left[\tan^{-1} \frac{\frac{17}{12}}{\frac{1}{2}} \right] = \tan \left[\tan^{-1} \frac{17}{6} \right] = \frac{17}{6}
 \end{aligned}$$

$$\begin{aligned}
 72. (c) \text{ Given, } \sin \left(\sin^{-1} \frac{1}{5} + \cos^{-1} x \right) &= 1 \\
 \Rightarrow \sin^{-1} \frac{1}{5} + \cos^{-1} x &= \sin^{-1} 1 \\
 \Rightarrow \sin^{-1} \frac{1}{5} + \cos^{-1} x &= \frac{\pi}{2} \\
 \Rightarrow \sin^{-1} \frac{1}{5} &= \frac{\pi}{2} - \cos^{-1} x \\
 \Rightarrow \sin^{-1} \frac{1}{5} &= \sin^{-1} x \Rightarrow x = \frac{1}{5}
 \end{aligned}$$

73. (d) Given, $\tan \left\{ \frac{1}{2} \sin^{-1} \left(\frac{2x}{1+x^2} \right) + \frac{1}{2} \cos^{-1} \left(\frac{1-y^2}{1+y^2} \right) \right\} \dots (i)$

On putting $x = \tan \alpha$ and $y = \tan \beta$ in Eq. (i), we get

$$\begin{aligned} & \tan \left\{ \frac{1}{2} \sin^{-1} \left(\frac{2 \tan \alpha}{1 + \tan^2 \alpha} \right) + \frac{1}{2} \cos^{-1} \left(\frac{1 - \tan^2 \beta}{1 + \tan^2 \beta} \right) \right\} \\ &= \tan \left\{ \frac{1}{2} \sin^{-1} (\sin 2\alpha) + \frac{1}{2} \cos^{-1} (\cos 2\beta) \right\} \\ &= \tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \cdot \tan \beta} = \frac{x + y}{1 - xy} \end{aligned}$$

74. (b) Radius of the circumscribed circle,

$$R = \frac{a}{2} \operatorname{cosec} \frac{\pi}{n}$$

and radius of the inscribed circle, $r = \frac{1}{2} a \cot \left(\frac{\pi}{n} \right)$

$$\begin{aligned} \Rightarrow R + r &= \frac{a}{2 \sin \left(\frac{\pi}{n} \right)} + \frac{a \cos \left(\frac{\pi}{n} \right)}{2 \sin \left(\frac{\pi}{n} \right)} \\ &= \frac{a \left[1 + \cos \left(\frac{\pi}{n} \right) \right]}{2 \times 2 \sin \left(\frac{\pi}{2n} \right) \cdot \cos \left(\frac{\pi}{2n} \right)} = \frac{1}{2} a \cot \left(\frac{\pi}{2n} \right) \end{aligned}$$

75. (b) Hint $2 \tan^{-1}(\cos x) = \tan^{-1}(2 \operatorname{cosec} x)$

$$\begin{aligned} \Rightarrow \tan^{-1} \left(\frac{2 \cos x}{1 - \cos^2 x} \right) &= \tan^{-1}(2 \operatorname{cosec} x) \\ \left[\because 2 \tan^{-1} x &= \tan^{-1} \left(\frac{2x}{1 - x^2} \right) \right] \end{aligned}$$

$$\Rightarrow \tan^{-1} \left(\frac{2 \cos x}{\sin^2 x} \right) = \tan^{-1} \left(\frac{2}{\sin x} \right)$$

76. (c) Hint $\tan^{-1} \sqrt{x(x+1)} + \sin^{-1} \sqrt{x^2 + x + 1} = \frac{\pi}{2}$

$$\Rightarrow \cos^{-1} \frac{1}{\sqrt{1 + (x^2 + x)}} + \sin^{-1} \sqrt{x^2 + x + 1} = \frac{\pi}{2}$$

$$\Rightarrow \cos^{-1} \frac{1}{\sqrt{1 + (x^2 + x)}} = \frac{\pi}{2} - \sin^{-1} \sqrt{x^2 + x + 1}$$

$$\Rightarrow \cos^{-1} \frac{1}{\sqrt{x^2 + x + 1}} = \cos^{-1} \sqrt{x^2 + x + 1}$$

77. (a) Given, $r_1 = r_2 + r_3 + r$

$$\Rightarrow r_1 - r = r_2 + r_3$$

$$\Rightarrow \frac{\Delta}{s-a} - \frac{\Delta}{s} = \frac{\Delta}{s-b} + \frac{\Delta}{s-c}$$

$$\Rightarrow \frac{s-s+a}{s(s-a)} = \frac{s-c+s-b}{(s-b)(s-c)}$$

$$\Rightarrow \frac{a}{s(s-a)} = \frac{a}{(s-b)(s-c)}$$

$$\Rightarrow s(a-b-c) + bc = 0$$

$$\Rightarrow \frac{(a+b+c)(a-b-c)}{2} + bc = 0$$

$$\Rightarrow a^2 - (b+c)^2 + 2bc = 0$$

$$\Rightarrow a^2 - b^2 - c^2 = 0$$

$$\Rightarrow b^2 + c^2 = a^2$$

So, $\triangle ABC$ is a right angled triangle.

78. (b) Since, $\operatorname{cosec}^{-1} \left(\frac{5}{3} \right) = \tan^{-1} \left(\frac{3}{4} \right)$

$$\therefore \cot \left(\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right)$$

$$= \cot \tan^{-1} \left[\frac{\frac{3}{4} + \frac{2}{3}}{1 - \frac{1}{2}} \right] = \cot \tan^{-1} \left[\frac{\left(\frac{17}{12} \right)}{\left(\frac{1}{2} \right)} \right]$$

$$= \cot \left[\tan^{-1} \left(\frac{17}{6} \right) \right] = \frac{6}{17}$$

79. (b) Given, $\sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$

$$\therefore \sin^{-1} \left(\frac{x}{5} \right) + \sin^{-1} \left(\frac{4}{5} \right) = \frac{\pi}{2}$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \frac{\pi}{2} - \sin^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \cos^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \sin^{-1} \left(\frac{3}{5} \right)$$

$$\therefore x = 3$$

80. (b) Given, $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$

$$\Rightarrow \cos^{-1} \left(\frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} \right) = \alpha$$

$$\Rightarrow \frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = \cos \alpha$$

$$\Rightarrow 2\sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = 2 \cos \alpha - xy$$

On squaring both sides, we get

$$\frac{4(1-x^2)(4-y^2)}{4} = 4 \cos^2 \alpha + x^2 y^2 - 4xy \cos \alpha$$

$$\Rightarrow 4 - 4x^2 - y^2 + x^2 y^2 = 4 \cos^2 \alpha + x^2 y^2 - 4xy \cos \alpha$$

$$\Rightarrow 4x^2 - 4xy \cos \alpha + y^2 = 4 \sin^2 \alpha$$

81. (c) Given, $\frac{\cos A}{a} = \frac{\cos B}{b} = \frac{\cos C}{c}$

$$\Rightarrow \frac{\cos A}{k \sin A} = \frac{\cos B}{k \sin B} = \frac{\cos C}{k \sin C}$$

$$\Rightarrow \cot A = \cot B = \cot C$$

$$\Rightarrow A = B = C = 60^\circ$$

$\therefore \triangle ABC$ is equilateral.

82. (c)
- $\angle A : \angle B : \angle C = 3 : 5 : 4$

$$\angle A = \frac{180^\circ \times 3}{3+5+4} = \frac{180^\circ \times 3}{12} = 45^\circ$$

$$\angle B = \frac{180^\circ \times 5}{12} = 75^\circ$$

$$\angle C = \frac{180^\circ \times 4}{12} = 60^\circ$$

By sine rule, $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k$

$$\Rightarrow a = k \sin 45^\circ = \frac{k}{\sqrt{2}}$$

$$b = k \sin 75^\circ = k \frac{(\sqrt{3}+1)}{2\sqrt{2}}$$

$$c = k \sin 60^\circ = k \frac{\sqrt{3}}{2}$$

$$\therefore a + b + \sqrt{2}c = \frac{k}{\sqrt{2}} + \frac{\sqrt{3}+1}{2\sqrt{2}}k + \frac{\sqrt{3}}{2}k\sqrt{2}$$

$$= k \left[\frac{1}{\sqrt{2}} + \frac{\sqrt{3}+1}{2\sqrt{2}} + \frac{\sqrt{3} \times \sqrt{2}}{2} \right] = k \left[\frac{2 + \sqrt{3} + 1 + 2\sqrt{3}}{2\sqrt{2}} \right]$$

$$= k \left[\frac{3 + 3\sqrt{3}}{2\sqrt{2}} \right] = \frac{3(\sqrt{3}+1)k}{2\sqrt{2}} = 3b$$

83. (a) Given,
- $\angle A = 30^\circ$
- ,
- $\angle B = 45^\circ$
- ,
- $a = 1$

$$\therefore \angle C = 105^\circ$$

Using sine rule, $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$

$$\Rightarrow \frac{1}{\left(\frac{1}{2}\right)} = \frac{b}{\left(\frac{1}{\sqrt{2}}\right)} = \frac{c}{\sin 105^\circ}$$

$$\Rightarrow b = \sqrt{2}$$

and $c = 2 \sin 105^\circ$

$$\therefore c = 2 \left(\frac{\sqrt{3}+1}{2\sqrt{2}} \right) = \frac{\sqrt{3}+1}{\sqrt{2}}$$

84. (a) Given,
- $\angle A = 75^\circ$
- ,
- $\angle B = 45^\circ \Rightarrow \angle C = 60^\circ$

By sine rule, $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$

$$\Rightarrow \frac{a}{\sin 75^\circ} = \frac{b}{\sin 45^\circ} = \frac{c}{\sin 60^\circ}$$

$$\Rightarrow b + c\sqrt{2} = \frac{\sin 45^\circ}{\sin 75^\circ} a + \sqrt{2} \frac{\sin 60^\circ}{\sin 75^\circ} a$$

$$= \frac{\frac{1}{\sqrt{2}}}{\frac{\sqrt{3}+1}{2\sqrt{2}}} a + \sqrt{2} \frac{\frac{\sqrt{3}}{2}}{\frac{\sqrt{3}+1}{2\sqrt{2}}} a = \frac{2}{\sqrt{3}+1} a + \frac{2\sqrt{3}a}{\sqrt{3}+1} = 2a$$

$$85. (a) \cot A = \frac{\cos A}{\sin A} = \frac{b^2 + c^2 - a^2}{2bc \sin A} = \frac{b^2 + c^2 - a^2}{4\Delta}$$

Similarly, $\cot B = \frac{a^2 + c^2 - b^2}{4\Delta}$

and $\cot C = \frac{a^2 + b^2 - c^2}{4\Delta}$

Given that, a^2, b^2 and c^2 are in AP.

$$\Rightarrow -2a^2, -2b^2, -2c^2 \text{ are in AP.}$$

$$\Rightarrow (a^2 + b^2 + c^2) - 2a^2, (a^2 + b^2 + c^2) - 2b^2, (a^2 + b^2 + c^2) - 2c^2 \text{ are in AP.}$$

$$\Rightarrow b^2 + c^2 - a^2, c^2 + a^2 - b^2, a^2 + b^2 - c^2 \text{ are in AP.}$$

$$\Rightarrow \frac{b^2 + c^2 - a^2}{4\Delta}, \frac{c^2 + a^2 - b^2}{4\Delta}, \frac{a^2 + b^2 - c^2}{4\Delta} \text{ are in AP.}$$

86. (c) Using projection formulae,

$$a = b \cos C + c \cos B$$

$$b = a \cos C + c \cos A$$

$$c = a \cos B + b \cos A$$

$$\therefore \left(\frac{b}{c} + \frac{c}{b}\right) \cos A + \left(\frac{a}{b} + \frac{b}{a}\right) \cos C + \left(\frac{a}{c} + \frac{c}{a}\right) \cos B$$

$$= \left(\frac{b}{c} \cos A + \frac{a}{c} \cos B\right) + \left(\frac{c}{b} \cos A + \frac{a}{b} \cos C\right)$$

$$+ \left(\frac{b}{a} \cos C + \frac{c}{a} \cos B\right)$$

$$= \frac{c}{c} + \frac{b}{b} + \frac{a}{a} = 3$$

87. (a) According to the question,

$$\tan \left(\frac{A-B}{2} \right) = \frac{1}{3} \tan \left(\frac{A+B}{2} \right) \quad \dots(i)$$

Using Napier's rule,

$$\tan \left(\frac{A-B}{2} \right) = \frac{a-b}{a+b} \cdot \cot \left(\frac{C}{2} \right) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{1}{3} \tan \left(\frac{A+B}{2} \right) = \frac{a-b}{a+b} \cdot \cot \left(\frac{C}{2} \right)$$

$$\Rightarrow \frac{1}{3} \cot \frac{C}{2} = \frac{a-b}{a+b} \cot \frac{C}{2}$$

$$\Rightarrow \frac{a-b}{a+b} = \frac{1}{3}$$

$$\Rightarrow \frac{2a}{-2b} = \frac{4}{-2}$$

[by componendo and dividendo]

$$\Rightarrow \frac{a}{b} = \frac{2}{1}$$

$$\therefore a : b = 2 : 1$$

BITSAT Archives

1. (d) We have,
- $|\sin x \cos x| + |\tan x + \cot x| = \sqrt{3}$

$$\Rightarrow |\sin x \cos x| + \frac{1}{|\sin x \cdot \cos x|} = \sqrt{3}$$

$$\text{But } |\sin x \cdot \cos x| + \frac{1}{|\sin x \cdot \cos x|} \geq 2$$

Hence, there is no solution.

2. (c) We have,
- $(\sin^{-1} x)^2 + (\cos^{-1} x)^2$

$$= (\sin^{-1} x + \cos^{-1} x)^2 - 2 \sin^{-1} x \cdot \cos^{-1} x$$

$$= \frac{\pi^2}{4} - 2 \sin^{-1} x \left(\frac{\pi}{2} - \sin^{-1} x \right) = \frac{\pi^2}{4} - \pi \sin^{-1} x + 2(\sin^{-1} x)^2$$

$$= 2 \left[(\sin^{-1} x)^2 - \frac{\pi}{2} \sin^{-1} x + \frac{\pi^2}{8} \right] = 2 \left[\left(\sin^{-1} x - \frac{\pi}{4} \right)^2 + \frac{\pi^2}{16} \right]$$

Thus, the least value is $2 \left(\frac{\pi^2}{16} \right)$ i.e. $\frac{\pi^2}{8}$ and the greatest

$$\text{value is } 2 \left[\left(\frac{-\pi}{2} - \frac{\pi}{4} \right)^2 + \frac{\pi^2}{16} \right] \text{ i.e. } \frac{5\pi^2}{4}.$$

3. (c) Clearly,
- $1 + \sin x \geq 0$

 $\therefore$ The given equation becomes

$$\cos x - \sin x = 1$$

$$\Rightarrow \cos x \cdot \frac{1}{\sqrt{2}} - \sin x \cdot \frac{1}{\sqrt{2}} = \frac{1}{\sqrt{2}} \Rightarrow \cos \left(x + \frac{\pi}{4} \right) = \frac{1}{\sqrt{2}}$$

$$\Rightarrow x + \frac{\pi}{4} = \frac{\pi}{4}, \frac{7\pi}{4}, \frac{9\pi}{4}, \frac{15\pi}{4} \Rightarrow x = 0, \frac{3\pi}{2}, 2\pi, \frac{7\pi}{2}$$

$$\therefore 0 \leq x \leq 3\pi \Rightarrow x = 0, \frac{3\pi}{2}, 2\pi$$

4. (d)
- $\sin \left[\cot^{-1} \left(\cos \frac{\pi}{4} \right) \right] = \sin \left[\cot^{-1} \frac{1}{\sqrt{2}} \right] = \sin \left[\sin^{-1} \sqrt{\frac{2}{3}} \right]$
-
- $$= \sqrt{\frac{2}{3}}$$

5. (c) Let
- $ED = h$
- ,
- $\angle EAB = \alpha$

$$\therefore \angle EBD = 2\alpha, \angle ECD = 3\alpha$$

Now,

$$\angle DBE = \angle EAB + \angle BEA$$

$$\Rightarrow 2\alpha = \alpha + \angle BEA$$

$$\Rightarrow \angle BEA = \alpha = \angle EAB$$

$$\Rightarrow AB = EB = a$$

Similarly, $\angle BEC = \alpha$

$$\text{In } \triangle EBC, \frac{BC}{\sin \alpha} = \frac{EB}{\sin(180^\circ - 3\alpha)}$$

$$\Rightarrow \frac{b}{\sin \alpha} = \frac{a}{\sin 3\alpha} \Rightarrow \frac{a}{b} = \frac{\sin 3\alpha}{\sin \alpha}$$

$$\Rightarrow \frac{a}{b} = \frac{3 \sin \alpha - 4 \sin^3 \alpha}{\sin \alpha} = 3 - 4 \sin^2 \alpha$$

$$\Rightarrow 4 \sin^2 \alpha = 3 - \frac{a}{b} = \frac{3b - a}{b} \Rightarrow \sin \alpha = \sqrt{\frac{3b - a}{4b}}$$

$$\text{In } \triangle EBD, \sin 2\alpha = \frac{ED}{EB}$$

$$\Rightarrow \frac{ED}{EB} = a \cdot 2 \sin \alpha \cdot \cos \alpha$$

$$\Rightarrow h = 2a \sqrt{\frac{3b-a}{4b}} \cdot \sqrt{1 - \frac{3b-a}{4b}} = 2a \sqrt{\frac{3b-a}{4b}} \sqrt{\frac{b+a}{4b}} = \frac{a}{2b} \sqrt{(a+b)(3b-a)}$$

6. (a) Given that,
- $\tan 20^\circ = p$

$$\therefore \frac{\tan 160^\circ - \tan 110^\circ}{1 + \tan 160^\circ \tan 110^\circ} = \frac{\tan(180^\circ - 20^\circ) - \tan(90^\circ + 20^\circ)}{1 + \tan(180^\circ - 20^\circ) \tan(90^\circ + 20^\circ)} = \frac{-\tan 20^\circ + \cot 20^\circ}{1 + \tan 20^\circ \cot 20^\circ} = \frac{-p + \frac{1}{p}}{1 + 1} = \frac{1 - p^2}{2p}$$

7. (d) Since,
- $30^\circ = 30^\circ \times \frac{\pi}{180} \text{ rad} = \frac{\pi}{6}$

Let angles $a, a + d, a + 2d$ are in AP.

$$\text{Now, } 3a + 3d = \pi \quad [\because A + B + C = \pi]$$

$$\Rightarrow 3 \times \frac{\pi}{6} + 3d = \pi$$

$$\Rightarrow d = \frac{1}{3} \left(\pi - \frac{\pi}{2} \right) = \frac{\pi}{6}$$

$$\therefore \text{Greatest angle} = a + 2d = \frac{\pi}{6} + 2 \cdot \frac{\pi}{6} = \frac{\pi}{2}$$

8. (a) Since,
- $A + B + C = 180^\circ = \cot(A + B + C)$

$$\Rightarrow \frac{\sum \cot A \cot B - 1}{\cot A \cot B \cot C - \sum \cot A} = \frac{1}{0}$$

$$\Rightarrow \cot A \cot B \cot C - \sum \cot A = 0$$

$$\Rightarrow \frac{\cot A + \cot B + \cot C}{\cot A \cot B \cot C} = 1$$

9. (b) Given,
- $a = 2, b = 3, \sin A = \frac{2}{3} \Rightarrow \sin^2 A = \frac{4}{9}$

$$\therefore \cos^2 A = 1 - \sin^2 A = \frac{5}{9}$$

$$\Rightarrow \cos A = \frac{\sqrt{5}}{3}$$

$$\therefore \cos C = \frac{2}{3}$$

10. (a) Given,
- $4 \sin^{-1} x + \cos^{-1} x = \pi$

$$\Rightarrow 4 \sin^{-1} x + \frac{\pi}{2} - \sin^{-1} x = \pi \Rightarrow 3 \sin^{-1} x = \frac{\pi}{2}$$

$$\Rightarrow x = \sin \left(\frac{\pi}{6} \right) = \frac{1}{2}$$

11. (d)
- $\therefore \tan(\theta + \phi) = \frac{\tan \theta + \tan \phi}{1 - \tan \theta \cdot \tan \phi}$

$$= \left(\frac{1}{2} + \frac{1}{3} \right) / \left(1 - \frac{1}{2} \cdot \frac{1}{3} \right) = 1 \Rightarrow \theta + \phi = \frac{\pi}{4}$$

12. (a) $\because \sin \theta = \frac{1}{2} = \sin \frac{\pi}{6}$
 $\therefore \theta = \frac{\pi}{6}, \pi - \frac{\pi}{6}$ and $\tan \theta = \frac{1}{\sqrt{3}} = \tan \left(\frac{\pi}{6} \right)$
 $\Rightarrow \theta = \frac{\pi}{6}, \pi + \frac{\pi}{6}$
 $\therefore$ Common value of θ is $\frac{\pi}{6}$.

Hence, general value of θ is $2n\pi + \frac{\pi}{6}, \forall n \in I$.

13. (b) Let $y = \sin x + \cos x = \sqrt{2} \left[\sin \left(\frac{\pi}{4} + x \right) \right]$

Here, y will be maximum when $x = \frac{\pi}{4}$.

14. (b) $\sin^{-1} \left(-\frac{\sqrt{3}}{2} \right) = \sin^{-1} \left(\sin \left(-\frac{\pi}{3} \right) \right) = -\frac{\pi}{3}$

15. (b) Since, $A + B + C = \pi$

But $2B = A + C$

$\therefore 3B = \pi$

$\Rightarrow B = \frac{\pi}{3} \therefore \frac{a+c}{b} = \frac{\sin A + \sin C}{\sin B}$

$$= \frac{2 \sin \left(\frac{A+C}{2} \right) \cos \left(\frac{A-C}{2} \right)}{\sin \frac{\pi}{3}}$$

$$= \frac{2 \sin \frac{\pi}{3} \cos \left(\frac{A-C}{2} \right)}{\sin \frac{\pi}{3}} = 2 \cos \left(\frac{A-C}{2} \right)$$

16. (b) $\left(1 + \cos \frac{\pi}{8} \right) \left(1 + \cos \frac{3\pi}{8} \right)$
 $\left(1 + \cos \frac{5\pi}{8} \right) \left(1 + \cos \frac{7\pi}{8} \right)$

$$= \left(1 - \cos^2 \frac{\pi}{8} \right) \left(1 - \cos^2 \frac{3\pi}{8} \right) = \sin^2 \frac{\pi}{8} \sin^2 \frac{3\pi}{8}$$

$$= \frac{1}{4} \left[\cos \frac{\pi}{4} - \cos \frac{\pi}{2} \right]^2 = \frac{1}{8}$$

17. (a) $\sec \theta - \operatorname{cosec} \theta = \frac{4}{3}$

$$\Rightarrow 3(\sin \theta - \cos \theta) = 4 \sin \theta \cos \theta$$

On squaring both sides, we get

$$9(\sin - \cos \theta)^2 = (4 \sin \theta \cos \theta)^2$$

$$\Rightarrow 9(1 - \sin 2\theta) = 4 \sin^2 2\theta$$

$$\Rightarrow 4 \sin^2 2\theta + 9 \sin 2\theta - 9 = 0$$

$$\Rightarrow \sin 2\theta = \frac{-9 \pm \sqrt{81 + 144}}{8} = \frac{3}{4}, -3$$

But $\sin 2\theta \neq -3$

$$\therefore \sin 2\theta = \frac{3}{4}$$

$$\Rightarrow \theta = \frac{1}{2} \left[n\pi + (-1)^n \sin^{-1} \frac{3}{4} \right]$$

18. (d) $\because AM > GM$

$$\therefore \frac{9 \tan^2 \theta + 4 \cot^2 \theta}{2} > \sqrt{4 \cot^2 \theta \cdot 9 \tan^2 \theta}$$

$$\Rightarrow 9 \tan^2 \theta + 4 \cot^2 \theta > 12$$

$\therefore$ Minimum value is 12.

19. (a) $\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}$... (i)

and $-\frac{\pi}{2} < \tan^{-1} x < \frac{\pi}{2}$... (ii)

On adding Eqs. (i) and (ii), we get

$$\frac{\pi}{2} - \frac{\pi}{2} < \sin^{-1} x + \cos^{-1} x + \tan^{-1} x < \frac{\pi}{2} + \frac{\pi}{2}$$

$$\Rightarrow 0 < \sin^{-1} x + \cos^{-1} x + \tan^{-1} x < \pi$$

On comparing it with given condition, we get

$$a = 0, b = \pi$$

20. (b) We have, $\sin^{-1} x + \sin^{-1} y = \frac{2\pi}{3}$... (i)

and $\cos^{-1} x - \cos^{-1} y = \frac{\pi}{3}$

$$\Rightarrow \left(\frac{\pi}{2} - \sin^{-1} x \right) - \left(\frac{\pi}{2} - \sin^{-1} y \right) = \frac{\pi}{3}$$

$$\Rightarrow -\sin^{-1} x + \sin^{-1} y = \frac{\pi}{3}$$
 ... (ii)

On adding Eqs. (i) and (ii), we get

$$\sin^{-1} y = \frac{\pi}{2} \Rightarrow y = 1$$

$$\Rightarrow \sin^{-1} x + \frac{\pi}{2} = \frac{2\pi}{3}$$
 [using Eq. (i)]

$$\Rightarrow \sin^{-1} x = \frac{2\pi}{3} - \frac{\pi}{2} = \frac{\pi}{6}$$

$$\therefore x = \frac{1}{2}$$

21. (c) Let r and R be the inradius and circumradius of incircle and circumcircle of the given regular polygon of side n .

Then, we know that

$$r + R = \frac{a}{2} \cot \frac{\pi}{n} + \frac{a}{2} \operatorname{cosec} \frac{\pi}{n} = \frac{a}{2} \left(\frac{1 + \cos \pi/n}{\sin \pi/n} \right)$$

$$= \frac{a}{2} \frac{2 \cos^2 \frac{\pi}{2n}}{2 \sin \frac{\pi}{2n} \cdot \cos \frac{\pi}{2n}} = \frac{a}{2} \cot \frac{\pi}{2n}$$

22. (c) We have, $\cos^2 B + \cos^2 C = \cos^2 B + \cos^2 \left(\frac{\pi}{2} - B \right)$
 $= \cos^2 B + \sin^2 B = 1$

23. (d) Using sine rule,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$
 ... (i)

and $\frac{\cos A}{a} = \frac{\cos B}{b} = \frac{\cos C}{c}$ [given] ... (ii)

We have, $\tan A = \tan B = \tan C$

$$\Rightarrow A = B = C = 60^\circ$$

Hence, triangle is equilateral whose side is $a = 2$.

$$\therefore \text{Area of } \Delta = \frac{\sqrt{3}}{4} a^2 \Rightarrow \Delta = \frac{\sqrt{3}}{4} (2)^2 = \sqrt{3} \text{ sq units}$$

24. (a) Draw $BP \perp AC$, the longer diagonal.

From right larger diagonal of ΔAPB , we have

$$\frac{AP}{AB} = \cos 30^\circ \Rightarrow AP = AB \cos 30^\circ$$

$$\therefore AP = 10 \times \frac{\sqrt{3}}{2} = 5\sqrt{3} \text{ cm}$$

Also, $\frac{BP}{AB} = \sin 30^\circ$

$$\therefore BP = AB \sin 30^\circ = 10 \times \frac{1}{2} = 5 \text{ cm}$$

From right longer diagonal of ΔBPC , we have

$$BP^2 + PC^2 = BC^2$$

$$\Rightarrow 5^2 + PC^2 = 6^2$$

$$\Rightarrow PC^2 = 6^2 - 5^2$$

$$\Rightarrow = (6-5)(6+5) = 11$$

$$\Rightarrow PC = \sqrt{11} \text{ cm}$$

$\therefore$ Longer diagonal,

$$AC = AP + PC = 5\sqrt{3} + \sqrt{11} \text{ cm}$$

25. (c) $\sqrt{3} \operatorname{cosec} 20^\circ - \sec 20^\circ$

$$= \frac{\tan 60^\circ}{\sin 20^\circ} - \frac{1}{\cos 20^\circ} = \frac{\sin 60^\circ \cos 20^\circ - \sin 20^\circ \cos 60^\circ}{\cos 60^\circ \sin 20^\circ \cos 20^\circ}$$

$$= \frac{\sin 40^\circ}{\cos 60^\circ \sin 20^\circ \cos 20^\circ} = \frac{2 \sin 20^\circ \cos 20^\circ}{\frac{1}{2} (\sin 20^\circ \cos 20^\circ)} = 4$$

26. (b) Given, $\tan \theta + \tan \left(\theta + \frac{\pi}{3} \right) + \tan \left(\theta + \frac{2\pi}{3} \right) = 3$

$$\Rightarrow \tan \theta + \frac{\tan \theta + \sqrt{3}}{1 - \sqrt{3} \tan \theta} + \frac{\tan \theta - \sqrt{3}}{1 + \sqrt{3} \tan \theta} = 3$$

$$\Rightarrow \tan \theta + \frac{8 \tan \theta}{1 - 3 \tan^2 \theta} = 3 \Rightarrow \frac{9 \tan \theta - 3 \tan^3 \theta}{1 - 3 \tan^2 \theta} = 3$$

$$\Rightarrow 3 \tan 3\theta = 3 \Rightarrow \tan 3\theta = 1$$

27. (b) Given equation is

$$\cos 2x + 2 \cos^2 x = 2$$

$$\Rightarrow 2 \cos^2 x - 1 + 2 \cos^2 x = 2$$

$$\Rightarrow 4 \cos^2 x = 3$$

$$\Rightarrow \cos^2 x = \frac{3}{4}$$

$$\Rightarrow \cos x = \pm \frac{\sqrt{3}}{2}$$

$$x = n\pi \pm \frac{\pi}{6}, n \in \mathbb{Z}$$

28. (b) Given that, $\sin^{-1} \left(\frac{3}{x} \right) + \sin^{-1} \left(\frac{4}{x} \right) = \frac{\pi}{2}$

$$\therefore \sin^{-1} \left(\frac{3}{x} \right) = \frac{\pi}{2} - \sin^{-1} \left(\frac{4}{x} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{3}{x} \right) = \cos^{-1} \left(\frac{4}{x} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{3}{x} \right) = \sin^{-1} \left(\frac{\sqrt{x^2 - 16}}{x} \right)$$

$$\Rightarrow \frac{3}{x} = \left(\frac{\sqrt{x^2 - 16}}{x} \right)$$

$$\Rightarrow 9 = x^2 - 16 \Rightarrow x^2 = 25$$

$$\Rightarrow x = \pm 5 \Rightarrow x = 5$$

[$\because -5$ does not satisfy the given equation]

29. (b) Given that,

$$\frac{1}{b+c} + \frac{1}{c+a} = \frac{3}{a+b+c}$$

$$\Rightarrow 1 + \frac{b}{a+c} + 1 + \frac{a}{b+c} = 3$$

$$\Rightarrow b(b+c) + a(a+c) = (a+c)(b+c)$$

$$\Rightarrow b^2 + bc + a^2 + ac = ab + ac + bc + c^2$$

$$\Rightarrow a^2 + b^2 - c^2 = ab$$

We know that, $\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{ab}{2ab} = \frac{1}{2}$

$$\Rightarrow C = 60^\circ$$

30. (d) Given that, $r_1 = 2r_2 = 3r_3$

$$\therefore \frac{\Delta}{s-a} = \frac{2\Delta}{s-b} = \frac{3\Delta}{s-c}$$

Then, $s-a=k, s-b=2k, s-c=3k$

$$\Rightarrow 3s - (a+b+c) = 6k \Rightarrow s = 6k$$

$$\therefore \frac{a}{5} = \frac{b}{4} = \frac{c}{3} = k$$

Now, $\frac{a}{b} + \frac{b}{c} + \frac{c}{a} = \frac{5}{4} + \frac{4}{3} + \frac{3}{5}$

$$= \frac{75 + 80 + 36}{60} = \frac{191}{60}$$

31. (a) Let AB be a hill whose height is f metre and CD be a pillar of height h metre.

In ΔEDB ,

$$\tan \alpha = \frac{h-h'}{ED} \quad \dots (i)$$

and in ΔACB ,

$$\tan \beta = \frac{h}{AC} = \frac{h}{ED} \quad \dots (ii)$$

Eliminate ED from Eqs. (i) and (ii), we get

$$\tan \alpha = \frac{h-h'}{h}$$

$$\Rightarrow h \frac{\tan \alpha}{\tan \alpha} = h - h'$$

$$\Rightarrow h' = \frac{h(\tan \beta - \tan \alpha)}{\tan \beta}$$

32. (a) Given that, $1 + \sin x \sin^2 \frac{x}{2} = 0$

$$\therefore 1 + \sin x \left(\frac{1 - \cos x}{2} \right) = 0$$

$$\Rightarrow 2 + \sin x - \sin x \cos x = 0$$

$$\Rightarrow \sin 2x - 2 \sin x = 4$$

Since, the maximum values of $\sin x$ and $\sin 2x$ are 1, which is not possible for any x in $[-\pi, \pi]$.

33. (c) We have,

$$\sin^{-1} x = 2 \tan^{-1} x$$

$$\therefore \sin^{-1} x = \sin^{-1} \frac{2x}{1+x^2} \Rightarrow x = \frac{2x}{1+x^2}$$

$$\Rightarrow x^3 - x = 0 \Rightarrow x(x+1)(x-1) = 0$$

$$\Rightarrow x \in \{-1, 1, 0\}$$

34. (c) Given that,

$$\sin A + \cos B = a \quad \dots(i)$$

$$\text{and} \quad \sin B + \cos A = b \quad \dots(ii)$$

On squaring and adding Eqs. (i) and (ii), we get

$$\sin^2 A + \cos^2 B + 2 \sin A \cos B + \sin^2 B + \cos^2 A + 2 \sin B \cos A = a^2 + b^2$$

$$\Rightarrow 2 \sin(A+B) + 2 = a^2 + b^2$$

$$\Rightarrow \sin(A+B) = \frac{a^2 + b^2 - 2}{2}$$

35. (c) $(a-b)^2 \cos^2 \frac{C}{2} + (a+b)^2 \sin^2 \frac{C}{2}$

$$= (a^2 + b^2 - 2ab) \cos^2 \frac{C}{2} + (a^2 + b^2 + 2ab) \sin^2 \frac{C}{2}$$

$$= (a^2 + b^2) + 2ab \left(\sin^2 \frac{C}{2} - \cos^2 \frac{C}{2} \right)$$

$$= a^2 + b^2 - 2ab \cos C$$

$$= a^2 + b^2 - (a^2 + b^2 - c^2) = c^2$$

36. (c) In $\triangle ABC$, $\tan 30^\circ = \frac{BC}{AC}$

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{h-150}{60} \Rightarrow h-150 = \frac{60}{\sqrt{3}}$$

$$\Rightarrow h = (150 + 20\sqrt{3}) \text{ m}$$

37. (c) $12 \cot^2 \theta - 31 \operatorname{cosec} \theta + 32 = 0$

$$\Rightarrow 12 \cos^2 \theta - 31 \sin \theta + 32 \sin^2 \theta = 0$$

$$\Rightarrow 12(1 - \sin^2 \theta) - 31 \sin \theta + 32 \sin^2 \theta = 0$$

$$\Rightarrow 20 \sin^2 \theta - 31 \sin \theta + 12 = 0$$

which is a quadratic equation in $\sin \theta$.

$$\therefore \sin \theta = \frac{31 \pm \sqrt{31^2 - 4 \cdot 20 \cdot 12}}{2 - 20} = \frac{31 \pm \sqrt{961 - 960}}{40} = \frac{31 \pm 1}{40}$$

$$\Rightarrow \sin \theta = \frac{4}{5}, \frac{3}{4}$$

38. (b) Given that, $\sin x - \cos x = \sqrt{2}$

$$\Rightarrow \frac{1}{\sqrt{2}} \sin x - \frac{1}{\sqrt{2}} \cos x = 1$$

$$\Rightarrow \sin 45^\circ \sin x - \cos 45^\circ \cos x = 1$$

$$\Rightarrow \cos \left(x + \frac{\pi}{4} \right) = -1 \Rightarrow \cos \left(x + \frac{\pi}{4} \right) = \cos(\pi)$$

$$\Rightarrow x + \frac{\pi}{4} = 2n\pi + \pi \Rightarrow x = 2n\pi + \frac{3\pi}{4}$$

39. (a) We know that, $\cos B = \frac{a^2 + c^2 - b^2}{2ac}$

$$\therefore \cos B = \frac{3^2 + 4^2 - 5^2}{2(3)(4)} = \frac{9 + 16 - 25}{2(3)(4)} = 0$$

$$\Rightarrow B = 90^\circ$$

$$\therefore \sin \frac{B}{2} + \cos \frac{B}{2} = \sin 45^\circ + \cos 45^\circ = \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} = \sqrt{2}$$

40. (c) Given, $\sin^{-1}(1-x) + 2 \sin^{-1} x = \frac{\pi}{2}$

$$\Rightarrow \sin^{-1}(1-x) = \frac{\pi}{2} - 2 \sin^{-1} x$$

$$\Rightarrow (1-x) = \sin \left(\frac{\pi}{2} - 2 \sin^{-1} x \right)$$

$$\Rightarrow (1-x) = \cos(2 \sin^{-1} x)$$

$$\Rightarrow (1-x) = \cos[\cos^{-1}(1-2x^2)]$$

$$\Rightarrow (1-x) = 1 - 2x^2 \Rightarrow 2x^2 - x = 0$$

$$\Rightarrow x = 0, \frac{1}{2}$$

But $x = \frac{1}{2}$ does not satisfy the given equation.

So, $x = \{0\}$ is the answer.

41. (b) Given that,

$$\sin \frac{\theta}{2} = \sqrt{\frac{x-1}{2x}}$$

In $\triangle ABC$,

$$\tan \frac{\theta}{2} = \sqrt{\frac{x-1}{x+1}} \therefore \tan \theta = \frac{2 \tan \frac{\theta}{2}}{1 - \tan^2 \frac{\theta}{2}}$$

$$= \frac{2 \sqrt{\frac{x-1}{x+1}}}{1 - \frac{x-1}{x+1}} = \frac{2 \sqrt{\frac{x-1}{x+1}}}{\frac{2}{x+1}} = \sqrt{x^2 - 1}$$

12

Rectangular Coordinates and Straight Line

Cartesian System of Rectangular Coordinates in a Plane

The cartesian system of rectangular coordinates in the plane are specified in terms of X and Y -axes, which are known as **coordinate axes** as illustrated in the figure given alongside. The intersection of X and Y -axes is known as **origin**. The cartesian coordinates of a point in the plane are written as (x, y) .

Here, the point has coordinates $(-4, 2)$, as the point is four units to the left and two units up from the origin.

Distance Formula

When coordinates of two points are given in cartesian form.

Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be the two points.

Then,

$$PQ = d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

or

$$\sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

Distance between the points $(0, 0)$ and (x, y) is $\sqrt{x^2 + y^2}$.

Distance formula can also be given as

$$\frac{x - x_1}{\cos \theta} = \frac{y - y_1}{\sin \theta} = r$$

where, r is the distance of the point (x, y) on the line from the point (x_1, y_1) and θ is the angle making the line with the positive direction of X -axis.

Applications of Distance Formulae

1. Collinearity of Three Given Points

The three given points A , B and C are collinear, i.e. lie on the same straight line, if any of three points (say B) lie on the straight line joining the other two points.

i.e. $AB + BC = AC$

2. Other Conditions for Collinearity

(i) Area of $\triangle ABC$ is zero. It means

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \frac{1}{2} [x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)] = 0$$

(ii) Slope of AB = Slope of BC

Three points (x_1, y_1) , (x_2, y_2) and (x_3, y_3) are collinear,

$$\text{if } \frac{y_2 - y_1}{x_2 - x_1} = \frac{y_3 - y_2}{x_3 - x_2}$$

3. Identifying the Types of Triangles

If A , B and C are vertices of triangle, then it would be

- (i) equilateral triangle, when $AB = BC = CA$.
- (ii) isosceles triangle, when any two sides are equal.
- (iii) right angled triangle, when sum of the square of any two sides is equal to square of the third side.

4. Position of Four Points

Let A , B , C and D be the four given points in a plane. By joining these points, following figures are formed:

- (i) Square, if $AB = BC = CD = DA$ and $AC = BD$.
- (ii) Rhombus, if $AB = BC = CD = DA$ and $AC \neq BD$.
- (iii) Parallelogram, if $AB = DC$, $BC = AD$, $AC \neq BD$.
- (iv) Rectangle, if $AB = DC$, $BC = DA$, $AC = BD$.

Conditions of Diagonals in Quadrilaterals

Quadrilateral	Diagonals	Angles between Diagonals
Parallelogram	Not equal	$\theta \neq \frac{\pi}{2}$
Rectangle	Equal	$\theta = \frac{\pi}{2}$
Rhombus	Not equal	$\theta = \frac{\pi}{2}$
Square	Equal	$\theta = \frac{\pi}{2}$

Section Formulae

Coordinates of a point which divide the line segment joining two points $P(x_1, y_1)$ and $Q(x_2, y_2)$ in the ratio $m_1 : m_2$ are

$$(i) \left(\frac{m_1 x_2 + m_2 x_1}{m_1 + m_2}, \frac{m_1 y_2 + m_2 y_1}{m_1 + m_2} \right) \quad [\text{internal division}]$$

$$(ii) \left(\frac{m_1 x_2 - m_2 x_1}{m_1 - m_2}, \frac{m_1 y_2 - m_2 y_1}{m_1 - m_2} \right) \quad [\text{external division}]$$

When m_1 and m_2 are of opposite signs, then division is **external**.

• Mid-point of the line joining (x_1, y_1) and (x_2, y_2) is $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$.

• Coordinates of any point on one line segment which divide the line segment joining two points $P(x_1, y_1)$ and $Q(x_2, y_2)$ in the ratio $\lambda : 1$, are given by

$$\left(\frac{x_1 + \lambda x_2}{\lambda + 1}, \frac{y_1 + \lambda y_2}{\lambda + 1} \right), (\lambda \neq -1)$$

• Lines formed by joining (x_1, y_1) and (x_2, y_2) is divided by

> X-axis in the ratio $-\frac{y_1}{y_2}$.

> Y-axis in the ratio $-\frac{x_1}{x_2}$.

If the ratio is positive, then the axis divides it internally and if ratio is negative, then the axis divides it externally.

• If the line $Ax + By + C = 0$ divides the line joining the points (x_1, y_1) and (x_2, y_2) in the ratio $\lambda : 1$, then

$$\lambda = - \left(\frac{Ax_1 + By_1 + C}{Ax_2 + By_2 + C} \right)$$

If λ is positive, then it divides internally and if λ is negative, then it divides externally.

Area of a Triangle

(a) Area of $\triangle ABC$, whose vertices are $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$, is given by

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \frac{1}{2} [x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$$

(b) If one vertex (x_3, y_3) is at origin $(0, 0)$, then

$$\Delta = \frac{1}{2} |x_1 y_2 - x_2 y_1|$$

Centroid of $\triangle ABC$

Centroid of a $\triangle ABC$ whose vertices are (x_1, y_1) , (x_2, y_2) and (x_3, y_3) , is given by

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3} \right)$$

Incentre of a ΔABC

Incentre of a ΔABC is given by

$$\left(\frac{ax_1 + bx_2 + cx_3}{a + b + c}, \frac{ay_1 + by_2 + cy_3}{a + b + c} \right)$$

Centres of a Inscribed Circle

Centres of inscribed circles are given by

$$\left(\frac{-ax_1 + bx_2 + cx_3}{-a + b + c}, \frac{-ay_1 + by_2 + cy_3}{-a + b + c} \right),$$

$$\left(\frac{ax_1 - bx_2 + cx_3}{a - b + c}, \frac{ay_1 - by_2 + cy_3}{a - b + c} \right)$$

and $\left(\frac{ax_1 + bx_2 - cx_3}{a + b - c}, \frac{ay_1 + by_2 - cy_3}{a + b - c} \right)$

respectively touching the sides BC , CA and AB internally; a, b, c being the sides BC, CA, AB of ΔABC .

Locus and its Equation

It is the path or curve traced by a moving point satisfying the given condition.

Equation to the Locus of a Point

The equation to the locus of a point is the algebraic relation which is satisfied by the coordinates of every point on the locus of the point.

Steps to Find the Locus of a Point

Step I Assumes the coordinates of the point, say (h, k) whose locus is to be find.

Step II Write the given condition involving (h, k) .

Step III Eliminate the variable(s), if any.

Step IV Replace $h \rightarrow x$ and $k \rightarrow y$. The equation so obtained is the locus of the point which moves under some definite conditions.

Translation of Axes

1. To Alter the Origin of Coordinates without Altering the Direction of the Axes

Let origin $O(0,0)$ be shifted to a point (a, b) by moving X and Y -axes parallel to themselves. If the coordinates of point P with reference to old axes are (x_1, y_1) , then coordinates of this point with respect to new axes will be $(x_1 - a, y_1 - b)$.

2. To Change the Direction of the Axes of Coordinates without Changing Origin

Let OX, OY be the old axes and OX', OY' be the new axes obtained by rotating the old OX and OY through an angle θ , then the coordinates of $P(x, y)$ with respect to new coordinate axes will be given by

	$x \downarrow$	$y \downarrow$
$x' \rightarrow$	$\cos \theta$	$\sin \theta$
$y' \rightarrow$	$-\sin \theta$	$\cos \theta$

(i) x, y are old coordinates and x', y' are new coordinates.

(ii) The axes rotation in anti-clockwise is positive and clockwise rotation of axes is negative.

3. To Change the Direction of the Axes of Coordinates by Changing the Origin

If $P(x, y)$ and the axes are shifted parallel to the original axis, so that new origin is (α, β) and then the axes are rotated about the new origin (α, β) by angle ϕ in the anti-clockwise (x', y') , then the coordinates of P will be given by

$$x = \alpha + x' \cos \phi - y' \sin \phi \quad \text{and} \quad y = \beta + x' \sin \phi + y' \cos \phi$$

Reflection (Image) of a Point

Let (x, y) be any point, then its image with respect to

X -axis is $(x, -y)$ Y -axis is $(-x, y)$ origin is $(-x, -y)$

line $y = x$ is (y, x)

Straight Line

A straight line defined as the curve which is such that the segment joining any two points on it lies wholly on it.

Slope of a Line

The trigonometrical tangent of the angle that a line makes with the positive direction of X -axis in anti-clockwise sense, is called the slope or gradient of the line. The slope of a line is generally denoted by m . Thus, θ is positive or negative according as it is measured in anti-clockwise or clockwise direction.

Various Forms of Equations of a Line

The equation of a line in the general form can be written as $ax + by + c = 0$

1. Slope Intercept Form

The equation of a line with slope m and making an intercept c on Y -axis is

$$y = mx + c$$

2. General Form to Slope Intercept Form

The general form of the equation of a line is

$$Ax + By + C = 0 \Rightarrow By = -Ax - C$$

$$\Rightarrow y = \left(-\frac{A}{B}\right)x + \left(-\frac{C}{B}\right)$$

This is of the form $y = mx + c$, where $m = -\frac{A}{B}$ and $c = -\frac{C}{B}$.

Thus, for the straight line $Ax + By + C = 0$ having slope $m = -\frac{A}{B}$ and intercept on Y -axis $= -\frac{C}{B}$.

3. Point Slope Form

The equation of a line which passes through the point (x_1, y_1) and has the slope m , is $y - y_1 = m(x - x_1)$

4. Two Points Form

The equation of a line passing through two points (x_1, y_1)

and (x_2, y_2) is $(y - y_1) = \left(\frac{y_2 - y_1}{x_2 - x_1}\right)(x - x_1)$

$$\text{or } \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

5. Intercept Form of a Line

The equation of a line which cuts-off intercepts a and b respectively from X and Y -axes, is $\frac{x}{a} + \frac{y}{b} = 1$.

6. General Equation of a Line to Intercept Form

The general equation of a line $Ax + By + C = 0$ is

$$-\frac{x}{\left(\frac{C}{A}\right)} + \frac{y}{\left(\frac{C}{B}\right)} = 1$$

7. Normal or Perpendicular Form

The equation of the straight line upon which the length of the perpendicular from the origin is p and this perpendicular makes an angle α with X -axis is

$$x \cos \alpha + y \sin \alpha = p, \text{ where } 0 \leq \alpha \leq \pi.$$

8. General Equation of a Line to the Normal Form

The general equation of a line is

$$Ax + By + C = 0.$$

Now, to reduce the general equation of a line to normal form, we first shift the constant term on the RHS and make it positive, if it is not so, then divide both sides by

$$\Rightarrow \frac{\sqrt{(\text{coefficient of } x)^2 + (\text{coefficient of } y)^2}}{\sqrt{A^2 + B^2}} \Rightarrow \left(\frac{A}{\sqrt{A^2 + B^2}}\right)x + \left(\frac{B}{\sqrt{A^2 + B^2}}\right)y = \left(\frac{-C}{\sqrt{A^2 + B^2}}\right)$$

9. Distance Point Form

The equation of the straight line passing through (x_1, y_1) and making an angle θ with the positive direction of X -axis is

$$\frac{x - x_1}{\cos \theta} = \frac{y - y_1}{\sin \theta} = r$$

where, r is the distance of the point (x, y) on the line from the point (x_1, y_1) .

Angle between Two Lines

The angle θ between the lines having slopes m_1 and m_2 is given by

$$\tan \theta = \left| \frac{m_2 - m_1}{1 + m_1 m_2} \right|$$

1. Parallelism of Lines

If two lines of slopes m_1 and m_2 are parallel, then the angle θ between them is 0° .

$$\therefore \tan \theta = \tan 0^\circ = 0 \Rightarrow \frac{m_2 - m_1}{1 + m_1 m_2} = 0$$

$$\Rightarrow m_1 = m_2$$

Thus, when two lines are parallel, their slopes are equal.

2. Perpendicularity of Two Lines

If two lines of slopes m_1 and m_2 are perpendicular, then the angle θ between them is 90° .

$$\therefore \cot \theta = 0$$

$$\Rightarrow \frac{1 + m_1 m_2}{m_1 - m_2} = 0 \Rightarrow m_1 \cdot m_2 = -1$$

Thus, when two lines are perpendicular, the product of their slopes is -1 .

If m is the slope of a line, then the slope of a line perpendicular to it is $\left(-\frac{1}{m}\right)$.

Equation of a Line Parallel and Perpendicular to a Given Line

The equation of a line **parallel** to a given line $ax + by + c = 0$, is $ax + by + k = 0$, where k is a constant.

The equation of a line **perpendicular** to a given line $ax + by + c = 0$, is $bx - ay + k = 0$, where k is a constant.

Point of Intersection of Two Lines

Let the equations of two lines be

$$a_1x + b_1y + c_1 = 0 \quad \dots(i)$$

$$\text{and} \quad a_2x + b_2y + c_2 = 0 \quad \dots(ii)$$

Suppose these two lines intersect at a point $P(x_1, y_1)$. Then, (x_1, y_1) satisfies each of the given equations

$$\therefore a_1x_1 + b_1y_1 + c_1 = 0$$

$$\text{and} \quad a_2x_1 + b_2y_1 + c_2 = 0$$

On solving these two equations by cross-multiplication method, we get

$$\frac{x_1}{b_1c_2 - b_2c_1} = \frac{y_1}{c_1a_2 - c_2a_1} = \frac{1}{a_1b_2 - a_2b_1}$$

$$\Rightarrow x_1 = \frac{b_1c_2 - b_2c_1}{a_1b_2 - a_2b_1}$$

$$\text{and} \quad y_1 = \frac{c_1a_2 - c_2a_1}{a_1b_2 - a_2b_1}$$

which is the required intersection point.

Distance of a Point from a Line

The length of the perpendicular from a point (x_1, y_1) to a line

$$ax + by + c = 0 \text{ is } \left| \frac{ax_1 + by_1 + c}{\sqrt{a^2 + b^2}} \right|.$$

(i) The length of the perpendicular from the origin to the line $ax + by + c = 0$ is $\frac{|c|}{\sqrt{a^2 + b^2}}$.

(ii) Distance between parallel lines $ax + by + c_1 = 0$ and $ax + by + c_2 = 0$ is $\frac{|c_2 - c_1|}{\sqrt{a^2 + b^2}}$.

Equation of Family of Lines Through the Intersection of Two Given Lines

The equation of the family of lines passing through the intersection of the lines

$$a_1x + b_1y + c_1 = 0$$

and

$$a_2x + b_2y + c_2 = 0, \text{ is}$$

$$(a_1x + b_1y + c_1) + \lambda(a_2x + b_2y + c_2) = 0$$

where, λ is a parameter.

Conditions for two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ to be coincident, parallel, perpendicular or intersecting, are given below:

$$(i) \text{ Coincident, if } \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

$$(ii) \text{ Parallel, if } \frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$$

$$(iii) \text{ Perpendicular, if } a_1a_2 + b_1b_2 = 0$$

$$(iv) \text{ Intersecting, if } a_1b_2 - a_2b_1 \neq 0$$

$$\text{i.e.} \quad \frac{a_1}{a_2} \neq \frac{b_1}{b_2}$$

Equations of Internal and External Bisectors of Angles between Two Lines

The equations of the bisectors of the angles between the lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are given by

$$\frac{a_1x + b_1y + c_1}{\sqrt{a_1^2 + b_1^2}} = \pm \frac{a_2x + b_2y + c_2}{\sqrt{a_2^2 + b_2^2}}$$

Conditions	Internal (acute) angle bisector	External (obtuse) angle bisector
$a_1a_2 + b_1b_2 > 0$	-	+
$a_1a_2 + b_1b_2 < 0$	+	-

Concurrent Lines

The three lines are concurrent, if they meet at a point.

Method 1 Find the point of intersection of any two lines and show that it satisfies the third also.

Method 2 The three lines $a_1x + b_1y + c_1 = 0$, $a_2x + b_2y + c_2 = 0$ and $a_3x + b_3y + c_3 = 0$, then they are concurrent if

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

Method 3 The condition for the lines $A = 0$, $B = 0$ and $C = 0$ to be concurrent is that three constants l , m , n (not all zeroes at the same time) can be obtained such that

$$lA + mB + nC = 0$$

Important Points

- The foot of perpendicular drawn from a point (x_1, y_1) to the line $ax + by + c = 0$ is

$$\left(\frac{x - x_1}{a}\right) = \left(\frac{y - y_1}{b}\right) = -\frac{ax_1 + by_1 + c}{a^2 + b^2}$$

- Let the equation of the line be $ax + by + c = 0$ and $P(x_1, y_1)$ and $Q(x_2, y_2)$ be two given points. Then,

- If $ax_1 + by_1 + c$ and $ax_2 + by_2 + c$ both are of the same signs, then the points P and Q lie on the same side of the line $ax + by + c = 0$.
- If $ax_1 + by_1 + c$ and $ax_2 + by_2 + c$ both are of opposite signs, then the points P and Q lie on the opposite side of the line $ax + by + c = 0$.

- The position of a point (x_1, y_1) and (x_2, y_2) relative to the line $ax + by + c = 0$

- If $\frac{(ax_1 + by_1 + c)}{ax_2 + by_2 + c} > 0$, then points lie on the same side.
- If $\frac{ax_1 + by_1 + c}{ax_2 + by_2 + c} < 0$, then the points lie on opposite side.

- The slope m of a line which is equally inclined with two lines of slopes m_1 and m_2 is given by

$$\frac{m - m_1}{1 + mm_1} = \frac{m_2 - m}{1 + mm_2}$$

- Let the image of a point (x_1, y_1) with respect to $ax + by + c = 0$ be (x_2, y_2) , then

$$\frac{x_2 - x_1}{a} = \frac{y_2 - y_1}{b} = \frac{-2(ax_1 + by_1 + c)}{a^2 + b^2}$$

- The image of the point $P(x_1, y_1)$ with respect to X -axis is $Q(x_1, -y_1)$.
- The image of the point $P(x_1, y_1)$ with respect to Y -axis is $Q(-x_1, y_1)$.
- The image of the point $P(x_1, y_1)$ with respect to mirror $y = x$ is $Q(y_1, x_1)$.
- The image of the point $P(x_1, y_1)$ with respect to the line mirror $y = x \tan \theta$ is

$$x = x_1 \cos 2\theta + y_1 \sin 2\theta;$$

$$y = x_1 \sin 2\theta - y_1 \cos 2\theta$$

- The image of the point $P(x_1, y_1)$ with respect to the origin is the point $(-x_1, -y_1)$.
- The length of perpendicular from a point (x_1, y_1) to a line $ax + by + c = 0$ is

$$\left| \frac{ax_1 + by_1 + c}{\sqrt{a^2 + b^2}} \right|$$

Practice Exercise

- If the base of an equilateral triangle with side $2a$ lies along the Y -axis such that the mid-point of the base is at the origin. Then, the vertices of the triangle are
 - $(\sqrt{3}a, 0), (0, a), (0, -a)$
 - $(\sqrt{3}a, 0), (a, 0), (1, -a)$
 - $(\sqrt{3}a, 1), (a, 0), (-a, 0)$
 - $(\sqrt{3}a, 0), (0, a), (-a, 0)$
- If the equation of the base of an equilateral triangle is $x + y = 2$ and the vertex is $(2, -1)$, then the length of the side of the triangle is (in unit)
 - $\sqrt{2}$
 - $\sqrt{\frac{3}{2}}$
 - $\sqrt{\frac{1}{2}}$
 - $\sqrt{\frac{5}{6}}$
- The coordinates of the middle points of the sides of a triangle are $(4, 2)$, $(3, 3)$ and $(2, 2)$. The coordinates of its centroid are
 - $(3, 7/3)$
 - $(3, 3)$
 - $(4, 3)$
 - None
- If p is the length of perpendicular from the origin on the line $\frac{x}{a} + \frac{y}{b} = 1$ and a^2, p^2, b^2 are in an AP, then $a^4 + b^4$ is equal to
 - 1
 - 2
 - 3
 - 0
- If the line joining two points $A(2, 0)$ and $B(3, 1)$ is rotated about A in anti-clockwise direction through an angle of 15° , then equation of the line in new position will be
 - $y - \sqrt{2}x + 2\sqrt{3} = 0$
 - $y - \sqrt{3}x + \sqrt{3} = 0$
 - $y - \sqrt{2}x + \sqrt{3} = 0$
 - $y - \sqrt{3}x + 2\sqrt{3} = 0$
- The number of integer values of m for which the x -coordinates of the point of intersection of the lines $3x + 4y = 9$ and $y = mx + 1$ is also an integer, is
 - 2
 - 0
 - 4
 - 1
- If p is the length of perpendicular from origin to the line whose intercept on the axes are a and b , then $\frac{1}{a^2} + \frac{1}{b^2}$ is equal to
 - $1/p^3$
 - $1/P$
 - $1/p^2$
 - p
- If t_1, t_2 and t_3 are distinct, then the points $(t_1, 2at_1 + at_1^3)$, $(t_2, 2at_2 + at_2^3)$ and $(t_3, 2at_3 + at_3^3)$ are collinear, when
 - $t_1 t_2 t_3 = 1$
 - $t_1 + t_2 + t_3 = t_1 t_2 t_3$
 - $t_1 + t_2 + t_3 = 0$
 - $t_1 + t_2 + t_3 = 1$

9. If two vertices of a triangle are $(5, -1)$ and $(-2, 3)$ and if its orthocentre lies at the origin, then the coordinates of third vertex are
 a. $(4, 7)$ b. $(-4, -7)$ c. $(2, -3)$ d. $(5, -1)$
10. If the vertices of a triangle have integral coordinates, then the triangle is
 a. equilateral b. never equilateral
 c. always isosceles d. None of these
11. The area bounded by the curves $x + 2|y| = 1$ and $x = 0$ is
 a. $\frac{1}{4}$ b. $\frac{1}{2}$ c. 1 d. 2
12. If x_1, x_2, x_3 as well as y_1, y_2, y_3 are in GP with same common ratio, then the points $P(x_1, y_1)$, $Q(x_2, y_2)$ and $R(x_3, y_3)$
 a. lie on a straight line b. lie on an ellipse
 c. lie on a circle d. are vertices of a triangle
13. If the area of the triangle whose vertices are (b, c) , (c, a) and (a, b) is Δ , then the area of triangle whose vertices are $(ac - b^2, ab - c^2)$, $(ba - c^2, bc - a^2)$ and $(cb - a^2, ca - b^2)$, is
 a. Δ^2 b. $(a + b + c)^2 \Delta$
 c. $a \Delta + b \Delta^2$ d. None of these
14. If $\frac{x}{c} + \frac{y}{d} = 1$ is any line through the intersection of $\frac{x}{a} + \frac{y}{b} = 1$ and $\frac{x}{b} + \frac{y}{a} = 1$, then
 a. $\frac{1}{c} + \frac{1}{d} = \frac{1}{a} + \frac{1}{b}$ b. $\frac{1}{d} + \frac{1}{a} = \frac{1}{b} + \frac{1}{c}$
 c. $\frac{1}{b} + \frac{1}{d} = \frac{1}{c} + \frac{1}{a}$ d. None of these
15. Let PS be the median of the triangle with vertices $P(2, 2)$, $Q(6, -1)$ and $R(7, 3)$. The equation of the line passing through $(1, -1)$ and parallel to PS , is
 a. $4x + 7y + 3 = 0$ b. $2x - 9y - 11 = 0$
 c. $4x - 7y - 11 = 0$ d. $2x + 9y + 7 = 0$
16. The x-coordinates of the incentre of the triangle that has the coordinates of mid-point of its sides as $(0, 1)$, $(1, 1)$ and $(1, 0)$, is
 a. $2 + \sqrt{2}$ b. $2 - \sqrt{2}$ c. $1 + \sqrt{2}$ d. $1 - \sqrt{2}$
17. The angle between the lines $\sqrt{3}x + y = 1$ and $x + \sqrt{3}y = 1$ is
 a. 30° b. 60°
 c. 90° d. 45°
18. The tangent of an angle between the lines $\frac{x}{a} + \frac{y}{b} = 1$ and $\frac{x}{a} - \frac{y}{b} = 1$ is equal to
 a. $\frac{3ab}{a^2 - b^2}$ b. $\frac{ab}{a^2 - b^2}$ c. $\frac{2ab}{a^2 - b^2}$ d. $\frac{4ab}{a^2 - b^2}$
19. The locus of the point of intersection of the lines $x \sin \theta + (1 - \cos \theta)y = a \sin \theta$ and $x \sin \theta - (1 + \cos \theta)y + a \sin \theta = 0$ is
 a. $x^2 - y^2 = a^2$ b. $x^2 + y^2 = a^2$
 c. $y^2 = ax$ d. None of these
20. If $A(2, -3)$ and $B(-2, 1)$ are two vertices of a triangle and third vertex moves on the line $2x + 3y = 9$, then the locus of the centroid of the triangle is
 a. $2x - 3y = 1$ b. $x - y = 1$
 c. $2x + 3y = 1$ d. $2x + 3y = 3$
21. If the line $2x + y = k$ passes through the point which divides the line segment joining the points $(1, 1)$ and $(2, 4)$ in the ratio $3 : 2$, then k is equal to
 a. $\frac{29}{5}$ b. 5 c. 6 d. $\frac{11}{5}$
22. The distance between the lines $3x + 4y = 9$ and $6x + 8y = 15$ is (in units)
 a. $\frac{3}{10}$ b. $\frac{2}{9}$ c. $\frac{1}{4}$ d. $\frac{1}{3}$
23. The foot of the perpendicular from $(2, 3)$ upon the line $4x - 5y + 8 = 0$ is
 a. $(0, 0)$ b. $(1, 1)$
 c. $(\frac{41}{78}, \frac{128}{75})$ d. $(\frac{78}{41}, \frac{128}{41})$
24. A straight line L with negative slope passes through the point $(8, 2)$ and cuts the positive coordinate axes at points P and Q . As L varies, the absolute minimum value of $OP + OQ$ is (O is origin)
 a. 10 b. 18 c. 16 d. 112
25. If the equation of the sides of a triangle are $x + y = 2$, $y = x$ and $\sqrt{3}y + x = 0$, then which of the following is an exterior point of the triangle?
 a. Orthocentre b. Incentre
 c. Centroid d. None of these
26. Without change of axes, if the origin is shifted to (h, k) , then from the equation $x^2 + y^2 - 4x + 6y - 7 = 0$, the terms containing linear powers are missing. The point (h, k) is
 a. $(3, 2)$ b. $(-3, 2)$ c. $(2, -3)$ d. $(-2, -3)$
27. If the family of lines $a(2x + y + 4) + b(x - 2y - 3) = 0$. Then, the number of lines belonging to the family at a distance of $\sqrt{10}$ units from $P(2, -3)$ is
 a. 0 b. 1 c. 2 d. 4
28. Let $A(h, k)$, $B(1, 1)$ and $C(2, 1)$ be the vertices of a right angled triangle with AC as its hypotenuse. If the area of the triangle is 1 sq unit, then the set of values which k can take, is given by
 a. $\{1, 3\}$ b. $\{0, 2\}$
 c. $\{-1, 3\}$ d. $\{-3, -2\}$

29. The value of k such that $3x^2 - 11xy + 10y^2 - 7x + 13y + k = 0$ may represent a pair of straight lines, is
 a. 3 b. 4 c. 6 d. 8
30. Let $A(2, -3)$ and $B(-2, 1)$ be the vertices of $\triangle ABC$. If the centroid of this triangle moves on the line $2x + 3y = 1$, then the locus of the vertex C is the line
 a. $2x + 3y = 9$ b. $2x - 3y = 7$
 c. $3x + 2y = 5$ d. $3x - 2y = 3$
31. Find the equations of the lines through the point of intersection of the lines $x - y + 1 = 0$ and $2x - 3y + 5 = 0$ and whose distance from the point $(3, 2)$ is $\frac{7}{5}$.
 a. $3x - 4y + 6 = 0$ and $4x - 3y + 1 = 0$
 b. $3x + 4y + 6 = 0$ and $4x + 3y + 1 = 0$
 c. $3x - 4y - 6 = 0$ and $4x + 3y + 1 = 0$
 d. None of the above
32. If the sides BC, CA, AB of $\triangle ABC$ are respectively $x + 2y = 1$, $3x + y + 5 = 0$, $x - y + 2 = 0$. Then, the altitude through B is
 a. $x - 3y + 1 = 0$ b. $x - 3y + 4 = 0$
 c. $3x - y + 4 = 0$ d. $x - y + 2 = 0$
33. The equation of the straight lines through $(-2, -7)$ and having intercept of length 3 units between the lines $4x + 3y = 12$ and $4x + 3y = 3$, is
 a. $7x - 24y - 182 = 0$
 b. $7x + 24y + 182 = 0$
 c. $7x + 24y - 182 = 0$
 d. None of the above
34. A variable straight line drawn through the point of intersection of the lines $\frac{x}{a} + \frac{y}{b} = 1$ and $\frac{x}{b} + \frac{y}{a} = 1$ meets the coordinate axes at A and B , the locus of the mid-point of AB is
 a. $2xy(a + b) = ab(x + y)$
 b. $2xy(a - b) = ab(x - y)$
 c. $2xy(a + b) = ab(x - y)$
 d. None of the above
35. If non-zero numbers a, b and c are in HP, then the straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ always passes through a fixed point
 a. $(1, -\frac{1}{2})$ b. $(1, -2)$
 c. $(-1, -2)$ d. $(-1, 2)$
36. The vertices of a triangle are $A(-1, -7)$, $B(5, 1)$ and $C(1, 4)$. Find the equation of the bisector of $\angle ABC$.
 a. $x + 7y - 2 = 0$ b. $x - 7y - 2 = 0$
 c. $x - 7y + 2 = 0$ d. None of these
37. If (a, a^2) falls inside the angle made by the lines $y = \frac{x}{2}$, $x > 0$ and $y = 3x$, $x > 0$, then a belongs to
 a. $(\frac{1}{2}, 3)$ b. $(-3, -\frac{1}{2})$ c. $(0, \frac{1}{2})$ d. $(3, \infty)$
38. Two equal sides of an isosceles triangle are $7x - y + 3 = 0$ and $x + y - 3 = 0$ and its third side passes through the point $(1, -10)$. Find the equation of the third side.
 a. $x - 3y = -31$ b. $x - 3y = 31$
 c. $x + 3y = 31$ d. $x + 3y = -31$
39. Let $P(-1, 0)$, $Q(0, 0)$ and $R(3, 3\sqrt{3})$ be three points. Then, the equation of the bisector of $\angle PQR$ is
 a. $\frac{\sqrt{3}}{2}x + y = 0$ b. $x + \sqrt{3}y = 0$
 c. $\sqrt{3}x + y = 0$ d. $x + \frac{\sqrt{3}}{2}y = 0$
40. A straight line through the point $A(3, 4)$ is such that its intercept between the axes is bisected at A . Its equation is
 a. $4x + 3y = 24$ b. $3x + 4y = 25$
 c. $x + y = 7$ d. $3x - 4y + 7 = 0$
41. The straight lines $5x + 4y = 0$, $x + 2y - 10 = 0$ and $2x + y + 5 = 0$ are
 a. concurrent
 b. the sides of an equilateral triangle
 c. the sides of a right angled triangle
 d. None of the above
42. Let a, b, c and d be non-zero numbers. If the point of intersection of the lines $4ax + 2ay + c = 0$ and $5bx + 2by + d = 0$ lie in the fourth quadrant and is equidistant from the two axes, then
 a. $3bc - 2ad = 0$ b. $3bc + 2ad = 0$
 c. $2bc - 3ad = 0$ d. $2bc + 3ad = 0$
43. Let PQR be a right angled isosceles triangle, right angled at $P(2, 1)$. If the equation of the line QR is $2x + y = 3$, then the equation representing the pair of lines PQ and PR is
 a. $3x^2 - 3y^2 + 8xy + 20x - 10y + 25 = 0$
 b. $3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0$
 c. $3x^2 - 3y^2 + 8xy + 10x + 15y + 20 = 0$
 d. $3x^2 - 3y^2 - 8xy - 10x - 15y - 20 = 0$

 - $(-1, -1)$
 - $(0, -1)$
 - $(1, 1)$
 - $(-1, 0)$

Answer with Solutions

Practice Exercise

1. (a) Let BC be the base of a triangle which lies on Y -axis and third vertex be $A(h, 0)$ or $A'(-h, 0)$.

Since, $\triangle ABC$ is an equilateral triangle.

$$\therefore AB = BC$$

$$\Rightarrow AB^2 = BC^2$$

$$\Rightarrow (h-0)^2 + (0-a)^2 = 4a^2$$

$$\left[\because \text{distance between two points } (x_1, y_1) \text{ and } (x_2, y_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \right]$$

$$\Rightarrow h^2 + a^2 = 4a^2 \Rightarrow h^2 = 3a^2$$

$$\Rightarrow h = \pm \sqrt{3}a \quad [\text{taking square root}]$$

Hence, the vertices of triangle are $(\sqrt{3}a, 0)$, $(0, a)$, $(0, -a)$

or $(-\sqrt{3}a, 0)$, $(0, a)$, $(0, -a)$.

2. (a) Let $\triangle ABC$ be an equilateral triangle.

Draw $AD \perp BC$. Then, length of $AD = \frac{|2-1-2|}{\sqrt{1+1}} = \frac{1}{\sqrt{2}}$

So, $\triangle ABC$ is an equilateral triangle.

Hence, $\angle ABC = 60^\circ$

So, in $\triangle ABD$,

$$\sin 60^\circ = \frac{AD}{AB} \Rightarrow \frac{\frac{1}{\sqrt{2}}}{2} = \frac{1}{AB}$$

$$\Rightarrow AB = \frac{\sqrt{2}}{3} \text{ unit}$$

$$\Rightarrow AB = BC = CA = \frac{\sqrt{2}}{3} \text{ unit}$$

3. (a) Let D, E and F be the mid-points of BC, CA and AB .

$\therefore$ Centroid of $\triangle ABC$ = Centroid of $\triangle DEF$

$$= \left[\frac{1}{3}(2+4+3), \frac{1}{3}(2+2+3) \right]$$

$$= \left(3, \frac{7}{3} \right)$$

4. (d) Given equation is $\frac{x}{a} + \frac{y}{b} = 1$... (i)

At origin, perpendicular distance from line (i) is

$$p = \frac{|0+0-1|}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2}}} \Rightarrow p = \frac{1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2}}} \Rightarrow \frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2} \quad \dots (ii)$$

Since, a^2, p^2 and b^2 are in an AP.

$$\therefore 2p^2 = a^2 + b^2$$

$$\text{Now, } \frac{1}{p^2} = \frac{a^2 + b^2}{a^2 b^2} \Rightarrow p^2 = \frac{a^2 b^2}{a^2 + b^2} \quad [\text{from Eq. (ii)}]$$

$$\Rightarrow \frac{a^2 + b^2}{2} = \frac{a^2 b^2}{a^2 + b^2}$$

$$\Rightarrow (a^2 + b^2)^2 = 2a^2 b^2$$

$$\Rightarrow a^4 + b^4 = 0$$

5. (d) The slope of the line AB is $\frac{1-0}{3-2} = 1$ or $\tan 45^\circ$. After

rotation of the line through 15° , the slope of the line AC in new position is $\tan 60^\circ = \sqrt{3}$.

Therefore, the equation of the new line AC is

$$y - 0 = \sqrt{3}(x - 2)$$

$$\Rightarrow y - \sqrt{3}x + 2\sqrt{3} = 0$$

6. (a) Given lines are

$$3x + 4y = 9$$

and

$$y = mx + 1$$

On solving both equations of lines, we get x -coordinates of the point of intersection as $x = \frac{5}{4m+3}$.

Since, x -coordinate is an integer.

$$\text{So, } 4m+3 = \pm 5$$

$$\text{or } 4m+3 = \pm 1$$

On solving these, we get

$$m = -1, -2$$

7. (c) Given equation of line in intercept form is

$$\frac{x}{a} + \frac{y}{b} = 1$$

$$\Rightarrow \frac{x}{a} + \frac{y}{b} - 1 = 0$$

Its distance from origin is

$$\left| \frac{0+0+(-1)}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2}}} \right| = p \quad \left[\because d = \left| \frac{ax_1 + by_1 + c}{\sqrt{a^2 + b^2}} \right| \right]$$

$$\Rightarrow p = \frac{1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2}}}$$

$$\Rightarrow \frac{1}{p} = \sqrt{\frac{1}{a^2} + \frac{1}{b^2}}$$

On squaring both sides, we get

$$\frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2}$$

8. (c) Hint $\begin{vmatrix} t_1 & 2at_1 + at_1^3 & 1 \\ t_2 & 2at_2 + at_2^3 & 1 \\ t_3 & 2at_3 + at_3^3 & 1 \end{vmatrix} = 0 \Rightarrow a \begin{vmatrix} t_1 & 2t_1 + t_1^3 & 1 \\ t_2 & 2t_2 + t_2^3 & 1 \\ t_3 & 2t_3 + t_3^3 & 1 \end{vmatrix} = 0$

Applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$\begin{vmatrix} t_1 & 2t_1 + t_1^3 & 1 \\ t_2 - t_1 & 2(t_2 - t_1) + (t_2^3 - t_1^3) & 0 \\ t_3 - t_1 & 2(t_3 - t_1) + (t_3^3 - t_1^3) & 0 \end{vmatrix} = 0$$

9. (b) Let $O(0, 0)$ be the orthocentre, $A(x_1, y_1)$ be the third vertex and $B(-2, 3)$ $C(5, -1)$ be other two vertices of the given triangle.

Then, $OA \perp BC$

$$\Rightarrow \frac{y_1 - 0}{x_1 - 0} \times \frac{-1 - 3}{5 + 2} = -1$$

$$\Rightarrow 7x_1 = 4y_1 \quad \dots(i)$$

and $OB \perp AC$

$$\Rightarrow \frac{-3}{2} \times \frac{-1 - y_1}{5 - x_1} = -1$$

$$\Rightarrow 2x_1 - 3y_1 = 13 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $x_1 = -4, y_1 = -7$

Thus, the orthocentre is $(-4, -7)$.

10. (b) Area of the equilateral triangle with side $a = \frac{\sqrt{3}}{4} a^2$
[an irrational number]

Let $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3) be vertices of an equilateral triangle. Then,

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \text{a rational number}$$

If x_1, y_1, x_2, y_2 and x_3, y_3 are integers.

An irrational number can't be equal to rational number.

Hence, a triangle with coordinates of the vertices as integers can't be an equilateral triangle.

11. (b) $x + 2|y| = 1$ and $x = 0$ gives $|y| = \frac{1}{2}$

$$\therefore y = \pm \frac{1}{2}$$

Required area = Area of $\triangle ABC$

where, AB is $x + 2y = 1$ and AC is $x - 2y = 1$.

$$\therefore \text{Required area} = \frac{1}{2} (BC)(OA) \\ = \frac{1}{2} (1)(1) = \frac{1}{2} \quad [\because BC = OA = 1]$$

12. (a) Let $x_1 = a, x_2 = ar, x_3 = ar^2$

$$\text{and } y_1 = b, y_2 = br, y_3 = br^2$$

$$\text{Now, } \frac{y_2 - y_1}{x_2 - x_1} = \frac{br - b}{ar - a} = \frac{b}{a}$$

$$\text{and } \frac{y_3 - y_2}{x_3 - x_2} = \frac{br^2 - br}{ar^2 - ar} = \frac{b}{a}$$

$\therefore$ Slope of PQ = Slope of QR

Hence, points P, Q, R are collinear.

13. (b) The area of the triangle formed by the second set of vertices is

$$\Delta = \frac{1}{2} \begin{vmatrix} b & c & 1 \\ c & a & 1 \\ a & b & 1 \end{vmatrix} \\ = \frac{1}{2} (a^2 + b^2 + c^2 - bc - ca - ab) \quad \dots(i)$$

and the area of the triangle formed by the second set of vertices is

$$\Delta' = \frac{1}{2} \begin{vmatrix} ac - b^2 & ab - c^2 & 1 \\ ba - c^2 & bc - a^2 & 1 \\ cb - a^2 & ca - b^2 & 1 \end{vmatrix} \\ = \frac{1}{2} \begin{vmatrix} (c-b)(a+b+c) & (a-c)(a+b+c) & 0 \\ (a-c)(a+b+c) & (b-a)(a+b+c) & 0 \\ bc - a^2 & ac - b^2 & 1 \end{vmatrix} \\ \text{[applying } R_1 \rightarrow R_1 - R_2 \text{ and } R_2 \rightarrow R_2 - R_3] \\ = \frac{1}{2} (a+b+c)^2 (a^2 + b^2 + c^2 - ab - bc - ca)$$

$$\therefore \Delta' = (a+b+c)^2 \Delta$$

14. (b) Any line through the intersection of

$$\frac{x}{a} + \frac{y}{b} = 1 \text{ and } \frac{x}{b} + \frac{y}{a} = 1 \text{ is}$$

$$\frac{x}{a} + \frac{y}{b} - 1 + k \left(\frac{x}{b} + \frac{y}{a} - 1 \right) = 0$$

$$\text{i.e. } \left(\frac{1}{a} + \frac{k}{b} \right) x + \left(\frac{1}{b} + \frac{k}{a} \right) y - (1+k) = 0$$

$$\text{If } \frac{x}{c} + \frac{y}{d} - 1 = 0, \text{ then } \frac{\frac{1}{a} + \frac{k}{b}}{\frac{1}{c}} = \frac{\frac{1}{b} + \frac{k}{a}}{\frac{1}{d}} = \frac{1+k}{1}$$

$$\therefore \frac{1}{a} + \frac{k}{b} = \frac{1}{c} + \frac{k}{d}$$

$$\Rightarrow \frac{1}{b} + \frac{k}{a} = \frac{1}{d} + \frac{k}{c}$$

$$\therefore \frac{1}{a} - \frac{1}{b} + k \left(\frac{1}{b} - \frac{1}{a} \right) = \frac{1}{c} - \frac{1}{d} + k \left(\frac{1}{d} - \frac{1}{c} \right)$$

$$\Rightarrow (1-k) \left(\frac{1}{a} - \frac{1}{b} \right) = (1-k) \left(\frac{1}{c} - \frac{1}{d} \right)$$

$$\Rightarrow \left(\frac{1}{a} - \frac{1}{b} \right) = \left(\frac{1}{c} - \frac{1}{d} \right)$$

$$\Rightarrow \frac{1}{a} + \frac{1}{d} = \frac{1}{b} + \frac{1}{c}$$

15. (d) Coordinates of S = Mid-point of line $QR = \left(\frac{13}{2}, 1 \right)$

$$\text{Hence, slope of line } PS = \frac{2-1}{2-\frac{13}{2}} = \frac{-2}{9}$$

Equation of line with slope $-2/9$ and passing through $(1, -1)$, is

$$\frac{y+1}{x-1} = \frac{-2}{9} \Rightarrow 9y+9 = -2x+2$$

$$\Rightarrow 2x+9y+7=0$$

16. (b) Given, mid-points of a triangle are $(0, 1)$, $(1, 1)$ and $(1, 0)$. Plot these points on a graph paper and make a triangle.

So, the sides of a triangle will be 2, 2 and $\sqrt{2^2 + 2^2}$, i.e. $2\sqrt{2}$.

$\therefore$ x-coordinate of incentre

$$= \frac{2 \cdot 0 + 2\sqrt{2} \cdot 0 + 2 \cdot 2}{2 + 2 + 2\sqrt{2}} = \frac{2}{2 + \sqrt{2}} \times \frac{2 - \sqrt{2}}{2 - \sqrt{2}} = 2 - \sqrt{2}$$

17. (a) **Hint** Given equations of lines are

$$\sqrt{3}x + y = 1 \Rightarrow y = -\sqrt{3}x + 1$$

and $x + \sqrt{3}y = 1$

$$\Rightarrow \sqrt{3}y = -x + 1 \Rightarrow y = \frac{-1}{\sqrt{3}}x + \frac{1}{\sqrt{3}}$$

Here, $m_1 = -\sqrt{3}$ and $m_2 = -\frac{1}{\sqrt{3}}$

18. (c) **Hint** Slope of given lines are

$$m_1 = -\frac{1/a}{1/b} = -\frac{b}{a} \text{ and } m_2 = \frac{-1/a}{-1/b} = \frac{b}{a}$$

19. (b) We have,

$$\frac{1 - \cos \theta}{\sin \theta} = \frac{a - x}{y} \quad \dots(i)$$

and $\frac{1 + \cos \theta}{\sin \theta} = \frac{a + x}{y} \quad \dots(ii)$

On multiplying Eqs. (i) and (ii), we get

$$\frac{1 - \cos^2 \theta}{\sin^2 \theta} = \frac{a^2 - x^2}{y^2} \Rightarrow x^2 + y^2 = a^2$$

20. (c) **Hint** The third vertex lies on $2x + 3y = 9$,

$\therefore$ Locus of centroid is

$$\left(\frac{2 - 2 + x}{3}, \frac{-3 + \frac{9 - 2x}{3} + 1}{3} \right) = (h, k)$$

21. (c) Given, line $L: 2x + y = k$ passes through point (say P) which divides a line segment (say AB) in the ratio 3 : 2, where $A(1, 1)$ and $B(2, 4)$. Using section formula, the coordinates of the point P which divides AB internally in the ratio 3 : 2, are

$$P\left(\frac{3 \times 2 + 2 \times 1}{3 + 2}, \frac{3 \times 4 + 2 \times 1}{3 + 2}\right) \equiv P\left(\frac{8}{5}, \frac{14}{5}\right)$$

Since, the line L passes through P . Hence, substituting the coordinates of $P\left(\frac{8}{5}, \frac{14}{5}\right)$ in the equation of

$L: 2x + y = k$, we get

$$2\left(\frac{8}{5}\right) + \left(\frac{14}{5}\right) = k \Rightarrow k = 6$$

22. (a) Given equations of lines $3x + 4y = 9$ and $6x + 8y = 15$ may be rewritten as $3x + 4y - 9 = 0$ and $3x + 4y - \frac{15}{2} = 0$.

Since, the slope of these lines are same, so they are parallel to each other.

Therefore, the distance between them is given by

$$d = \frac{\left| -9 + \frac{15}{2} \right|}{\sqrt{3^2 + 4^2}} = \frac{3}{10} \text{ unit}$$

23. (d) If foot is (h, k) , then

$$\frac{h - 2}{4} = \frac{k - 3}{-5} = \frac{-(8 - 15 + 8)}{16 + 25} = \frac{-1}{41}$$

$$\Rightarrow h = 2 - \frac{4}{41} = \frac{78}{41} \text{ and } k = 3 + \frac{5}{41} = \frac{128}{41}$$

So, the required point is $\left(\frac{78}{41}, \frac{128}{41}\right)$.

24. (b) The equation of the line L be $y - 2 = m(x - 8)$, $m < 0$.

Coordinates of P and Q are $\left(8 - \frac{2}{m}, 0\right)$ and $(0, 2 - 8m)$ respectively.

$$\text{So, } OP + OQ = 8 - \frac{2}{m} + 2 - 8m = 10 + \frac{2}{(-m)} + 8(-m)$$

$$\geq 10 + 2\sqrt{\frac{2}{(-m)} \times 8(-m)} \geq 18$$

[since, $AM \geq GM$ for two positive numbers]

So, absolute minimum value of $OP + OQ$ is 18.

25. (a) The lines $y = x$ and $\sqrt{3}y + x = 0$ are inclined at 45° and 150° , respectively. Thus, the angle between the two lines is an obtuse interior angle. Hence, orthocentre lies outside the given triangle.

26. (c) Let the new coordinates be $P(x', y')$.

After shifting origin to $P(x', y')$, i.e. $x = x' + h$ and $y = y' + k$
 $\therefore (x' + h)^2 + (y' + k)^2 - 4(x' + h) + 6(y' + k) - 7 = 0$
 $\Rightarrow (x')^2 + (y')^2 + 2(h - 2)x' + 2(k + 3)y' + (h^2 + k^2 - 4h + 6k - 7) = 0$

According to the question, $h - 2 = 0$ and $k + 3 = 0$

$$\Rightarrow (h, k) = (2, -3)$$

27. (b) **Hint** $P = \frac{a(4 - 3 + 4) + b(2 + 6 - 3)}{\sqrt{(2a + b)^2 + (a - 2b)^2}} = \sqrt{10}$

28. (c) **Hint** $AB = \sqrt{(1 - h)^2 + (1 - k)^2}$;

$$BC = \sqrt{(2 - 1)^2 + (1 - 1)^2} = 1$$

and $CA = \sqrt{(h - 2)^2 + (k - 1)^2}$

$$\begin{aligned} \text{Since, } AC^2 &= AB^2 + BC^2 = h^2 + 4 - 4h + k^2 + 1 - 2k \\ &= 1 + h^2 - 2h + k^2 + 1 - 2k + 1 \\ \Rightarrow h &= 1 \end{aligned} \quad \dots(i)$$

$$\therefore \text{Area of } \triangle ABC = \frac{1}{2} \times AB \times BC$$

29. (b) Given equation is

$$3x^2 - 11xy + 10y^2 - 7x + 13y + k = 0$$

On comparing with standard equation, we get

$$a = 3, b = 10, h = -\frac{11}{2}, g = \frac{-7}{2}, f = \frac{13}{2}, c = k$$

A second degree equation represents a pair of straight line, is given by

$$\begin{aligned} abc + 2fgh - af^2 - bg^2 - ch^2 &= 0 \\ \Rightarrow 3 \times 10 \times k + 2 \times \left(\frac{13}{2}\right) \left(\frac{-7}{2}\right) \left(\frac{-11}{2}\right) \\ &- 3 \left(\frac{13}{2}\right)^2 - 10 \left(\frac{-7}{2}\right)^2 - k \left(\frac{-11}{2}\right)^2 = 0 \\ \Rightarrow 30k + \frac{1001}{4} - \frac{507}{4} - \frac{490}{4} - \frac{121k}{4} &= 0 \\ \Rightarrow -\frac{k}{4} + 1 &= 0 \\ \Rightarrow k &= 4 \end{aligned}$$

30. (a) Let the third vertex be $C(x_1, y_1)$.

$$\text{The centroid is } \left(\frac{2-2+x_1}{3}, \frac{-3+1+y_1}{3} \right)$$

$$\text{i.e. } \left(\frac{x_1}{3}, \frac{y_1-2}{3} \right)$$

It lies on the line $2x + 3y = 1$

$$\therefore \frac{2}{3}(x_1) + 3 \left(\frac{y_1-2}{3} \right) = 1$$

Hence, the locus of C is $2x + 3y = 9$.

31. (a) **Hint** Equation of a line passing through the point of intersection of lines is

$$\begin{aligned} x - y + 1 + \lambda(2x - 3y + 5) &= 0 \\ \Rightarrow x(1 + 2\lambda) + y(-1 - 3\lambda) + 1 + 5\lambda &= 0 \end{aligned} \quad \dots(i)$$

Its distance from point $(3, 2) = \frac{7}{5}$

$$\Rightarrow \frac{|3(1 + 2\lambda) + 2(-1 - 3\lambda) + 1 + 5\lambda|}{\sqrt{(1 + 2\lambda)^2 + (-1 - 3\lambda)^2}} = \frac{7}{5}$$

32. (b) **Hint** Required equation of line is

$$x + 2y - 1 + \lambda(x - y + 2) = 0 \quad \dots(i)$$

It is perpendicular to $3x + y + 5 = 0$

$$\therefore 3(1 + \lambda) + 2 - \lambda = 0$$

33. (b) Let m be the slope of the line and angle θ , it makes with the parallel line.

$$\therefore \sin \theta = \frac{3}{5} \text{ or } \tan \theta = \frac{3}{4}$$

Hence, slope of the parallel lines is $-\frac{4}{3}$.

$$\begin{aligned} \therefore \left| \frac{m + \frac{4}{3}}{1 - \frac{4m}{3}} \right| &= \tan \theta = \frac{3}{4} \\ \Rightarrow \frac{3m + 4}{3 - 4m} &= \pm \frac{3}{4} \Rightarrow m = -\frac{7}{24} \end{aligned}$$

$$\text{Hence, the line is } y + 7 = -\frac{7}{24}(x + 2)$$

$$\text{or } 7x + 24y + 182 = 0$$

34. (a) **Hint** The intersection of given lines is $\frac{x}{a} + \frac{y}{b} - 1 + \lambda \left(\frac{x}{b} + \frac{y}{a} - 1 \right) = 0$ meets the coordinate axes at

$$A \left(\frac{1 + \lambda}{\frac{1}{a} + \frac{\lambda}{b}}, 0 \right) \text{ and } B \left(0, \frac{1 + \lambda}{\frac{1}{b} + \frac{\lambda}{a}} \right)$$

The mid-point of AB is given by

$$2x = \frac{1 + \lambda}{\frac{1}{a} + \frac{\lambda}{b}}, 2y = \frac{1 + \lambda}{\frac{1}{b} + \frac{\lambda}{a}}$$

35. (b) Since, a, b and c are in HP. Then, $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in an AP.

$$\therefore \frac{2}{b} = \frac{1}{a} + \frac{1}{c} \Rightarrow \frac{1}{a} - \frac{2}{b} + \frac{1}{c} = 0$$

Hence, straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ is always passes through a fixed point $(1, -2)$.

36. (c) $BC = 5$ units, $BA = 10$ units

Let D divides AC in the ratio $2 : 1$

So, the coordinate of D is $\left(\frac{1}{3}, \frac{1}{3} \right)$.

$$\text{Slope of } BD = \frac{\frac{1}{3} - 1}{\frac{1}{3} - 5} = \frac{1}{7}$$

$\therefore$ Equation of the line joining B and D is

$$\frac{y - 1}{x - 5} = \frac{1}{7} \Rightarrow x - 7y + 2 = 0$$

37. (a) The point (a, a^2) lies in the sector bounded by the lines

$$x - 2y = 0 \text{ and } 3x - y = 0$$

$$\therefore (a - 2a^2)(3a - a^2) < 0 \Rightarrow \left[a - \frac{1}{2} \right] (a - 3) < 0$$

$$\text{Hence, } a \in \left(\frac{1}{2}, 3 \right)$$

38. (b) The third side is parallel to a bisector of the angle between the equal sides.

The bisectors are $7x - y + 3 = \pm 5(x + y - 3)$

$$\Rightarrow 2x - 6y + 18 = 0$$

$$\text{or } 12x + 4y - 12 = 0$$

$$\Rightarrow x - 3y + 9 = 0$$

$$\text{or } 3x + y - 3 = 0$$

Let the third side be $x - 3y = k$ or $3x + y = L$

It passes through $(1, -10)$.

$$\therefore k = 31, L = -7$$

Hence, required lines are $x - 3y = 31$, $3x + y = -7$.

39. (c) Slope of $QR = \frac{3\sqrt{3} - 0}{3 - 0} = \sqrt{3} = \tan \theta \Rightarrow \theta = \frac{\pi}{3}$

$\therefore$ The angle between $\angle PQR$ is $\frac{2\pi}{3}$, so the line QM makes an angle $\frac{2\pi}{3}$ from positive direction of X -axis.

$$\text{Slope of the line } QM = \tan \frac{2\pi}{3} = -\sqrt{3}$$

Hence, equation of line QM is

$$y = -\sqrt{3}x \Rightarrow \sqrt{3}x + y = 0$$

40. (a) Since, A is the mid-point of line PQ .

$$\therefore 3 = \frac{a+0}{2} \Rightarrow a = 6 \text{ and } 4 = \frac{0+b}{2} \Rightarrow b = 8$$

Hence, the equation of line is $\frac{x}{6} + \frac{y}{8} = 1$ or $4x + 3y = 24$

$$41. (a) \text{ Hint } \Delta = \begin{vmatrix} 5 & 4 & 0 \\ 1 & 2 & -10 \\ 2 & 1 & 5 \end{vmatrix} = 0$$

42. (a) Given, lines are

$$4ax + 2ay + c = 0 \quad \dots(i)$$

$$\text{and } 5bx + 2by + d = 0 \quad \dots(ii)$$

Let the point of intersection be $(h, -h)$.

On substituting it in Eqs. (i) and (ii), we get

$$4ah - 2ah + c = 0$$

$$\text{and } 5bh - 2bh + d = 0$$

On eliminating h in the above two equations, we get

$$\frac{-c}{2a} = \frac{-d}{3b}$$

$$\text{Hence, } 3bc - 2ad = 0$$

43. (b) Let m be the slope of PR .

Slope of RQ , i.e. $2x + y = 3$ is -2 .

$$\therefore \tan 45^\circ = \left| \frac{m+2}{1+m(-2)} \right| = \left| \frac{m+2}{1-2m} \right|$$

$$\therefore m+2 = 1-2m$$

$$\text{or } -(m+2) = 2m-1$$

$$\Rightarrow 3m = -1 \text{ or } m = 3$$

$$\Rightarrow m = -\frac{1}{3} \text{ or } m = 3$$

$$\therefore \text{Equation of } PR \text{ is } y - 1 = -\frac{1}{3}(x - 2)$$

$$\text{i.e. } x + 3y - 5 = 0$$

and equation of PQ is

$$y - 1 = 3(x - 2)$$

$$\text{i.e. } 3x - y - 5 = 0$$

$\therefore$ Required pair of lines is given by

$$(x + 3y - 5)(3x - y - 5) = 0$$

$$\Rightarrow 3x^2 + 9xy - 15x - xy - 3y^2 + 5y - 5x - 15y + 25 = 0$$

$$\text{i.e. } 3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0$$

BITSAT Archives

1. (b) Hint $\begin{vmatrix} 2 & -3 & k \\ 3 & -4 & -13 \\ 8 & -11 & -33 \end{vmatrix} = 0$

2. (c) For the two lines $24x + 7y - 20 = 0$ and $4x - 3y - 2 = 0$, the angle bisectors are given by

$$\frac{24x + 7y - 20}{25} = \pm \frac{4x - 3y - 2}{5}$$

Taking positive sign,

we get $24x + 7y - 20 = 4x - 3y - 2$

So, the given lines are concurrent with one line bisecting the angle between the other two.

3. (d) Hint Let m be the slope of required line.

$$\therefore \left| \frac{m - (-1)}{1 + m(-1)} \right| = 1 \Rightarrow \frac{m + 1}{1 - m} = \pm 1$$

4. (d) Length of perpendicular from $A(2, -1)$ to the line $x + y - 2 = 0$ is

$$AD = \left| \frac{2 - 1 - 2}{\sqrt{1 + 1}} \right| = \frac{1}{\sqrt{2}} \text{ unit}$$

In $\triangle ABD$, $\frac{AD}{AB} = \sin 60^\circ$

$$\Rightarrow \frac{1}{\sqrt{2} AB} = \frac{\sqrt{3}}{2}$$

$$\therefore AB = \frac{\sqrt{2}}{\sqrt{3}}$$

5. (a) Let M be the foot of perpendicular from $P(3, 4)$ on the line $3x - 4y + 5 = 0$. Then, M is the point of intersection of $3x - 4y + 5 = 0$ and line passing through $P(3, 4)$ and perpendicular to

$$3x - 4y + 5 = 0 \quad \dots(i)$$

Equation of the line perpendicular to

$$3x - 4y + 5 = 0 \text{ is } 4x + 3y + \lambda = 0$$

which passes through $(3, 4)$.

$$\Rightarrow 12 + 12 + \lambda = 0 \Rightarrow \lambda = -24$$

$$\therefore \text{Equation of line is } 4x + 3y - 24 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$y = 92/25 \text{ and } x = 81/25$$

$$\therefore \text{Required point is } \left(\frac{81}{25}, \frac{92}{25} \right).$$

6. (c) Hint Given equations are

$$3x + 4y + 5 = 0$$

$$\text{and } 12x - 5y - 7 = 0$$

$$\therefore a_1 a_2 + b_1 b_2 = 3 \times 12 + 4 \times (-5) = 16 > 0$$

$\therefore$ For acute angle bisector,

$$\frac{a_1 x + b_1 y + c_1}{\sqrt{a_1^2 + b_1^2}} = - \frac{(a_2 x + b_2 y + c_2)}{\sqrt{a_2^2 + b_2^2}}$$

$$7. (c) \text{ Required ratio} = - \frac{(-1 + 1 - 4)}{(5 + 7 - 4)} = \frac{1}{2}$$

8. (b) Here, $a + b = 1 - 1 = 0$

Hence, pair of lines are perpendicular.

9. (c) The given diagonal does not pass through $(1, 3)$ and $(5, 1)$ as slope of the diagonal is 2 and that of the line joining $(1, 3)$ and $(5, 1)$ is

$$\frac{1 - 3}{5 - 1} = -\frac{1}{2}$$

The centre of the rectangle is mid-point of the join of $(1, 3)$ and $(5, 1)$ must lie on $y = 2x + c$.

$$\Rightarrow \left(\frac{1 + 5}{2}, \frac{3 + 1}{2} \right) = (3, 2) \text{ lies on } y = 2x + c$$

$$\Rightarrow 2 = 2 \times 3 + c$$

$$\Rightarrow c = -4$$

10. (b) Since, the axes are rotated through an angle 45° , so we replace (x, y) by

$$(x \cos 45^\circ - y \sin 45^\circ, x \sin 45^\circ + y \cos 45^\circ)$$

$$\text{i.e. } \left(\frac{x}{\sqrt{2}} - \frac{y}{\sqrt{2}}, \frac{x}{\sqrt{2}} + \frac{y}{\sqrt{2}} \right)$$

In the given equation,

$$3x^2 + 3y^2 + 2xy = 2$$

$$\therefore 3 \left(\frac{x}{\sqrt{2}} - \frac{y}{\sqrt{2}} \right)^2 + 3 \left(\frac{x + y}{\sqrt{2}} \right)^2 + 2 \left(\frac{x - y}{\sqrt{2}} \right) \left(\frac{x + y}{\sqrt{2}} \right) = 2$$

$$\Rightarrow \frac{3}{2} (x^2 + y^2 + 2xy) + \frac{3}{2} (x^2 + y^2 - 2xy) + \frac{2}{2} (x^2 - y^2) = 2$$

$$\Rightarrow 4x^2 + 2y^2 = 2$$

$$\Rightarrow 2x^2 + y^2 = 1$$

11. (b) Since, l, m, n are in an AP.

$$\therefore 2m = l + n$$

Given equation of line is

$$lx + my + n = 0$$

Now, assume that the point $(1, -2)$ satisfy the given equation.

$$\therefore l - 2m + n = 0$$

$$\Rightarrow 2m = l + n$$

$\Rightarrow l, m, n$ are in an AP.

12. (a) Let D and E be the mid-points of AB and AC . Then, coordinates of B and C are $(-3, 3)$ and $(5, 3)$ respectively.

$$\begin{aligned}\text{Centroid of triangle} &= \left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3} \right) \\ &= \left(\frac{1 - 3 + 5}{3}, \frac{1 + 3 + 3}{3} \right) = \left(1, \frac{7}{3} \right)\end{aligned}$$

13. (c) Since, two sides $x - 3y = 0$ and $3x + y = 0$ are perpendicular to each other. Therefore, its orthocentre is the point of intersection of $x - 3y = 0$ and $3x + y = 0$, i.e. $(0, 0)$. So, the line $3x - 4y = 0$ passes through the orthocentre of triangle.

14. (c) Let the points be $B(x_1, y_1)$ and $D(x_2, y_2)$. Then, the mid-point of

$$BD = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$$

and mid-point of $AC = (0, 1)$

We know that, mid-point of both diagonals lie on the same point E .

$$\Rightarrow \frac{x_1 + x_2}{2} = 0 \text{ and } \frac{y_1 + y_2}{2} = 1$$

$$\Rightarrow x_1 + x_2 = 0 \quad \dots(i)$$

$$\text{and } y_1 + y_2 = 2 \quad \dots(ii)$$

$\therefore$ Slope of $BD \times$ Slope of $AC = -1$

$$\therefore \frac{(y_1 - y_2)}{(x_1 - x_2)} \times \frac{(3 + 1)}{(0 - 0)} = -1$$

$$\Rightarrow y_1 - y_2 = 0 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$y_1 = 1, y_2 = 1$$

Now, slope of $AB \times$ slope of $BC = -1$

$$\Rightarrow \frac{(y_1 + 1)}{(x_1 - 0)} \times \frac{(y_1 - 3)}{(x_1 - 0)} = -1$$

$$\Rightarrow (y_1 + 1)(y_1 - 3) = -x_1^2$$

$$\Rightarrow 2(-2) = -x_1^2 \quad [\because y_1 = 1]$$

$$\Rightarrow x_1 = \pm 2$$

Hence, the required points are $(2, 1)$ and $(-2, 1)$.

15. (c) Let the points be $A(3, -4)$ and $B(5, 2)$ and mid-point of $AB = (4, -1)$

It is given that the bisecting line intercept the coordinate axes in the ratio $2 : 1$.

$\therefore$ Point of coordinate axes are $(2k, 0)$ and $(0, k)$. The equation of line passing through the above point is

$$y - 0 = \frac{k - 0}{0 - 2k}(x - 2k)$$

$$\text{or } y = -\frac{1}{2}(x - 2k) \quad \dots(i)$$

Since, it is passing through the mid-point of AB , i.e. $(4, -1)$.

$$\Rightarrow -1 = -\frac{1}{2}(4 - 2k)$$

$$\Rightarrow 2 = 4 - 2k$$

$$\Rightarrow k = 1$$

Putting the value of k in Eq. (i), we get

$$y = -\frac{1}{2}(x - 2)$$

$$\Rightarrow x + 2y = 2$$

16. (a) Given equation of lines are

$$xy + 2x + 2y + 4 = 0$$

$$\text{or } (x + 2)(y + 2) = 0$$

$$\text{or } x + 2 = 0, y + 2 = 0 \quad \dots(i)$$

$$\text{and } x + y + 2 = 0 \quad \dots(ii)$$

These three lines makes $\triangle CAB$, right angled at A .

The circumcentre of a triangle is the mid-point of BC , i.e. $(-1, -1)$.

13

The Circle

Circle

The locus of a point which moves in such a way that its distance from a fixed point in the plane remains constant, is called a circle. This fixed point, is called the **centre** and the constant distance, is called the **radius** of the circle.

General Form of Equation of Circle

(i) The general form of the equation of a circle is $x^2 + y^2 + 2gx + 2fy + c = 0$

Its centre is $(-g, -f)$ and radius is $\sqrt{g^2 + f^2 - c}$.

(ii) The general form of the equation of a circle can also be written as

$$ax^2 + ay^2 + 2gx + 2fy + c = 0, a \neq 0$$

Its centre is $\left(\frac{-g}{a}, \frac{-f}{a}\right)$ and radius is $\sqrt{\frac{g^2}{a^2} + \frac{f^2}{a^2} - \frac{c}{a}}$.

- NOTE**
- The equation of a circle is a second degree equation in x and y .
 - It contains no term of xy .
 - Coefficient of x^2 = Coefficient of y^2
 - Coordinates of centre = $\left(\frac{-\text{Coefficient of } x}{2}, \frac{-\text{Coefficient of } y}{2}\right)$
 - A circle where radius is zero, is called point circle.

Different Types of Equations of Circle

(i) Circle having Centre (h, k) and Radius r

Equation of the circle is $(x - h)^2 + (y - k)^2 = r^2$.

(ii) Circle having Centre $(0, 0)$ and Radius r

Equation of the circle is $x^2 + y^2 = r^2$.

- (iii) Centre at X-axis y-coordinate of

centre $\equiv 0$, i.e. $f = 0$

Centre $\equiv (-g, 0)$

Equation of the circle is

$$x^2 + y^2 + 2gx + c = 0$$

- (iv) Centre at Y-axis x-coordinate of centre $\equiv 0$, i.e. $g = 0$

Centre $\equiv (0, -f)$

Equation of the circle is

$$x^2 + y^2 + 2fy + c = 0$$

- (v) Centre at Origin

Centre $\equiv (-g, -f) \equiv (0, 0)$

Equation of the circle is $x^2 + y^2 + c = 0$.

- (vi) Circle Passing through Origin

Equation of the circle is

$$x^2 + y^2 + 2gx + 2fy = 0$$

because $(0, 0)$ should satisfy the equation of the circle, i.e.

$$c = 0$$

NOTE Equation of a circle passing through the origin which cuts X-axis at $(a, 0)$ and Y-axis at $(0, b)$ is $x^2 + y^2 - ax - by = 0$.

- (vii) Circle Touching Y-axis at Origin and Centred at X-axis

Equation of the circle is

$$x^2 + y^2 - 2gx = 0$$

$(0, 0)$ and $(2g, 0)$ are the end points of the diameter.

- (viii) Circle Touching X-axis at Origin and Centred at Y-axis

Equation of the circle is

$$x^2 + y^2 - 2fy = 0$$

$(0, 0)$ and $(0, -2f)$ are the end points of the diameter.

- (ix) Equation of a Circle in

Diametric Form If (x_1, y_1) and (x_2, y_2) are the end points of one of the diameter, then the equation of the circle is

$$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$$

NOTE The diametric form of a circle can also be written as $x^2 + y^2 - x(x_1 + x_2) - y(y_1 + y_2) + x_1x_2 + y_1y_2 = 0$ or $x^2 + y^2 - x(\text{sum of abscissae}) - y(\text{sum of ordinates}) + \text{product of abscissae} + \text{product of ordinates} = 0$

- (x) Parametric Form of a Circle

Consider the circle $(x - h)^2 + (y - k)^2 = r^2$, centred at $A(h, k)$ and radius r .

Let $P \equiv (x, y)$, the coordinates of P can be expressed as $x = h + r \cos \theta$ and $y = k + r \sin \theta$.

These equations represent the coordinates of any point on the circle in terms of the parameter θ .

Position of a Point with Respect to a Circle

A point (x_1, y_1) lies outside, on or inside a circle

$$S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$$

According as $S_1 >, =$ or < 0 respectively

where, $S_1 = x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c$

NOTE The greatest and least distances of a point $A(x, y)$ from a circle with centre C and radius r are $|AC + r|$ and $|AC - r|$, respectively.

Tangent to a Circle

- (i) Let $P(x_1, y_1)$ be a point lying on the circle.

Then, equations of tangents in different forms of circles are given below:

Equation of the circle	Equation of the tangent at $P(x_1, y_1)$
(a) $x^2 + y^2 = r^2$	$T \equiv xx_1 + yy_1 - r^2 = 0$
(b) $(x - h)^2 + (y - k)^2 = r^2$	$T \equiv (x - h)(x_1 - h) + (y - k)(y_1 - k) - r^2 = 0$
(c) $x^2 + y^2 + 2gx + 2fy + c = 0$	$T \equiv xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c = 0$

- (ii) **Condition for Tangency** A line L may be a Tangent to any given circle S , if the perpendicular distance L from the centre of S is equal to the radius of the circle S .

Let the line $y = mx + c$ be a tangent to $x^2 + y^2 = r^2$ with radius r , then $c = \pm r\sqrt{1+m^2}$.

The equation of tangents of slope m to the circle $x^2 + y^2 = r^2$ are $y = mx \pm r\sqrt{1+m^2}$ and coordinates of point of contact are $\left(\pm \frac{rm}{\sqrt{1+m^2}}, \mp \frac{r}{\sqrt{1+m^2}}\right)$.

(iii) **Length of Tangent** The length of the tangent from a given point (x_1, y_1) to a circle

$x^2 + y^2 + 2gx + 2fy + c = 0$ is given as

$$l = \sqrt{x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c}$$

NOTE If a line touches the circle, then length of perpendicular from the centre upon the line is equal to the radius of the circle.

Pair of Tangents

If a point P lies outside a given circle, then a pair of tangents can be drawn from P to the circle as shown in figure.

The combined equation of the pair of tangents drawn from the point $P(x_1, y_1)$ to the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is

$$T^2 = SS_1$$

where, $S = x^2 + y^2 + 2gx + 2fy + c$,

$$S_1 = x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c$$

and $T = xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c$

Director Circle

The locus of the point of intersection of two perpendicular tangents to a given circle, is known as director circle. If the equation of a circle is $x^2 + y^2 = a^2$. Then, equation of director circle is $x^2 + y^2 = 2a^2$.

NOTE The radius of the director circle is $\sqrt{2}$ times the radius of the given circle.

Equation of Normals

The normal at any point on a curve is a straight line which is perpendicular to the tangent to the curve at that point and it always passes through origin.

1. Point Form

The equation of normal to the circle

$x^2 + y^2 + 2gx + 2fy + c = 0$ or $x^2 + y^2 = a^2$ at any point (x_1, y_1) is

$$\frac{x - x_1}{x_1 + g} = \frac{y - y_1}{y_1 + f} \quad \text{or} \quad \frac{x}{x_1} = \frac{y}{y_1}$$

2. Parametric Form

The equation of normal to the circle $x^2 + y^2 = a^2$ at point

$(a \cos \theta, a \sin \theta)$ is $\frac{x}{\cos \theta} = \frac{y}{\sin \theta}$.

Chord of Contact

The chord joining the points of contact of the two tangents from a point is called the chord of contact of tangents. The equation of the chord of contact of tangents drawn from a point (x_1, y_1) to the circle $x^2 + y^2 = r^2$ is

$$xx_1 + yy_1 = r^2 \text{ or } T = 0.$$

If AB is a chord of contact of tangents from C to the circle $x^2 + y^2 = r^2$ and M is the mid-point of AB as shown in figure.

Then,

$$(i) \text{ Coordinates of } M = \left(\frac{r^2 x_1}{x_1^2 + y_1^2}, \frac{r^2 y_1}{x_1^2 + y_1^2} \right)$$

$$(ii) AB = 2r \frac{\sqrt{x_1^2 + y_1^2 - r^2}}{\sqrt{x_1^2 + y_1^2}}$$

$$(iii) BC = \sqrt{x_1^2 + y_1^2 - r^2}$$

$$(iv) \text{ Area of quadrilateral } OACB = r \sqrt{x_1^2 + y_1^2 - r^2}$$

$$(v) \text{ Area of } \triangle ABC = \frac{r}{x_1^2 + y_1^2} (x_1^2 + y_1^2 - r^2)^{3/2}$$

$$(vi) \text{ Area of } \triangle OAB = \frac{r^3}{x_1^2 + y_1^2} \sqrt{x_1^2 + y_1^2 - r^2}$$

$$(vii) \text{ Angle between two tangents } \angle ACB \text{ is } 2 \tan^{-1} \frac{r}{\sqrt{S_1}}.$$

Chord Bisected at a Given Point

The equation of the chord of the circle $x^2 + y^2 = a^2$ bisected at the point (x_1, y_1) is given by

$$xx_1 + yy_1 - a^2 = x_1^2 + y_1^2 - a^2$$

or

$$T = S_1$$

Of all the chords which pass through a given point $M(a, b)$ inside the circle, the shortest chord is one whose middle point is (a, b) .

Equation of Common Chord of Two Circles

If $S = 0$ and $S' = 0$ are two intersecting circles, then equation of common chord is $S - S' = 0$.

Also, its length $= 2\sqrt{r_1^2 - p_1^2} = 2\sqrt{r_2^2 - p_2^2}$

where, p_1 and p_2 are the perpendicular distances of the centres from the common chord.

Intersection of a Line and a Circle

Consider the circle $x^2 + y^2 = r^2$ and the line $y = mx + c$.

(i) If $r > \left| \frac{c}{\sqrt{1+m^2}} \right|$, then the line intersects the circle at two distinct points.

(ii) If $r = \left| \frac{c}{\sqrt{1+m^2}} \right|$, then the line intersects the circle at only one point. It is called a tangent.

(iii) If $r < \left| \frac{c}{\sqrt{1+m^2}} \right|$, then the line does not intersect the circle.

NOTE The length of side of an equilateral triangle inscribed in the circle $x^2 + y^2 = a^2$ is $a\sqrt{3}$.

Family of Circles

The equation of a family of circles passing through the intersection of a circle $x^2 + y^2 + 2gx + 2fy + c = 0$ and line $L \equiv lx + my + n = 0$ is

$$x^2 + y^2 + 2gx + 2fy + c + \lambda(lx + my + n) = 0 \text{ or } S + \lambda L = 0$$

where, λ is any real number.

The equation of the family of circles passing through the point $A(x_1, y_1)$ and $B(x_2, y_2)$ is

$$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) + \lambda \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow (x - x_1)(x - x_2) + (y - y_1)(y - y_2) + \lambda L = 0$$

where, $L = 0$ represents the line passing through $A(x_1, y_1)$ and $B(x_2, y_2)$ and $\lambda \in R$.

The equation of the family of circles touching the circle $S = x^2 + y^2 + 2gx + 2fy + c = 0$ at point $P(x_1, y_1)$ is

$$x^2 + y^2 + 2gx + 2fy + c + \lambda\{xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c\} = 0$$

$$\text{or } S + \lambda L = 0$$

where, $L = 0$ is the equation of the tangent to $S = 0$ at (x_1, y_1) and $\lambda \in R$ the equation of the family of the circles passing through the intersection of the circles

$$S_1 = x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$$

$$\text{and } S_2 = x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0 \text{ is}$$

where $(\lambda \neq -1)$ is an arbitrary real number.

Angle of Intersection of Two Circles

The angle of intersection of two circles is defined as the angle between the tangents or angle between the normals to the two circles at their point of intersection is given by

$$\cos \theta = \frac{r_1^2 + r_2^2 - d^2}{2r_1 r_2}$$

where, d is distance between centres of the circles.

Orthogonal Circles

Two circles are said to intersect orthogonally, if their angle of intersection is a right angle.

$$(\text{Radius of 1st circle})^2 + (\text{Radius of 2nd circle})^2 = (\text{Distance between centres})^2$$

$$\Rightarrow 2(g_1g_2 + f_1f_2) = c_1 + c_2$$

which is the condition of orthogonality of two circles.

The circles having radii r_1 and r_2 intersect orthogonally.

$$\text{Length of their common chord} = \frac{2r_1r_2}{\sqrt{r_1^2 + r_2^2}}$$

Common Tangents of Two Circles

Let the centres and radii of two circles be C_1, C_2 and r_1, r_2 , respectively.

(i) When one circle contains other, no common tangent is possible.

Condition $C_1C_2 < r_1 - r_2$.

- (ii) When two circles touch internally, one common tangent is possible.

Condition $C_1C_2 = r_1 - r_2$

- (iii) When two circles intersect, two common tangents are possible.

Condition $|r_1 - r_2| < C_1C_2 < r_1 + r_2$

- (iv) When two circles touch externally, three common tangents are possible.

Condition $C_1C_2 = r_1 + r_2$

A divides C_1C_2 externally in the ratio $r_1:r_2$ and B divides C_1C_2 internally in the ratio $r_1:r_2$.

- (v) When two circles do not touch each other, four common tangents are possible.

Condition $C_1C_2 > r_1 + r_2$

Practice Exercise

- The points $(-5, 11)$, $(11, 19)$, $(18, -4)$ lie on a circle, centre of the circle is at
 - $(3, 4)$
 - $(4, 3)$
 - $(5, 4)$
 - None of these
- If the base of a triangle and the ratio of the lengths of the other two unequal sides are given, then the vertex lies on a/an.
 - straight line
 - circle
 - ellipse
 - parabola
- Find the equation of a circle concentric with the circle $x^2 + y^2 - 6x + 12y + 15 = 0$ and has double of its area.
 - $x^2 + y^2 - 6x + 12y - 15 = 0$
 - $x^2 + y^2 - 6x - 12y + 15 = 0$
 - $x^2 + y^2 - 6x + 12y + 15 = 0$
 - None of the above
- A circle of radius 5 units touches both the axes and lies in the first quadrant. If the circle makes one complete roll on the X-axis along the positive direction of X-axis, then its equation in the new position is
 - $x^2 + y^2 + 20\pi x - 10y + 100\pi^2 = 0$
 - $x^2 + y^2 + 20\pi x + 10y + 100\pi^2 = 0$
 - $x^2 + y^2 - 20\pi x - 10y + 100\pi^2 = 0$
 - None of the above
- If the circle $x^2 + y^2 + 6x + 5 + \lambda(x^2 + y^2 - 8x + 7) = 0$ is converted into a point, then the values of λ are
 - $1 \pm \frac{\sqrt{2}}{3}$
 - $2 \pm \frac{2\sqrt{2}}{3}$
 - $2 \pm \frac{4\sqrt{2}}{3}$
 - $1 \pm \frac{4\sqrt{2}}{3}$
- Find the equation of the circle which passes through the points $(2, 3)$ and $(4, 5)$ and the centre lies on the straight line $y - 4x + 3 = 0$.
 - $x^2 + y^2 - 4x - 10y + 25 = 0$
 - $x^2 + y^2 - 4x - 10y - 25 = 0$
 - $x^2 + y^2 - 4x + 10y - 25 = 0$
 - None of the above
- The equation of circle which passes through the point $(2, 0)$ and whose centre is the limit of the point of intersection of the lines $3x + 5y = 1$ and $(2 + c)x + 5c^2y = 1$ as $c \rightarrow 1$, is
 - $25(x^2 + y^2) - 20x + 2y + 60 = 0$
 - $25(x^2 + y^2) - 20x + 2y - 60 = 0$
 - $25(x^2 - y^2) - 20x - 2y - 60 = 0$
 - None of the above
- Consider a family of circles which are passing through the point $(-1, 1)$ and are tangent to X-axis. If (h, k) are the coordinates of the centre of the circles, then the set of values of k is given by the interval
 - $0 < k < \frac{1}{2}$
 - $k \geq \frac{1}{2}$
 - $-\frac{1}{2} \leq k \leq \frac{1}{2}$
 - $k \leq \frac{1}{2}$
- The cartesian equations of the curves $x = 7 + 4 \cos \alpha$ and $y = -3 + 4 \sin \alpha$ is
 - $x^2 + y^2 - 14x + 6y + 42 = 0$
 - $x^2 + y^2 - 6x + 14y + 21 = 0$
 - $x^2 + y^2 - 10x + 12y + 28 = 0$
 - None of the above

10. If the two conics $a_1x^2 + 2h_1xy + b_1y^2 = c_1$, $a_2x^2 + 2h_2xy + b_2y^2 = c_2$ intersect in 4 concyclic points, then
 a. $(a_1 - b_1)h_2 = (a_2 - b_2)h_1$ b. $(a_1 - b_1)h_1 = (a_2 - b_2)h_2$
 c. $(a_1 + b_1)h_2 = (a_2 + b_2)h_1$ d. $(a_1 + b_1)h_1 = (a_2 + b_2)h_2$
11. The circle passing through $(1, -2)$ and touching the X-axis at $(3, 0)$, also passes through the point
 a. $(-5, 2)$ b. $(2, -5)$
 c. $(5, -2)$ d. $(-2, 5)$
12. A circle touches the hypotenuse of a right angle triangle at its middle point and passes through the mid-point of the shorter side. If a and b ($a < b$) are the length of the sides, then the radius is
 a. $\frac{b}{a}\sqrt{a^2 + b^2}$ b. $\frac{b}{2a}\sqrt{a^2 - b^2}$
 c. $\frac{b}{4a}\sqrt{a^2 + b^2}$ d. None of these
13. If the lines $3x - 4y - 7 = 0$ and $2x - 3y - 5 = 0$ are two diameters of a circle of area 49π sq units, then equation of the circle is
 a. $x^2 + y^2 + 2x - 2y - 62 = 0$
 b. $x^2 + y^2 - 2x + 2y - 62 = 0$
 c. $x^2 + y^2 - 2x + 2y - 47 = 0$
 d. $x^2 + y^2 + 2x - 2y - 47 = 0$
14. The equation of the locus of a point such that the sum of its distances from $(0, 2)$ and $(0, -2)$ is 6, is given by
 a. $\frac{x^2}{5} + \frac{y^2}{9} = 1$ b. $\frac{x^2}{9} + \frac{y^2}{5} = 1$
 c. $\frac{x^2}{5} - \frac{y^2}{9} = 1$ d. None of these
15. If the circle $x^2 + y^2 - 4x - 4y - 1 = 0$ has two points P and Q on it which are farthest and nearest respectively from the point $(6, 5)$, then
 a. $P \equiv \left(-\frac{22}{5}, 3\right)$ b. $Q \equiv \left(\frac{22}{5}, \frac{19}{5}\right)$
 c. $P \equiv \left(\frac{14}{3}, -\frac{11}{5}\right)$ d. $Q \equiv \left(-\frac{14}{3}, -4\right)$
16. Equation of the circle with centre on the Y-axis and passing through the origin and the point $(2, 3)$, is
 a. $x^2 + y^2 + 13y = 0$
 b. $3x^2 + 3y^2 + 13x + 3 = 0$
 c. $6x^2 + 6y^2 - 26y = 0$
 d. $x^2 + y^2 + 13x + 3 = 0$
17. Find the equation of a circle which touches both the axes and the line $3x - 4y + 8 = 0$ and lies in the third quadrant.
 a. $x^2 + y^2 + 4x + 4y - 4 = 0$
 b. $x^2 + y^2 - 4x - 4y + 4 = 0$
 c. $x^2 + y^2 + 4x + 4y + 4 = 0$
 d. None of the above
18. If a circle has centre $(3, -1)$ and cut-off an intercept of length 6 from the line $2x - 5y + 18 = 0$. Then, the equation of the circle is
 a. $x^2 + y^2 - 6x + 2y + 28 = 0$
 b. $x^2 + y^2 + 6x + 2y - 28 = 0$
 c. $x^2 + y^2 - 6x - 2y + 28 = 0$
 d. $x^2 + y^2 - 6x + 2y - 28 = 0$
19. The equation of a circle with origin as centre and passing through the vertices of an equilateral triangle whose median is of length $3a$, is
 a. $x^2 + y^2 = 9a^2$ b. $x^2 + y^2 = 16a^2$
 c. $x^2 + y^2 = 4a^2$ d. $x^2 + y^2 = a^2$
20. The centre of a circle passing through the points $(0, 0)$, $(1, 0)$ and touching the circle $x^2 + y^2 = 9$, is
 a. $\left(\frac{3}{2}, \frac{1}{2}\right)$ b. $\left(\frac{1}{2}, \frac{3}{2}\right)$
 c. $\left(\frac{1}{2}, \frac{1}{2}\right)$ d. $\left(\frac{1}{2}, -2^{1/2}\right)$
21. If the squares of the length of the tangents from a point P to the circles $x^2 + y^2 = a^2$, $x^2 + y^2 = b^2$ and $x^2 + y^2 = c^2$ are in AP, then
 a. a, b, c are in AP b. a, b, c are in GP
 c. a^2, b^2, c^2 are in AP d. a^2, b^2, c^2 are in GP
22. If the lines $3x - 4y + 4 = 0$ and $6x - 8y - 7 = 0$ are tangents to a circle, then find the radius of the circle.
 a. $\frac{3}{4}$ b. $\frac{4}{3}$ c. $\frac{1}{4}$ d. $\frac{7}{4}$
23. What is the length of an equilateral triangle inscribed in the circle $x^2 + y^2 = \frac{4}{3}$?
 a. 2 units b. 5 units c. 3 units d. 7 units
24. The circle $x^2 + y^2 = 5$ has a tangent at the point $(1, -2)$. If this tangent touches the circle $x^2 + y^2 - 8x + 6y + 20 = 0$ also. Then, its point of contact is
 a. $(3, -1)$ b. $(-3, 0)$
 c. $(-1, -1)$ d. $(-2, 1)$
25. The point of contact of $4x + 5y + 6 = 0$ and $x^2 + y^2 - 2x - 4y - 8 = 0$ is
 a. $\left(\frac{2}{3}, \frac{2}{5}\right)$ b. $\left(\frac{2}{5}, \frac{5}{4}\right)$
 c. $(3, -2)$ d. None of these
26. Let A be the centre of the circle $x^2 + y^2 - 2x - 4y - 20 = 0$. If the tangents at the points $B(1, 7)$ and $D(4, -2)$ on the circle meet at C , then find the area of the quadrilateral $ABCD$.
 a. 78 b. 75
 c. 79 d. 85

27. The ΔPQR is inscribed in the circle $x^2 + y^2 = 25$. If Q and R have coordinates $(3, 4)$ and $(-4, 3)$, respectively, then $\angle QPR$ is equal to
 a. $\frac{\pi}{2}$ b. $\frac{\pi}{3}$ c. $\frac{\pi}{4}$ d. $\frac{\pi}{6}$
28. If $(x - b)^2 + (y - a)^2 = c^2$ and $(x - a)^2 + (y - b)^2 = c^2$ are two circles touching each other, then
 a. $a = b \pm 2c$ b. $a = b \pm \sqrt{2}c$
 c. $b \pm c$ d. None of these
29. How many tangents can be drawn from the point $(3, -2)$ to the circle $x^2 + y^2 - 8x - 6y + 9 = 0$?
 a. 2 b. 1
 c. 0 d. None of these
30. If the line $3x - 4y - k = 0$, touches the circle $x^2 + y^2 - 4x - 8y - 5 = 0$ at (a, b) , then $k + a + b$ is equal to
 a. 20 b. 22 c. -30 d. -28
31. The locus of the point, the chord of contact of tangents from which to the circle $x^2 + y^2 = a^2$ subtends a right angle at the centre, is a circle of radius
 a. $2a$ b. $\frac{a}{2}$ c. $\sqrt{2}a$ d. a^2
32. The locus of the mid-point of the chords of a circle $x^2 + y^2 = 4$, which subtends a right angle at the centre, is
 a. $x + y = 2$ b. $x^2 + y^2 = 1$ c. $x^2 + y^2 = 2$ d. $x - y = 0$
33. If two distinct chords drawn from the point (p, q) on the circle $x^2 + y^2 = px + qy$ (where $pq \neq 0$) are bisected by the X -axis, then
 a. $p^2 = q^2$ b. $p^2 = 8q^2$ c. $p^2 < 8q^2$ d. $p^2 > 8q^2$
34. The equation of the circle described on the common chord of the circles, $x^2 + y^2 - 12x + 2y - 10 = 0$ and $x^2 + y^2 - 8x + 5y - 37 = 0$ as a diameter, is
 a. $25(x^2 + y^2) - 348x + 14y - 74 = 0$
 b. $25(x^2 + y^2) - 348x + 140y - 74 = 0$
 c. $25(x^2 + y^2) - 300x + 14y + 70 = 0$
 d. None of the above
35. AB is chord of the circle $x^2 + y^2 = 25$. The tangents of A and B intersect at C . If $(2, 3)$ is the mid-point of AB , then area of the quadrilateral $OACB$ is
 a. $50\sqrt{\frac{13}{3}}$ b. $50\sqrt{\frac{3}{13}}$ c. $50\sqrt{3}$ d. $\frac{50}{\sqrt{3}}$
36. The equation of the smallest circle passing through the intersection of line $x + y = 2$ and the circle $x^2 + y^2 = 16$ is
 a. $x^2 + y^2 - 2x - 2y - 12 = 0$
 b. $x^2 + y^2 - 2x + 2y - 12 = 0$
 c. $x^2 + y^2 + 2x + 2y + 12 = 0$
 d. $x^2 + y^2 + 2x - 2y - 12 = 0$
37. If the circles $x^2 + y^2 + 2ax + cy + a = 0$ and $x^2 + y^2 - 3ax + dy - 1 = 0$ intersect in two distinct points P and Q . Then, the line $5x + by - a = 0$ passes through P and Q for
 a. exactly two values of a
 b. infinitely many values of a
 c. no value of a
 d. exactly one value of a
38. The circle $x^2 + y^2 = 4x + 8y + 5$ intersects the line $3x - 4y = m$ at two distinct points, if
 a. $-85 < m < -35$ b. $-35 < m < 15$
 c. $15 < m < 65$ d. $35 < m < 85$
39. If P and Q are the points of intersection of the circles $x^2 + y^2 + 3x + 7y + 2p - 5 = 0$ and $x^2 + y^2 + 2x + 2y - p^2 = 0$, then there is a circle passing through P , Q and $(1, 1)$ and
 a. all values of p b. all except one value of p
 c. all except two values of p d. exactly one value of p
40. The circles $x^2 + y^2 - 10x + 16 = 0$ and $x^2 + y^2 = r^2$ intersect each other in two distinct points, if
 a. $r < 2$ b. $r > 8$ c. $2 < r < 8$ d. $2 \leq r \leq 8$
41. If a circle passes through the point (a, b) and cuts the circle $x^2 + y^2 = p^2$ orthogonally, then the equation of the locus of its centre is
 a. $2ax + 2by - (a^2 + b^2 + p^2) = 0$
 b. $x^2 + y^2 - 2ax - 3by + (a^2 - b^2 - p^2) = 0$
 c. $2ax + 2by - (a^2 + b^2 + 2b^2 + p^2) = 0$
 d. $x^2 + y^2 - 3ax - 4by + (a^2 + b^2 - p^2) = 0$
42. If $2x - 4y = 9$ and $6x - 12y + 7 = 0$ are common tangents to a circle, then radius of the circle is
 a. $\frac{\sqrt{3}}{5}$ b. $\frac{17}{6\sqrt{5}}$
 c. $\frac{\sqrt{2}}{3}$ d. $\frac{17}{3\sqrt{5}}$
43. Let C be the circle with centre $(1, 1)$ and radius 1. If T is the circle centred at $(0, y)$, passing through origin and touching the circle C externally, then the radius of T is equal to
 a. $\frac{1}{2}$ b. $\frac{1}{4}$
 c. $\frac{\sqrt{3}}{\sqrt{2}}$ d. $\frac{\sqrt{3}}{2}$
44. If two circles $x^2 + y^2 + 4x + 6y = 0$ and $x^2 + y^2 + 2g'x + 2f'y = 0$ touch each other, then
 a. $3g' = 2f'$
 b. $3f' = 2g'$
 c. $f' + g' = 6$
 d. $f' - g' = 1$

BITSAT Archives

- If the equation of circle which passes through the origin and cuts off intercepts 5 and 6 from the positive parts of the X-axis and Y-axis respectively, is $\left(x - \frac{5}{2}\right)^2 + (y - 3)^2 = \lambda$, then λ equals [2013]
 - $\frac{61}{4}$
 - $\frac{4}{6}$
 - $\frac{1}{4}$
 - 0
- The equation of the circle circumscribing the triangle formed by the lines $x + y = 6$, $2x + y = 4$ and $x + 2y = 5$ is [2012]
 - $x^2 + y^2 + 17x + 19y - 50 = 0$
 - $x^2 + y^2 - 17x - 19y - 50 = 0$
 - $x^2 + y^2 + 17x - 19y - 50 = 0$
 - $x^2 + y^2 - 17x - 19y + 50 = 0$
- The length of the tangent from (5, 1) to the circle $x^2 + y^2 + 6x - 4y - 3 = 0$ is [2012]
 - 7
 - 49
 - 63
 - 21
- The angle between the tangent drawn from origin to the circle $(x - 7)^2 + (y + 1)^2 = 25$ is [2010, 09]
 - $\frac{\pi}{3}$
 - $\frac{\pi}{6}$
 - $\frac{\pi}{2}$
 - $\frac{\pi}{8}$
- If the circle passes through (0, 0) (a, 0) and (0, b), then the coordinates of its centre are [2009]
 - $\left(\frac{b}{2}, \frac{a}{2}\right)$
 - $\left(\frac{a}{2}, \frac{b}{2}\right)$
 - (b, a)
 - (a, b)
- If the sum of the distance of a point P from two perpendicular lines in a plane, is 1, then the locus of P is a [2008]
 - rhombus
 - circle
 - straight line
 - pair of straight lines
- If the lines $2x - 3y = 5$ and $3x - 4y = 7$ are two diameters of a circle of radius 7, then the equation of the circle is [2008]
 - $x^2 + y^2 + 2x - 4y - 47 = 0$
 - $x^2 + y^2 = 49$
 - $x^2 + y^2 - 2x + 2y - 47 = 0$
 - $x^2 + y^2 = 17$
- The radius of the circle with the polar equation $r^2 - 8r(\sqrt{3} \cos \theta + \sin \theta) + 15 = 0$, is [2008]
 - 8
 - 7
 - 6
 - 5
- The centre of circle whose normals are $x^2 - 2xy - 3x + 6y = 0$, is [2007]
 - $\left(3, \frac{3}{2}\right)$
 - $\left(3, -\frac{3}{2}\right)$
 - $\left(\frac{3}{2}, 3\right)$
 - None of these
- The centres of a set of circles, each of radius 3, lie on the circle $x^2 + y^2 = 25$. The locus of any point in the set is [2007]
 - $4 \leq x^2 + y^2 \leq 64$
 - $x^2 + y^2 \leq 25$
 - $x^2 + y^2 \geq 25$
 - $3 \leq x^2 + y^2 \leq 9$
- If the two circles $x^2 + y^2 - 2x + 22y + 5 = 0$ and $x^2 + y^2 + 14x + 6y + k = 0$ intersect orthogonally, k is equal to [2006]
 - 47
 - 47
 - 49
 - 49
- The radius of the circle $x^2 + y^2 + 4x + 6y + 13 = 0$ is [2006]
 - $\sqrt{26}$
 - $\sqrt{13}$
 - $\sqrt{23}$
 - 0
- The centre of the circles $x = 2 + 3 \cos \theta$, $y = 3 \sin \theta - 1$ is [2006]
 - (3, 3)
 - (2, -1)
 - (-2, 1)
 - (-1, 2)
- The equation to the circle with centre (2, 1) and touching the line $3x + 4y = 5$ is [2006]
 - $x^2 + y^2 - 4x - 2y + 5 = 0$
 - $x^2 + y^2 - 4x - 2y - 5 = 0$
 - $x^2 + y^2 - 4x - 2y + 4 = 0$
 - $x^2 + y^2 - 4x - 2y - 4 = 0$
- The condition for a line $y = 2x + c$ to touch the circle $x^2 + y^2 = 16$ is [2006]
 - $c = 10$
 - $c^2 = 80$
 - $c = 12$
 - $c^2 = 64$
- Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be two points such that their abscissae x_1 and x_2 are the roots of the equation $x^2 + 2x - 3 = 0$ while the ordinates y_1 and y_2 are the roots of the equation $y^2 + 4y - 12 = 0$. Then, the centre of the circle with PQ as diameter is [2005]
 - (-1, -2)
 - (1, 2)
 - (1, -2)
 - (-1, 2)
- The number of common tangents to circles $x^2 + y^2 + 2x + 8y - 23 = 0$ and $x^2 + y^2 - 4x - 10y + 9 = 0$ is [2005]
 - 1
 - 3
 - 2
 - None of these
- If $\frac{x}{\alpha} + \frac{y}{\beta} = 1$ touches the circle $x^2 + y^2 = a^2$, then the point $\left(\frac{1}{\alpha}, \frac{1}{\beta}\right)$ lies on a/an [2005]
 - straight line
 - circle
 - parabola
 - ellipse

Answer with Solutions

Practice Exercise

1. (a) **Hint** Let the centre be (x, y) , $OA = OB$ (radius of same circle)

$$\Rightarrow \sqrt{(x+5)^2 + (y-11)^2} = \sqrt{(x-11)^2 + (y-19)^2}$$

and $OA = OC$ (radius)

$$\sqrt{(x+5)^2 + (y-11)^2} = \sqrt{(x-18)^2 + (y-14)^2}$$

2. (b) Let the base of the triangle be the line joining $B(0, 0)$ and $C(a, 0)$ and let the vertex be $A(h, k)$, where a is fixed. Also let

$$\frac{AB}{AC} = \lambda, \lambda \neq 1$$

$$\Rightarrow AB^2 = \lambda^2 AC^2$$

$$\Rightarrow h^2 + k^2 = \lambda^2 [(h-a)^2 + k^2]$$

$$\Rightarrow h^2(1-\lambda^2) + k^2(1-\lambda^2) + 2a\lambda^2 h - a^2\lambda^2 = 0$$

$$\text{So, } A(h, k) \text{ lies on } x^2 + y^2 + 2a \frac{\lambda^2}{1-\lambda^2} x - \frac{a^2\lambda^2}{1-\lambda^2} = 0$$

which is a circle.

3. (a) Centre of given circle $x^2 + y^2 - 6x + 12y + 15 = 0$ is $(3, -6)$.

$$\therefore \text{Radius} = \sqrt{(3)^2 + (-6)^2 - 15} = \sqrt{30}$$

$$\text{Area of circle} = \pi r^2 = \pi (\sqrt{30})^2 = 30\pi$$

Area of required circle = 2 (Area of given circle)

$$\Rightarrow \pi R^2 = 2 \times 30\pi = 60\pi$$

$$\Rightarrow R^2 = 60 \Rightarrow R = 2\sqrt{15}$$

$\therefore$ Equation of required circle is

$$(x-3)^2 + (y+6)^2 = (2\sqrt{15})^2$$

$$\Rightarrow x^2 + 9 - 6x + y^2 + 36 + 12y = 60$$

$$\Rightarrow x^2 + y^2 - 6x + 12y - 15 = 0$$

4. (d) The x -coordinate of new position of the circle is $5 \times (\text{circumference of circle})$ i.e. $(5 + 10\pi)$.

Here, y -coordinate is 5 and radius is also 5.

Hence, the equation of the circle in new position is

$$(x-5-10\pi)^2 + (y-5)^2 = 5^2$$

$$\Rightarrow x^2 + y^2 - 10x - 10y - 20\pi x + 100\pi^2 + 100\pi = 0$$

5. (c) **Hint** We have,

$$x^2(1+\lambda) + y^2(1+\lambda) + (6-8\lambda)x + (5+7\lambda)y = 0$$

$$\Rightarrow x^2 + y^2 + \left(\frac{6-8\lambda}{1+\lambda}\right)x + \left(\frac{5+7\lambda}{1+\lambda}\right)y = 0$$

This will convert into a point circle, if

Radius of the circle = 0

$$\Rightarrow \sqrt{\left(\frac{3-4\lambda}{1+\lambda}\right)^2 + 0 - \left(\frac{5+7\lambda}{1+\lambda}\right)} = 0$$

6. (a) Let the equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \dots(i)$$

Since, it passes through the points $(2, 3)$ and $(4, 5)$.

$$\therefore 2^2 + 3^2 + 2g(2) + 2f(3) + c = 0$$

$$\Rightarrow 4g + 6f + c + 13 = 0 \quad \dots(ii)$$

$$\text{and } 4^2 + 5^2 + 2g(4) + 2f(5) + c = 0$$

$$\Rightarrow 8g + 10f + c + 41 = 0 \quad \dots(iii)$$

On subtracting Eq. (ii) from Eq. (iii), we get

$$4g + 4f + 28 = 0$$

$$\Rightarrow g + f + 7 = 0 \quad \dots(iv)$$

Also, centre $(-g, -f)$ lies on line $y - 4x + 3 = 0$.

$$\therefore -f + 4g + 3 = 0 \quad \dots(v)$$

On solving Eqs. (iv) and (v), we get $g = -2, f = -5$

On putting $g = -2, f = -5$ in Eq. (ii), we get

$$4(-2) + 6(-5) + c + 13 = 0 \Rightarrow c = 25$$

On putting the values of g, f and c in Eq. (i), we get

$$x^2 + y^2 - 4x - 10y + 25 = 0$$

7. (b) Given lines are $3x + 5y = 1$... (i)

$$\text{and } (2+c)x + 5c^2y = 1 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$(1-c)x + 5(1-c^2)y = 0 \Rightarrow c = 1, x + 10y = 0$$

$$\therefore \text{Centre} = \left(\frac{2}{5}, -\frac{1}{25}\right)$$

$\therefore$ Equation of circle is

$$\left(x - \frac{2}{5}\right)^2 + \left(y + \frac{1}{25}\right)^2 = \left(2 - \frac{2}{5}\right)^2 + \frac{1}{25^2}$$

$$\Rightarrow 25(x^2 + y^2) - 20x + 2y - 60 = 0$$

8. (b) Equation of circle which touches X -axis and coordinates of centre are (h, k) , is $(x-h)^2 + (y-k)^2 = k^2$

Since, it passes through $(-1, 1)$, then

$$(-1-h)^2 + (1-k)^2 = k^2 \Rightarrow h^2 + 2h - 2k + 2 = 0$$

For real circles, $D \geq 0$

$$\Rightarrow (2)^2 - 4(-2k + 2) \geq 0 \Rightarrow k \geq 1/2$$

9. (a) **Hint** Given, $h = 7$, $k = -3$ and $r = 4$

$$\Rightarrow (x - 7)^2 + (y + 3)^2 = 16$$

10. (a)

11. (c) Let the equation of circle be

$$(x - 3)^2 + (y)^2 + \lambda y = 0$$

As it passes through $(1, -2)$.

$$\therefore (1 - 3)^2 + (-2)^2 + \lambda(-2) = 0$$

$$\Rightarrow 4 + 4 - 2\lambda = 0$$

$$\Rightarrow \lambda = 4$$

$$\therefore \text{Equation of circle is } (x - 3)^2 + y^2 + 4y = 0$$

By hit and trial method, we see that point $(5, -2)$ satisfies equation of circle.

12. (c) The equation of the circle touching $\frac{x}{a} + \frac{y}{b} = 1$ at $P\left(\frac{a}{2}, \frac{b}{2}\right)$ is

$$\left(x - \frac{a}{2}\right)^2 + \left(y - \frac{b}{2}\right)^2 + \lambda\left(\frac{x}{a} + \frac{y}{b} - 1\right) = 0 \quad \dots(i)$$

Since, it passes through $Q\left(\frac{a}{2}, 0\right)$.

Therefore, $\lambda = \frac{b^2}{2}$ [from Eq. (i)]

On putting the value of λ in Eq. (i), we get

$$\begin{aligned} &\left(x - \frac{a}{2}\right)^2 + \left(y - \frac{b}{2}\right)^2 + \frac{b^2}{2}\left(\frac{x}{a} + \frac{y}{b} - 1\right) = 0 \\ \Rightarrow &x^2 + y^2 - \left(a - \frac{b^2}{2a}\right)x - \frac{by}{2} + \frac{a^2 - b^2}{4} = 0 \end{aligned}$$

Let r be the radius of this circle.

$$\text{Then, } r^2 = \frac{1}{4}\left(a - \frac{b^2}{2a}\right)^2 + \frac{b^2}{16} - \left(\frac{a^2 - b^2}{4}\right) = \frac{b^2(a^2 + b^2)}{16a^2}$$

$$\Rightarrow r = \frac{b}{4a} \sqrt{a^2 + b^2}$$

13. (c) **Hint** The intersection of two diameters is the centre of circle, which is $(1, -1)$.

Let r be the radius of circle, then

$$\text{Area of circle} = 49\pi$$

$$\Rightarrow \pi r^2 = 49\pi \Rightarrow r = 7 \text{ units}$$

14. (a) Let the moving point be $P(x, y)$ and $A(0, 2)$

and $B(0, -2)$.

Now,

$$AP + BP = \sqrt{(x - 0)^2 + (y - 2)^2} + \sqrt{(x - 0)^2 + (y + 2)^2} = 6$$

$$\Rightarrow \sqrt{x^2 + (y - 2)^2} = 6 - \sqrt{x^2 + (y + 2)^2}$$

Squaring both sides, we get

$$x^2 + (y - 2)^2 = 36 + x^2 + (y + 2)^2 - 12\sqrt{x^2 + (y + 2)^2}$$

$$\text{or } -8y - 36 = -12\sqrt{x^2 + (y + 2)^2}$$

$$2y + 9 = 3\sqrt{x^2 + (y + 2)^2}$$

Squaring again, we get

$$4y^2 + 36y + 81 = 9(x^2 + y^2 + 4y + 4)$$

$$\text{or } 9x^2 + 5y^2 = 45 \text{ or } \frac{x^2}{5} + \frac{y^2}{9} = 1$$

15. (b) Clearly, centre and radius of the given circle

$$x^2 + y^2 - 4x - 4y - 1 = 0$$

are $(2, 2)$ and $\sqrt{4 + 4 + 1} = 3$, respectively.

$$\therefore AQ = CA - CQ = 5 - 3 = 2$$

$$\therefore CQ : QA = 3 : 2, \text{ then } Q = \left(\frac{3 \times 6 + 2 \times 2}{3 + 2}, \frac{3 \times 5 + 2 \times 2}{3 + 2}\right)$$

$$\text{i.e. } Q = \left(\frac{22}{5}, \frac{19}{5}\right)$$

16. (c) **Hint** Let the centre of circle be $(0, k)$.

Let equation of circle be

$$x^2 + y^2 - 2(0)x - 2ky + c = 0$$

$$\Rightarrow x^2 + y^2 - 2ky + c = 0$$

17. (c) Let a be the radius of the circle and centre of circle be $(-a, -a)$.

Since, the perpendicular distance from centre to the tangent is equal to the radius of the circle.

$$\therefore a = \frac{3(-a) - 4(-a) + 8}{\sqrt{3^2 + (-4)^2}} \Rightarrow a = \frac{a + 8}{5}$$

$$\Rightarrow 4a = 8 \Rightarrow a = 2$$

$$\therefore \text{Equation of circle is } (x + 2)^2 + (y + 2)^2 = 2^2$$

$$\Rightarrow x^2 + y^2 + 4x + 4y + 4 = 0$$

18. (d) Let $C \equiv (3, -1)$ be the centre. Line AB has equation

$$2x - 5y + 18 = 0$$

$$AB = 6$$

$$AL = 3$$

$CL =$ Length of the perpendicular from C on AB

$$= \frac{|2 \times 3 - 5 \times (-1) + 18|}{\sqrt{(2)^2 + (-5)^2}} = \sqrt{29}$$

$\therefore$ Radius of the circle, $AC = \sqrt{AL^2 + CL^2} = \sqrt{3^2 + 29} = \sqrt{38}$

Thus, equation of the required circle is

$$(x - 3)^2 + (y + 1)^2 = 38$$

$$\Rightarrow x^2 + y^2 - 6x + 2y - 28 = 0$$

19. (c) Let equation of circle be $x^2 + y^2 = r^2$... (i)

Since, in an equilateral triangle, the centroid coincides with the centre of the circumcircle.

Also, centroid divides the median in the ratio 2 : 1.

$$\therefore \text{Radius of circle, } r = \frac{2}{3}(3a) = 2a$$

On putting $r = 2a$ in Eq. (i), we get

$$x^2 + y^2 = (2a)^2 \Rightarrow x^2 + y^2 = 4a^2$$

20. (d) Since, the required circle touches the given circle and passes through its centre (0, 0).

$\therefore$ Its radius is half that of the given circle
 $= \frac{3}{2}$

Let this circle be $x^2 + y^2 + 2gx + 2fy = 0$

[$\because$ it passes through origin]

It also passes through (1, 0).

$$\therefore 1 + 2g = 0 \text{ i.e. } 2g = -1$$

$$\therefore \text{Centre of the circle} = \left(\frac{1}{2}, k\right) \quad [\text{say}]$$

$$\text{Radius} = \left(\frac{1}{4} + k^2\right)^{1/2}$$

$$\therefore \frac{9}{4} = \frac{1}{4} + k^2 \Rightarrow k^2 = \frac{8}{4} = 2$$

$$\Rightarrow k = \pm \sqrt{2}$$

$$\therefore \text{Centre of the circle is } \left(\frac{1}{2}, \pm \sqrt{2}\right).$$

21. (c) Let $P(x_1, y_1)$ be the given point and PT_1, PT_2, PT_3 be the lengths of the tangents from P to the circle $x^2 + y^2 = a^2$, $x^2 + y^2 = b^2$ and $x^2 + y^2 = c^2$, respectively. Then,

$$PT_1 = \sqrt{x_1^2 + y_1^2 - a^2}, PT_2 = \sqrt{x_1^2 + y_1^2 - b^2}$$

$$\text{and } PT_3 = \sqrt{x_1^2 + y_1^2 - c^2}$$

Now, PT_1^2, PT_2^2 and PT_3^2 are in A.P.

$$\Rightarrow 2PT_2^2 = PT_1^2 + PT_3^2$$

$$\Rightarrow 2(x_1^2 + y_1^2 - b^2) = (x_1^2 + y_1^2 - a^2) + (x_1^2 + y_1^2 - c^2)$$

$$\Rightarrow 2b^2 = a^2 + c^2$$

$\Rightarrow a^2, b^2, c^2$ are in A.P.

22. (a) Given lines are $3x - 4y + 4 = 0$

$$\text{and } 6x - 8y - 7 = 0 \text{ or } 3x - 4y - \frac{7}{2} = 0$$

are tangents to the circle.

Also, given lines are parallel.

$$\therefore \text{Radius} = \frac{1}{2} (\text{Distance between two parallel lines})$$

$$= \frac{1}{2} \frac{\left|4 + \frac{7}{2}\right|}{\sqrt{3^2 + 4^2}} = \frac{1}{2} \frac{\left|\frac{15}{2}\right|}{\sqrt{9 + 16}} = \frac{15}{4\sqrt{25}} = \frac{15}{4 \times 5} = \frac{3}{4}$$

23. (a) Given equation of circle is $x^2 + y^2 = \frac{4}{3}$.

$$\text{Radius of circle} = \frac{2}{\sqrt{3}}$$

$\therefore$ Length of equilateral triangle inscribed in circle

$$= \sqrt{3} \times \frac{2}{\sqrt{3}} = 2 \text{ units}$$

24. (a) The tangent at point (1, -2) to the circle $x^2 + y^2 = 5$ is

$$x - 2y - 5 = 0 \quad \dots (i)$$

Let this tangent touches the circle

$$x^2 + y^2 - 8x + 6y + 20 = 0 \text{ at } (x_1, y_1)$$

$\therefore$ Equation of tangent at (x_1, y_1) is

$$xx_1 + yy_1 - 4(x + x_1) + 3(y + y_1) + 20 = 0$$

$$\Rightarrow x(x_1 - 4) + y(y_1 + 3) - 4x_1 + 3y_1 + 20 = 0 \quad \dots (ii)$$

Now, Eqs. (i) and (ii) represent the same line.

$$\therefore \frac{x_1 - 4}{1} = \frac{y_1 + 3}{-2} = \frac{-4x_1 + 3y_1 + 20}{-5}$$

$$\Rightarrow -2x_1 + 8 = y_1 + 3$$

$$\Rightarrow 2x_1 + y_1 - 5 = 0$$

Only the point (3, -1) satisfies it.

Hence, the point of contact is (3, -1).

25. (b) Let the point of contact be (x_1, y_1) .

$\therefore$ The equation of tangent to the circle

$$x^2 + y^2 - 2x - 4y - 8 = 0 \text{ is}$$

$$xx_1 + yy_1 - (x + x_1) - 2(y + y_1) - 8 = 0$$

$$\text{or } x(x_1 - 1) + y(y_1 - 2) - (x_1 + 2y_1 + 8) = 0$$

But $4x + 5y + 6 = 0$, also represents the same line.

$$\therefore \frac{(x_1 - 1)}{4} = \frac{(y_1 - 2)}{5} = \frac{-(x_1 + 2y_1 + 8)}{6}$$

$$5x_1 - 4y_1 + 3 = 0 \quad \dots (i)$$

$$\text{and } 5x_1 + 16y_1 + 28 = 0 \quad \dots (ii)$$

On solving Eqs. (i) and (ii), we get

$$x_1 = \frac{2}{5} \text{ and } y_1 = \frac{5}{4}$$

So, the point of contact is $\left(\frac{2}{5}, \frac{5}{4}\right)$.

26. (b) The tangent at $B(1, 7)$ is $y = 7$

$$\text{and } D(4, -2) \text{ is } 3x - 4y - 20 = 0.$$

Then, meet at $C(16, 7)$.

$$\text{Now, } AB = 5, BC = 15$$

$$\text{Area of quadrilateral } ABCD = AB \cdot BC = 75$$

27. (c) QR subtend $\frac{\pi}{2}$ at the centre and QR subtends $\frac{\pi}{4}$ at P

or $\angle QPR = \frac{\pi}{4}$.

28. (b) |Radius of one circle $\pm$ Radius of other circle|
= Distance between centres

$$\Rightarrow |c \pm c| = \sqrt{(a-b)^2 + (a-b)^2}$$

Taking positive sign,

$$\pm(2c) = \sqrt{2}(a-b) \Rightarrow a-b = \pm\sqrt{2}c \Rightarrow a = b \pm \sqrt{2}c$$

29. (a) If $S \equiv x^2 + y^2 - 8x - 6y + 9 = 0$

Then, S at $(3, -2) = 9 + 4 - 24 + 12 + 9 > 0$

So, the point $(3, -2)$ lies outside the circle.

Hence, two tangents can be drawn to the circle from the point $(3, -2)$.

30. (a) Since, the given line touches the given circle, the length of the perpendicular from the centre $(2, 4)$ of the circle to the line $3x - 4y - k = 0$ is equal to the radius $\sqrt{4 + 16 + 5} = 5$ of the circle.

$$\therefore \frac{3 \times 2 - 4 \times 4 - k}{\sqrt{9 + 16}} = \pm 5$$

$$\Rightarrow k = 15 \quad [\because k > 0]$$

Now, equation of the tangent at (a, b) to the given circle is

$$xa + yb - 2(x + a) - 4(y + b) - 5 = 0$$

$$\Rightarrow (a-2)x + (b-4)y - (2a+4b+5) = 0$$

If it represents the given line $3x - 4y - k = 0$.

$$\text{Then, } \frac{a-2}{3} = \frac{b-4}{-4} = \frac{2a+4b+5}{k} = l \quad [\text{say}]$$

$$\Rightarrow a = 3l + 2, \quad b = 4 - 4l$$

$$\text{and } 2a + 4b + 5 = kl$$

$$\Rightarrow 2(3l+2) + 4(4-4l) + 5 = 15l \quad [\because k = 15]$$

$$\Rightarrow l = 1$$

$$\Rightarrow a = 5, b = 0$$

$$\therefore k + a + b = 15 + 5 + 0 = 20$$

31. (c) Let $P(h, k)$ be the point. Then, the chord of contact of tangents drawn from P to the circle $x^2 + y^2 = a^2$ is $hx + ky = a^2$.

The combined equation of the lines joining the (centre) origin to the points of intersection of the circle $x^2 + y^2 = a^2$ and the chord of the contact of tangents drawn from $P(h, k)$ is a homogeneous equation of second degree given by

$$x^2 + y^2 = a^2 \left(\frac{hx + ky}{a^2} \right)^2$$

$$\Rightarrow a^2(x^2 + y^2) = (hx + ky)^2$$

The lines given by above equation will be perpendicular if coefficient of x^2 + coefficient of $y^2 = 0$

$$\Rightarrow h^2 - a^2 + k^2 - a^2 = 0 \Rightarrow h^2 + k^2 = 2a^2$$

So, locus of (h, k) is $x^2 + y^2 = 2a^2$. Clearly, it is circle of radius $\sqrt{2}a$.

32. (c) Given circle is $x^2 + y^2 = 4$

Let MN be the one chord and P be the mid-point and the coordinate of P is (h, k) .

Then,

$$OM = ON = \text{radius}$$

$$\angle MON = 90^\circ$$

$\Rightarrow$

$$\angle MOP = \angle PON = 45^\circ$$

In $\triangle MOP$.

$$OP = OM \cos 45^\circ = 2 \times \frac{1}{\sqrt{2}} = \sqrt{2}$$

$\Rightarrow$

$$OP = \sqrt{2} \quad \dots(i)$$

Centre of circle O is $(0, 0)$ and P is (h, k) .

$$\therefore OP = \sqrt{(h-0)^2 + (k-0)^2}$$

$\Rightarrow$

$$OP = \sqrt{h^2 + k^2} \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$\sqrt{h^2 + k^2} = \sqrt{2}$$

$\Rightarrow$

$$h^2 + k^2 = 2$$

$\Rightarrow$ Locus of (h, k) is $x^2 + y^2 = 2$.

33. (d) Let (t, m) be the other end of the chord drawn from the point (p, q) on the circle $x^2 + y^2 = px + qy$

$$\text{Their mid-point is } \left(\frac{t+p}{2}, \frac{m+q}{2} \right)$$

Since, mid-point lies on X -axis i.e. $y = 0$

$$\therefore m + q = 0 \quad \dots(i)$$

Also, (t, m) lies on the circle.

$$\therefore t^2 + m^2 - pt - qm = 0 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $t^2 - pt + 2q^2 = 0$

which is quadratic in t such that,

Discriminant > 0

$$\Rightarrow p^2 - 8q^2 > 0 \Rightarrow p^2 > 8q^2$$

34. (a) $\therefore$ The equation of common chord of two given circles S_1 and S_2 is

$$S_1 - S_2 = 0 \quad \dots(i)$$

and the equation of circle passing through the end points of common chord is $S_1 + \lambda S_2 = 0$ $\dots(ii)$

$$\therefore \text{Common chord} = (x^2 + y^2 - 8x + 5y - 37) -$$

$$(x^2 + y^2 - 12x + 2y - 10) = 0$$

$\Rightarrow$

$$4x + 3y - 27 = 0 \quad \dots(iii)$$

Therefore, the equation of circle passing through end points of $4x + 3y - 27 = 0$ is

$$(x^2 + y^2 - 8x + 5y - 37) + \lambda(4x + 3y - 27) = 0.$$

$$\Rightarrow x^2 + y^2 + (4\lambda - 8)x + (5 + 3\lambda)y - (37 + 27\lambda) = 0 \quad \dots(iv)$$

The centre of the circle (iv) is $\left[-\frac{(4\lambda - 8)}{2}, -\frac{(5 + 3\lambda)}{2} \right]$ and

it lies on the common chord.

$$\begin{aligned}\therefore -4(2\lambda - 4) - 3\left(\frac{5 + 3\lambda}{2}\right) - 27 &= 0 \\ \Rightarrow -8\lambda + 16 - \frac{15}{2} - \frac{9\lambda}{2} - 27 &= 0 \\ \Rightarrow \frac{-25\lambda}{2} + \frac{17}{2} - 27 &= 0 \\ \Rightarrow \frac{-25\lambda}{2} - \frac{37}{2} = 0 \Rightarrow \lambda &= -\frac{37}{25}\end{aligned}$$

Therefore, the required circle is

$$\begin{aligned}x^2 + y^2 + \left[4 \times \left(-\frac{37}{25}\right) - 8\right]x + \left[5 + 3\left(-\frac{37}{25}\right)\right]y \\ - \left[37 + 27\left(-\frac{37}{25}\right)\right] = 0 \\ \Rightarrow x^2 + y^2 - \frac{348x}{25} + \frac{14y}{25} - \frac{74}{25} = 0 \\ \Rightarrow 25(x^2 + y^2) - 348x + 14y - 74 = 0\end{aligned}$$

35. (b) Area of quadrilateral $OACB$,

$$\begin{aligned}A = OB \cdot BC = 5^2 \cot \theta = 50 \sqrt{\frac{3}{13}} \\ \left[\because \sin \theta = \frac{\sqrt{13}}{5} \right]\end{aligned}$$

36. (a) Circle passing through the intersection of the given line and the circle has equation

$$(x^2 + y^2 - 16) + k(x + y - 2) = 0$$

Its centre is $\left(\frac{-k}{2}, \frac{-k}{2}\right)$.

The circle is the smallest, if the centre $\left(\frac{-k}{2}, \frac{-k}{2}\right)$ lies on the chord $x + y = 2$.

$$\therefore \frac{-k}{2} - \frac{k}{2} = 2 \Rightarrow \frac{-2k}{2} = 2 \Rightarrow k = -2$$

$\therefore$ Required equation of smallest circle is

$$(x^2 + y^2 - 16) - 2(x + y - 2) = 0$$

$$\text{i.e. } x^2 + y^2 - 2x - 2y - 12 = 0$$

37. (c) Let equation of circles be

$$S_1 \equiv x^2 + y^2 + 2ax + cy + a = 0$$

$$\text{and } S_2 \equiv x^2 + y^2 - 3ax + dy - 1 = 0$$

Chord through intersection points P and Q of the given circles is $S_1 - S_2 = 0$.

$$\therefore (x^2 + y^2 + 2ax + cy + a) - (x^2 + y^2 - 3ax + dy - 1) = 0$$

$$\Rightarrow 5ax + (c - d)y + a + 1 = 0$$

On comparing it with $5x + by - a = 0$, we get

$$\frac{5a}{5} = \frac{c - d}{b} = \frac{a + 1}{-a}$$

$$\Rightarrow a(-a) = a + 1 \Rightarrow a^2 + a + 1 = 0$$

which gives no real value of a .

Hence, the line passes through P and Q for no value of a .

38. (b) Since, the coordinates of the centre of the circle are $(2, 4)$.

$$\text{Also, } r^2 = 4 + 16 + 5 = 25$$

The line will intersect the circle at two distinct points, if the distance of $(2, 4)$ from $3x - 4y = m$ is less than radius of the circle.

$$\therefore \frac{|6 - 16 - m|}{5} < 5 \Rightarrow -25 < 10 + m < 25$$

$$\therefore -35 < m < 15$$

39. (c) Let $S \equiv x^2 + y^2 + 3x + 7y + 2p - 5 = 0$

$$\text{and } S' \equiv x^2 + y^2 + 2x + 2y - p^2 = 0$$

So, equation of the required circle is $S + \lambda S' = 0$.

As it passes through $(1, 1)$, the value of

$$\lambda = -(7 + 2p)/(6 - p^2)$$

Here, λ is not defined at $p = \pm \sqrt{6}$.

Hence, it is true for all except two values of p .

40. (c) Given circle is $x^2 + y^2 = r^2$

Its centre is $C_1(0, 0)$ and radius $r_1 = r$

$$\text{and } x^2 + y^2 - 10x + 16 = 0$$

Its centre, $C_2 = (5, 0)$

$$\text{and radius, } r_2 = \sqrt{(5)^2 - 16} = \sqrt{9} = 3$$

Distance between the centre C_1C_2 .

$$= \sqrt{(5 - 0)^2 + (0 - 0)^2} = 5$$

To intersect two circle at two distinct points

$$|r_1 - r_2| < C_1C_2 < |r_1 + r_2|$$

$$\Rightarrow |r_1 - r_2| < C_1C_2 \text{ and } C_1C_2 < |r_1 + r_2|$$

$$\Rightarrow r - 3 < 5 \text{ or } 5 < r + 3$$

$$\Rightarrow r < 8 \text{ or } 2 < r$$

$$\Rightarrow r < 8 \quad \dots(i)$$

$$\Rightarrow r > 2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $2 < r < 8$

41. (a) Let the equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

It cuts the circle $x^2 + y^2 = p^2$ orthogonally.

$$\therefore 2g(0) + 2f(0) = c - p^2 \Rightarrow c = p^2$$

Also, it passes through (a, b) .

$$\therefore a^2 + b^2 + 2ga + 2fb + p^2 = 0$$

So, locus of $(-g, -f)$ is

$$a^2 + b^2 - 2ax - 2by + p^2 = 0$$

$$\Rightarrow 2ax + 2by - (a^2 + b^2 + p^2) = 0$$

42. (b) Distance between given parallel lines $2x - 4y - 9 = 0$

$$\text{and } 2x - 4y + \frac{7}{3} = 0 \text{ is}$$

$$d = \frac{\left| \frac{7}{3} + 9 \right|}{\sqrt{4 + 16}} \quad \left[\because d = \frac{c_2 - c_1}{\sqrt{a^2 + b^2}} \right]$$

$$= \frac{34}{3(2)\sqrt{5}} = \frac{17}{3\sqrt{5}}$$

$$\therefore \text{Radius of the circle} = \frac{1}{2} \left(\frac{17}{3\sqrt{5}} \right) = \frac{17}{6\sqrt{5}}$$

43. (b) According to the figure,

$\therefore$

$$y = \frac{1}{4}$$

BITSAT Archives

1. (a) From figure, we have

$$OP = 5, OQ = 6$$

and $OM = \frac{5}{2}, CM = 3$

In $\triangle OMC$, $OC^2 = OM^2 + MC^2$

$$\Rightarrow OC^2 = \left(\frac{5}{2}\right)^2 + (3)^2$$

$$\Rightarrow OC = \frac{\sqrt{61}}{2}$$

Thus, the required circle has its centre $\left(\frac{5}{2}, 3\right)$ and radius $\frac{\sqrt{61}}{2}$.

Hence, its equation is $\left(x - \frac{5}{2}\right)^2 + (y - 3)^2 = \frac{61}{4}$

$$\therefore \lambda = \frac{61}{4}$$

2. (d) Lines, $x + y = 6$, $2x + y = 4$ and $x + 2y = 5$ intersect at points $(-2, 8)$, $(7, -1)$ and $(1, 2)$.

Now, all these points lie on

$$x^2 + y^2 - 17x - 19y + 50 = 0$$

3. (a) Required length of tangent is $\sqrt{S_1}$

Where, $S_1 = 25 + 1 + 30 - 4 - 3 = 49$

$$\therefore \sqrt{S_1} = 7$$

4. (c) Let the equation of tangent drawn from $(0, 0)$ to the circle be $y = mx$. Then,

$$p = a \Rightarrow \frac{7m + 1}{\sqrt{m^2 + 1}} = 5$$

$$\Rightarrow 24m^2 + 14m - 24 = 0$$

$$\Rightarrow 12m^2 + 7m - 12 = 0$$

44. (a) The centre of the first circle is $(-2, -3)$ and radius $r_1 = \sqrt{13}$ and centre of second circle is $(-g', -f')$ and radius $r_2 = \sqrt{g'^2 + f'^2}$

$$\therefore C_1C_2 = \sqrt{(g' + 2)^2 + (f' + 3)^2}$$

$\therefore$ Circles touch each other, so $C_1C_2 = r_1 \pm r_2$

$$\text{i.e. } \sqrt{g'^2 + f'^2 + 4 + 9 + 4g' + 6f'} = \sqrt{13} \pm \sqrt{(g')^2 + (f')^2}$$

On squaring both sides, we get

$$(2g' + 3f')^2 = 13(g'^2 + f'^2)$$

$$\Rightarrow 12g'f' = 4f'^2 + 9g'^2$$

$$\Rightarrow (3g' - 2f')^2 = 0$$

$$\Rightarrow 3g' = 2f'$$

$$\Rightarrow m_1m_2 = \frac{-12}{12} = -1$$

$$\therefore \text{Required angle} = \frac{\pi}{2}$$

5. (b) Circle passing through the points $(0, 0)$, $(a, 0)$ and $(0, b)$ is

$$x^2 + y^2 - ax - by = 0 \text{ and its centre is } \left(\frac{a}{2}, \frac{b}{2}\right).$$

6. (a) If the sum of the distance of a point P from two perpendicular lines in a plane, is 1, then the locus of P is a rhombus.

7. (c) Since, the lines $2x - 3y = 5$ and $3x - 4y = 7$ are the diameters of a circle. Therefore, the point of intersection is the centre of the circle. On solving the given equations, we get $x = 1$ and $y = -1$ i.e. the centre of the circle.

$\therefore$ Required equation of circle is

$$(x - 1)^2 + (y + 1)^2 = 7^2$$

$$\Rightarrow x^2 + y^2 - 2x + 2y + 2 = 49$$

$$\Rightarrow x^2 + y^2 - 2x + 2y - 47 = 0$$

8. (b) Given polar equation of circle is

$$r^2 - 8r(\sqrt{3} \cos \theta + \sin \theta) + 15 = 0$$

$$\text{or } r^2 - 8(\sqrt{3}r \cos \theta + r \sin \theta) + 15 = 0$$

$$\text{where, } r \cos \theta = x \text{ and } y = r \sin \theta$$

It can be rewritten in cartesian form as

$$x^2 + y^2 - 8(\sqrt{3}x + y) + 15 = 0$$

$$\Rightarrow x^2 + y^2 - 8\sqrt{3}x - 8y + 15 = 0$$

Now, $\text{radius} = \sqrt{(4\sqrt{3})^2 + (4)^2 - 15}$
 $= \sqrt{48 + 16 - 15} = 7$

9. (a) Given equation can be rewritten as

$$x(x - 2y) - 3(x - 2y) = 0 \text{ or } (x - 3)(x - 2y) = 0$$

$$\begin{aligned} \text{or} \quad & x = 3 \quad \dots(i) \\ \text{and} \quad & x = 2y \quad \dots(ii) \end{aligned}$$

Since, normals always pass through the centre. Therefore, the point of intersection of two normals are the coordinates of the centre.

On solving Eqs. (i) and (ii), we get the required coordinates of centre are $\left(3, \frac{3}{2}\right)$.

10. (a) Let (h, k) be the centre of a circle, then equation of circle is $(x - h)^2 + (y - k)^2 = 9$

$$\text{This centre lies on } x^2 + y^2 = 25 \Rightarrow h^2 + k^2 = 25$$

$$\therefore 2 \leq \text{Distance between the centres of the two circles} \leq 8$$

$$\Rightarrow 2 \leq \sqrt{(h - 0)^2 + (k - 0)^2} \leq 8$$

$$\Rightarrow 2 \leq \sqrt{h^2 + k^2} \leq 8 \Rightarrow 4 \leq h^2 + k^2 \leq 64.$$

$$\therefore \text{Locus of } (h, k) \text{ is } 4 \leq x^2 + y^2 \leq 64.$$

11. (a) By using the condition that, if two circles intersect orthogonally, then

$$2(g_1g_2 + f_1f_2) = c_1 + c_2$$

$$\text{where, } g_1 = -1, f_1 = 11, c_1 = 5$$

$$\text{and } g_2 = 7, f_2 = 3, c_2 = k$$

$$\Rightarrow 2(-1 \cdot 7 + 11 \cdot 3) = 5 + k$$

$$\Rightarrow 2(26) = 5 + k \Rightarrow k = 47$$

12. (d) Given equation is $x^2 + y^2 + 4x + 6y + 13 = 0$

$$\text{or } (x^2 + 4x + 4) + (y^2 + 6y + 9) = 13 + 4 + 9 = 11$$

$$\text{or } (x + 2)^2 + (y + 3)^2 = 0$$

$$\therefore \text{Radius of circle} = 0$$

13. (b) Given parametric equations are

$$x = 2 + 3 \cos \theta, y = 3 \sin \theta - 1$$

$$\text{or } \cos \theta = \frac{x - 2}{3}, \sin \theta = \frac{y + 1}{3}$$

$$\text{Since, } \sin^2 \theta + \cos^2 \theta = 1$$

$$\Rightarrow \left(\frac{x - 2}{3}\right)^2 + \left(\frac{y + 1}{3}\right)^2 = 1 \Rightarrow (x - 2)^2 + (y + 1)^2 = 3^2$$

$$\therefore \text{Centre of circle is } (2, -1).$$

14. (c) **Hint** Distance from centre $(2, 1)$ to the line $3x + 4y - 5 = 0$ is radius of circle

$$\Rightarrow \frac{|3(2) + 4(1) - 5|}{\sqrt{3^2 + 4^2}} = r$$

$$\Rightarrow r = 1$$

15. (b) If $y = mx + c$ touches the circle

$$x^2 + y^2 = a^2 \text{ then, } c^2 = a^2(1 + m^2)$$

Now, the line $y = 2x + c$ touches the circle

$$x^2 + y^2 = 16$$

$$\therefore c^2 = 16(1 + 4) = 16 \times 5 \Rightarrow c^2 = 80$$

16. (a) Given, x_1, x_2 are the roots of the equation

$$x^2 + 2x - 3 = 0$$

$$\Rightarrow x^2 + 3x - x - 3 = 0 \Rightarrow x(x + 3) - 1(x + 3) = 0$$

$$\Rightarrow (x - 1)(x + 3) = 0 \Rightarrow x_1 = -3, x_2 = 1$$

and y_1, y_2 are the roots of the equation

$$y^2 + 4y - 12 = 0$$

$$\Rightarrow y^2 + 6y - 2y - 12 = 0 \Rightarrow y(y + 6) - 2(y + 6) = 0$$

$$\Rightarrow y_1 = -6, y_2 = 2$$

$\therefore$ Points are $P(-3, -6)$ and $Q(1, 2)$.

Since, P and Q are the end points of a diameter.

$$\therefore \text{Centre} = \text{Mid-point of } PQ = \left(\frac{-3 + 1}{2}, \frac{-6 + 2}{2}\right) = (-1, -2)$$

17. (c) The centre and radius of the first circle

$$x^2 + y^2 + 2x + 8y - 23 = 0 \text{ are } C_1(-1, -4)$$

and $r_1 = \sqrt{40}$. Similarly, the centre and radius of second circle $x^2 + y^2 - 4x - 10y + 9 = 0$ are $C_2(2, 5)$ and $r_2 = \sqrt{20}$.

$$\text{Now, } C_1C_2 = \sqrt{(2 + 1)^2 + (5 + 4)^2}$$

$$= \sqrt{9 + 81} = \sqrt{90} \text{ and } r_1 + r_2 = \sqrt{40} + \sqrt{20}$$

$$\text{also, } r_1 - r_2 = \sqrt{40} - \sqrt{20}$$

$$\text{Here, } r_1 - r_2 < C_1C_2 < r_1 + r_2$$

$\therefore$ Two common tangents can be drawn.

18. (b) Since, the line $\frac{x}{\alpha} + \frac{y}{\beta} = 1$ touches the circle $x^2 + y^2 = a^2$.

$\therefore$ The perpendicular distance from centre $(0, 0)$ to the tangent = Radius of the circle

$$\Rightarrow \frac{|-1|}{\sqrt{\frac{1}{\alpha^2} + \frac{1}{\beta^2}}} = a$$

$$\Rightarrow \frac{1}{a^2} = \frac{1}{\alpha^2} + \frac{1}{\beta^2}$$

$$\text{The locus of } \left(\frac{1}{\alpha}, \frac{1}{\beta}\right) \text{ is } \frac{1}{a^2} = \frac{1}{x^2} + \frac{1}{y^2}$$

which represents a circle.

14

Conic Sections

Introduction

Let l be a fixed vertical line and m be another line intersecting it at fixed point V and inclined to it at a semi-vertical angle α . Suppose we rotate a line m around the line l in such a way that $\angle \alpha$ remain constant, then the surface generated is double napped right circular cone.

Section of a Cone

Let β be the angle made by the intersecting plane with vertical axis of the cone

When the plane cuts the nappe (other than the vertex) of the cone, we have following situations:

- (i) When $\beta = 90^\circ$, the section is a circle.
- (ii) When $\alpha < \beta < 90^\circ$, the section is an ellipse.
- (iii) When $\beta = \alpha$, the section is a parabola.
- (iv) When $0 \leq \beta < \alpha$, the plane cut through both the nappes and intersection is a hyperbola.

Conic Section as Locus

A conic is the locus of point which moves in a plane such that the ratio of its distance from fixed point **focus** and fixed line **directrix** is constant. This constant ratio is called eccentricity (e).

According to different values of e , conic section is named as

- (i) If $e = 1$, the conic is called a parabola.
- (ii) If $e < 1$, the conic is called an ellipse.
- (iii) If $e > 1$, the conic is called a hyperbola.
- (iv) If $e = 0$, the conic is called a circle.
- (v) If $e = \infty$, the conic is called a pair of straight lines.

Some Important Terms

- (i) **Focus** The fixed point is called the focus of the conic section or conic and denoted by S .
- (ii) **Directrix** The fixed straight line is called directrix of the conic.
- (iii) **Axis** The straight line perpendicular to the directrix and passing through the focus is said to be the axis.
- (iv) **Vertex** The point of intersection of the conic section and the axis is called vertex of the conic.
- (v) **Focal chord** Any chord passing through the focus is called focal chord.
- (vi) **Double ordinate** A straight line drawn perpendicular to the axis and terminated at both ends by the curve is a double ordinate.
- (vii) **Latusrectum** The double ordinate passing through the focus is called the latusrectum.

Equation of Conic Section

If the focus is (α, β) , directrix is $ax + by + c = 0$ and P is any point. Then, ratio of distance of point P from the fixed point (focus) to fixed line (directrix) is

$$\frac{PS}{PM} = e$$

$$\Rightarrow \sqrt{(x - \alpha)^2 + (y - \beta)^2} = e \frac{ax + by + c}{\sqrt{a^2 + b^2}}$$

$$\Rightarrow (x - \alpha)^2 + (y - \beta)^2 = \frac{e^2(ax + by + c)^2}{a^2 + b^2}$$

On simplifying above equation, we get second degree equation

$$ax^2 + by^2 + 2gx + 2fy + 2hxy + c = 0$$

Here discriminant,

$$\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$$

Equations will represent different conics, they are given as

Case I When $\Delta = 0$

Condition	Nature of conic
$ab - h^2 = 0$	A pair of coincident lines
$ab - h^2 < 0$	Real and distinct pair of straight lines
$ab - h^2 > 0$	Lines are imaginary

Case II When $\Delta \neq 0$

Condition	Nature of conic
$h = 0, a = b, e = 0$	A circle
$ab - h^2 = 0, e = 1$	A parabola
$ab - h^2 > 0, e < 1$	An ellipse
$ab - h^2 < 0, e > 1$	A hyperbola
$ab - h^2 < 0, a + b = 0, e = \sqrt{2}$	A rectangular hyperbola

Parabola

A parabola is the locus of a point which moves in a plane such that its distance from a fixed point (focus) in the plane is always equal to its distance from fixed line in the same plane.

Mathematically, $\frac{|PS|}{|PM|} = e = 1$

where, e is eccentricity.

Standard Equation of the Parabola

Let S be the focus and directrix be ZZ' , then standard form of parabola is $y^2 = 4ax$.

Other forms of parabola are

$$(i) y^2 = -4ax \quad (ii) x^2 = 4ay \quad (iii) x^2 = -4ay$$

Terminology of Parabolas

Terms	$y^2 = 4ax$	$y^2 = -4ax$	$x^2 = 4ay$	$x^2 = -4ay$
Vertex	(0, 0)	(0, 0)	(0, 0)	(0, 0)
Focus	(a, 0)	(-a, 0)	(0, a)	(0, -a)
Directrix	$x = -a$	$x = a$	$y = -a$	$y = a$
Axis	$y = 0$	$y = 0$	$x = 0$	$x = 0$
Latusrectum	$4a$	$4a$	$4a$	$4a$
Focal distance	$x + a$	$a - x$	$y + a$	$a - y$

- NOTE**
- If vertex of parabola is not origin, then its equation is $(y - k)^2 = 4a(x - h)$, where (h, k) are coordinates of vertex and axis is parallel to X-axis.
 - If vertex of parabola is (h, k) and axis is parallel to Y-axis, then equation of parabola is $(x - h)^2 = 4b(y - k)$.

Parametric Equations of Parabola

Expressing equation of parabola in some parameters, is called parametric equation of parabola. Here, we are giving some parametric forms of parabolic equation:

Parabola	$y^2 = 4ax$	$y^2 = -4ax$	$x^2 = 4ay$	$x^2 = -4ay$
Parametric equations	$x = at^2, y = 2at$	$x = -at^2, y = 2at$	$x = 2at, y = at^2$	$x = -2at, y = at^2$

The parametric equations of parabola

$$(y - k)^2 = 4a(x - h) \text{ are } x = h + at^2, y = k + 2at.$$

Position of a Point w.r.t. Parabola

The point $P(x_1, y_1)$ lies outside, on or inside the parabola $y^2 = 4ax$, according as $y_1^2 - 4ax_1 >, =, < 0$

or $P_1 > 0, P_1 = 0, P_1 < 0,$

where, $P_1 = y_1^2 - 4ax_1$

Equation of Chord Joining any Two Points of the Parabola

If $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ are two given points, then equation of chord is

$$(y - 2at_1) = \frac{2at_2 - 2at_1}{at_2^2 - at_1^2} (x - at_1^2)$$

$$\Rightarrow y(t_1 + t_2) = 2x + 2at_1 t_2$$

which is the required equation.

Hence, slope of the chord = $\frac{2}{t_1 + t_2}$

- (i) If chord AB passes through the point $(c, 0)$, then

$$t_1 t_2 = -\frac{c}{a}.$$

- (ii) If chord AB is focal chord or passes through the focus, then $t_1 t_2 = -1$.

- (iii) Length of chord of the parabola intercepted by the line $y = mx + c$ is given by $l = \frac{4}{m^2} \sqrt{a(1+m^2)(a-mc)}$ and in parametric form, when $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ are its end points, is $\sqrt{(t_1 + t_2)^2 - 4t_1 t_2 \{(t_1 + t_2)^2 + 4\}}$.

- (iv) Length of the focal chord of parabola having t_1, t_2 as end points, is $a(t_2 - t_1)^2$.

Intersection of a Line and a Parabola

Let the parabola be $y^2 = 4ax$ and the given line be $y = mx + c$. Solving the line and parabola, we get

$$m^2 x^2 + 2(mc - 2a)x + c^2 = 0$$

which is quadratic in x .

Hence, the line intersects the parabola in 2 distinct points.

- NOTE**
- The two points are real and distinct, if $c > \frac{a}{m}$.
 - The two points are real and coincident, if $c = \frac{a}{m}$.
 - The two points are imaginary, if $c < \frac{a}{m}$.

Condition of Tangency

- (a) The straight line $y = mx + c$ touches parabola $y^2 = 4ax$, iff $c = \frac{a}{m}$.

Any tangent to the parabola $y^2 = 4ax$ is

$$y = mx + \frac{a}{m}$$

Points of contact is $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$.

- (b) The straight line $lx + my + n = 0$ touches $y^2 = 4ax$, if $nl = am^2$.

- (c) $x \cos \alpha + y \sin \alpha = p$ touches $y^2 = 4ax$, if $p \cos \alpha + a \sin^2 \alpha = 0$.

Equations of Tangent in Different Forms

If $y^2 = 4ax$ is parabola, then equation of tangent at the point (x_1, y_1) is $T = 0$, where $T = yy_1 - 2a(x + x_1)$.

(i) Cartesian Form

Equation of parabola	Equation of tangent
$y^2 = 4ax$	$yy_1 = 2a(x + x_1)$
$y^2 = -4ax$	$yy_1 = -2a(x + x_1)$
$x^2 = 4ay$	$xx_1 = 2a(y + y_1)$
$x^2 = -4ay$	$xx_1 = -2a(y + y_1)$

(ii) **Parametric Form** Equations of tangent in parametric form for different standard forms is given as follows:

Equation of parabola	Parametric coordinates	Tangent at t
$y^2 = 4ax$	$(at^2, 2at)$	$ty = x + at^2$
$y^2 = -4ax$	$(-at^2, 2at)$	$ty = -x + at^2$
$x^2 = 4ay$	$(2at, at^2)$	$xt = y + at^2$
$x^2 = -4ay$	$(2at, -at^2)$	$xt = -y + at^2$

(iii) **Slope Form** If a line $y = mx + c$ is tangent to the parabola, then following are equations of tangent line in slope form:

Equation of parabola	Point of contact	Equation of tangent line	Condition for tangency
$y^2 = 4ax$	$\left(\frac{a}{m^2}, \frac{2a}{m}\right)$	$y = mx + \frac{a}{m}$	$c = \frac{a}{m}$
$y^2 = -4ax$	$\left(\frac{-a}{m^2}, \frac{-2a}{m}\right)$	$y = mx - \frac{a}{m}$	$c = -\frac{a}{m}$
$x^2 = 4ay$	$(2am, am^2)$	$y = mx - am^2$	$c = -am^2$
$x^2 = -4ay$	$(-2am, -am^2)$	$y = mx + am^2$	$c = am^2$

NOTE

- If a line is tangent at a point $P(x_1, y_1)$, then equation of tangent line is $T = 0$.
- The equation of tangent line at (x_1, y_1) is obtained by replacing x^2 by xx_1 , y^2 by yy_1 , x by $\frac{x+x_1}{2}$, y by $\frac{y+y_1}{2}$ and xy by $\frac{xy_1 + x_1y}{2}$ and without changing constant (if any) in the equation of the curve.

Some Important Points

- The point of intersection of tangent at two points $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ on the parabola $y^2 = 4ax$, is $\{(at_1t_2, a(t_1 + t_2))\}$ or (GM of x -coordinate, AM of y -coordinate).
- The locus of point of intersection of perpendicular tangents to a conic, is known as director circle. The director circle of parabola is directrix.
i.e. $x + a = 0$ for $y^2 = 4ax$
- The locus of point of intersection of tangent to a parabola, intersect at an angle α is $(x + a)^2 \tan^2 \alpha = y^2 - 4ax$.
- Area of triangle formed by two intersecting tangents is

Equation of Pair of Tangents from a Point to a Parabola

The combined equation of the pair of tangents drawn from a point to a parabola is $SS' = T^2$

where, $S = y^2 - 4ax$, $S' = y_1^2 - 4ax_1$
and $T = yy_1 - 2a(x + x_1)$

Equation of Normal in Different Forms

(i) **Cartesian Form** We know that, equation of tangent line is $yy_1 = 2a(x + x_1)$

$$\therefore \text{Slope of the normal} = -\frac{y_1}{2a}$$

$$\therefore \text{Equation of normal is } y - y_1 = \left(-\frac{y_1}{2a}\right)(x - x_1)$$

(ii) **Slope Form** Coordinates of point of contact, when m is slope of the tangent, is $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$. If m is slope of

the normal, then above coordinates can be written as $(am^2, -2am)$.

$$\therefore \text{Equation of the normal is } (y + 2am) = m(x - am^2)$$

$$\Rightarrow y = mx - 2am - am^3$$

(iii) **Parametric Form** Equation of normal in parametric form, where t is parameter at the point $(at^2, 2at)$ is

$$(y - 2at) = \frac{-2at}{2a}(x - at^2)$$

$$\Rightarrow y + tx = 2at + at^3$$

Equation of Normal for Different Parabolas

Forms $\rightarrow$	$y^2 = 4ax$	$y^2 = -4ax$	$x^2 = 4ay$	$x^2 = -4ay$
Cartesian form	$y - y_1 = \frac{-y_1}{2a}(x - x_1)$	$y - y_1 = \frac{y_1}{2a}(x - x_1)$	$y - y_1 = \frac{-2a}{x_1}(x - x_1)$	$y - y_1 = \frac{2a}{x_1}(x - x_1)$
Parametric form	$y + tx = 2at + at^3$	$y - tx = 2at + at^3$	$x + ty = 2at + at^3$	$x - ty = 2at + at^3$
Slope form	$y = mx - 2am - am^3$	$y = mx + 2am + am^3$	$y = mx + 2a + \frac{a}{m^2}$	$y = mx - 2a - \frac{a}{m^2}$

Conditions of Normality and Points of Contact

Here, we are listing conditions of normality in slope form.

Equation of parabola	Point of contact	Condition of normality
$y^2 = 4ax$	$(am^2, -2am)$	$c = -2am - am^3$
$y^2 = -4ax$	$(-am^2, 2am)$	$c = 2am + am^3$
$x^2 = 4ay$	$\left(\frac{-2a}{m}, \frac{a}{m^2}\right)$	$c = 2a + \frac{a}{m^2}$
$x^2 = -4ay$	$\left(\frac{2a}{m}, -\frac{a}{m^2}\right)$	$c = -2a - \frac{a}{m^2}$

Some Important Points

- The point of intersection of normal at any two points $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ on the parabola $y^2 = 4ax$ is $R[2a + a(t_1^2 + t_2^2 + t_1 t_2), -at_1 t_2(t_1 + t_2)]$.
- If normal drawn at t_1 meets the parabola again at t_2 , then for parabola $y^2 = 4ax$, $t_2 = -t_1 - \frac{2}{t_1}$.

- The points on the curve at which the normal passes through a common point, are called conormal points. The conormal points, also called feet of the normals.
- Three normals can be drawn from a point to a parabola, in which one or all are real.
- The algebraic sum of the slope of three normals at conormal point is zero.
- The sum of the ordinates of the conormal points is zero.
- The centroid of the triangle formed by the conormal points lies on the axis of the parabola.
- If three normals are drawn from the point (h, k) to the parabola $y^2 = 4ax$, then $h > 2a$.

Equation of Chord of Contact of Tangents to a Parabola

Let PQ and PR be tangents to the parabola $y^2 = 4ax$ drawn from any point $P(x_1, y_1)$.

Then, QR is called chord of contact of the parabola $y^2 = 4ax$.

Equation of chord of contact to the parabola is $T = 0$, i.e. $yy_1 = 2a(x + x_1)$

Here, (x_1, y_1) is a point of intersection of two tangents.

Equation of Chord when Mid-point is Given

Equation of chord when its mid-point is given, is $T = S_1$, where $T = yy_1 - 2a(x + x_1)$ and $S_1 = y_1^2 - 4ax_1$.

Here, (x_1, y_1) is the mid-point of the chord.

NOTE Equation of chord of contact to the parabola is $T = 0$ but the point (x_1, y_1) is in different positions in all cases.

Important Results of a Parabola

- The length of the side of an equilateral triangle inscribed in the parabola $y^2 = 4ax$ is $8a\sqrt{3}$ (one angular point is at the vertex).
- The equation of the parabola, whose axis is parallel to X-axis, is $x = Ay^2 + By + C$ and $y = Ax^2 + Bx + C$, is a parabola with its axis parallel to Y-axis.
- If the line $x \cos \alpha + y \sin \alpha = p$ touches the parabola $y^2 = 4ax$, then $p \cos \alpha + a \sin^2 \alpha = 0$ and the point of contact is $(a \tan^2 \alpha, -2a \tan \alpha)$.
- Area of a triangle formed by three points on a parabola is twice the area of the triangle formed by the tangents at these points.
- The angle of intersection of two parabolas $y^2 = 4ax$ and $x^2 = 4by$ is given by $\tan^{-1} \left| \frac{3a^{1/3}b^{1/3}}{2(a^{2/3} + b^{2/3})} \right|$.
- The equation of the common tangents to the parabola $y^2 = 4ax$ and $x^2 = 4by$ is $a^{1/3}x + b^{1/3}y + a^{2/3}b^{2/3} = 0$.

- If the normals at points $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ on the parabola $y^2 = 4ax$ meet on the parabola, then $t_1 t_2 = 2$.
- If the normal at a point $P(at^2, 2at)$ to the parabola $y^2 = 4ax$ subtends a right angle at the vertex of the parabola, then $t^2 = 2$.
- If the tangents are drawn from the point (x_1, y_1) to the parabola $y^2 = 4ax$. Then, the length of their chord of contact is $\frac{1}{|a|} \sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)}$.

- The area of triangle formed by the tangents drawn from (x_1, y_1) to $y^2 = 4ax$ and their chord of contact is $\frac{(y_1^2 - 4ax_1)^{3/2}}{2a}$.
- If one end of the focal chord of parabola is $(at^2, 2at)$, then other end will be $(a/t^2, -2a/t)$ and length of chord $= a(t + 1/t)^2$.
- If l_1 and l_2 are the lengths of segments of a focal chord of a parabola, then its latusrectum is $\frac{4l_1 l_2}{l_1 + l_2}$.

Diameter

The locus of the mid-point of a system of parallel chords of a parabola is called its diameter.

Its equation is $y = \frac{2a}{m}$,

where, m is the slope of the chords.

Ellipse

An ellipse is the locus of a point which moves in a plane, so that the ratio of its distance from a fixed point (focus) and fixed line (directrix) is constant which is less than one. For an ellipse, $e < 1$.

Let S be the focus, ZM be the directrix of the ellipse and $P(x, y)$ be any point on the ellipse, then by definition, equation of ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

where

$$b^2 = a^2(1 - e^2).$$

Since,

$$e < 1$$

$\Rightarrow$

$$a^2(1 - e^2) < a^2$$

$\Rightarrow$

$$b^2 < a^2$$

The other form of equation of ellipse is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

where, $a^2 = b^2(1 - e^2)$ i.e. $a < b$

Definition and Basic Terminology of an Ellipse

- Focal axis** Line containing two fixed points F_1 and F_2 , is called focal axis or major axis.
- Focal length** Distance between F_1 and F_2 , is called focal length or focal distance, i.e. $F_1 F_2 = 2ae$.
- Diameter** Any chord of the ellipse passing through its centre, is called diameter.
- Principal axis** Major and minor axes together, known as principal axis.
- Latusrectum** Line perpendicular to major axis and passing through focus, is called latusrectum.

Important Terms of an Ellipse

Important terms	$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, a > b$	$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, b > a$
Centre	(0, 0)	(0, 0)
Foci	($\pm ae, 0$)	(0, $\pm be$)
Vertex	($\pm a, 0$)	(0, $\pm b$)
Major axis	$2a$	$2b$
Eccentricity	$e^2 = 1 - \frac{b^2}{a^2}$	$e^2 = 1 - \frac{a^2}{b^2}$
Equation of directrix	$x = \pm \frac{a}{e}$	$y = \pm \frac{b}{e}$
Length of latusrectum	$\frac{2b^2}{a}$	$\frac{2a^2}{b}$
Ends of latusrectum	$(\pm ae, \pm \frac{b^2}{a})$	$(\pm \frac{a^2}{b}, \pm be)$

Parametric Form of an Ellipse

Let the equation of ellipse in standard form be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

Then, the equations of an ellipse in the parametric form will be

$x = a \cos \phi$, $y = b \sin \phi$, where ϕ is eccentric angle.

Auxiliary Circle

Circle described on the major axis of an ellipse as the diameter, is called an auxiliary circle.

Here, $x^2 + y^2 = a^2$ is the equation of auxiliary circle and

$(a \cos \theta, b \sin \theta)$, where

$\theta \in (0, 2\pi)$, is known as parametric coordinates of an ellipse and θ is an eccentric angle.

Position of a Point w.r.t. Ellipse

Let standard equation of an ellipse be $E: \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0$, then

the point $P(x_1, y_1)$ will lie outside the ellipse, if $E(P) > 0$ lie inside, if $E(P) < 0$ and on the ellipse, if $E(P) = 0$.

Condition for Intersection of a Line and an Ellipse

Let us consider a line $y = mx + c$ and an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$,

then the line will touch, intersect and do not intersect according as $a^2m^2 + b^2 = c^2$, $a^2m^2 + b^2 > c^2$ and $a^2m^2 + b^2 < c^2$, respectively.

Equations of Tangent in Different Forms

(i) **Point Form** The equation of the tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point (x_1, y_1) is $T = 0$.

i.e. $\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$

(ii) **Slope Form** If the line $y = mx + c$ touches the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Then, $c^2 = a^2m^2 + b^2$

Hence, the straight line $y = mx \pm \sqrt{a^2m^2 + b^2}$ is the equation of tangent in slope form and coordinates of point of contact are $\left(\frac{\pm a^2m}{\sqrt{a^2m^2 + b^2}}, \frac{\mp b^2}{\sqrt{a^2m^2 + b^2}} \right)$.

(iii) **Parametric Form** The equation of tangent in parametric form at the point $(a \cos \phi, b \sin \phi)$ is

$$\frac{x}{a} \cos \phi + \frac{y}{b} \sin \phi = 1$$

Condition for Tangency

(a) The straight line $y = mx + c$ is a tangent to an ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \text{ if } c^2 = a^2m^2 + b^2 \text{ at point}$$

$$\left(\frac{\pm a^2m}{\sqrt{a^2m^2 + b^2}}, \frac{\pm b^2}{\sqrt{a^2m^2 + b^2}} \right)$$

Thus, tangent is $y = mx + \sqrt{a^2m^2 + b^2}$

(b) $x \cos \alpha + y \sin \alpha = p$ touches $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if

$$p^2 = a^2 \cos^2 \alpha + b^2 \sin^2 \alpha$$

(c) $lx + my + n = 0$ touches $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if $n^2 = a^2l^2 + b^2m^2$

Equation of Pair of Tangents

The equation of pair of tangents PA and PB is $SS_1 = T^2$

where, $S = \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1$

$$S_1 = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1 \text{ and } T = \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1$$

Director Circle

The director circle is the locus of points from which perpendicular tangents drawn to the ellipse. The equation of director circle is

$$x^2 + y^2 = a^2 + b^2$$

Equation of Normal in Different Forms

(i) **Point Form** The equation of the normal at (x_1, y_1) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $\frac{a^2x}{x_1} - \frac{b^2y}{y_1} = a^2 - b^2$.

(ii) **Slope Form** If m is the slope of the normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. Then, the equation of normal is

$y = mx \mp \frac{m(a^2 - b^2)}{\sqrt{a^2 + b^2 m^2}}$. The coordinates of point of contact is $\left(\pm \frac{a^2}{\sqrt{a^2 + b^2 m^2}}, \pm \frac{mb^2}{\sqrt{a^2 + b^2 m^2}} \right)$.

- (iii) **Parametric Form** The equation of the normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at $(a \cos \phi, b \sin \phi)$ is $ax \sec \phi - by \operatorname{cosec} \phi = a^2 - b^2$

Chord of Contact

If PQ and PR are the tangents through the point $P(x_1, y_1)$ to the ellipse, then the equation of the chord of contact QR is $\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$ or $T = 0$ at (x_1, y_1) .

Equation of Chord with Mid-point

The equation of the chord of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ whose mid-point is (x_1, y_1) , is $T = S_1$

where, $T = \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1$

$$\Rightarrow S_1 = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1$$

Equation of Chord Joining Two Points on an Ellipse

The equation of chord joining two points having eccentric angles θ and ϕ on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, is

$$\frac{x}{a} \cos\left(\frac{\theta + \phi}{2}\right) + \frac{y}{b} \sin\left(\frac{\theta + \phi}{2}\right) = \cos\left(\frac{\theta - \phi}{2}\right)$$

Important Results of an Ellipse

- Sum of distance of the point $P(x, y)$ lie on the ellipse from two foci is equal to constant.
 - Product of length of perpendicular from either focus on a variable tangent to an ellipse is equal to square of semi-minor axis, i.e. b^2 .
 - Locus of the foot of perpendicular from the either foci on a variable tangent to an ellipse lie on its auxiliary circle.
- The straight line $lx + my + n = 0$ touches ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if $a^2 l^2 + b^2 m^2 = n^2$.
- The line $x \cos \alpha + y \sin \alpha = p$ touches the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if $a^2 \cos^2 \alpha + b^2 \sin^2 \alpha = p^2$ and that point of contact is $\left(\frac{a^2 \cos \alpha}{p}, \frac{b^2 \sin \alpha}{p} \right)$.

- The locus of the foot of the perpendicular drawn from centre upon any tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $(x^2 + y^2)^2 = a^2 x^2 + b^2 y^2$ or $r^2 = a^2 \cos^2 \theta + b^2 \sin^2 \theta$ (in terms of polar coordinates).
- If $y = mx + c$ is the normal of $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then condition of normality is $c^2 = \frac{m^2(a^2 - b^2)^2}{a^2 + b^2 m^2}$.
- The straight line $lx + my + n = 0$ is a normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if $\frac{a^2}{l^2} + \frac{b^2}{m^2} = \left(\frac{a^2 - b^2}{n} \right)^2$.
- If S is the focus and G is the point, where the normal at P meets the axis of an ellipse, then $SG = e \cdot SP$ and the tangent and normal at P bisect the external and internal angles between the focal distances of P .

Hyperbola

A hyperbola is the locus of a point which moves in a plane, so that the ratio of its distance from fixed point (focus) and fixed line (directrix) is constant and which is greater than 1.

Any second degree curve $f(x, y) = ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ represents a hyperbola, if $h^2 > ab$ or $e > 1$.

Standard Equation of the Hyperbola

Let F_1 be the focus, ZM be the directrix and e be the eccentricity of the hyperbola, then $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, where $b^2 = a^2(e^2 - 1)$ is standard equation of hyperbola.

Conjugate Hyperbola

The hyperbola whose transverse and conjugate axes are respectively the conjugate and transverse axes of a given hyperbola, is called conjugate hyperbola of given hyperbola.

Equation of conjugate hyperbola is

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Terms Related to Hyperbola

- (i) **Symmetry** Since, equation of hyperbola has only even powers of x and y , hence it is symmetric in X and Y -axes.
- (ii) **Transverse and conjugate axes** Transverse axis is one which lie along the line passing through the foci and perpendicular to the directrices and conjugate axis is one which is perpendicular to transverse axis and passes through the mid-point of foci.
- (iii) **Focal chord** A chord of hyperbola which passes through the focus, is called a focal chord of the hyperbola.
- (iv) **Directrix** A line which is perpendicular to the axis and it lies between centre and vertex, is known as directrix. The equation of directrix is $x = \pm \frac{a}{e}$.
- (v) **Double ordinates** Perpendicular line drawn to axis of hyperbola whose end points lie on hyperbola.
- (vi) **Latusrectum** The double ordinates passes through the focus, is called latusrectum.
 - (a) The vertex divides the join of focus and foot of the directrix externally or internally in the ratio $e : 1$.
 - (b) Domain and range of a hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $x \leq -a$ or $x \geq a$ and $y \in R$ respectively.

Important Terms of Hyperbola

Focal radii	$SP = ex_1 - a$ $S'P = ex_1 + a$	$SP = ey_1 - b$ $S'P = ey_1 + b$
Difference in focal radii = $(S'P - SP)$	$2a$	$2b$
Tangent at the vertices	$x = -a, x = a$	$y = -b, y = b$
Equation of transverse axis	$y = 0$	$x = 0$
Equations of conjugate axis	$x = 0$	$y = 0$

NOTE If the centre of the hyperbola is (h, k) and axes are parallel to the coordinate axes, then its equation is

$$\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$$

Auxiliary Circle

Let $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ be the hyperbola, then the equation of the auxiliary circle is $x^2 + y^2 = a^2$.

Here, $\angle QOM = \theta$ is called eccentric angle and P, Q are corresponding points on hyperbola and auxiliary circle.

Parametric Equations of Hyperbola

The equations $x = a \sec \theta$ and $y = b \tan \theta$ are known as the parametric equations of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. The point $(a \sec \theta, b \tan \theta)$ will lie on the hyperbola for all values of θ .

Condition for Intersection of Line and Hyperbola

Let us consider a line $y = mx + c$

and a hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

By above two equations, we have $\frac{x^2}{a^2} - \frac{(mx + c)^2}{b^2} = 1$.

This line will intersect, touch or do not intersect the hyperbola according to discriminant of above equation, i.e.

- (i) If $D > 0$, then line will intersect the hyperbola at two points.
- (ii) If $D = 0$, then $c^2 = a^2m^2 - b^2$ touches the parabola.
- (iii) If $D < 0$, then line is outside the hyperbola.

Position of a Point w.r.t. Hyperbola

Any point $P(x, y)$ lie on the hyperbola

$$H: \frac{x^2}{a^2} - \frac{y^2}{b^2} - 1 = 0$$

According to the following conditions:

- (i) Outside the hyperbola, $H(P) < 0$
- (ii) Inside the hyperbola, $H(P) > 0$
- (iii) On the hyperbola, $H(P) = 0$

Equation of Tangent in Different Forms

- (i) **Point Form** The equation of the tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at (x_1, y_1) is $\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$
- (ii) **Slope Form** The equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $y = mx \pm \sqrt{a^2m^2 - b^2}$ and coordinates of the point of contact are $\left(\pm \frac{a^2m}{\sqrt{a^2m^2 - b^2}}, \pm \frac{b^2}{\sqrt{a^2m^2 - b^2}} \right)$.
- (iii) **Parametric Form** The equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at $(a \sec \theta, b \tan \theta)$ is $\frac{x}{a} \sec \theta - \frac{y}{b} \tan \theta = 1$

Condition for Tangency

- (a) The straight line $y = mx + c$ is a tangent to hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $c^2 = a^2m^2 - b^2$
Hence, $y = mx \pm \sqrt{a^2m^2 - b^2}$ touches the hyperbola at $\left(\frac{\pm a^2m}{\sqrt{a^2m^2 - b^2}}, \frac{\mp b^2}{\sqrt{a^2m^2 - b^2}} \right)$.
- (b) $x \cos \alpha + y \sin \alpha = p$ touches hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $p^2 = a^2 \cos^2 \alpha - b^2 \sin^2 \alpha$.
- (c) $lx + my + n = 0$ touches hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $n^2 = a^2l^2 - b^2m^2$.

Equation of Pair of Tangents

If $P(x_1, y_1)$ is any point outside the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then pair of tangents PQ and PR can be drawn to it from P as shown alongside. The equation of tangents PQ and PR is $SS_1 = T^2$

where, $S = \frac{x^2}{a^2} - \frac{y^2}{b^2} - 1$

$$\Rightarrow S_1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 \Rightarrow T = \frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1$$

Director Circle

The director circle is the locus of points from which perpendicular tangents is drawn to given hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, is $x^2 + y^2 = a^2 - b^2$.

Equation of Normal in Different Forms

- (i) **Cartesian Form** The equation of normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at (x_1, y_1) is $\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$
- (ii) **Slope Form** The equation of the normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ in terms of slope is $y = mx \mp \frac{m(a^2 + b^2)}{\sqrt{a^2 - b^2m^2}}$
Point of contact is $\left(\pm \frac{a^2}{\sqrt{a^2 - m^2b^2}}, \mp \frac{mb^2}{\sqrt{a^2 - b^2m^2}} \right)$ and condition of normality is $c = \mp \frac{m(a^2 + b^2)}{\sqrt{a^2 - m^2b^2}}$ or $c^2 = \frac{m^2(a^2 + b^2)^2}{(a^2 - m^2b^2)}$
- (iii) **Parametric Form** The equation of the normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ in parametric form at $(a \sec \theta, b \tan \theta)$ is $ax \cos \theta + by \cot \theta = a^2 + b^2$

Equation of the Chord in Terms of Mid-point

The equation of the chord of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ whose mid-point is (x_2, y_2) , is $T = S_1$.

i.e. $\frac{xx_2}{a^2} - \frac{yy_2}{b^2} = \frac{x_2^2}{a^2} - \frac{y_2^2}{b^2}$

Chord of Contact

If PM and PN are the tangents passing through the point $P(x_1, y_1)$ to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then the equation of chord of contact MN is given by $\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$ or $T = 0$.

Rectangular or Equilateral Hyperbola

A hyperbola for which $a = b$ is said to be rectangular or equilateral. Its equation is $x^2 - y^2 = a^2$.

Conjugate Hyperbola

$\frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$ is known as conjugate hyperbola to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If e_1 and e_2 are their eccentricities, then

$$e_1^2 = 1 + \frac{b^2}{a^2} \quad \dots(i)$$

and

$$e_2^2 = 1 + \frac{a^2}{b^2} \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\frac{1}{e_1^2} + \frac{1}{e_2^2} = 1$$

Asymptote of Hyperbola

The combined equation of the asymptotes of the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ is } \frac{x^2}{a^2} - \frac{y^2}{b^2} = 0$$

Some Important Results of Hyperbola

- (i) Difference of the focal distances, i.e. $PS' - PS = \text{constant} \Rightarrow 2a = \text{Length of transverse axis}$
- (ii) Eccentricity of the rectangular hyperbola $= \sqrt{2}$ and angle between asymptotes $= 90^\circ$.

Practice Exercise

- The curves described parametrically by $x = t^2 + t + 1$, $y = t^2 - t + 1$ represents
 - a pair of straight lines
 - an ellipse
 - a parabola
 - a hyperbola
- Consider a circle with its centre lying on the focus of the parabola $y^2 = 2px$ such that it touches the directrix of the parabola. Then, the point of intersection of the circle and the parabola is
 - $\left(\frac{p}{2}, p\right)$ or $\left(\frac{p}{2}, -p\right)$
 - $\left(\frac{p}{2}, -\frac{p}{2}\right)$
 - $\left(-\frac{p}{2}, p\right)$
 - $\left(-\frac{p}{2}, -\frac{p}{2}\right)$
- The equation of parabola having vertex $(0, 0)$ passing through $(2, 3)$ and axis is along X -axis, is
 - $x^2 = \frac{9}{2}y$
 - $y^2 = \frac{9}{2}x$
 - $y^2 = -\frac{9}{2}x$
 - $x^2 = -\frac{9}{2}y$
- If the points $(0, 4)$ and $(0, 2)$ are respectively the vertex and focus of a parabola, then the equation of the parabola is
 - $x^2 + 8y = 16$
 - $x^2 + 8y = 32$
 - $x^2 + 16y = 30$
 - $x^2 - 8y = 32$
- The equation of the parabola, whose axis is parallel to Y -axis and which passes through the points $(0, 4)$, $(1, 9)$ and $(-2, 6)$, is
 - $y = 2\left(x + \frac{3}{4}\right)^2 + \frac{23}{8}$
 - $y = 2\left(x + \frac{3}{2}\right)^2 - \frac{1}{2}$
 - $y = 2\left(x + \frac{3}{5}\right)^2 + \frac{1}{2}$
 - $y = 2\left(x + \frac{1}{2}\right)^2 - \frac{1}{2}$
- If PQ is a double ordinate of a parabola $y^2 = 4ax$. Then, the locus of its point of trisection is
 - $9y^2 = 8ax$
 - $9y^2 = 4ax$
 - $25y^2 = 16ax$
 - $3y^2 = 4ax$
- If a parabola has the origin as its focus and the line $x = 2$ as the directrix. Then, the vertex of the parabola is at
 - $(2, 0)$
 - $(0, 2)$
 - $(1, 0)$
 - $(0, 1)$
- If the tangent at the point $P(2, 4)$ to the parabola $y^2 = 8x$ meets the parabola $y^2 = 8x + 5$ at Q and R , then the mid-point of QR is
 - $(2, 4)$
 - $(4, 2)$
 - $(7, 9)$
 - None
- The equation of the common tangents touching the circle $(x - 3)^2 + y^2 = 9$ and the parabola $y^2 = 4x$ above X -axis, is
 - $\sqrt{3}y = 3x + 1$
 - $\sqrt{3}y = -(x + 3)$
 - $\sqrt{3}y = x + 3$
 - $\sqrt{3}y = -(3x + 1)$

10. The equation(s) of the common tangent(s) to the parabolas $y^2 - 4x - 2y + 5 = 0$ and $y^2 = -4x$ is/are
 a. $x + y = 2, x - y = 1$ b. $x + y = 3, x - y = 2$
 c. $x + y = 1, 4x - 2y = 1$ d. $x + 2y = 1, x + y = -3$
11. The locus of the mid-point of the chords of the parabola $y^2 = 4ax$ which subtend a right angle at the vertex of the parabola, is
 a. $y^2 - 2ax + 8a^2 = 0$ b. $y^2 + 2ax + 8a^2 = 0$
 c. $y^2 - 2ax - 8a^2 = 0$ d. $y^2 - ax + 8a^2 = 0$
12. The slope of the line touching both the parabolas $y^2 = 4x$ and $x^2 = -32y$, is
 a. $\frac{1}{2}$ b. $\frac{3}{2}$ c. $\frac{1}{8}$ d. $\frac{2}{3}$
13. Tangents are drawn from $(-2, 0)$ to $y^2 = 8x$, radius of circle(s) that would touch these tangents and the corresponding chord of contact, can be equal to
 a. $4(\sqrt{2} + 1)$ b. $2(\sqrt{2} - 1)$ c. $8\sqrt{3}$ d. $9\sqrt{2}$
14. The number of distinct normals that can be drawn from $\left(\frac{11}{4}, \frac{1}{4}\right)$ to the parabola $y^2 = 4x$, is
 a. 3 b. 2 c. 1 d. 4
15. The locus of the mid-points of the chords of the parabola $y^2 = 4x$ which touch the parabola $x^2 = -8y$, is
 a. $y^3 - 2xy - 8 = 0$ b. $y^3 + 2xy - 8 = 0$
 c. $y^3 - 2xy + 8 = 0$ d. $y^3 - xy - 8 = 0$
16. If P is the point $(1, 0)$ and Q is the point on $y^2 = 8x$. Then, the locus of mid-point of PQ is equal to
 a. $x^2 - 4y + 2 = 0$ b. $x^2 + 4y + 2 = 0$
 c. $y^2 + 4x + 2 = 0$ d. $y^2 - 4x + 2 = 0$
17. If $a \neq 0$ and the line $2bx + 3cy + 4d = 0$ passes through the points of intersection of the parabolas $y^2 = 4ax$ and $x^2 = 4ay$, then
 a. $d^2 + (2b + 3c)^2 = 0$ b. $d^2 + (3b + 2c)^2 = 0$
 c. $d^2 + (2b - 3c)^2 = 0$ d. $d^2 + (3b - 2c)^2 = 0$
18. The length of the chord of the parabola $x^2 = 4ay$ passing through the vertex and having slope $\tan \alpha$, is
 a. $4a \operatorname{cosec} \alpha \cot \alpha$ b. $4a \tan \alpha \sec \alpha$
 c. $4a \cos \alpha \cot \alpha$ d. $4a \sin \alpha \tan \alpha$
19. If P is a point on the ellipse $\frac{x^2}{16} + \frac{y^2}{25} = 1$ whose foci are S and S' , then $PS + PS'$ is equal to
 a. 8 b. 7 c. 5 d. 10
20. The equation of the ellipse whose focus is $(1, -1)$, the directrix $x - y - 3 = 0$ and eccentricity $1/2$, is
 a. $7x^2 + 2xy + 7y^2 - 10x + 10y + 7 = 0$
 b. $7x^2 + 2xy + 7y^2 + 7 = 0$
 c. $7x^2 + 2xy + 7y^2 + 10x - 10y - 7 = 0$
 d. None of the above
21. The number of points outside the ellipse on major axis from which a normal (other than X-axis) can be drawn to the ellipse, is
 a. 0 b. 3
 c. 5 d. None of these
22. The eccentricity of the ellipse which meets the straight line $\frac{x}{7} + \frac{y}{2} = 1$ on X-axis and the straight line $\frac{x}{3} - \frac{y}{5} = 1$ on Y-axis and whose axes lie along the axes of coordinates, is
 a. $\frac{1}{\sqrt{2}}$ b. $\frac{2\sqrt{6}}{7}$ c. $\frac{\sqrt{3}}{7}$ d. $\frac{\sqrt{5}}{7}$
23. If tangent at any point P on the ellipse $7x^2 + 16y^2 = 12$ cuts the tangent at the end points of the major axis at the points A and B , then the circle with AB as diameter passes through a fixed point whose coordinates are
 a. $(\pm \sqrt{a^2 - b^2}, 0)$ b. $(\pm \sqrt{a^2 + b^2}, 0)$
 c. $(0, \pm \sqrt{a^2 - b^2})$ d. $(0, \pm \sqrt{a^2 + b^2})$
24. The minimum area of triangle formed by the tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and coordinate axes, is
 a. ab b. $\frac{a^2 + b^2}{2}$
 c. $\frac{(a + b)^2}{2}$ d. $\frac{a^2 + ab + b^2}{3}$
25. If the angle between the lines joining the end points of minor axis of an ellipse with its foci is $\frac{\pi}{2}$, then the eccentricity of the ellipse is
 a. $1/2$ b. $1/\sqrt{2}$ c. $\sqrt{3}/2$ d. $1/2\sqrt{2}$
26. PQ is a chord of the ellipse through the centre. If the square of its length is the HM of the squares of major and minor axes, then find its inclination with X-axis.
 a. $\frac{\pi}{4}$ b. $\frac{\pi}{2}$
 c. $\frac{2\pi}{3}$ d. None of these
27. The locus of the foot of perpendicular drawn from the centre of the ellipse $x^2 + 3y^2 = 6$ on any tangent to it, is
 a. $(x^2 - y^2)^2 = 6x^2 + 2y^2$ b. $(x^2 - y^2)^2 = 6x^2 - 2y^2$
 c. $(x^2 + y^2)^2 = 6x^2 + 2y^2$ d. $(x^2 + y^2)^2 = 6x^2 - 2y^2$
28. Equation of tangent to the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ which cut-off equal intercepts on the axis, is
 a. $y = x + \sqrt{3}$ b. $y = -x + \sqrt{3}$
 c. $y = -x - \sqrt{13}$ d. $y = -x - \sqrt{3}$
29. The equation of tangent to the ellipse $x^2 + 3y^2 = 3$ which is perpendicular to the line $4y = x - 5$, is
 a. $4x + y + 7 = 0$ b. $4x + y - 23 = 0$
 c. $4x + 2y + 5 = 0$ d. $4x + y + 23 = 0$

30. If the line $x \cos \alpha + y \sin \alpha = p$, is tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then the value of $a^2 \cos^2 \alpha + b^2 \sin^2 \alpha$ is
 a. p b. p^2
 c. $\frac{1}{p^2}$ d. None of these
31. The length of the common tangent to the ellipse $\frac{x^2}{25} + \frac{y^2}{4} = 1$ and the circle $x^2 + y^2 = 16$ intercepted by the coordinate axes, is
 a. 5 b. $2\sqrt{7}$ c. $\frac{7}{\sqrt{3}}$ d. $\frac{14}{\sqrt{3}}$
32. The distance of the centre of ellipse $x^2 + 2y^2 - 2 = 0$ to those tangents of the ellipse which are equally inclined from both the axes, is
 a. $\frac{3}{\sqrt{2}}$ b. $\sqrt{3/2}$ c. $\frac{\sqrt{2}}{3}$ d. $\frac{\sqrt{3}}{2}$
33. The ellipse $x^2 + 4y^2 = 4$ is inscribed in a rectangle aligned with the coordinate axes, which in turn is inscribed in another ellipse that passes through the point $(4, 0)$. Then, the equation of the ellipse is
 a. $x^2 + 12y^2 = 16$ b. $4x^2 + 48y^2 = 48$
 c. $4x^2 + 64y^2 = 48$ d. $x^2 + 16y^2 = 16$
34. If the chords of contact of tangents from two points (x_1, y_1) and (x_2, y_2) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are at right angles, then $\frac{x_1 x_2}{y_1 y_2}$ is equal to
 a. $\frac{a^2}{b^2}$ b. $-\frac{b^2}{a^2}$ c. $-\frac{a^4}{b^4}$ d. $-\frac{b^4}{a^4}$
35. If the line $3y = 3x + 1$ is a normal to the ellipse $\frac{x^2}{5} + \frac{y^2}{b^2} = 1$, then the length of the minor axis of the ellipse is
 a. 4 or $\frac{2}{3}\sqrt{55}$ b. 2 or $\frac{2}{5}\sqrt{55}$ c. 3 or $\sqrt{5}$ d. 11 or $\sqrt{13}$
36. If θ and ϕ are eccentric angles of the end of a pair of conjugate diameters of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then $\theta - \phi$ is equal to
 a. $\pm \frac{\pi}{2}$ b. $\pm \pi$ c. 0 d. None
37. If the chords of contact of tangents from two points (x_1, y_1) and (x_2, y_2) to the ellipse $\frac{x^2}{(5)^2} + \frac{y^2}{(6)^2} = 1$ are at right angles, then $\frac{x_1 x_2}{y_1 y_2}$ is equal to
 a. $-\left(\frac{5}{6}\right)^4$ b. $\left(\frac{6}{5}\right)^4$ c. $-\left(\frac{6}{5}\right)^4$ d. $\left(\frac{5}{6}\right)^4$
38. The equation $16x^2 - 3y^2 - 32x + 12y - 44 = 0$ represents a hyperbola
 a. the length of whose transverse axis is $4\sqrt{3}$
 b. the length of whose conjugate axis is 4
 c. whose centre is $(-1, 2)$
 d. whose eccentricity is $\sqrt{19/3}$
39. Let $P(a \sec \theta, b \tan \theta)$ and $Q(a \sec \phi, b \tan \phi)$, where $\theta + \phi = \frac{\pi}{2}$ be two points on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If (h, k) is the point of intersection of the normals at P and Q , then k is equal to
 a. $\frac{a^2 + b^2}{a}$ b. $-\left(\frac{a^2 + b^2}{a}\right)$ c. $\frac{a^2 + b^2}{b}$ d. $-\left(\frac{a^2 + b^2}{b}\right)$
40. If the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{b^2} = 1$ and the hyperbola $\frac{x^2}{144} - \frac{y^2}{81} = \frac{1}{25}$ coincide, then the value of b^2 is
 a. 1 b. 5 c. 7 d. 9
41. If two points P and Q on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, whose centre C is such that CP is perpendicular to CQ , $a < b$. Then,
 a. $\frac{1}{CP^2} + \frac{1}{CQ^2} = \frac{1}{b^2} - \frac{1}{a^2}$ b. $\frac{1}{CP^2} + \frac{1}{CQ^2} = \frac{1}{a^2} - \frac{1}{b^2}$
 c. $\frac{1}{CP^2} + \frac{1}{CQ^2} = \frac{1}{4a^2} - \frac{1}{b^2}$ d. $\frac{1}{CP^2} + \frac{1}{CQ^2} = \frac{1}{a^2} - \frac{1}{2b^2}$
42. A hyperbola, having the transverse axis of length $2 \sin \theta$, is confocal with the ellipse $3x^2 + 4y^2 = 12$. Then, its equation is
 a. $x^2 \csc^2 \theta - y^2 \sec^2 \theta = 1$ b. $x^2 \sec^2 \theta - y^2 \csc^2 \theta = 1$
 c. $x^2 \sin^2 \theta - y^2 \cos^2 \theta = 1$ d. $x^2 \cos^2 \theta - y^2 \sin^2 \theta = 1$
43. If e_1 is the eccentricity of the ellipse $\frac{x^2}{16} + \frac{y^2}{25} = 1$ and e_2 is the eccentricity of the hyperbola passing through the foci of the ellipse and $e_1 e_2 = 1$, then equation of the hyperbola is
 a. $\frac{x^2}{9} - \frac{y^2}{16} = 1$ b. $\frac{x^2}{16} - \frac{y^2}{9} = -1$
 c. $\frac{x^2}{9} - \frac{y^2}{25} = 1$ d. None of these
44. If m_1 and m_2 are slopes of tangents from a point $(1, 4)$ on the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$. Then, the point from which the tangents drawn on the hyperbola having slopes $|m_1|$ and $|m_2|$ and positive intercepts on Y-axis, is
 a. $(-7, 2)$ b. $(-7, -3)$ c. $(-7, -4)$ d. $(3, -7)$
45. The area of triangle formed by the lines $x - y = 0$, $x + y = 0$ and any tangent to the hyperbola $x^2 - y^2 = a^2$, is
 a. $2a^2$ b. $6a^2$ c. a^2 d. $4a^2$

46. If the line $2x + \sqrt{6}y = 2$ touches the hyperbola $x^2 - 2y^2 = 4$, then the point of contact is
 a. $(-2, \sqrt{6})$ b. $(-5, 2\sqrt{6})$ c. $\left(\frac{1}{2}, \frac{1}{\sqrt{6}}\right)$ d. $(4, -\sqrt{6})$
47. The common tangent to $9x^2 - 4y^2 = 36$ and $x^2 + y^2 = 3$ is
 a. $y - 2\sqrt{3}x - \sqrt{39} = 0$ b. $y + 2\sqrt{3}x + \sqrt{39} = 0$
 c. $y - 2\sqrt{3}x + \sqrt{39} = 0$ d. None of these
48. The locus of the points of intersection of perpendicular tangents to $\frac{x^2}{16} - \frac{y^2}{9} = 1$ is
 a. $x^2 - y^2 = 7$ b. $x^2 - y^2 = 25$
 c. $x^2 + y^2 = 25$ d. $x^2 + y^2 = 7$
49. A tangent to the hyperbola $\frac{x^2}{4} - \frac{y^2}{2} = 1$ meets X -axis at P and Y -axis at Q . Lines PR and QR are drawn such that $OPRQ$ is a rectangle, where O is the origin. Then, R lies on
 a. $\frac{4}{x^2} + \frac{2}{y^2} = 1$ b. $\frac{2}{x^2} - \frac{4}{y^2} = 1$
 c. $\frac{2}{x^2} + \frac{4}{y^2} = 1$ d. $\frac{4}{x^2} - \frac{2}{y^2} = 1$
50. If P is a point on the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$ and N is the foot of the perpendicular from P on the transverse axis. The tangent to the hyperbola at P meets the transverse axis at T . If O is the centre of the hyperbola, then $OT \cdot ON$ is equal to
 a. 9 b. 4 c. e^2 d. None
51. Tangents are drawn from points on the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$ to the circle $x^2 + y^2 = 9$. The locus of the mid-point of the chord of contact is
 a. $x^2 + y^2 = \frac{x^2}{9} - \frac{y^2}{4}$ b. $(x^2 + y^2)^2 = \frac{x^2}{9} - \frac{y^2}{4}$
 c. $(x^2 + y^2)^2 = 81\left(\frac{x^2}{9} - \frac{y^2}{4}\right)$ d. $(x^2 + y^2)^2 = 9\left(\frac{x^2}{9} - \frac{y^2}{4}\right)$
52. The equation of a tangent to the hyperbola $3x^2 - y^2 = 3$ parallel to the line $y = 2x + 4$, is
 a. $y = 3x + 4$ b. $y = 2x + 1$ c. $y = 2x - 2$ d. $y = 3x + 5$
53. If chords of the hyperbola $x^2 - y^2 = a^2$ touch the parabola $y^2 = 4ax$. Then, the locus of their mid-point is
 a. $y^2(x - a) = 2x^2$ b. $y^2(x - a) = x^3$
 c. $y^2(x - a) = x^4$ d. $y^2(x + a) = x^3$
54. The product of the length of perpendiculars drawn from any point on the hyperbola $x^2 - 2y^2 - 2 = 0$ to its asymptotes, is
 a. $\frac{1}{2}$ b. $\frac{2}{3}$
 c. $\frac{3}{2}$ d. 2
55. If $x = 9$ is the chord of contact of tangents of $x^2 - y^2 = 9$, then the equation of the corresponding tangents is
 a. $9x^2 - 8y^2 + 18x + 9 = 0$ b. $9x^2 - 8y^2 - 18x + 9 = 0$
 c. $9x^2 - 8y^2 - 18x - 9 = 0$ d. $9x^2 - 8y^2 + 18x - 9 = 0$

BITSAT Archives

1. The locus of the points of intersection of the tangents at the extremities of the chords of the ellipse $x^2 + 2y^2 = 6$ which touches the ellipse $x^2 + 4y^2 = 4$, is
 a. $x^2 + y^2 = 4$ [2014]
 b. $x^2 + y^2 = 6$
 c. $x^2 + y^2 = 9$
 d. None of the above
2. If a variable chord PQ of the parabola $y^2 = 4ax$ subtends a right angle at the vertex, then the locus of the points of intersection of the normal at P and Q is
 a. a parabola [2014]
 b. a hyperbola
 c. a circle
 d. None of the above
3. The foci of the conic section $25x^2 + 16y^2 - 150x = 175$ are [2013]
 a. $(0, \pm 3)$ b. $(0, \pm 2)$ c. $(3, \pm 3)$ d. $(0, \pm 1)$
4. The radius of the circle passing through the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$ and having its centre $(0, 3)$, is
 a. 4 b. $\frac{3}{7}$ c. $\sqrt{12}$ d. $\frac{7}{2}$ [2013]
5. If OAB is an equilateral triangle inscribed in the parabola $y^2 = 4ax$ with O as the vertex, then the length of the side of $\triangle OAB$ is [2013]
 a. $8a\sqrt{3}$ b. $4a\sqrt{3}$
 c. $2a\sqrt{3}$ d. $a\sqrt{3}$
6. If the length of the major axis of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is three times the length of minor axis, then its eccentricity is [2012]
 a. $\frac{1}{3}$ b. $\frac{1}{\sqrt{3}}$ c. $\sqrt{\frac{2}{3}}$ d. $\frac{2\sqrt{2}}{3}$

7. Let S and T be the foci of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and B be an end of the minor axis. If STB is an equilateral triangle, then eccentricity of the ellipse is [2012]
 a. $\frac{1}{4}$ b. $\frac{1}{3}$ c. $\frac{1}{2}$ d. $\frac{\sqrt{3}}{2}$
8. The difference of the focal distance of any point on the hyperbola is equal to its [2012]
 a. latusrectum
 b. eccentricity
 c. length of the transverse axis
 d. half the length of the transverse axis
9. If the focus of parabola is at $(0, -3)$ and its directrix is $y = 3$, then its equation is [2012]
 a. $x^2 = -12y$ b. $x^2 = 12y$
 c. $y^2 = -12x$ d. $y^2 = 12x$
10. The length of tangent from point $(5, 1)$ to the circle $x^2 + y^2 + 6x - 4y - 3 = 0$ is [2011]
 a. 81 b. 29 c. 7 d. 21
11. The length of the latusrectum of the parabola $169\{(x-1)^2 + (y-3)^2\} = (5x-12y+17)^2$ is [2011]
 a. $\frac{14}{13}$ b. $\frac{12}{13}$ c. $\frac{28}{13}$ d. None
12. If the centre, one of the foci and semi-major axis of an ellipse are $(0, 0)$, $(0, 3)$ and 5, then its equation is [2011]
 a. $\frac{x^2}{16} + \frac{y^2}{25} = 1$ b. $\frac{x^2}{25} + \frac{y^2}{16} = 1$
 c. $\frac{x^2}{9} + \frac{y^2}{25} = 1$ d. None of these
13. The radius of the director circle of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is [2011]
 a. $a - b$ b. $\sqrt{a - b}$
 c. $\sqrt{a^2 - b^2}$ d. $\sqrt{a^2 + b^2}$
14. The equation of the chord of $y^2 = 8x$ which is bisected at $(2, -3)$, is [2010]
 a. $4x + 3y = 1$ b. $4x - 3y = 1$
 c. $4x + 3y = 9$ d. None of these
15. All chords of the curve $3x^2 - y^2 - 2x + 4y = 0$ which subtend a right angle at the origin, pass through the fix point [2009]
 a. $(1, 2)$ b. $(1, -2)$ c. $(-1, 2)$ d. $(-1, -2)$
16. The line $y = 2t^2$ meets the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ in real points, if [2009]
 a. $|t| \leq 1$ b. $|t| > 1$
 c. $|t| < 3$ d. $|t| < 4$
17. The distance between the foci of the hyperbola $x^2 - 3y^2 - 4x - 6y - 11 = 0$ is [2008]
 a. 4 b. 6 c. 8 d. 10
18. The length of the common chord of the ellipse $\frac{(x-1)^2}{9} + \frac{(y-2)^2}{4} = 1$ and the circle $(x-1)^2 + (y-2)^2 = 1$, is [2007]
 a. 0 b. $\sqrt{3}$ c. 4 d. 5
19. For hyperbola $\frac{x^2}{\cos^2 \alpha} - \frac{y^2}{\sin^2 \alpha} = 1$, which of the following remains constant with change in α ? [2007]
 a. Abscissae of vertices b. Abscissae of foci
 c. Eccentricity d. Directrix
20. The equation of the parabola with its vertex at $(1, 1)$ and focus $(3, 1)$ is [2007]
 a. $(x-1)^2 = 8(y-1)$ b. $(y-1)^2 = 8(x-3)$
 c. $(y-1)^2 = 8(x-1)$ d. $(x-3)^2 = 8(y-1)$
21. The ends of the latusrectum of the conic $x^2 + 10x - 16y + 25 = 0$ are [2006]
 a. $(3, -4), (13, 4)$ b. $(-3, -4), (13, -4)$
 c. $(3, 4), (-13, 4)$ d. $(5, -8), (-5, 8)$
22. The equation to the hyperbola having its eccentricity 2 and the distance between its foci is 8, is [2006]
 a. $\frac{x^2}{12} - \frac{y^2}{4} = 1$ b. $\frac{x^2}{4} - \frac{y^2}{12} = 1$
 c. $\frac{x^2}{8} - \frac{y^2}{2} = 1$ d. $\frac{x^2}{16} - \frac{y^2}{9} = 1$
23. The sum of the focal distances of any point on the conic $\frac{x^2}{25} + \frac{y^2}{16} = 1$ is [2006]
 a. 10 b. 9 c. 41 d. 18
24. The equation of a parabola which passes through the intersection of a straight line $x + y = 0$ and the circle $x^2 + y^2 + 4y = 0$ is [2005]
 a. $y^2 = 4x$ b. $y^2 = x$
 c. $y^2 = 2x$ d. None of these
25. The point $(4, -3)$ with respect to the ellipse $4x^2 + 5y^2 = 1$ [2005]
 a. lies on the curve b. is inside the curve
 c. is outside the curve d. is focus of the curve
26. The tangents from a point $(2\sqrt{2}, 1)$ to the hyperbola $16x^2 - 25y^2 = 400$ include an angle equal to [2005]
 a. $\pi/2$ b. $\pi/4$
 c. π d. $\pi/3$
27. The equation of a straight line drawn through the focus of the parabola $y^2 = -4x$ at an angle of 120° to X -axis, is [2005]
 a. $y + \sqrt{3}(x-1) = 0$ b. $y - \sqrt{3}(x-1) = 1$
 c. $y + \sqrt{3}(x+1) = 0$ d. $y - \sqrt{3}(x+1) = 0$

Answer with Solutions

Practice Exercise

1. (c) $x = t^2 + t + 1, y = t^2 - t + 1$

$$\Rightarrow x + y = 2(t^2 + 1) \text{ and } x - y = 2t$$

$$\therefore \frac{x+y}{2} = \left(\frac{x-y}{2}\right)^2 + 1$$

$$\Rightarrow x^2 + y^2 - 2xy - 2(x+y) + 4 = 0$$

which represent a parabola, since $h^2 = ab$.

$$[\because a = 1 = b \text{ and } h = -1]$$

2. (a) Here, centre = $\left(\frac{p}{2}, 0\right)$

Any circle with this centre is

$$\left(x - \frac{p}{2}\right)^2 + (y - 0)^2 = r^2$$

which touches directrix $x = -\frac{p}{2}$.

$$\therefore \frac{\left|\frac{p}{2} + \frac{p}{2}\right|}{1} = r \Rightarrow r^2 = p^2$$

$$\text{Now required circle is } \left(x - \frac{p}{2}\right)^2 + y^2 = p^2$$

$$\text{or } x^2 + y^2 - px = \frac{3p^2}{4} \quad \dots(i)$$

Also, parabola is $y^2 = 2px$.

On solving Eqs. (i) and (ii), we get

$$x^2 + 2px - px = \frac{3p^2}{4} \Rightarrow x^2 + px - \frac{3p^2}{4} = 0$$

$$\Rightarrow 4x^2 + 4px - 3p^2 = 0$$

$$\Rightarrow (2x - p)(2x + 3p) = 0$$

$$\Rightarrow x = \frac{p}{2} \text{ or } -\frac{3p}{2}$$

$$\text{When } x = \frac{p}{2}, y^2 = 2p \cdot \frac{p}{2} = p^2$$

$$\therefore y = p \text{ or } -p$$

$$\text{Now, required point is } \left(\frac{p}{2}, p\right) \text{ or } \left(\frac{p}{2}, -p\right).$$

3. (b) Given, vertex = (0, 0), point = (2, 3) and axis is along X-axis.

Since, point (2, 3) lies in first quadrant.

Hence, equation of parabola will be of the form $y^2 = 4ax$, which passes through (2, 3).

$$\text{i.e. } (3)^2 = 4a \times (2) \Rightarrow a = \frac{9}{8}$$

$\therefore$ Required equation of parabola is

$$y^2 = 4\left(\frac{9}{8}\right)x \Rightarrow y^2 = \frac{9}{2}x$$

4. (b) Given, vertex = (0, 4) and focus = (0, 2).

Let the equation of parabola be

$$(x - 0)^2 = -4a(y - 4) \quad \dots(i)$$

$\therefore a =$ Distance between focus and vertex

$$= \sqrt{0^2 + (2 - 4)^2} = 2$$

On putting $a = 2$ in Eq. (i), we get

$$x^2 = -4 \times 2(y - 4) \Rightarrow x^2 + 8y = 32$$

$$\Rightarrow x^2 + 8y - 32 = 0 \Rightarrow x^2 + 8y = 32$$

5. (a) The equation of the parabola whose axis is parallel to Y-axis, is

$$y = ax^2 + bx + c$$

which passes through the points (0, 4), (1, 9) and (-2, 6).

If $c = 4$, then $9 = a + b + c$ and $6 = 4a - 2b + c$

$$a + b = 5$$

$$\text{and } 4a - 2b = 2 \Rightarrow 2a - b = 1$$

$$\therefore 3a = 6 \Rightarrow a = 2 \text{ and } b = 3$$

Thus, required equation of the parabola is

$$y = 2x^2 + 3x + 4 = 2\left(x + \frac{3}{4}\right)^2 + \frac{23}{8}$$

6. (b) Let PQ be a double ordinate of a given parabola $y^2 = 4ax$.

Let $P(at^2, 2at)$, so that Q will be $(at^2, -2at)$.

Let A (α, β) or B (α', β') be the point of trisection of the double ordinate PQ, then

$$\alpha = at^2, \beta = \frac{2at}{3}, \alpha' = at^2, \beta' = -\frac{2at}{3}$$

On eliminating t from the above equations, we get

$$\beta^2 = \frac{4a}{9}\alpha, \beta'^2 = \frac{4a}{9}\alpha'$$

$\therefore$ Locus of (α, β) or (α', β') is given by $9y^2 = 4ax$.

7. (c) From the figure, it is clear that, vertex of the parabola is at (1, 0).

8. (a) The equation of the tangent to $y^2 = 8x$ at $(2, 4)$ is

$$4y = 4(x + 2) \text{ or } x - y + 2 = 0 \quad \dots(i)$$

Let (x_1, y_1) be the mid-point of chord QR .

Then, equation of QR is

$$yy_1 - 4(x + x_1) - 5 = y_1^2 - 8x_1 - 5$$

$$\Rightarrow 4x - yy_1 - 4x_1 + y_1^2 = 0 \quad \dots(ii)$$

Clearly, Eqs. (i) and (ii) represent the same line.

$$\text{So, } \frac{4}{1} = \frac{y_1}{1} = \frac{-4x_1 + y_1^2}{2}$$

$$\Rightarrow y_1 = 4 \text{ and } 8 = -4x_1 + y_1^2$$

$$\Rightarrow y_1 = 4 \text{ and } x_1 = 2$$

9. (c) Any tangent to the parabola $y^2 = 4ax$ is

$$y = mx + \frac{1}{m} \quad \dots(i)$$

It is a tangent to the circle $(x - 3)^2 + y^2 = 9$, if the length of the perpendicular from the centre $(3, 0)$ upon Eq. (i) is equal to radius of the circle, i.e. 3.

$$\therefore \frac{\left| 3m + \frac{1}{m} - 0 \right|}{\sqrt{1 + m^2}} = 3$$

$$\Rightarrow 9m^2 + \frac{1}{m^2} + 6 = 9(1 + m^2) \Rightarrow \frac{1}{m^2} = 3$$

$$\Rightarrow m = \pm \frac{1}{\sqrt{3}}, \text{ but } m > 0$$

$\therefore$ parabola is above X -axis

$\therefore$ Required line is

$$y = \frac{1}{\sqrt{3}}x + \sqrt{3} \Rightarrow \sqrt{3}y = x + 3$$

10. (c) The equation of tangent to $y^2 = -4x$ is

$$y = mx - \frac{1}{m} \quad \dots(i)$$

The parabola $y^2 - 4x - 2y + 5 = 0$ can be written as

$$y^2 - 2y + 1 = 4x - 4$$

$$\Rightarrow (y - 1)^2 = 4(x - 1)$$

So, the equation of tangent to $(y - 1)^2 = 4(x - 1)$ is

$$y - 1 = m(x - 1) + \frac{1}{m}$$

$$\Rightarrow y = mx - m + \frac{1}{m} + 1 \quad \dots(ii)$$

The equation of common tangent to the parabolas (i) and (ii) represent the same line.

$$\therefore -\frac{1}{m} = -m + \frac{1}{m} + 1$$

$$\Rightarrow m - \frac{2}{m} - 1 = 0 \Rightarrow m^2 - m - 2 = 0$$

$$\Rightarrow (m - 2)(m + 1) = 0 \Rightarrow m = 2, -1$$

$\therefore$ The required common tangents are

$$y = 2x - \frac{1}{2} \text{ and } y = -x + 1$$

$$\Rightarrow 4x - 2y - 1 = 0 \text{ and } x + y = 1$$

11. (a) Let $P(h, k)$ be the mid-point of a chord QR of the parabola $y^2 = 4ax$, then equation of chord QR is

$$T = S_1$$

$$\Rightarrow yk - 2a(x + h) = k^2 - 4ah$$

$$\Rightarrow yk - 2ax = k^2 - 2ah \quad \dots(i)$$

Let A be vertex of the parabola.

For combined equation of AQ and AR , use homogeneous form of $y^2 = 4ax$ with the help of Eq. (i).

$$\therefore y^2 = 4ax \left(\frac{yk - 2ax}{k^2 - 2ah} \right)$$

$$\Rightarrow y^2(k^2 - 2ah) - 4akxy + 8a^2x^2 = 0$$

$$\therefore \angle QAR = 90^\circ$$

$$\therefore \text{Coefficient of } x^2 + \text{Coefficient of } y^2 = 0$$

$$\therefore k^2 - 2ah + 8a^2 = 0$$

Hence, the locus of $P(h, k)$ is

$$y^2 - 2ax + 8a^2 = 0$$

12. (a) Equation of tangent at $A(t^2, 2t)$, $yt = x + t^2$ is tangent to $x^2 + 32y = 0$ at B .

$$\Rightarrow x^2 + 32\left(\frac{x}{t} + t\right) = 0$$

$$\Rightarrow x^2 + \frac{32}{t}x + 32t = 0$$

$$\Rightarrow \left(\frac{32}{t}\right)^2 - 4(32t) = 0$$

$$\Rightarrow 32\left(\frac{32}{t^2} - 4t\right) = 0$$

$$\Rightarrow t^3 = 8$$

$$\Rightarrow t = 2$$

$$\therefore \text{Slope of tangent is } \frac{1}{t} = \frac{1}{2}.$$

13. (a) Point P clearly lies on the directrix of $y^2 = 8x$.

Thus, slope of PA and PB are 1 and -1 respectively. Equation of $PA : y = x + 2$,

equation of $PB : y = -x - 2$ and equation of $AB : x = 2$.

Let the centre of the circle be $(h, 0)$ and radius be r .

$$\Rightarrow \frac{|h + 2|}{\sqrt{2}} = \frac{|h - 2|}{1} = r$$

$$\Rightarrow h^2 + 4 + 4h = 2(h^2 + 4 - 4h)$$

$$\Rightarrow h^2 - 12h + 4 = 0$$

$$\Rightarrow h = \frac{12 \pm 8\sqrt{2}}{2}$$

$$\Rightarrow h = 6 \pm 4\sqrt{2}$$

$$\Rightarrow |h - 2| = 4(\sqrt{2} - 1), 4(\sqrt{2} + 1)$$

14. (a) The equation of a normal to $y^2 = 4x$ is $y = mx - 2m - m^3$.

If it passes through $\left(\frac{11}{4}, \frac{1}{4}\right)$, then $\frac{1}{4} = \frac{11m}{4} - 2m - m^3$.

$$\Rightarrow 1 = 11m - 8m - 4m^3$$

$$\Rightarrow 4m^3 - 3m + 1 = 0$$

$$\Rightarrow m = \frac{1}{2}, \frac{-1 \pm \sqrt{3}}{2}$$

Hence, three normals can be drawn from $(11/4, 1/4)$ to $y^2 = 4x$.

15. (a) Let the mid-point of a chord of the parabola $y^2 = 4x$ be (h, k)

$\therefore$ Equation of the chord is

$$\Rightarrow ky - 2(x + h) = k^2 - 4h$$

$$\Rightarrow ky - 2x = k^2 - 2h$$

$$\text{or } y = \frac{2}{k}x + \frac{k^2 - 2h}{k} \quad \dots(i)$$

Line (i) touches the parabola $x^2 = -8y$.

$$\therefore \frac{k^2 - 2h}{k} = 2\left(\frac{2}{k}\right)^2$$

$[\because \text{line } y = mx + c \text{ touches the parabola } x^2 = 4ay, \text{ if } c = -am^2]$

$$\Rightarrow k^3 - 2hk = 8$$

$\therefore$ Locus of (h, k) is $y^3 - 2xy - 8 = 0$.

16. (d) Since, the coordinates of P are $(1, 0)$.

Let any point Q on $y^2 = 8x$ be $(2t^2, 4t)$.

Again, let mid-point of PQ be (h, k) , then

$$h = \frac{2t^2 + 1}{2} \Rightarrow 2h = 2t^2 + 1 \quad \dots(i)$$

$$\text{and } k = \frac{4t + 0}{2} \Rightarrow t = \frac{k}{2} \quad \dots(ii)$$

On putting the value of t from Eq. (ii) in Eq. (i), we get

$$2h = \frac{2k^2}{4} + 1$$

$$\Rightarrow 4h = k^2 + 2$$

Hence, locus of (h, k) is $y^2 - 4x + 2 = 0$.

17. (a) Given, equations of parabolas are $y^2 = 4ax$ and $x^2 = 4ay$.

The points of intersection of parabolas are $A(0, 0)$ and $B(4a, 4a)$.

Also, given that line $2bx + 3cy + 4d = 0$ passes through the points A and B respectively.

$$\therefore d = 0 \quad \dots(i)$$

$$\text{and } 2b \cdot 4a + 3c \cdot 4a + 4d = 0$$

$$\Rightarrow 2ab + 3ac + d = 0$$

$$\Rightarrow a(2b + 3c) = 0 \quad [\because d = 0]$$

$$\Rightarrow 2b + 3c = 0 \quad \dots(ii)$$

On squaring and adding Eqs. (i) and (ii), we get

$$d^2 + (2b + 3c)^2 = 0$$

18. (b) Let A be the vertex and AP be a chord of $x^2 = 4ay$ such that slope of AP is $\tan \alpha$.

Let the coordinates of P be $(2at, at^2)$.

$$\text{Then, slope of } AP = \frac{at^2}{2at} = \frac{t}{2}$$

$$\Rightarrow \tan \alpha = \frac{t}{2} \Rightarrow t = 2 \tan \alpha$$

$$\begin{aligned} \text{Now, } AP &= \sqrt{(2at - 0)^2 + (at^2 - 0)^2} = at\sqrt{4 + t^2} \\ &= 2a \tan \alpha \sqrt{4 + 4 \tan^2 \alpha} = 4a \tan \alpha \sec \alpha \end{aligned}$$

19. (d) Given, equation of ellipse is $\frac{x^2}{16} + \frac{y^2}{25} = 1$

$$\text{Here, } a^2 = 16, b^2 = 25$$

$$\text{i.e. } b > a$$

$$\therefore PS + PS' = 2b \quad [\because \text{sum of focal radii} = 2b] \\ = 2 \times 5 = 10$$

20. (a) By definition of ellipse, $SP = e \cdot PM$, where P is any point, S is focus and M is point on directrix.

$$\Rightarrow \sqrt{(x-1)^2 + (y+1)^2} = \frac{1}{2} \cdot \frac{|x-y-3|}{\sqrt{1^2+1^2}}$$

$$\Rightarrow \sqrt{(x-1)^2 + (y+1)^2} = \frac{1}{2\sqrt{2}} |x-y-3|$$

$$\begin{aligned} \Rightarrow 8(x^2 + 1 - 2x + y^2 + 1 + 2y) \\ = x^2 + y^2 + 9 - 2xy + 6y - 6x \end{aligned}$$

$$\Rightarrow 7x^2 + 7y^2 + 2xy - 10x + 10y + 7 = 0$$

21. (a) Equation of any normal is

$$ax \sec \theta - by \operatorname{cosec} \theta = a^2 - b^2$$

If the normal intersects X -axis at $(\alpha, 0)$, then

$$\alpha = \frac{a^2 - b^2}{a \sec \theta} = \frac{a e^2}{\sec \theta}$$

$$[\because a = 1, e < 1 \text{ and } |\sec \theta| \geq 1 \Rightarrow |\alpha| < |a|]$$

$\Rightarrow (\alpha, 0)$ lies inside the ellipse.

Hence, no point lie outside the ellipse.

22. (b) Let the equation of the ellipse be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

which passes through the points $(7, 0)$ and $(0, -5)$.

$$\text{So, } a^2 = 49 \text{ and } b^2 = 25 \quad [\because a^2 > b^2]$$

$$\therefore b^2 = a^2(1 - e^2) \Rightarrow 25 = 49(1 - e^2)$$

$$\Rightarrow e = \frac{2\sqrt{6}}{7}$$

23. (a) Equation of tangent at any point $P(a \cos \theta, b \sin \theta)$ is

$\frac{x}{a} \cos \theta + \frac{y}{b} \sin \theta = 1$. The equation of tangents at the end points of the major axis are $x = a, x = -a$.

$\therefore$ The intersection point of these tangents are

$$A = \left(a, b \tan \frac{\theta}{2}\right), B = \left(-a, b \cot \frac{\theta}{2}\right)$$

Equation of circle with AB as diameter is

$$(x-a)(x+a) + \left(y - b \tan \frac{\theta}{2}\right) \left(y - b \cot \frac{\theta}{2}\right) = 0$$

$$\Rightarrow x^2 - a^2 + y^2 - by \left(\tan \frac{\theta}{2} + \cot \frac{\theta}{2} \right) + b^2 = 0$$

$$\Rightarrow x^2 + y^2 - a^2 + b^2 - 2by \operatorname{cosec} \theta = 0$$

which is the equation of family of circles passing through the point of intersection of the circle

$$x^2 + y^2 - a^2 + b^2 = 0 \text{ and } y = 0$$

So, the fixed point is $(\pm\sqrt{a^2 - b^2}, 0)$.

24. (a) Equation of tangent $\frac{x}{a} \cos \theta + \frac{y}{b} \sin \theta = 1$

meets the axis at $A\left(\frac{a}{\cos \theta}, 0\right)$ and $B\left(0, \frac{b}{\sin \theta}\right)$.

$$\therefore \text{Area of } \triangle AOB = \frac{1}{2} OA \cdot OB = \frac{ab}{\sin 2\theta} \geq ab$$

25. (b) Let the equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, a > b$.

$$\therefore \angle FBF' = \frac{\pi}{2}$$

$$\Rightarrow \angle FBC = \frac{\pi}{4}$$

$$\therefore \angle CFB \text{ is also an angle of } \frac{\pi}{4}$$

$$\Rightarrow BC = CF \Rightarrow b = ae$$

$$\Rightarrow b^2 = a^2 e^2 \quad \dots(i)$$

$$\text{We know that, } b^2 = a^2(1 - e^2)$$

$$\therefore a^2 e^2 = a^2(1 - e^2) \quad [\text{from Eq. (i)}]$$

$$\Rightarrow e^2 = 1 - e^2$$

$$\Rightarrow 2e^2 = 1$$

$$\Rightarrow e = \frac{1}{\sqrt{2}}$$

26. (a) The straight line $x = r \cos \theta, y = r \sin \theta$ meets the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, where r is given.

$$\therefore \frac{1}{r^2} = \frac{\cos^2 \theta}{a^2} + \frac{\sin^2 \theta}{b^2} \quad \dots(i)$$

$$\text{But } PQ^2 = 4r^2 = \text{HM of } 4a^2, 4b^2$$

$$\therefore \frac{1}{r^2} = \frac{1}{2a^2} + \frac{1}{2b^2} \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$\frac{\cos^2 \theta}{a^2} + \frac{\sin^2 \theta}{b^2} = \frac{1}{2a^2} + \frac{1}{2b^2}$$

which is possible when $\theta = \frac{\pi}{4}$.

27. (c) The equation of the line passing through $P(h, k)$ and perpendicular to line joining it to origin, is

$$y - k = \frac{-h}{k}(x - h)$$

$$\Rightarrow y = \frac{-h}{k}x + \frac{h^2 + k^2}{k}$$

Since, it is tangent to ellipse.

$$\therefore c^2 = a^2 m^2 + b^2$$

$$\Rightarrow \left(\frac{h^2 + k^2}{k}\right)^2 = \frac{6h^2}{k^2} + 2$$

$$\Rightarrow (x^2 + y^2)^2 = 6x^2 + 2y^2$$

which is the required locus.

28. (c) Equation of tangent in terms of slope is

$$y = mx \pm \sqrt{(9m^2 + 4)}$$

$$\text{But } m = \pm 1$$

$$\therefore y = \pm x \pm \sqrt{13}$$

29. (a) Equation of the ellipse is $x^2 + 3y^2 = 3$

$$\Rightarrow \frac{x^2}{3} + \frac{y^2}{1} = 1 \Rightarrow \frac{x^2}{(\sqrt{3})^2} + \frac{y^2}{1^2} = 1$$

Equation of tangent in terms of slope is

$$y = mx \pm \sqrt{(3m^2 + 1)} \quad \dots(i)$$

$$\text{Here, } m = -4$$

[since, tangent is perpendicular to $4y = x - 5$]

From Eq. (i), we get

$$y = -4x \pm \sqrt{49} \Rightarrow y = -4x \pm 7$$

$$\Rightarrow 4x + y \mp 7 = 0$$

30. (b) Given equation of line is

$$y = -x \cot \alpha + p \operatorname{cosec} \alpha$$

$$\text{Here, } m = -\cot \alpha$$

The given line touches the ellipse, if

$$p \operatorname{cosec} \alpha = \pm \sqrt{a^2 m^2 + b^2} = \pm \sqrt{a^2 \cot^2 \alpha + b^2}$$

$$\Rightarrow p^2 \operatorname{cosec}^2 \alpha = a^2 \cot^2 \alpha + b^2$$

$$\Rightarrow p^2 = a^2 \frac{\cot^2 \alpha}{\operatorname{cosec}^2 \alpha} + b^2 \sin^2 \alpha$$

$$\Rightarrow p^2 = a^2 \cos^2 \alpha + b^2 \sin^2 \alpha$$

31. (d) The tangent to $\frac{x^2}{25} + \frac{y^2}{4} = 1$ is $\frac{x}{5} \cos \theta + \frac{y}{2} \sin \theta = 1$. If it is also tangent to the circle, then

$$16 = \frac{1}{\frac{\cos^2 \theta}{25} + \frac{\sin^2 \theta}{4}} = \frac{100}{4 + 21 \sin^2 \theta}$$

$$\Rightarrow \sin^2 \theta = \frac{3}{28}, \cos^2 \theta = \frac{25}{28}$$

If the tangents meet the axes at A and B, then

$$A = \left(\frac{5}{\cos \theta}, 0\right) \text{ and } B = \left(0, \frac{2}{\sin \theta}\right)$$

$$\therefore AB^2 = \frac{25}{\cos^2 \theta} + \frac{4}{\sin^2 \theta}$$

$$= 28 + \frac{4}{3} \cdot 28 = \frac{196}{3}$$

$$\Rightarrow AB = \frac{14}{\sqrt{3}}$$

32. (d) Given equation of ellipse is $\frac{x^2}{2} + \frac{y^2}{1} = 1$.

General equation of tangent to the ellipse of slope m is $y = mx \pm \sqrt{2m^2 + 1}$.

Since, this is equally inclined to axes, so $m = \pm 1$.

Then, tangents are $y = \pm x \pm \sqrt{2+1} = \pm x \pm \sqrt{3}$

$\therefore$ Distance of any tangent from origin = $\frac{|0 + 0 \pm \sqrt{3}|}{\sqrt{1^2 + 1^2}} = \frac{\sqrt{3}}{2}$

33. (a) Let the equation of the required ellipse be $\frac{x^2}{16} + \frac{y^2}{b^2} = 1$.

But the ellipse passes through the point (2, 1).

$$\Rightarrow \frac{1}{4} + \frac{1}{b^2} = 1$$

$$\Rightarrow \frac{1}{b^2} = \frac{3}{4} \Rightarrow b^2 = \frac{4}{3}$$

Hence, the equation is

$$\frac{x^2}{16} + \frac{3y^2}{4} = 1$$

$$\Rightarrow x^2 + 12y^2 = 16$$

34. (c) The equations of the chords of contact of tangents drawn from (x_1, y_1) and (x_2, y_2) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, are

$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1 \quad \dots(i)$$

and

$$\frac{xx_2}{a^2} + \frac{yy_2}{b^2} = 1 \quad \dots(ii)$$

It is given that Eqs. (i) and (ii) are at right angles.

$$\therefore \frac{-b^2}{a^2} \cdot \frac{x_1}{y_1} \times \frac{-b^2}{a^2} \cdot \frac{x_2}{y_2} = -1 \Rightarrow \frac{x_1 x_2}{y_1 y_2} = -\frac{a^4}{b^4}$$

35. (a) Equation of normal with slope m to the given ellipse is

$$y = mx \pm \frac{m(5-b^2)}{\sqrt{b^2 m^2 + 5}}$$

$$\Rightarrow y = x \pm \frac{(5-b^2)}{\sqrt{b^2 + 5}} \quad [\text{as } m = 1] \dots(i)$$

Also, $y = x + \frac{1}{3}$ is the normal to ellipse. [given] ... (ii)

Eqs. (i) and (ii) both represent same line.

$$\therefore \pm \frac{(5-b^2)}{\sqrt{b^2 + 5}} = \frac{1}{3} \Rightarrow (5-b^2)^2 = \frac{1}{9} (5+b^2)$$

$$\Rightarrow 9b^4 - 91b^2 + 220 = 0 \Rightarrow b^2 = 4 \text{ or } \frac{55}{9}$$

So, length of minor axis is either 4 or $\frac{2}{3}\sqrt{55}$.

36. (a) Let $y = m_1 x$ and $y = m_2 x$ be a pair of conjugate diameters of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and let $P(a \cos \theta, b \sin \theta)$ and $Q(a \cos \phi, b \sin \phi)$ be ends of these two diameters. Then,

$$m_1 m_2 = -\frac{b^2}{a^2}$$

$$\Rightarrow \frac{b \sin \theta - 0}{a \cos \theta - 0} \times \frac{b \sin \phi - 0}{a \cos \phi - 0} = -\frac{b^2}{a^2}$$

$$\Rightarrow \sin \theta \sin \phi = -\cos \theta \cos \phi$$

$$\Rightarrow \cos(\theta - \phi) = 0 \Rightarrow \theta - \phi = \pm \frac{\pi}{2}$$

37. (a) Given chords of contact are

$$\frac{xx_1}{25} + \frac{yy_1}{36} = 1 \text{ and } \frac{xx_2}{25} + \frac{yy_2}{36} = 1$$

$\therefore$ Product of the slopes = -1

$$\therefore \left(-\frac{x_1/25}{y_1/36} \right) \left(-\frac{x_2/25}{y_2/36} \right) = -1$$

$$\Rightarrow \frac{x_1 x_2}{625} \cdot \frac{(36)^2}{y_1 y_2} = -1$$

$$\Rightarrow \frac{x_1 x_2}{y_1 y_2} = -\frac{(5)^4}{(6)^4} = -\left(\frac{5}{6}\right)^4$$

38. (d) $16(x^2 - 2x) - 3(y^2 - 4y) = 44$

$$\Rightarrow 16(x-1)^2 - 3(y-2)^2 = 48$$

$$\Rightarrow \frac{(x-1)^2}{3} - \frac{(y-2)^2}{16} = 1$$

which represents a hyperbola with eccentricity given by

$$e = \sqrt{1 + \left(\frac{\text{Conjugate axis}}{\text{Transverse axis}} \right)^2} = \sqrt{1 + \left(\frac{4}{\sqrt{3}} \right)^2} = \sqrt{\frac{19}{3}}$$

39. (d) Normals at θ, ϕ where $\phi = \frac{\pi}{2} - \theta$ pass through (h, k) .

$$\therefore ah \cos \theta + bk \cot \theta = a^2 + b^2 \quad \dots(i)$$

$$\text{and } ah \sin \theta + bk \tan \theta = a^2 + b^2 \quad \dots(ii)$$

Eliminating h from Eqs. (i) and (ii), we get $bk(\cot \theta \sin \theta - \tan \theta \cos \theta)$

$$= (a^2 + b^2)(\sin \theta - \cos \theta) \text{ or } k = -\frac{(a^2 + b^2)}{b}$$

40. (c) For the given ellipse, $a^2 = 16$.

$$\therefore e = \sqrt{1 - \frac{b^2}{a^2}}$$

$$\Rightarrow e = \sqrt{1 - \frac{b^2}{16}} = \sqrt{\frac{16 - b^2}{16}}$$

So, the foci of the ellipse are $(\pm ae, 0)$, i.e. $(\pm \sqrt{16 - b^2}, 0)$.

For the hyperbola, $a^2 = \left(\frac{12}{5}\right)^2$, $b^2 = \left(\frac{9}{5}\right)^2$

The eccentricity e is given by

$$e = \sqrt{1 + \frac{b^2}{a^2}} = \sqrt{1 + \frac{81}{144}} = \frac{15}{12} = \frac{5}{4}$$

Thus, the foci of the hyperbola are $(\pm ae, 0)$ or $(\pm 3, 0)$.

Since, the foci of the ellipse and hyperbola coincide.

$$\text{Therefore, } \sqrt{16 - b^2} = 3 \Rightarrow b^2 = 7$$

41. (b) Let $CP = r_1$ be inclined to transverse axis at an angle θ , so that P is $(r_1 \cos \theta, r_1 \sin \theta)$ and P lies on the hyperbola.

$$\Rightarrow r_1^2 \left(\frac{\cos^2 \theta}{a^2} - \frac{\sin^2 \theta}{b^2} \right) = 1$$

$$\Rightarrow \frac{1}{r_1^2} + \frac{1}{r_2^2} = \frac{\cos^2 \theta}{a^2} - \frac{\sin^2 \theta}{b^2} + \frac{\sin^2 \theta}{a^2} - \frac{\cos^2 \theta}{b^2}$$

$$\Rightarrow \frac{1}{r_1^2} + \frac{1}{r_2^2} = \frac{1}{a^2} - \frac{1}{b^2}$$

$$\Rightarrow \frac{1}{CP^2} + \frac{1}{CQ^2} = \frac{1}{a^2} - \frac{1}{b^2}$$

42. (a) Here, $a = \sin \theta$

Since, foci of the ellipse are $(\pm 1, 0)$.

$$\therefore \pm 1 = \sqrt{a^2 + b^2} \Rightarrow b^2 = \cos^2 \theta$$

$$\text{Then, equation is } \frac{x^2}{\sin^2 \theta} - \frac{y^2}{\cos^2 \theta} = 1$$

$$\Rightarrow x^2 \operatorname{cosec}^2 \theta - y^2 \sec^2 \theta = 1$$

43. (b) Here, $e_1 = \sqrt{1 - \frac{16}{25}} = \frac{3}{5}$

$$\therefore e_1 e_2 = 1 \Rightarrow e_2 = \frac{5}{3}$$

Since, foci of ellipse are $(0, \pm 3)$.

$$\text{Hence, equation of hyperbola is } \frac{x^2}{16} - \frac{y^2}{9} = -1.$$

44. (c) Any tangent to the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$ of slope m is

$$y = mx \pm \sqrt{25m^2 - 16} \Rightarrow (4 - m)^2 = 25m^2 - 16$$

$$\Rightarrow 3m^2 + m - 4 = 0 \Rightarrow m_1 = 1, m_2 = -\frac{4}{3}$$

$$\Rightarrow |m_1| = 1, |m_2| = \frac{4}{3}$$

$$\therefore \text{ Tangents are } y = x + 3 \quad \dots(i)$$

$$\text{and } y = \frac{4}{3}x + \frac{16}{3} \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $(-7, -4)$

45. (c) Given equation of tangent is $x \sec \theta - y \tan \theta = a$ and lines are $x - y = 0, x + y = 0$.

So, vertices of triangle are $(0, 0)$,

$$\left(\frac{a}{\sec \theta - \tan \theta}, \frac{a}{\sec \theta - \tan \theta} \right)$$

$$\text{and } \left(\frac{a}{\sec \theta + \tan \theta}, \frac{-a}{\sec \theta + \tan \theta} \right).$$

$$\text{Using } \Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = a^2$$

46. (d) As we know, equation of tangent at (x_1, y_1) is $xx_1 - 2yy_1 = 4$, which is same as $2x + \sqrt{6}y = 2$.

$$\therefore \frac{x_1}{2} = -\frac{2y_1}{\sqrt{6}} = \frac{4}{2} \Rightarrow x_1 = 4 \text{ and } y_1 = -\sqrt{6}$$

47. (a) Suppose the common tangent is $y = mx + c$ to

$$9x^2 - 4y^2 = 36 \text{ and } x^2 + y^2 = 3$$

$$\therefore c^2 = a^2 m^2 - b^2 = 4m^2 - 9 \quad \dots(i)$$

$$\text{and } c^2 = 3 + 3m^2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$4m^2 - 9 = 3m^2 + 3 \Rightarrow m^2 = 12 \Rightarrow m = 2\sqrt{3}$$

$$\therefore c = \sqrt{3 + 3 \times 12} = \sqrt{39}$$

Hence, the common tangent is

$$y = 2\sqrt{3}x + \sqrt{39}$$

48. (d) The equation of tangent in slope form to the hyperbola

$$\frac{x^2}{16} - \frac{y^2}{9} = 1 \text{ is } y = mx + \sqrt{16m^2 - 9}.$$

Since, it passes through (h, k) .

$$\therefore k = mh + \sqrt{16m^2 - 9} \Rightarrow (k - mh)^2 = (16m^2 - 9^2)$$

$$\Rightarrow k^2 + m^2 h^2 - 2mkh - 16m^2 + 9^2 = 0$$

which is quadratic in m .

Let the slope of two tangents be m_1 and m_2 , then

$$m_1 m_2 = \frac{k^2 + 9}{h^2 - 16} \Rightarrow -1 = \frac{k^2 + 9}{h^2 - 16} \Rightarrow h^2 + k^2 = 7$$

So, the required locus is $x^2 + y^2 = 7$.

49. (d) Hint Here, $a^2 = 4, b^2 = 2 \Rightarrow a = 2, b = \sqrt{2}$

The equation of tangent is

$$\frac{x}{a} \sec \theta - \frac{y}{b} \tan \theta = 1$$

$$\Rightarrow \frac{x}{a} \sec \theta - \frac{y}{\sqrt{2}} \tan \theta = 1$$

So, the coordinates of P and Q are $P(2 \cos \theta, 0)$ and $Q(0, -\sqrt{2} \cot \theta)$, respectively.

Let coordinates of R be (h, k) .

$$\therefore h = 2 \cos \theta, k = -\sqrt{2} \cot \theta \Rightarrow \frac{k}{h} = \frac{-\sqrt{2}}{\sin \theta}$$

$$\Rightarrow \sin \theta = \frac{-\sqrt{2}h}{2k} \Rightarrow \sin^2 \theta = \frac{2h^2}{4k^2}$$

50. (a) The point on the hyperbola is $P(x_1, y_1)$, then N is $(x, 0)$.

$$\therefore \text{ Tangent at } (x_1, y_1) \text{ is } \frac{xx_1}{9} - \frac{yy_1}{4} = 1$$

$$\text{This meets X-axis at } T \left(\frac{9}{x_1}, 0 \right).$$

$$\therefore OT \cdot ON = \frac{9}{x_1} \cdot x_1 = 9$$

51. (c) Any point on the hyperbola is $(3 \sec \theta, 2 \tan \theta)$. The chord of contact to the circle is

$$3x \sec \theta + 2y \tan \theta = 9 \quad \dots(i)$$

If (x_1, y_1) is the mid-point of the chord, then its equation is

$$xx_1 + yy_1 = x_1^2 + y_1^2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{3 \sec \theta}{x_1} = \frac{2 \tan \theta}{y_1} = \frac{9}{x_1^2 + y_1^2}$$

On eliminating θ , we get $\frac{1}{81}(x_1^2 + y_1^2)^2 = \frac{x_1^2}{9} - \frac{y_1^2}{4}$

Hence, the locus is $(x^2 + y^2)^2 = 81\left(\frac{x^2}{9} - \frac{y^2}{4}\right)$.

52. (b) Given equation of the hyperbola is $3x^2 - y^2 = 3$

$$\Rightarrow \frac{x^2}{1} - \frac{y^2}{3} = 1$$

Equation of tangent in terms of slope is

$$y = mx \pm \sqrt{(m^2 - 3)}$$

Given, $m = 2$

$$\therefore y = 2x \pm 1$$

53. (b) If (h, k) is the mid-point of the chord, then its equation by $T = S_1$ is

$$hx - ky = h^2 - k^2 \Rightarrow y = \frac{h}{k}x + \frac{k^2 - h^2}{k}$$

If it touches the parabola $y^2 = 4ax$, then

$$\frac{k^2 - h^2}{k} = \frac{a \cdot k}{h} \Rightarrow ak^2 = hk^2 - h^3 \Rightarrow ay^2 = xy^2 - x^3$$

So, required locus is $y^2(x - a) = x^3$.

54. (b) Given equation can be rewritten as

$$\frac{x^2}{2} - \frac{y^2}{1} = 1$$

Here, $a^2 = 2, b^2 = 1$

We know that, the length of perpendicular drawn from any

point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ to the asymptotes is

$$\frac{a^2 b^2}{a^2 + b^2} = \frac{2(1)}{2+1} = \frac{2}{3}$$

55. (b) Let $P(x_1, y_1)$ be the point from which tangents are drawn.

The chord of contact is $S_1 = -8$.

$$\text{i.e. } xx_1 - yy_1 = 9$$

It is same as $x = 9$.

$$\therefore x_1 = 9$$

$$y_1 = 0$$

Equation of tangent is $T_1 = SS_1$.

$$\therefore (x - 9)^2 = -8(x^2 - y^2 - 9)$$

$$\Rightarrow 9x^2 - 8y^2 - 18x + 9 = 0$$

BITSAT Archives

1. (c) The given equation of second ellipse can be rewritten as

$$\frac{x^2}{4} + \frac{y^2}{1} = 1$$

Equation of tangent to this ellipse is

$$\frac{x}{2} \cos \theta + y \sin \theta = 1 \quad \dots(i)$$

Equation of the first ellipse can be rewritten as

$$\frac{x^2}{6} + \frac{y^2}{3} = 1 \quad \dots(ii)$$

Let ellipse (i) meets the ellipse at P and Q and the tangents at P and Q to the second ellipse intersected at (h, k) , then Eq. (i) is the chord of contact of (h, k) with respect to the ellipse (ii) and thus its equation is

$$\frac{hx}{6} + \frac{ky}{3} = 1 \quad \dots(iii)$$

Since, Eqs. (i) and (iii) represent the same line.

$$\therefore \frac{h/6}{\cos \frac{\theta}{2}} = \frac{k/3}{\sin \theta} = 1$$

$$\Rightarrow h = 3 \cos \theta \text{ and } k = 3 \sin \theta$$

Hence, locus is $x^2 + y^2 = 9$.

2. (a) Let P be $(at_1^2, 2at_1)$ and Q be $(at_2^2, 2at_2)$.

Since, PQ subtends a right angle at the vertex $(0, 0)$.

$$\text{Hence, } t_1 t_2 = -4 \quad \dots(i)$$

If (h, k) is the point of intersection of normals at P and Q , then

$$h = 2a + a(t_1^2 + t_2^2 + t_1 t_2) \quad \dots(ii)$$

$$\text{and } k = -at_1 t_2(t_1 + t_2) \quad \dots(iii)$$

In order to find the locus of (h, k) , we have to eliminate t_1 and t_2 between Eqs. (i), (ii) and (iii).

$$\therefore k = 4a(t_1 + t_2) \quad \dots(iv)$$

[from Eqs. (i) and (iii)]

$$\text{and } h - 2a = a[(t_1 + t_2)^2 - t_1 t_2]$$

$$\Rightarrow h - 2a = a\left[\frac{k^2}{16a^2} + 4\right] \quad \text{[from Eq. (iv)]}$$

$$\Rightarrow h - 6a = \frac{k^2}{16a}$$

Hence, the required locus is $y^2 = 16a(x - 6a)$, which is a parabola.

$$3. (c) \text{ Hint } \frac{(x-3)^2}{16} + \frac{y^2}{25} = 1$$

$$4. (a) \text{ Given, } \frac{x^2}{16} + \frac{y^2}{9} = 1$$

$$\begin{aligned} \therefore e &= \sqrt{1 - \frac{9}{16}} \\ &= \sqrt{\frac{16-9}{16}} \\ &= \sqrt{\frac{7}{16}} \\ &= \frac{\sqrt{7}}{4} \end{aligned}$$

$\therefore$ Coordinates of foci are $(\pm \sqrt{7}, 0)$.

Since, centre of circle is $(0, 3)$ and passing through foci $(\pm \sqrt{7}, 0)$.

$$\begin{aligned} \therefore \text{Radius of the circle} &= \sqrt{(0 \pm \sqrt{7})^2 + (3 - 0)^2} \\ &= \sqrt{7 + 9} = 4 \text{ units} \end{aligned}$$

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{2at}{at^2} \Rightarrow t = 2\sqrt{3}$$

Again in $\triangle OCA$,

$$\begin{aligned} OA &= \sqrt{OC^2 + AC^2} = \sqrt{(at^2)^2 + (2at)^2} \\ &= \sqrt{[(2\sqrt{3})^2]^2 a^2 + 4a^2 (2\sqrt{3})^2} \\ &= \sqrt{192a^2} = 8a\sqrt{3} \end{aligned}$$

6. (d) Length of minor axis = $2b$ and according to the given condition, length of major axis = $3(2b) = 6b$

$$\therefore e = \sqrt{1 - \frac{b^2}{(3b)^2}} = \sqrt{\frac{8}{9}} = \frac{2\sqrt{2}}{3}$$

7. (c) **Hint** In $\triangle BOT$,

$$\frac{b}{ae} = \tan 60^\circ$$

$$\Rightarrow b = ae\sqrt{3}$$

$$\therefore e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{a^2 e^2 3}{a^2}}$$

8. (c) The difference of the focal distance at any point on the hyperbola is same as length of the transverse axis, i.e. $2a$.

9. (a) **Hint** Let $P(x, y)$ be any point on the parabola.

$$\text{Then, } \sqrt{(x-0)^2 + (y+3)^2} = (y-3)$$

10. (c) Length of tangent = $\sqrt{S_1}$
- $$= \sqrt{5^2 + 1^2 + 30 - 4 - 3} = \sqrt{49} = 7 \text{ units}$$

11. (c) Given equation can be rewritten as

$$(x-1)^2 + (y-3)^2 = \left(\frac{5x-12y+17}{13}\right)^2$$

$$\Rightarrow SP = PM$$

Here, focus is $(1, 3)$, then directrix is

$$5x - 12y + 17 = 0$$

$\therefore$ The distance of the focus from the directrix

$$= \frac{|5 - 36 + 17|}{\sqrt{25 + 144}} = \frac{14}{13} = 2a$$

$$\therefore \text{Length of latusrectum} = 2 \times \frac{14}{13} = \frac{28}{13} \text{ units}$$

12. (a) **Hint** Given, centre = $(0, 0)$, focus = $(0, 3)$, $b = 5$

$$\Rightarrow be = 3 \Rightarrow e = \frac{3}{5}$$

$$\therefore a = b\sqrt{1 - e^2}$$

13. (c) The equation of director circle to the hyperbola is $x^2 + y^2 = a^2 - b^2$

$$\therefore \text{Radius} = \sqrt{a^2 - b^2}$$

14. (d) **Hint** The equations of the required chord is given by

$$S = T$$

15. (b) Given equation of the curve is

$$3x^2 - y^2 - 2x + 4y = 0 \quad \dots (i)$$

Let the equation of one of the chord be

$$y = mx + c \Rightarrow \frac{y - mx}{c} = 1 \quad \dots (ii)$$

On making Eq. (i) homogeneous, we get

$$3x^2 - y^2 + (-2x + 4y)\left(\frac{y - mx}{c}\right) = 0$$

$$\Rightarrow x^2(3c + 2m) + y^2(-c + 4) - 2xy - 4mxy = 0$$

which represents a pair of straight lines passing through origin.

Since, the angle subtended is a right angle.

$$\therefore 3c + 2m - c + 4 = 0$$

$$\Rightarrow c = -m - 2$$

Substituting the value of c in $y = mx + c$, we get

$$y = mx - m - 2$$

$$\Rightarrow y + 2 = m(x - 1)$$

$\therefore$ All such chords pass through a fixed point $(1, -2)$.

16. (a) Putting $y = 2t^2$ in the equation of the given ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$, we get

$$\frac{x^2}{9} + \frac{4t^4}{4} = 1$$

$$\Rightarrow x^2 = 9(1 - t^4)$$

$$= 9(1 - t^2)(1 + t^2)$$

This will give real values of x , if $1 - t^2 \geq 0$

$$\text{i.e. } |t| \leq 1$$

17. (c) Given, equation of hyperbola is

$$x^2 - 3y^2 - 4x - 6y - 11 = 0 \text{ units}$$

$$\Rightarrow (x^2 - 4x + 4) - 3(y^2 + 2y + 1) - 11 = 4 - 3$$

$$\Rightarrow (x - 2)^2 - 3(y + 1)^2 = 12$$

$$\Rightarrow \frac{(x - 2)^2}{12} - \frac{(y + 1)^2}{4} = 1$$

$$\text{Now, } e = \sqrt{1 + \frac{4}{12}} = \frac{2}{\sqrt{3}}$$

$\therefore$ Distance between foci

$$= 2ae = 2 \times \sqrt{12} \times \frac{2}{\sqrt{3}} = 8 \text{ units}$$

18. (a) It is clear from the figure that, the two curves do not intersect each other.

19. (b) **Hint** Here, $a^2 = \cos^2 \alpha$ and $b^2 = \sin^2 \alpha$

$$\therefore \sin^2 \alpha + \cos^2 \alpha = a^2 + b^2 \Rightarrow 1 = a^2 + b^2$$

$$\therefore e = \sqrt{\frac{a^2 + b^2}{a^2}}$$

20. (c) Given vertex of parabola $(h, k) \equiv (1, 1)$ and its focus $(a + h, k) \equiv (3, 1)$ or $a + h = 3 \Rightarrow a = 2$

Since, y -coordinate of vertex and focus are same, therefore axis of parabola is parallel to X -axis.

Thus, equation of parabola is

$$(y - k)^2 = 4a(x - h) \Rightarrow (y - 1)^2 = 8(x - 1)$$

21. (c) Given,

$$x^2 + 10x - 16y + 25 = 0 \Rightarrow (x + 5)^2 = 16y$$

$$\Rightarrow X^2 = 4AY$$

$$\text{where, } X = x + 5, A = 4, Y = y$$

The ends of the latusrectum are

$$(2A, A) \text{ and } (-2A, A)$$

$$\Rightarrow x + 5 = 2(4) \Rightarrow x = -8 - 5 = -13, y = 4$$

$$\text{and } x + 5 = -2(4) \Rightarrow x = -8 - 5 = -13, y = 4$$

$$\Rightarrow (3, 4) \text{ and } (-13, 4)$$

22. (b) **Hint** Given, $e = 2, 2ae = 8$

$$\Rightarrow ae = 4 \Rightarrow a = 2$$

$$\therefore b^2 = a^2(e^2 - 1)$$

23. (a) We know that, if P is any point on the curve, then Sum of focal distances = Length of major axis

$$\text{i.e. } SP + S'P = 2a = 2(5) \quad [\because a^2 = 5^2] \\ = 10$$

24. (c) Given equation of line is

$$x + y = 0 \quad \dots (i)$$

and equation of circle is

$$x^2 + y^2 + 4y = 0 \quad \dots (ii)$$

On solving Eqs. (i) and (ii), we get

$$x^2 + (-x)^2 + 4(-x) = 0 \Rightarrow 2x^2 - 4x = 0$$

$$\Rightarrow 2x(x - 2) = 0 \Rightarrow x = 0, 2$$

$$\text{and } y = 0, -2$$

Now, taking option (c),

$$y^2 = 2x$$

$$\text{At point } (0, 0) \Rightarrow 0 = 0$$

$$\text{and at point } (2, -2)$$

$$\Rightarrow (-2)^2 = 2(2) \Rightarrow 4 = 4$$

25. (c) Given equation of ellipse is $4x^2 + 5y^2 = 1$

$$\text{or } OS \equiv 4x^2 + 5y^2 - 1 = 0 \quad \dots (i)$$

At point $(4, -3)$,

$$S \equiv 4(4)^2 + 5(-3)^2 - 1 \\ \equiv 108 > 0$$

Therefore, the given point lies outside the ellipse.

26. (a) Equation of director circle of given hyperbola is

$$\frac{x^2}{25} - \frac{y^2}{16} = 1 \text{ is } x^2 + y^2 = 25 - 16$$

$$\Rightarrow x^2 + y^2 = 9 \quad \dots (i)$$

This circle passes through $(2\sqrt{2}, 1)$ and we know that director circle is the locus of point of intersection of perpendicular tangents drawn to hyperbola.

Thus, the angle between the tangents is $\pi/2$.

27. (c) Equation of parabola is

$$y^2 = -4x$$

$$\therefore \text{Focus is } (-1, 0).$$

The equation of line passing through $(-1, 0)$ is

$$y - 0 = m(x + 1) \quad \dots (i)$$

Since, the line makes an angle $\theta = 20^\circ$.

$$\therefore m = \tan \theta = \tan 120^\circ$$

$$\Rightarrow m = -\sqrt{3}$$

On putting the value of m in Eq. (i), we get

$$y = -\sqrt{3}(x + 1)$$

15

Three Dimensional Geometry

Coordinates Axes and Coordinate Planes

The three mutually perpendicular lines in a space which divides the space into eight parts are called **coordinate axes**. They determine three mutually perpendicular planes called **coordinate planes**. The coordinates of a point are the distances from the origin to the foot of the perpendiculars from the point on the respective coordinate axes. The coordinates of any point on X , Y and Z -axes will be as $(x,0,0)$ $(0,y,0)$ and $(0,0,z)$ respectively and the coordinates of any point will be as (x,y,z) .

Distance between Two Points

The distance between two points $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ is

$$|AB| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

Section Formulae

There are two types of section formulae which are defined as follows :

1. For Internal Division

Formulae for internal division in cartesian and vector forms are given below:

Cartesian Form

Let two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ in space and $R(x, y, z)$ be a point on the line joining points P and Q such that it divides the join of P and Q internally in the ratio $m : n$, then the coordinates of R are

$$\left[\frac{mx_2 + nx_1}{m+n}, \frac{my_2 + ny_1}{m+n}, \frac{mz_2 + nz_1}{m+n} \right]$$

NOTE The coordinates of the mid-point of the line joining of $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ are $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2} \right)$.

Vector Form

Let P and Q be two points with position vectors $\mathbf{r}_1$ and $\mathbf{r}_2$ respectively and $OR = \mathbf{r}$. Then,

$$\mathbf{r} = \frac{m\mathbf{r}_2 + n\mathbf{r}_1}{m+n}$$

NOTE The position vector ($\mathbf{r}$) of the mid-point of the joining of P and Q , with position vectors $\mathbf{r}_1$ and $\mathbf{r}_2$, is $\mathbf{r} = \frac{\mathbf{r}_1 + \mathbf{r}_2}{2}$.

2. For External Division

Formulae for external division in cartesian and vector forms are given below:

Cartesian Form

Let two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ in space and R be a point on PQ produced dividing it externally in the ratio $m:n$ ($m \neq n$). Then, the coordinates of R are

$$\left[\frac{mx_2 - nx_1}{m-n}, \frac{my_2 - ny_1}{m-n}, \frac{mz_2 - nz_1}{m-n} \right]$$

Vector Form

Let R be a point dividing PQ externally in the ratio $m:n$ and $OR = \mathbf{r}$, then

$$\mathbf{r} = \frac{m\mathbf{r}_2 - n\mathbf{r}_1}{m-n}$$

Some Important Facts

If $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ are the vertices of ΔABC , then

(i) Centroid of triangle = $\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}, \frac{z_1 + z_2 + z_3}{3} \right)$

(ii) Area of $\Delta ABC = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix}$

(iii) If area of $\Delta ABC = 0$, then these points are collinear.

Direction Cosines and Ratios

If a vector makes angles α, β and γ with the positive directions of X, Y and Z -axes respectively, then $\cos \alpha, \cos \beta$ and $\cos \gamma$ are called the direction cosines and it is denoted by l, m, n i.e. $l = \cos \alpha, m = \cos \beta$ and $n = \cos \gamma$. If numbers a, b and c are proportional to l, m and n respectively, then a, b and c are called direction ratios.

Thus, a, b and c are the direction ratios of a vector, provided

$$\frac{l}{a} = \frac{m}{b} = \frac{n}{c}$$

where, $l = \pm \frac{a}{\sqrt{a^2 + b^2 + c^2}}, m = \pm \frac{b}{\sqrt{a^2 + b^2 + c^2}}$

and

$$n = \pm \frac{c}{\sqrt{a^2 + b^2 + c^2}}$$

Some Important Facts

(i) If a vector $\mathbf{r} = a\hat{i} + b\hat{j} + c\hat{k}$ having direction cosines l, m and n , then

$$l = \frac{a}{|\mathbf{r}|}, m = \frac{b}{|\mathbf{r}|}$$

and

$$n = \frac{c}{|\mathbf{r}|}$$

where, a, b and c are direction ratios of $\mathbf{r}$.

(ii) Direction ratios of the line joining two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ are $x_2 - x_1, y_2 - y_1, z_2 - z_1$ and its direction cosines are

$$\frac{x_2 - x_1}{|PQ|}, \frac{y_2 - y_1}{|PQ|}, \frac{z_2 - z_1}{|PQ|}$$

(iii) If $P(x, y, z)$ is a point in space, then

(a) $x = l|\mathbf{r}|, y = m|\mathbf{r}|, z = n|\mathbf{r}|$

(b) $l|\mathbf{r}|, m|\mathbf{r}|$ and $n|\mathbf{r}|$ are projections of $\mathbf{r}$ on OX, OY and OZ , respectively.

(c) $\mathbf{r} = |\mathbf{r}|(\hat{i}l + \hat{j}m + \hat{k}n)$

(iv) The projection of the line segment joining points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ to the line having direction cosines l, m, n , is

$$|(x_2 - x_1)l + (y_2 - y_1)m + (z_2 - z_1)n|$$

(v) The sum of squares of direction cosines is always unity i.e. $l^2 + m^2 + n^2 = 1$.

(vi) DC's of X, Y and Z -axes are $(1, 0, 0)$, $(0, 1, 0)$ and $(0, 0, 1)$.

(vii) Direction cosines of a line are unique but direction ratio of a line are not unique and can be infinite.

(viii) DC's of a line which is equally inclined to the coordinate axes, are $\left(\pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{3}} \right)$.

Straight Line in Space

A straight line is the locus of the intersection of any two planes.

Some Important Facts

- (i) **Equation of a line passing through a given point and having given direction cosines** The equation of line which passes through (x_1, y_1, z_1) and having direction cosines l, m, n , is given by

$$\frac{x - x_1}{l} = \frac{y - y_1}{m} = \frac{z - z_1}{n} = r \quad [\text{say}]$$

If we use direction ratios instead of direction cosines, then the equation of the line is

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} = \lambda$$

where, $a^2 + b^2 + c^2 \neq 1$

This is also called the symmetrical form of a line.

- (ii) **Vector equation of a line passing through a point and parallel to given vector** The equation of a line passing through a point with position vector $\mathbf{a}$ and parallel to vector $\mathbf{b}$, is $\mathbf{r} = \mathbf{a} + \lambda \mathbf{b}$.
- (iii) **Equation of line passing through two given points**

- (a) **Cartesian Form** Direction ratios of AB

$$= (x_2 - x_1, y_2 - y_1, z_2 - z_1)$$

Direction ratios of AP

$$= (x - x_1, y - y_1, z - z_1)$$

Since, they are proportional.

$$\therefore \frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}$$

- (b) **Vector Form** $\mathbf{r} = \mathbf{a} + \lambda (\mathbf{b} - \mathbf{a})$

- (iv) **Changing unsymmetrical form to symmetrical form**

The unsymmetrical form of a line

$$ax + by + cz + d = 0 \quad \text{and} \quad a'x + b'y + c'z + d' = 0$$

can be changed to symmetrical form as

$$\frac{x - \frac{bd' - b'd}{ab' - a'b}}{bc' - b'c} = \frac{y - \frac{da' - d'a}{ab' - a'b}}{ca' - c'a} = \frac{z}{ab' - a'b}$$

- (v) **Foot of perpendicular from a point $A(\alpha, \beta, \gamma)$ to the line $\frac{x - x_1}{l} = \frac{y - y_1}{m} = \frac{z - z_1}{n}$, length and equation of perpendicular** If B is the foot of perpendicular, then B is $(lk + x_1, mk + y_1, nk + z_1)$. Find the direction ratios of AB and apply the condition of perpendicularity of AB and the given line. This will give the value of k and hence the point B which is foot of perpendicular. Its length is the distance AB and its equation is the line joining two known points A and B .

Angle between Two Intersecting Lines

The angle between two intersecting lines with cartesian equations and vector equations can be found as given below:

Cartesian Form

If θ is the angle between two lines whose direction cosines are (l_1, m_1, n_1) , (l_2, m_2, n_2) and (a_1, b_1, c_1) , (a_2, b_2, c_2) are direction ratios, then

$$\cos \theta = l_1 l_2 + m_1 m_2 + n_1 n_2 = \pm \frac{\Sigma a_1 a_2}{[\Sigma a_1^2 \cdot \Sigma a_2^2]^{1/2}}$$

$$\sin^2 \theta = \left| \frac{m_1}{m_2} \frac{n_1}{n_2} \right|^2 + \left| \frac{n_1}{n_2} \frac{l_1}{l_2} \right|^2 + \left| \frac{l_1}{l_2} \frac{m_1}{m_2} \right|^2$$

$$\tan \theta = \pm \frac{[\Sigma (l_1 m_2 - l_2 m_1)^2]^{1/2}}{l_1 l_2 + m_1 m_2 + n_1 n_2}$$

The lines are parallel to each other if and only if

$$(i) \frac{l_1}{l_2} = \frac{m_1}{m_2} = \frac{n_1}{n_2}$$

$$(ii) \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

The lines are perpendicular to each other if and only if

$$(i) l_1 l_2 + m_1 m_2 + n_1 n_2 = 0 \quad \text{or} \quad \theta = 90^\circ$$

$$(ii) a_1 a_2 + b_1 b_2 + c_1 c_2 = 0$$

Vector Form

If the vector equations of two lines

$$\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1 \quad \text{and} \quad \mathbf{r} = \mathbf{a}_2 + \mu \mathbf{b}_2, \text{ then}$$

$$\cos \theta = \frac{|\mathbf{b}_1 \cdot \mathbf{b}_2|}{|\mathbf{b}_1| |\mathbf{b}_2|}$$

Skew-lines

Two straight lines in a space which are neither parallel nor intersecting, are called skew-lines. Thus, skew-lines are those lines which do not lie in the same plane.

Shortest Distance between Two Lines

Cartesian Form

(i) Let the two skew-lines be

$$\frac{x-x_1}{l_1} = \frac{y-y_1}{m_1} = \frac{z-z_1}{n_1}$$

and

$$\frac{x-x_2}{l_2} = \frac{y-y_2}{m_2} = \frac{z-z_2}{n_2}$$

$$\therefore d = \frac{\begin{vmatrix} x_2-x_1 & y_2-y_1 & z_2-z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix}}{\sqrt{(m_1n_2 - m_2n_1)^2 + (n_1l_2 - l_1n_2)^2 + (l_1m_2 - m_1l_2)^2}}$$

Vector Form

Shortest distance between the lines

$$\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1$$

and $\mathbf{r} = \mathbf{a}_2 + \mu \mathbf{b}_2$ is given by

$$d = \frac{|(\mathbf{a}_2 - \mathbf{a}_1) \cdot (\mathbf{b}_1 \times \mathbf{b}_2)|}{|\mathbf{b}_1 \times \mathbf{b}_2|}$$

NOTE • The shortest distance between two parallel lines

$$\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b} \text{ and } \mathbf{r} = \mathbf{a}_2 + \mu \mathbf{b} \text{ is } d = \frac{|(\mathbf{a}_2 - \mathbf{a}_1) \times \mathbf{b}|}{|\mathbf{b}|}$$

• Two lines $\mathbf{r}_1 = \mathbf{a}_1 + \lambda \mathbf{b}_1$ and $\mathbf{r}_2 = \mathbf{a}_2 + \mu \mathbf{b}_2$ will intersect provided $d = 0$ i.e. when $(\mathbf{a}_2 - \mathbf{a}_1) \cdot (\mathbf{b}_1 \times \mathbf{b}_2) = 0$.

Plane

A plane is a surface such that all the points of a straight line joining any two points on the surface lie on it.

Equation of Plane in Different Forms

(i) General Equation of a Plane

Every equation of first degree in x, y, z represents a plane.

Thus, the general equation of a plane is

$$ax + by + cz + d = 0, \text{ where } a^2 + b^2 + c^2 \neq 0$$

NOTE (a) Equation of YZ-plane is $x = 0$.

(b) Equation of ZX-plane is $y = 0$.

(c) Equation of XY-plane is $z = 0$.

(ii) Normal Form

(a) **Cartesian Form** If l, m, n are the direction cosines of the normal to a given plane and p is the length of perpendicular from origin to the plane, then the equation of the plane is

$$lx + my + nz = p$$

(b) **Vector Form** If $\hat{\mathbf{n}}$ is a unit vector normal to given plane and p is the length of perpendicular from the origin to the plane, then the equation of the plane is

$$\mathbf{r} \cdot \hat{\mathbf{n}} = p$$

(iii) One-point Form

(a) **Cartesian Form** The equation of plane passing through one point (x_1, y_1, z_1) is

$$a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$$

(b) **Vector Form** If $\mathbf{a}$ is the position vector of the point through which plane passes, then the equation of plane is given by $(\mathbf{r} - \mathbf{a}) \cdot \hat{\mathbf{n}} = 0$.

(iv) Intercepts Form of the Plane

The equation of a plane whose intercepts are a, b and c on X, Y and Z -axes, respectively is

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$$

Equation of Planes in Particular Cases

1. The equation of plane parallel to the plane

$$ax + by + cz + d = 0 \text{ is}$$

$$ax + by + cz + k = 0 \quad [\text{only constant term is changed}]$$

2. Plane passes through two points (x_1, y_1, z_1) and (x_2, y_2, z_2) is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$

$$\text{where, } a(x_2 - x_1) + b(y_2 - y_1) + c(z_2 - z_1) = 0$$

3. Plane passes through three non-collinear points (x_1, y_1, z_1) , (x_2, y_2, z_2) and (x_3, y_3, z_3) is

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ x_2-x_1 & y_2-y_1 & z_2-z_1 \\ x_3-x_1 & y_3-y_1 & z_3-z_1 \end{vmatrix} = 0$$

4. Plane $ax + by + cz + d = 0$ intersecting a line segment joining $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ divides in the ratio

$$\frac{ax_1 + by_1 + cz_1 + d}{ax_2 + by_2 + cz_2 + d}$$

- (i) If this ratio is positive, then A and B are on opposite sides of the plane.
 (ii) If this ratio is negative, then A and B are on the same side of the plane.
5. Any plane passing through the line of intersection of the planes $ax + by + cz + d = 0$ and $a_1x + b_1y + c_1z + d_1 = 0$ is
 $(ax + by + cz + d) + \lambda(a_1x + b_1y + c_1z + d_1) = 0$
6. Any plane containing the line $\frac{x - x_1}{l} = \frac{y - y_1}{m} = \frac{z - z_1}{n}$ is
 $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$, where $al + bm + cn = 0$

Some Important Facts

- (i) A line parallel to plane $ax + by + cz + d = 0$ In this case, it will be perpendicular to normal.
 $\therefore al + bm + cn = 0$
- (ii) A line perpendicular to a plane $ax + by + cz + d = 0$
 In this case, it will be parallel to normal.
 $\therefore \frac{a}{l} = \frac{b}{m} = \frac{c}{n}$
- (iii) Line to lie in the plane $ax + by + cz + d = 0$
 The normal to the plane will be perpendicular to the line.
 $\therefore al + bm + cn = 0$
 Also, point (x_1, y_1, z_1) through which the line passes will also lie on the plane.
 $\therefore ax_1 + by_1 + cz_1 + d = 0$

Distance of a Point from a Plane

Distance of a point (x_1, y_1, z_1) from the plane $ax + by + cz + d = 0$ is $\frac{|ax_1 + by_1 + cz_1 + d|}{\sqrt{a^2 + b^2 + c^2}}$.

Distance of the origin is $\frac{|d|}{\sqrt{a^2 + b^2 + c^2}}$.

Distance between Two Parallel Planes

The distance between two parallel planes $ax + by + cz + d_1 = 0$ and $ax + by + cz + d_2 = 0$ is $\frac{|d_1 - d_2|}{\sqrt{a^2 + b^2 + c^2}}$.

Coplanar Line

A line which is in the same plane as another line. Any two intersecting lines must lie in the same plane and therefore will be coplanar.

Condition for Coplanarity of Two Lines

Cartesian Form

The lines $\frac{x - x_1}{l_1} = \frac{y - y_1}{m_1} = \frac{z - z_1}{n_1}$

and $\frac{x - x_2}{l_2} = \frac{y - y_2}{m_2} = \frac{z - z_2}{n_2}$

are coplanar, if $\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$.

Vector Form

Two lines $\mathbf{r} = \mathbf{a} + \lambda \mathbf{b}$ and $\mathbf{r} = \mathbf{c} + \mu \mathbf{d}$ are coplanar or intersecting, if $(\mathbf{a} - \mathbf{c}) \cdot (\mathbf{b} \times \mathbf{d}) = 0$

$$\Rightarrow [\mathbf{a} \ \mathbf{b} \ \mathbf{d}] = [\mathbf{c} \ \mathbf{b} \ \mathbf{d}]$$

Angle between Two Planes

Cartesian Form

The angle between the planes

$$a_1x + b_1y + c_1z + d_1 = 0$$

and $a_2x + b_2y + c_2z + d_2 = 0$ is given by

$$\cos \theta = \pm \frac{a_1a_2 + b_1b_2 + c_1c_2}{\sqrt{(\Sigma a_1^2)} \sqrt{(\Sigma a_2^2)}}$$

where, θ is acute angle between the planes.

Vector Form

If $\mathbf{n}_1$ and $\mathbf{n}_2$ are normals to the plane and θ is the angle between $\mathbf{r} \cdot \mathbf{n}_1 = d_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = d_2$, then

$$\cos \theta = \frac{|\mathbf{n}_1 \cdot \mathbf{n}_2|}{|\mathbf{n}_1| |\mathbf{n}_2|}$$

Angle between a Line and a Plane

Cartesian Form

If angle between the line $\frac{x-x_1}{a} = \frac{y-y_1}{b} = \frac{z-z_1}{c}$ and the plane $a_1x + b_1y + c_1z + d = 0$ is θ , then $(90^\circ - \theta)$ is the angle between normal and the line.

$$\text{i.e. } \cos(90^\circ - \theta) = \left| \frac{aa_1 + bb_1 + cc_1}{\sqrt{a^2 + b^2 + c^2} \sqrt{a_1^2 + b_1^2 + c_1^2}} \right|$$

Vector Form

The angle between a line $\mathbf{r} = \mathbf{a} + \lambda\mathbf{b}$ and plane $\mathbf{r} \cdot \mathbf{n} = d$, is defined as the complement of the angle between the line and normal to the plane.

$$\text{i.e. } \sin\theta = \frac{\mathbf{n} \cdot \mathbf{b}}{|\mathbf{n}| |\mathbf{b}|}$$

Some Important Results

- **Foot of perpendicular from a point $A(\alpha, \beta, \gamma)$ to a given plane $ax + by + cz + d = 0$**

If AB is perpendicular from A to given plane, then it is parallel to normal so that its equation is

$$\frac{x-\alpha}{a} = \frac{y-\beta}{b} = \frac{z-\gamma}{c} = k$$

where, a, b, c are direction ratios of the normal.

Any point P on it is $(ak + \alpha, bk + \beta, ck + \gamma)$. It lies on the given plane and we find the value of k and hence the point B . $ax + by + cz + d = 0$

- Four non-coplanar points $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$, $C(x_3, y_3, z_3)$ and $D(x_4, y_4, z_4)$ forms a tetrahedron with vertices A, B, C and D , edges AB, AC, AD, BC, BD and CD ; faces ABC, ABD, ACD and BCD , then

$$(a) \text{ Centroid} = \left(\frac{x_1 + x_2 + x_3 + x_4}{4}, \frac{y_1 + y_2 + y_3 + y_4}{4}, \frac{z_1 + z_2 + z_3 + z_4}{4} \right)$$

$$(b) \text{ Volume} = \frac{1}{6} |\mathbf{AB} \times \mathbf{AC} \cdot \mathbf{AD}| = \frac{1}{6} \begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \\ x_4 - x_1 & y_4 - y_1 & z_4 - z_1 \end{vmatrix}$$

Practice Exercise

- The XY -plane divides the line joining the points $(-1, 3, 4)$ and $(2, -5, 6)$
 - internally in the ratio $2 : 3$
 - externally in the ratio $2 : 3$
 - internally in the ratio $3 : 2$
 - externally in the ratio $3 : 2$
- If a line makes angles $\frac{\pi}{3}$ and $\frac{\pi}{4}$ with X -axis and Y -axis respectively, then the angle made by the line with Z -axis is
 - $\frac{\pi}{2}$
 - $\frac{\pi}{3}$
 - $\frac{\pi}{4}$
 - $\frac{5\pi}{12}$
- If $A(3, 2, 0)$, $B(5, 3, 2)$ and $C(-9, 6, -3)$ are three points forming a triangle and AD is bisector of $\angle BAC$, then AD meets BC at the point
 - $\left(\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$
 - $\left(-\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$
 - $\left(\frac{19}{8}, -\frac{57}{16}, \frac{17}{16}\right)$
 - None of these
- If $\triangle ABC$ is such that the mid-points of the sides BC, CA and AB are $(l, 0, 0)$, $(0, m, 0)$ and $(0, 0, n)$, respectively. Then, $\frac{AB^2 + BC^2 + CA^2}{l^2 + m^2 + n^2}$ is equal to
 - 2
 - 4
 - 8
 - 16
- If $P(x, y, z)$ is a point on the line segment joining $Q(2, 2, 4)$ and $R(3, 5, 6)$ such that the projection of OP on the axes are $\frac{13}{5}, \frac{19}{5}, \frac{26}{5}$ respectively, then P divides QR in the ratio.
 - $1 : 2$
 - $3 : 2$
 - $2 : 3$
 - $1 : 3$
- If the projections of a directed line segment on the coordinate axes are $12, 4, 3$, then the direction cosines of the line are
 - $\frac{12}{13}, \frac{-4}{13}, \frac{3}{13}$
 - $\frac{-12}{13}, \frac{-4}{13}, \frac{3}{13}$
 - $\frac{12}{13}, \frac{4}{13}, \frac{3}{13}$
 - None of these

7. If the lines $\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4}$ and $\frac{x-3}{1} = \frac{y-p}{2} = \frac{z}{1}$ intersect, then p is equal to
 a. $\frac{9}{2}$ b. 10 c. 1 d. $\frac{12}{11}$
8. The foot of perpendicular from $(0, 2, 3)$ to the line $\frac{x+3}{5} = \frac{y-1}{2} = \frac{z+4}{3}$, is
 a. $(-2, 3, 4)$ b. $(2, -1, 3)$ c. $(2, 3, -1)$ d. $(3, 2, -1)$
9. The perpendicular distance of $P(1, 2, 3)$ from the lines $\frac{x-6}{3} = \frac{y-7}{2} = \frac{z-7}{-2}$ is
 a. 7 b. 5 c. 8 d. 0
10. The length of perpendicular drawn from the point $(2, 3, 4)$ to line $\frac{4-x}{2} = \frac{y}{6} = \frac{1-z}{3}$, is
 a. $\frac{3}{7}\sqrt{101}$ b. $\frac{2}{7}\sqrt{101}$ c. $\frac{2}{7}\sqrt{103}$ d. $\frac{3}{7}\sqrt{103}$
11. The angle between the lines $\frac{x-2}{3} = \frac{y+1}{-2}$, $z=2$ and $\frac{x-1}{1} = \frac{2y+3}{3} = \frac{z+5}{2}$ is equal to
 a. $\pi/2$ b. $\pi/3$
 c. $\pi/6$ d. None of these
12. The angle between the diagonal of a cube and an edge of the cube intersecting the diagonal, is
 a. $\cos^{-1}\left(\frac{1}{3}\right)$ b. $\cos^{-1}\left(\sqrt{\frac{2}{3}}\right)$
 c. $\tan^{-1}(\sqrt{2})$ d. None of these
13. The angle between the lines whose direction cosines are given by $l+m+n=0$ and $l^2+m^2-n^2=0$, is
 a. $\frac{\pi}{6}$ b. $\frac{\pi}{4}$ c. $\frac{\pi}{3}$ d. $\frac{\pi}{2}$
14. The angle between the lines whose direction cosines (l, m, n) satisfy the equations $l+m+n=0$ and $2lm+2ln-mn=0$, is
 a. 60° b. 90° c. 110° d. 120°
15. The shortest distance between the lines $\frac{x+1}{7} = \frac{y+1}{-6} = \frac{z+1}{1}$ and $\frac{x-3}{1} = \frac{y-5}{-2} = \frac{z-7}{1}$, is
 a. $\sqrt{29}$ units b. 29 units
 c. $\frac{29}{2}$ units d. $2\sqrt{29}$ units
16. If a plane meets the coordinate axes in A, B, C and (α, β, γ) is the centroid of $\triangle ABC$. Then, the equation of the plane is
 a. $\frac{x}{3\alpha} + \frac{y}{3\beta} + \frac{z}{3\gamma} = 1$ b. $\frac{3x}{\alpha} + \frac{3y}{\beta} + \frac{3z}{\gamma} = 1$
 c. $\alpha x + \beta y + \gamma z = 1$ d. None of these
17. If the plane $\frac{x}{2} + \frac{y}{3} + \frac{z}{6} = 1$ cuts the coordinate axes at points A, B and C . Then, find the area of $\triangle ABC$.
 a. $\sqrt{18}$ sq units b. 30 sq units
 c. $3\sqrt{14}$ sq units d. $13\sqrt{14}$ sq units
18. The distance of the point of intersection of the line $\frac{x-2}{3} = \frac{y+1}{4} = \frac{z-2}{12}$ and the plane $x-y+z=5$ from the point $(-1, -5, -10)$, is
 a. 10 b. 11 c. 12 d. 13
19. The intercepts made on the axes by the plane which bisects the line joining the points $(1, 2, 3)$ and $(-3, 4, 5)$ at right angle, are
 a. $\left(\frac{-9}{2}, 9, 9\right)$ b. $\left(\frac{9}{2}, -9, 9\right)$ c. $\left(19, -\frac{9}{2}, 9\right)$ d. $\left(9, \frac{9}{2}, 19\right)$
20. A line with positive direction cosines passes through the point $P(2, -1, 2)$ and makes equal angles with the coordinate axes. The line meets the plane $2x+y+z=9$ at point Q . The length of the line segment PQ equals
 a. $\sqrt{5}$ b. $3\sqrt{2}$ c. $\sqrt{3}$ d. $\sqrt{7}$
21. The projection of the line $\frac{x+1}{-1} = \frac{y}{2} = \frac{z-1}{3}$ on the plane $x-2y+z=6$ is the line of intersection of this plane with the plane
 a. $2x+y+2=0$ b. $3x+y+z=20$
 c. $2x+3y+8z=13$ d. $6x-y-2z=12$
22. The equation of the plane containing the line $\frac{x+1}{-3} = \frac{y-3}{2} = \frac{z+2}{1}$ and the point $(0, 7, -7)$, is
 a. $x+y+z=1$ b. $x+y+z=2$
 c. $x+y+z=0$ d. None of these
23. The equation of the plane through $(3, 1, -3)$ and $(1, -2, 2)$ and parallel to the line with DR's $1, 1, -2$, is
 a. $x-y+z+1=0$ b. $x+y-z+1=0$
 c. $x-y-z-1=0$ d. $x+y+z-1=0$
24. The equation of the plane through the line of intersection of the planes $x+y+z-1=0$ and $2x+y-3z+2=0$ passing through the point $(1, 1, 1)$, is
 a. $x-4z+3=0$ b. $x-y+z=1$
 c. $x+y+z=3$ d. $2x-y+z=2$
25. The coordinates of the point where the line passes through the points $(3, -4, -5)$ and $(2, -3, 1)$ crosses the plane passing through three points $(2, 2, 1)$, $(3, 0, 1)$ and $(4, -1, 0)$, is
 a. $(1, 2, 7)$ b. $(-1, 2, -7)$
 c. $(1, -2, 7)$ d. None of these
26. The plane passing through the point $(-2, -2, 2)$ and containing the line joining the points $(1, -1, 2)$ and

- (1, 1, 1) makes intercepts on the coordinate axes and the sum of whose length is
 a. 3 b. 6 c. 12 d. 20
27. The equation of the plane passing through (2, 1, 5) and parallel to the plane $3x - 4y + 5z = 4$, is
 a. $3x - 4y + 5z - 27 = 0$ b. $3x - 4y + 5z + 21 = 0$
 c. $3x - 4y + 5z + 26 = 0$ d. $3x - 4y + 5z + 17 = 0$
28. The equation of the line passing through the point (3, 0, 1) and parallel to the planes $x + 2y = 0$ and $3y - z = 0$, is
 a. $\frac{x-3}{-2} = \frac{y-0}{1} = \frac{z-1}{3}$ b. $\frac{x-3}{1} = \frac{y-0}{-2} = \frac{z-1}{3}$
 c. $\frac{x-3}{3} = \frac{y-0}{1} = \frac{z-1}{-2}$ d. None of these
29. The equation of the plane which contains two parallel lines $\frac{x+1}{3} = \frac{y-2}{2} = \frac{z}{1}$ and $\frac{x-3}{3} = \frac{y+4}{2} = \frac{z-1}{1}$, is
 a. $3x + 2y + z = 10$ b. $8x + y - 26z + 6 = 0$
 c. $4x + 6y + z = 50$ d. None of these
30. If the planes $x - cy - bz = 0$, $cx - y + az = 0$ and $bx + ay - z = 0$ pass through a straight line, then the value of $a^2 + b^2 + c^2 + 2abc$ is
 a. 2 b. 3 c. 0 d. 1
31. The equation of plane through the intersection of the planes $x + 2y + 3z - 4 = 0$ and $2x + y - z + 5 = 0$ and perpendicular to the plane $5x + 3y + 6z = 8$, is
 a. $51x + 15y - 50z - 173 = 0$ b. $51x - 15y + 50z + 173 = 0$
 c. $51x + 15y - 50z + 173 = 0$ d. $51x - 15y - 50z - 173 = 0$
32. The equation of a line $4x - 4y - z + 11 = 0 = x + 2y - z - 1$ can be form as
 a. $\frac{x}{2} = \frac{y-2}{1} = \frac{z-3}{4}$ b. $\frac{x-4}{2} = \frac{y-4}{1} = \frac{z-11}{5}$
 c. $\frac{x-2}{-2} = \frac{y}{3} = \frac{z+3}{5}$ d. $\frac{x+2}{3} = \frac{y+2}{4} = \frac{z-1}{4}$
33. Let the line $\frac{x-2}{3} = \frac{y-1}{-5} = \frac{z+2}{2}$ lies in the plane $x + 3y - \alpha z + \beta = 0$. Then, (α, β) equals
 a. (6, -17) b. (-6, 7) c. (5, -15) d. (-5, 15)
34. Find the distance of the plane $x + 2y - z = 2$ from the point (2, -1, 3) as measured in the direction with DR's (2, 2, 1).
 a. 2 b. -3 c. -2 d. 3
35. A plane is such that the foot of perpendicular drawn from the origin to it is (2, -1, 1). The distance of (1, 2, 3) from the plane, is
 a. $3/2$ b. $\sqrt{3/2}$ c. 2 d. 0
36. The distance of the point (1, 0, -3) from the plane $x - y - z = 9$ measured parallel to the line $\frac{x-2}{2} = \frac{y+2}{3} = \frac{z-6}{-6}$, is
 a. 6 b. 7 c. 17 d. 26
37. The equations of the planes through the intersection of the planes $x + 3y + 6 = 0$ and $3x - y - 4z = 0$, whose perpendicular distance from the origin is unity, are
 a. $x + y - 2z + 3 = 0$; $x - 2y - 2z - 3 = 0$
 b. $2x + y - 2z + 3 = 0$; $x - 2y - 2z - 3 = 0$
 c. $x - y + 2z + 3 = 0$; $x + 2y + 2z + 3 = 0$
 d. $2x - y + 2z - 3 = 0$; $x + 2y + 2z + 3 = 0$
38. A plane L passes through the point $(-1, -2, -1)$ and normal to it is perpendicular to the lines $\frac{x+1}{3} = \frac{y+2}{1} = \frac{z+1}{2}$ and $\frac{x-2}{1} = \frac{y+2}{2} = \frac{z-3}{3}$. The distance of the point (1, 1, 1) from the plane L is
 a. $\frac{12}{\sqrt{75}}$ b. $\frac{17}{\sqrt{75}}$ c. $\frac{13}{\sqrt{75}}$ d. $\frac{20}{\sqrt{75}}$
39. A plane passes through the point (1, -2, 3) and is parallel to the plane $2x - 2y + z - 9 = 0$. The distance of the point $(-1, 2, 0)$ from the plane, is
 a. 2 b. 3 c. 4 d. 5
40. The distance between two parallel planes $2x + y + 2z = 8$ and $4x + 2y + 4z + 5 = 0$ is
 a. $\frac{3}{2}$ b. $\frac{5}{2}$ c. $\frac{7}{2}$ d. $\frac{9}{2}$
41. If the lines $\frac{x-2}{1} = \frac{y-3}{1} = \frac{z-4}{-k}$ and $\frac{x-1}{k} = \frac{y-4}{2} = \frac{z-5}{1}$ are coplanar, then k can have
 a. any value b. exactly one value
 c. exactly two values d. exactly three values
42. The coordinates of the foot of the perpendicular drawn from the origin to plane $2x - 3y + 4z - 6 = 0$, are
 a. $\left(\frac{12}{29}, \frac{-18}{29}, \frac{24}{29}\right)$ b. $\left(\frac{13}{19}, \frac{-18}{29}, \frac{24}{29}\right)$
 c. $\left(\frac{-12}{29}, \frac{18}{29}, \frac{24}{29}\right)$ d. $\left(\frac{12}{19}, \frac{-18}{29}, \frac{-24}{29}\right)$
43. The image of the point P (1, 3, 4) in the plane $2x - y + z + 3 = 0$ is
 a. (3, 5, -2) b. (-3, 5, 2) c. (3, -5, 2) d. (3, 5, 2)
44. The image of the point (1, 6, 3) in the line $\frac{x}{1} = \frac{y-1}{2} = \frac{z-2}{3}$ is
 a. (-1, 0, 7) b. (-1, 0, -7) c. (1, 0, 7) d. (2, 0, 7)
45. The image of the line $\frac{x-1}{3} = \frac{y-3}{1} = \frac{z-4}{-5}$ in the plane $2x - y + z + 3 = 0$ is the line
 a. $\frac{x-3}{-3} = \frac{y+5}{-1} = \frac{z-2}{5}$ b. $\frac{x+3}{3} = \frac{y-5}{1} = \frac{z-2}{-5}$
 c. $\frac{x+3}{-3} = \frac{y-5}{-1} = \frac{z+2}{5}$ d. $\frac{x-3}{3} = \frac{y+5}{1} = \frac{z-2}{-5}$
46. The volume of the tetrahedron formed by coordinate planes and $2x + 3y + z = 6$, is
 a. 5 b. 4 c. 6 d. 0

BITSAT Archives

- If two lines, whose equations are $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{\lambda}$ and $\frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3}$ lie in the same plane. Then, the value of $\sin^{-1} \sin \lambda$ is [2014]
a. 3 b. $\pi - 3$ c. 4 d. $\pi - 4$
- If the plane $x + y + z = 1$ is rotated through an angle 90° about its line of intersection with the plane $x - 2y + 3z = 0$, then the new position of the plane is [2014]
a. $x - 5y + 4z = 1$ b. $x - 5y + 4z = -1$ c. $x - 8y + 7z = 2$ d. $x - 8y + 7z = -2$
- The distance of the point $(1, -5, 9)$ from the plane $x + y + z = 5$ measured along a straight line $x = y = z$ is $2\sqrt{3}k$, then the value of k is [2014]
a. 5 b. 6 c. $\sqrt{3}$ d. 4
- The acute angle between the lines, whose direction cosines are given by $2l - m + 2n = 0$ and $lm + mn + nl = 0$, is [2013]
a. $\frac{\pi}{6}$ b. $\frac{\pi}{4}$ c. $\frac{\pi}{3}$ d. $\frac{\pi}{2}$
- Let L be the line of intersection of the planes $2x + 3y + z = 1$ and $x + 3y + 2z = 2$. If L makes an angle α with the positive X -axis, then $\cos \alpha$ is equal to [2013]
a. $1/2$ b. 1 c. $1/\sqrt{2}$ d. $1/\sqrt{3}$
- A plane passes through the point $(1, -2, 3)$ and is parallel to the plane $2x - 2y + z = 0$. The distance of the point $(-1, 2, 0)$ from the plane is [2013]
a. 2 b. 3 c. 4 d. 5
- The line $\frac{x-2}{3} = \frac{y+1}{2} = \frac{z-1}{-1}$ intersects the curve $xy = c^2, z = 0$, if c is equal to [2010]
a. ± 1 b. $\pm 1/3$ c. $\pm \sqrt{5}$ d. None
- The direction ratios of the line $x - y + z - 5 = 0 = x - 3y - 6$ are [2009]
a. 3, 1, -2 b. 2, -4, 1
c. $\frac{3}{\sqrt{14}}, \frac{1}{\sqrt{14}}, \frac{-2}{\sqrt{14}}$ d. $\frac{2}{\sqrt{41}}, \frac{-4}{\sqrt{41}}, \frac{1}{\sqrt{41}}$
- The intercepts of the plane $2x - 3y + 4z = 12$ on the coordinate axes are given by [2009]
a. 3, -2, 1.5 b. 6, -4, 3 c. 6, -4, -3 d. 2, -3, 4
- The point of intersection of the line $\frac{x-1}{3} = \frac{y+2}{4} = \frac{z-3}{-2}$ and plane $2x - y + 3z - 1 = 0$ is [2005]
a. (10, -10, 3) b. (10, 10, -3) c. (-10, 10, 3) d. None of these
- The equation of plane passing through a point $A(2, -1, 3)$ and parallel to the vectors $\mathbf{a} = (3, 0, -1)$ and $\mathbf{b} = (-3, 2, 2)$, is [2005]
a. $2x - 3y + 6z - 25 = 0$ b. $2x - 3y + 6z + 25 = 0$
c. $3x - 2y + 6z - 25 = 0$ d. $3x - 2y + 6z + 25 = 0$

Answer with Solutions

Practice Exercise

- (b) Suppose XY -plane divides the line joining the given points in the ratio $\lambda : 1$. The coordinates of the point of division are $\left(\frac{2\lambda - 1}{\lambda + 1}, \frac{-5\lambda + 3}{\lambda + 1}, \frac{6\lambda + 4}{\lambda + 1}\right)$. This point lies on XY -plane.
 $\therefore \frac{6\lambda + 4}{\lambda + 1} = 0 \Rightarrow \lambda = -\frac{2}{3}$
- (b) Hint We have, $\alpha = \frac{\pi}{3}, \beta = \frac{\pi}{4}$
 $\therefore l = \cos \frac{\pi}{3} = \frac{1}{2}$
 $m = \cos \frac{\pi}{4} = \frac{1}{\sqrt{2}}$
 $\therefore l^2 + m^2 + n^2 = 1$

- (a) The bisector of $\angle BAC$ i.e. AD divides the side BC in the ratio $AB : AC$.
i.e. $\frac{BD}{CD} = \frac{AB}{AC}$
Now, $AB = \sqrt{(3-5)^2 + (2-3)^2 + (0-2)^2} = \sqrt{4+1+4} = 3$
 $AC = \sqrt{(-9-3)^2 + (6-2)^2 + (-3-0)^2} = \sqrt{144+16+9} = 13$
Let coordinates of D be (x, y, z) .
Then, $x = \frac{3 \times (-9) + 13 \times 5}{3+13} = \frac{38}{16} = \frac{19}{8}$
 $y = \frac{3 \times 6 + 13 \times 13}{3+13} = \frac{57}{16}$ and $z = \frac{-3 \times 3 + 13 \times 2}{3+13} = \frac{17}{16}$
 $\therefore D \equiv \left(\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$

4. (c) Given, mid-points of sides are $D(l, 0, 0)$, $E(0, m, 0)$ and $F(0, 0, n)$.

Also, $EF^2 = \frac{BC^2}{4}$ [by mid-point theorem]

$\Rightarrow BC^2 = 4(m^2 + n^2)$

Similarly, $AB^2 = 4(l^2 + m^2)$ and $CA^2 = 4(l^2 + n^2)$

$\therefore \frac{AB^2 + BC^2 + CA^2}{l^2 + m^2 + n^2} = 8$

5. (b) Since, $\mathbf{OP}$ has projections $\frac{13}{5}$, $\frac{19}{5}$ and $\frac{26}{5}$ on the coordinate axes.

$\therefore \mathbf{OP} = \frac{13}{5}\hat{i} + \frac{19}{5}\hat{j} + \frac{26}{5}\hat{k}$

Suppose P divides the join of Q and $R(3, 5, 6)$ in the ratio $\lambda : 1$. Then, the position vector of P is

$$\left(\frac{3\lambda + 2}{\lambda + 1}\right)\hat{i} + \left(\frac{5\lambda + 2}{\lambda + 1}\right)\hat{j} + \left(\frac{6\lambda + 4}{\lambda + 1}\right)\hat{k}$$

$\therefore \frac{13}{5}\hat{i} + \frac{19}{5}\hat{j} + \frac{26}{5}\hat{k} = \left(\frac{3\lambda + 2}{\lambda + 1}\right)\hat{i} + \left(\frac{5\lambda + 2}{\lambda + 1}\right)\hat{j} + \left(\frac{6\lambda + 4}{\lambda + 1}\right)\hat{k}$

$\Rightarrow \frac{3\lambda + 2}{\lambda + 1} = \frac{13}{5}, \frac{5\lambda + 2}{\lambda + 1} = \frac{19}{5}, \frac{6\lambda + 4}{\lambda + 1} = \frac{26}{5}$

$\Rightarrow 2\lambda = 3 \Rightarrow \lambda = 3/2$

Hence, P divides QR in the ratio $3 : 2$.

6. (c) **Hint** Let r be the magnitude of given line segments and l, m, n be the direction cosines.

So, projection on X -axis i.e. $|r| \cdot l = 12$... (i)

Projection on Y -axis i.e. $|r| \cdot m = 4$... (ii)

and projection on Z -axis i.e. $|r| \cdot n = 3$... (iii)

On squaring and adding Eqs. (i), (ii) and (iii), we get

$$|r|^2 (l^2 + m^2 + n^2) = 12^2 + 4^2 + 3^2$$

7. (a) Any point on the first line is $(2r_1 + 1, 3r_1 - 1, 4r_1 + 1)$ and on second line is $(r_2 + 3, 2r_2 + p, r_2)$.

The lines will intersect, when

$$2r_1 + 1 = r_2 + 3$$

$$3r_1 - 1 = 2r_2 + p$$

$\Rightarrow 2r_1 - r_2 = 2$... (i)

$4r_1 + 1 = r_2$ and $4r_1 - r_2 = -1$... (ii)

On solving Eqs. (i) and (ii), we get

$$r_1 = -\frac{3}{2} \text{ and } r_2 = -5$$

$\therefore p = 3r_1 - 2r_2 - 1 = -\frac{9}{2} + 10 - 1 = \frac{9}{2}$

8. (c) Let L be foot of perpendicular from $P(0, 2, 3)$ on the line

$$\frac{x - (-3)}{5} = \frac{y - 1}{2} = \frac{z - (-4)}{3} = t \quad \dots (i)$$

Any point on Eq. (i) is $L(-3 + 5t, 1 + 2t, -4 + 3t)$.

Then, DR's of PL are

$$(-3 + 5t - 0, 1 + 2t - 2, -4 + 3t - 3)$$

or $(5t - 3, 2t - 1, 3t - 7)$

Since, PL is perpendicular to Eq. (i).

$$\therefore 5(5t - 3) + 2(2t - 1) + 3(3t - 7) = 0 \Rightarrow t = 1$$

So, the coordinates of L are $(2, 3, -1)$.

9. (a) The point $A(6, 7, 7)$ lie on the line.

Let the perpendicular from P meet the line at L . Then,

$$AP^2 = (6 - 1)^2 + (7 - 2)^2 + (7 - 3)^2 = 66$$

Also, AL = Projection of AP on line

[since, actual DC's are

$$\left(\frac{3}{\sqrt{17}}, \frac{2}{\sqrt{17}}, \frac{-2}{\sqrt{17}}\right)]$$

$$= (6 - 1) \cdot \frac{3}{\sqrt{17}} + (7 - 2) \cdot \frac{2}{\sqrt{17}} + (7 - 3) \left(\frac{-2}{\sqrt{17}}\right) = \sqrt{17}$$

$\therefore$ Perpendicular distance of P from the line is given by

$$d^2 = AP^2 - AL^2 \Rightarrow d^2 = 66 - 17 = 49 \Rightarrow d = 7$$

10. (a) Let P be the foot of the perpendicular drawn from $A(2, 3, 4)$ to the given line l .

Then, $\frac{x - 4}{-2} = \frac{y}{6} = \frac{z - 1}{-3}$

Now, any point on the line l is given by

$$x = 4 - 2\lambda, y = 6\lambda, z = 1 - 3\lambda$$

The coordinates of P are $(4 - 2\lambda, 6\lambda, 1 - 3\lambda)$.

The direction ratios of AP are

$$(4 - 2\lambda - 2, 6\lambda - 3, 1 - 3\lambda - 4)$$

i.e. $(2 - 2\lambda, 6\lambda - 3, -3 - 3\lambda)$

So, the direction ratios of l are $-2, 6$ and -3 .

Given, $AP \perp l$

$$\therefore -2(2 - 2\lambda) + 6(6\lambda - 3) - 3(-3 - 3\lambda) = 0$$

$$\Rightarrow \lambda = \frac{13}{49}$$

$$\therefore AP^2 = (4 - 2\lambda - 2)^2 + (6\lambda - 3)^2 + (1 - 3\lambda - 4)^2$$

$$= 22 - 26\lambda + 49\lambda^2$$

Put $\lambda = \frac{13}{49}$, we get

$$AP^2 = \frac{909}{49}$$

$$\Rightarrow AP = \frac{3}{7}\sqrt{101}$$

11. (a) Given lines are

$$\frac{x - 2}{3} = \frac{y + 1}{-2} = \frac{z - 2}{1} \quad \dots (i)$$

and $\frac{x - 1}{1} = \frac{2y + 3}{3} = \frac{z + 5}{2} \quad \dots (ii)$

Line (i) passes through $\mathbf{a}_1 = 2\hat{i} - \hat{j} + 2\hat{k}$ and parallel to $\mathbf{b}_1 = 3\hat{i} - 2\hat{j} + 0\hat{k}$ and line (ii) passes through

$$\mathbf{a}_2 = \hat{i} - \frac{3}{2}\hat{j} - 5\hat{k}$$

and parallel to $\mathbf{b}_2 = \hat{i} + \frac{3}{2}\hat{j} + 2\hat{k}$

Therefore, angle between lines (i) and (ii) is same as angle between $\mathbf{b}_1$ and $\mathbf{b}_2$.

$$\therefore \cos \theta = \frac{\mathbf{b}_1 \cdot \mathbf{b}_2}{|\mathbf{b}_1| |\mathbf{b}_2|}$$

$$\Rightarrow \cos \theta = \frac{(3\hat{i} - 2\hat{j} + 0\hat{k}) \cdot (\hat{i} + \frac{3}{2}\hat{j} + 2\hat{k})}{\sqrt{9+4+0} \sqrt{1+9/4+4}}$$

$$\Rightarrow \cos \theta = \frac{3-3}{\sqrt{13}\sqrt{\frac{29}{4}}} = 0 \Rightarrow \theta = \pi/2$$

12. (c) If three edges of the cube are along x, y and z , then diagonal has DR's $(1, 1, 1)$ and edge along X -axis has DR's $(1, 0, 0)$. The angle between them is

$$\cos^{-1} \frac{1}{\sqrt{3}} = \tan^{-1} \sqrt{2}$$

13. (c) $l^2 + m^2 - n^2 = 0 \Rightarrow 1 - 2n^2 = 0 \Rightarrow n = \pm \frac{1}{\sqrt{2}}$

Eliminating n from the given relations, we get $lm = 0$

So, the two lines having direction cosines are $0, -\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}$ and $-\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}}$.

Hence, the angle between them is $\cos^{-1} \frac{1}{2} = \frac{\pi}{3}$.

14. (d) Given, $l + m + n = 0$ and $mn - 2l(m + n) = 0$

On eliminating l , we get

$$mn + 2(m + n)^2 = 0 \Rightarrow 2m^2 + 5mn + 2n^2 = 0$$

$$\Rightarrow (m + 2n)(2m + n) = 0$$

Either $m + 2n = 0$ or $2m + n = 0$

$$\Rightarrow m = -2n \text{ or } n = -2m \quad \dots(i)$$

Let the two lines whose direction cosines satisfy the given relations have their direction cosines

$$(l_1, m_1, n_1) \text{ and } (l_2, m_2, n_2)$$

Then, from Eq. (i), $m_1 + 2n_1 = 0 \Rightarrow m_1 = -2n_1$

where, $l_1 + m_1 + n_1 = 0 \Rightarrow l_1 = -(m_1 + n_1)$

$$l_1 = n_1 \Rightarrow l_1 = \frac{m_1}{-2} = n_1$$

$$\Rightarrow \frac{l_1}{1} = \frac{m_1}{-2} = \frac{n_1}{1} = \frac{\sqrt{l_1^2 + m_1^2 + n_1^2}}{\sqrt{1+4+1}}$$

$$\Rightarrow l_1 = \frac{1}{\sqrt{6}}, m_1 = \frac{-2}{\sqrt{6}}, n_1 = \frac{1}{\sqrt{6}} \quad \dots(ii)$$

Again, from Eq. (i),

$$2m_2 + n_2 = 0 \text{ and } l_2 = -m_2 - n_2 = m_2$$

$$\therefore \frac{l_2}{1} = \frac{m_2}{1} = \frac{-n_2}{2} = \frac{\sqrt{l_2^2 + m_2^2 + n_2^2}}{\sqrt{1+1+4}} = \frac{1}{\sqrt{6}}$$

$$\Rightarrow l_2 = \frac{1}{\sqrt{6}}, m_2 = \frac{1}{\sqrt{6}}, n_2 = \frac{-2}{\sqrt{6}} \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get

$$\begin{aligned} \cos \theta &= l_1 l_2 + m_1 m_2 + n_1 n_2 \\ &= \left(\frac{1}{\sqrt{6}}\right)\left(\frac{1}{\sqrt{6}}\right) + \left(\frac{-2}{\sqrt{6}}\right)\left(\frac{1}{\sqrt{6}}\right) + \left(\frac{1}{\sqrt{6}}\right)\left(\frac{-2}{\sqrt{6}}\right) \\ &= \frac{1}{6} - \frac{2}{6} - \frac{2}{6} = -\frac{1}{2} \end{aligned}$$

$\therefore$ The angle between the two lines is given by

$$\cos \theta = \left(-\frac{1}{2}\right) \Rightarrow \theta = 120^\circ$$

15. (d) **Hint** For line 1st, DR's is $(7, -6, 1)$ and it passes through $(-1, -1, -1)$, then equation of given lines (in vector form) is

$$\mathbf{r}_1 = -\hat{i} - \hat{j} - \hat{k} + \lambda(7\hat{i} - 6\hat{j} + \hat{k})$$

Similarly, $\mathbf{r}_2 = 3\hat{i} + 5\hat{j} + 7\hat{k} + \mu(\hat{i} - 2\hat{j} + \hat{k})$

Here, $\mathbf{a}_1 = -\hat{i} - \hat{j} - \hat{k}$, $\mathbf{b}_1 = 7\hat{i} - 6\hat{j} + \hat{k}$

and $\mathbf{a}_2 = 3\hat{i} + 5\hat{j} + 7\hat{k}$, $\mathbf{b}_2 = \hat{i} - 2\hat{j} + \hat{k}$

So, the shortest distance between the given lines

$$d = \frac{|(\mathbf{b}_1 \times \mathbf{b}_2) \cdot (\mathbf{a}_2 - \mathbf{a}_1)|}{|\mathbf{b}_1 \times \mathbf{b}_2|}$$

16. (a) The intercept form of the plane equation is

$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 0$, where a, b and c are the intercepts made by the plane on the axes.

$$\therefore \alpha = \frac{0+0+a}{3}, \beta = \frac{0+0+b}{3}, \gamma = \frac{0+0+c}{3}$$

$$\Rightarrow a = 3\alpha, b = 3\beta \text{ and } c = 3\gamma$$

So, the equation of plane is $\frac{x}{3\alpha} + \frac{y}{3\beta} + \frac{z}{3\gamma} = 1$.

17. (c) Given, the plane meets axes at $A(2, 0, 0)$, $B(0, 3, 0)$ and $C(0, 0, 6)$.

$$\text{Then, area of } \triangle ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$$

$$= \frac{1}{2} |(-2\hat{i} + 3\hat{j}) \times (-2\hat{i} + 6\hat{k})| = 3\sqrt{14} \text{ sq units}$$

18. (d) **Hint** Any point on the line is $3r + 2, 4r - 1, 12r + 2$.

If it lies on the plane $x - y + z = 5$, then

$$(3r + 2) - (4r - 1) + (12r + 2) = 5$$

$$\therefore r = 0$$

Hence, the point of intersection is $(2, -1, 2)$.

19. (a) Direction ratios of the line joining points $P(1, 2, 3)$ and $Q(-3, 4, 5)$ are $-4, 2, 2$ which are direction ratios of the normal to the plane.

Equation of plane is $-4x + 2y + 2z = k$.

This plane passes through $(-1, 3, 4)$.

$$\therefore -4(-1) + 2(3) + 2(4) = k \Rightarrow k = 18$$

Equation of plane is $2x - y - z = -9$

Thus, the intercepts are $\left(-\frac{9}{2}, 9, 9\right)$.

20. (c) Given equation of the line is

$$\frac{x-2}{1} = \frac{y+1}{1} = \frac{z-2}{1}$$

Now, any point on the line is given by

$$x = k + 2, y = k - 1, z = k + 2, \text{ where } k \text{ is constant}$$

Since, the point $Q(k + 2, k - 1, k + 2)$ lies on the plane

$2x + y + z = 9$, therefore we get

$$2(k + 2) + k - 1 + k + 2 = 9 \Rightarrow k = 1$$

The coordinates of Q are $(3, 0, 3)$.

$$\therefore PQ = \sqrt{(3-2)^2 + (0+1)^2 + (3-2)^2} = \sqrt{3}$$

21. (a) Equation of the plane through $(-1, 0, 1)$ is

$$a(x + 1) + b(y - 0) + c(z - 1) = 0 \quad \dots(i)$$

which is parallel to the given line and perpendicular to the given plane.

$$\therefore -a + 2b + 3c = 0 \quad \dots(ii)$$

$$\text{and } a - 2b + c = 0 \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get

$$c = 0, a = 2b$$

On putting values of a and c in Eq. (i), we get

$$2b(x + 1) + by = 0$$

$$\therefore 2x + y + 2 = 0$$

22. (c) Any plane containing the line

$$\frac{x+1}{-3} = \frac{y-3}{2} = \frac{z+2}{1} \text{ is}$$

$$a(x + 1) + b(y - 3) + c(z + 2) = 0 \quad \dots(i)$$

$$\text{where, } -3a + 2b + c = 0 \quad \dots(ii)$$

which passes through $(0, 7, -7)$.

$$\therefore a + 4b - 5c = 0 \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get

$$\frac{a}{-14} = \frac{b}{-14} = \frac{c}{-14} \Rightarrow \frac{a}{1} = \frac{b}{1} = \frac{c}{1}$$

Hence, the required plane is

$$x + 1 + y - 3 + z + 2 = 0$$

$$\text{i.e. } x + y + z = 0$$

23. (d) Equation of plane passing through $(3, 1, -3)$ is

$$a(x - 3) + b(y - 1) + c(z + 3) = 0$$

It passes through $(1, -2, 2)$, then

$$-2a - 3b + 5c = 0$$

$$\text{Also, } a + b - 2c = 0$$

On solving, we get $a = 1, b = 1$ and $c = 1$

$\therefore$ Equation of plane is

$$(x - 3) \cdot 1 + (y - 1) \cdot 1 + (z + 3) \cdot 1 = 0$$

$$\Rightarrow x + y + z - 1 = 0$$

24. (a) **Hint** The required plane is

$$2x + y - 3z + 2 + \lambda(x + y + z - 1) = 0$$

25. (c) Given equation of plane through three points

$(2, 2, 1), (3, 0, 1)$ and $(4, -1, 0)$ is

$$[(\mathbf{r} - \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} - 2\hat{\mathbf{j}})] \times (\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}}) = 0$$

$$\text{i.e. } \mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = 7 \text{ or } 2x + y + z - 7 = 0 \quad \dots(i)$$

Equation of line through $(3, -4, -5)$ and $(2, -3, 1)$ is

$$\frac{x-3}{-1} = \frac{y+4}{1} = \frac{z+5}{6} \quad \dots(ii)$$

Any point on line (ii) is $(-\lambda + 3, \lambda - 4, 6\lambda - 5)$. This point lies on plane (i).

$$\text{Therefore, } 2(-\lambda + 3) + (\lambda - 4) + (6\lambda - 5) - 7 = 0 \Rightarrow \lambda = 2$$

Hence, the required point is $(1, -2, 7)$.

26. (c) Required equation of plane is

$$\begin{vmatrix} x-1 & y-1 & z-1 \\ -3 & -3 & 1 \\ 0 & -2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow x - 3y - 6z + 8 = 0$$

Since, the intercepts are $8, \frac{8}{3}, \frac{8}{6}$.

So, their sum is 12.

27. (a) Given equation of the plane passing through $(2, 1, 5)$

and parallel to the plane $3x - 4y + 5z = 4$ is

$$3x - 4y + 5z + k = 0$$

On substituting coordinates $(2, 1, 5)$, we get

$$3 \times 2 - 4 \times 1 + 5 \times 5 + k = 0$$

$$\Rightarrow k = -27$$

So, the equation of plane is $3x - 4y + 5z - 27 = 0$.

28. (a) Let a, b and c be the direction ratios of the required

line. Then, its equation is

$$\frac{x-3}{a} = \frac{y-0}{b} = \frac{z-1}{c} \quad \dots(i)$$

Since, Eq. (i) is parallel to the planes $x + 2y + 0z = 0$ and $0x + 3y - z = 0$. Therefore, normal to the plane is perpendicular to the line.

$$\therefore a(1) + b(2) + c(0) = 0 \text{ and } a(0) + b(3) + c(-1) = 0$$

On solving these two equations by cross-multiplication, we get

$$\frac{a}{(2)(-1) - (0)(3)} = \frac{b}{(0)(0) - (1)(-1)} = \frac{c}{(1)(3) - (0)(2)}$$

$$\Rightarrow \frac{a}{-2} = \frac{b}{1} = \frac{c}{3} = \lambda \quad [\text{say}]$$

$$\Rightarrow a = -2\lambda, b = \lambda \text{ and } c = 3\lambda$$

On substituting the values of a, b and c in Eq. (i), we get the equation of the required line as

$$\frac{x-3}{-2} = \frac{y-0}{1} = \frac{z-1}{3}$$

29. (b) Let the equation of the plane containing the first line be

$$a(x + 1) + b(y - 2) + cz = 0 \quad \dots(i)$$

$$\therefore 3a + 2b + c = 0$$

Also, other line will lie on the plane, if the point $(3, -4, 1)$ lies on the plane i.e. $a(3 + 1) + b(-4 - 2) + c = 0$

$$\Rightarrow 4a - 6b + c = 0 \quad \dots(ii)$$

On solving Eq. (ii), we get

$$\frac{a}{8} = \frac{b}{1} = \frac{c}{-26}$$

So, the required equation is $8x + y - 26z + 6 = 0$.

30. (a) Given, $x - cy - bz = 0$... (i)
 $cx - y + az = 0$... (ii)
 and $bx + ay - z = 0$... (iii)

Equation of plane passing through the line of intersection of planes (i) and (ii), is

$$(x - cy - bz) + \lambda(cx - y + az) = 0$$

$$\Rightarrow x(1 + \lambda c) - y(c + \lambda) + z(-b + a\lambda) = 0 \quad \dots (iv)$$

If planes (iii) and (iv) are same, then Eqs. (iii) and (iv) will be identical.

$$\therefore \frac{1 + c\lambda}{b} = \frac{-(c + \lambda)}{a} = \frac{-b + a\lambda}{-1}$$

$$\Rightarrow \lambda = \frac{-(a + bc)}{(ac + b)} \text{ and } \lambda = -\left(\frac{ab + c}{1 - a^2}\right)$$

$$\Rightarrow \frac{-(a + bc)}{(ac + b)} = \frac{-(ab + c)}{(1 - a^2)}$$

$$\Rightarrow (a + bc)(1 - a^2) = (ab + c)(ac + b)$$

$$\Rightarrow a - a^3 - a^2bc - ab^2 - ac^2 - a^2bc = 0$$

$$\Rightarrow -a^3 - a^2bc - ab^2 - ac^2 - a^2bc = -a$$

$$\Rightarrow a^2 + abc + b^2 + c^2 + abc = 1$$

$$\Rightarrow a^2 + b^2 + c^2 + 2abc = 1$$

31. (c) **Hint** Any plane through the intersection of the given planes P and Q is

$$P + \lambda Q = 0$$

$$\Rightarrow (x + 2y + 3z - 4) + \lambda(2x + y - z + 5) = 0$$

Use condition $5(1 + 2\lambda) + 3(2 + \lambda) + 6(3 - \lambda) = 0$

32. (a) Given equations are

$$4x - 4y - z + 11 = 0 \quad \dots (i)$$

and $x + 2y - z - 1 = 0 \quad \dots (ii)$

The direction ratios of normals to the planes (i), (ii) are $(4, -4, -1)$ and $(1, 2, -1)$, respectively.

Let direction ratios of line of intersection of planes be l, m, n .

As the line of intersection of the planes is perpendicular to the normals of the both planes.

$$\therefore 4l - 4m - n = 0 \text{ and } l + 2m - n = 0$$

$$\therefore \frac{l}{6} = \frac{m}{3} = \frac{n}{12} \Rightarrow \frac{l}{2} = \frac{m}{1} = \frac{n}{4}$$

If $x = 0$, then Eqs. (i) and (ii) will be

$$-4y - z + 11 = 0 \text{ and } 2y - z - 1 = 0$$

Then, $y = 2$ and $z = 3$

$\therefore$ Equation of line is

$$\frac{x}{2} = \frac{y - 2}{1} = \frac{z - 3}{4}$$

33. (b) Direction ratios of given line are $(3, -5, 2)$.

Direction ratios of normal to the plane $= (1, 3, -\alpha)$

Since, line is perpendicular to the normal.

$$\therefore 3(1) - 5(3) + 2(-\alpha) = 0$$

$$\Rightarrow 3 - 15 - 2\alpha = 0$$

$$\Rightarrow 2\alpha = -12 \Rightarrow \alpha = -6$$

Also, point $(2, 1, -2)$ lies on the plane

$$2 + 3 + 6(-2) + \beta = 0$$

$$\Rightarrow \beta = 7$$

$$\therefore (\alpha, \beta) = (-6, 7)$$

34. (a) Let the line through $(2, -1, 3)$ with DC's $\frac{2}{3}, \frac{2}{3}, \frac{1}{3}$, be

$$\frac{x - 2}{2/3} = \frac{y + 1}{2/3} = \frac{z - 3}{1/3} = r \quad [\text{say}]$$

$$\therefore x = 2 + \frac{2r}{3}, y = -1 + \frac{2r}{3}, z = 3 + \frac{r}{3}$$

Since, it lies on the plane $x + 2y - z = 2$.

$$\therefore 2 + \frac{2r}{3} - 2 + \frac{4r}{3} - 3 - \frac{r}{3} = 2 \Rightarrow r = 3$$

35. (b) Given plane is $2x - y + z = k$

It passes through $(2, -1, 1)$.

$$\therefore k = 6$$

The distance of $(1, 2, 3)$ from $2x - y + z = 6$ is

$$d = \frac{|2 - 2 + 3 - 6|}{\sqrt{2^2 + 1 + 1}} = \frac{3}{\sqrt{6}} = \frac{\sqrt{3}}{2}$$

36. (b) Given equation of plane is $x - y - z = 9$... (i)

and line AB is $\frac{x - 2}{2} = \frac{y + 2}{3} = \frac{z - 6}{-6}$... (ii)

Equation of line passing through $(1, 0, -3)$ are parallel to

$$\frac{x - 2}{2} = \frac{y + 2}{3} = \frac{z - 6}{-6} \text{ and } \frac{x - 1}{2} = \frac{y}{3} = \frac{z + 3}{-6} \quad \dots (iii)$$

Coordinate of any point on Eq. (iii) are

$$P(2k + 1, 3k, -6k - 3), \text{ where } k \text{ is constant.}$$

If P is intersection of Eqs. (i) and (iii), then it must lie on Eq. (i).

$$\text{i.e. } (2k + 1) - 3k - (-6k - 3) = 9 \Rightarrow k = 1$$

$$\therefore P \equiv (3, 3, -9)$$

Now, distance between $(1, 0, -3)$ and $(3, 3, -9)$

$$= \sqrt{(3 - 1)^2 + (3 - 0)^2 + (-9 + 3)^2} = 7$$

37. (b) Any plane through the intersection of given planes is

$$(x + 3y + 6) + \lambda(3x - y - 4z) = 0$$

$$\text{or } (1 + 3\lambda)x + (3 - \lambda)y - 4\lambda z + 6 = 0 \quad \dots (i)$$

Its perpendicular distance from $(0, 0, 0)$ is 1.

$$\therefore \frac{6}{[(1 + 3\lambda)^2 + (3 - \lambda)^2 + 16\lambda^2]^{1/2}} = 1$$

$$\Rightarrow 1 + 6\lambda + 9\lambda^2 + 9 + \lambda^2 - 6\lambda + 16\lambda^2 = 36$$

$$\Rightarrow 26\lambda^2 = 26 \Rightarrow \lambda = \pm 1$$

On putting the value of λ in Eq. (i), we get the required equations as

$$2x + y - 2z + 3 = 0 \text{ and } x - 2y - 2z - 3 = 0$$

38. (c) Since, the plane contains the first line, therefore it must be parallel to this line and direction ratios of the normal to plane be l, m, n , then

$$3l + m + 2n = 0$$

$$l + 2m + 3n = 0$$

$$\Rightarrow \frac{l}{-1} = \frac{m}{-7} = \frac{n}{5}$$

Equation of the plane L is

$$-1(x + 1) - 7(y + 2) + 5(z + 1) = 0$$

$$\Rightarrow x + 7y - 5z + 10 = 0$$

$$\text{Its distance from } (1, 1, 1) = \frac{|1 + 7 - 5 + 10|}{\sqrt{1^2 + 7^2 + (-5)^2}} = \frac{13}{\sqrt{75}} \text{ units}$$

39. (d) Let parallel plane be $2x - 2y + z + \lambda = 0$.

It passes through $(1, -2, 3)$.

$$\therefore \lambda = -9$$

The distance of $(-1, 2, 0)$ from the plane

$$2x - 2y + z - 9 = 0 \text{ is } \left| \frac{-2 - 4 - 9}{3} \right| = 5$$

40. (c) Given planes are

$$2x + y + 2z - 8 = 0 \text{ and } 2x + y + 2z + \frac{5}{2} = 0$$

Distance between two planes

$$\begin{aligned} &= \frac{|c_1 - c_2|}{\sqrt{a^2 + b^2 + c^2}} = \frac{\left| -8 - \frac{5}{2} \right|}{\sqrt{(2)^2 + (1)^2 + (2)^2}} = \frac{\left| \frac{-21}{2} \right|}{\sqrt{9}} = \frac{21}{3} \\ &= \frac{21}{6} = \frac{7}{2} \end{aligned}$$

41. (c) Hint $\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = 0$

42. (a) Let the coordinates of the foot of the perpendicular P from the origin to the plane be (x_1, y_1, z_1) .

Then, the direction ratios of the line OP are x_1, y_1, z_1 .

On writing the equation of the plane in the normal form, we get

$$\frac{2}{\sqrt{29}}x - \frac{3}{\sqrt{29}}y + \frac{4}{\sqrt{29}}z = \frac{6}{\sqrt{29}}$$

where, $\frac{2}{\sqrt{29}}, \frac{-3}{\sqrt{29}}, \frac{4}{\sqrt{29}}$ are the direction cosines of OP .

Since, direction cosines and direction ratios of a line are proportional.

$$\therefore \frac{x_1}{2} = \frac{y_1}{-3} = \frac{z_1}{4} = k$$

$$\text{i.e. } x_1 = \frac{2k}{\sqrt{29}}, y_1 = \frac{-3k}{\sqrt{29}}$$

$$\text{and } z_1 = \frac{4k}{\sqrt{29}}$$

On substituting these values in the equation of the plane, we get $k = \frac{6}{\sqrt{29}}$.

Thus, the foot of perpendicular is $\left(\frac{12}{29}, \frac{-18}{29}, \frac{24}{29} \right)$.

43. (b) Let the image of point $P(1, 3, 4)$ in the given plane be the point Q . The equation of the line through P and normal to the given plane is

$$\frac{x-1}{2} = \frac{y-3}{-1} = \frac{z-4}{1} = r$$

Since, this line passes through Q , so let the coordinates of Q be $(2r+1, -r+3, r+4)$.

The coordinates of the mid-point of PQ are

$$\left(r+1, \frac{-r}{2} + 3, \frac{r}{2} + 4 \right)$$

This point lies on the given plane.

Therefore, $r = -2$.

Hence, the coordinates of Q are $(-3, 5, 2)$.

44. (c) Let $P(1, 6, 3)$ be the given point and L be the foot of perpendicular from P to the given line. The coordinates of a general point on the given line are

$$\frac{x-0}{1} = \frac{y-1}{2} = \frac{z-2}{3}$$

i.e.

$$x = \lambda$$

$$y = 2\lambda + 1$$

$$z = 3\lambda + 2$$

If the coordinates of L are $(\lambda, 2\lambda + 1, 3\lambda + 2)$, then the direction ratios of PL are $(\lambda - 1, 2\lambda - 5, 3\lambda - 1)$.

Since, the direction ratios of given line which is perpendicular to PL , are 1, 2 and 3. Therefore, $(\lambda - 1)1 + (2\lambda - 5)2 + (3\lambda - 1)3 = 0$, which gives $\lambda = 1$.

Hence, coordinates of L are $(1, 3, 5)$.

Let $Q(x_1, y_1, z_1)$ be the image of $P(1, 6, 3)$ in the given line. Then, L is the mid-point of PQ .

$$\text{Therefore, } \frac{x_1+1}{2} = 1, \frac{y_1+6}{2} = 3, \frac{z_1+3}{2} = 5$$

$$\Rightarrow x_1 = 1, y_1 = 0, z_1 = 7$$

Hence, the image of $(1, 6, 3)$ in the given line is $(1, 0, 7)$.

45. (b) Given equation of line is

$$\frac{x-1}{3} = \frac{y-3}{1} = \frac{z-4}{-5} \quad \dots(i)$$

and equation of plane is

$$2x - y + z + 3 = 0 \quad \dots(ii)$$

$$\begin{aligned} \therefore \frac{x-1}{2} &= \frac{y-3}{-1} = \frac{z-4}{1} \\ &= \frac{-2(2-3+4+3)}{4+1+1} \end{aligned}$$

$$\Rightarrow \frac{x-1}{2} = \frac{y-3}{-1} = \frac{z-4}{1} = -2$$

Image of point $(1, 3, 4)$ on given line in the given plane is $(-3, 5, 2)$. Line is parallel to given plane.

Therefore, image is

$$\frac{x+3}{3} = \frac{y-5}{1} = \frac{z-2}{-5}$$

46. (c) Since, the vertices of the tetrahedron are $(0, 0, 0), (3, 0, 0), (0, 2, 0)$ and $(0, 0, 6)$.

$$\therefore \text{Volume of tetrahedron} = \frac{1}{6} \begin{vmatrix} 3 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 6 \end{vmatrix} = 6$$

BITSAT Archives

1. (d) Given lines are $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{\lambda}$... (i)

and $\frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3}$... (ii)

These lines lie in the same plane. So, both are coplanar.

$$\therefore \begin{vmatrix} 2 & 3 & \lambda \\ 3 & 2 & 3 \\ 1 & -1 & -1 \end{vmatrix} = 0$$

$$\Rightarrow 2(-2+3) - 3(-3-3) + \lambda(-3-2) = 0$$

$$\Rightarrow 2 + 18 - 5\lambda = 0 \Rightarrow 5\lambda = 20 \Rightarrow \lambda = 4$$

$$\therefore \sin^{-1} \sin \lambda = \sin^{-1} \sin 4 = \sin^{-1} \sin(\pi - 4) = \pi - 4$$

2. (d) The new position of plane is

$$(x-2y+3z) + \lambda(x+y+z-1) = 0$$

$$\Rightarrow (1+\lambda)x + (\lambda-2)y + (3+\lambda)z - \lambda = 0$$

Given that this is perpendicular to

$$x + y + z = 1$$

$$\therefore (1+\lambda) \cdot 1 + (\lambda-2) \cdot 1 + (3+\lambda) \cdot 1 = 0$$

$$\Rightarrow 1 + \lambda + \lambda - 2 + 3 + \lambda = 0$$

$$\Rightarrow 3\lambda + 2 = 0 \Rightarrow \lambda = -\frac{2}{3}$$

Hence, the new position of the plane is

$$(x-2y+3z) - \frac{2}{3}(x+y+z-1) = 0$$

$$\Rightarrow 3x - 2x - 6y - 2y + 9z - 2z + 2 = 0$$

$$\Rightarrow x - 8y + 7z = -2$$

3. (a) Given equation of plane is $x + y + z = 5$.

The distance measured along the line $x = y = z$. Direction ratios of the given line is (1, 1, 1).

So, the equation of line PQ is

$$\frac{x-1}{1} = \frac{y+5}{1} = \frac{z-9}{1} = \lambda \quad [\text{say}]$$

$$\Rightarrow x = \lambda + 1, y = \lambda + 5, z = \lambda + 9$$

lies on the plane $x + y + z = 5$

$$\therefore \lambda + 1 + \lambda + 5 + \lambda + 9 = 5 \Rightarrow \lambda = -10$$

The coordinate of Q is (-9, -15, -1) and the coordinate of P is (1, -5, 9).

$$PQ = \sqrt{(10)^2 + (10)^2 + (10)^2} = 10\sqrt{3}$$

$$\therefore 2\sqrt{3}k = 10\sqrt{3} \Rightarrow k = 5$$

4. (d) Given that, $2l - m + 2n = 0$... (i)

and $lm + mn + nl = 0$... (ii)

From Eq. (i), $m = 2(l + n)$

Put in Eq. (ii), we get

$$2l(l+n) + 2n(l+n) + nl = 0$$

$$\Rightarrow 2l^2 + 2nl + 2nl + 2n^2 + nl = 0$$

$$\Rightarrow 2l^2 + 5nl + 2n^2 = 0 \Rightarrow 2l^2 + 4nl + nl + 2n^2 = 0$$

$$\Rightarrow 2l(l+2n) + n(l+2n) = 0 \Rightarrow (l+2n)(n+2l) = 0$$

$$\Rightarrow l = -2n \text{ and } n = -2l$$

$$\text{If } l = -2n, \text{ then } m = 2(-2n+n) = -2n$$

$$\text{and if } n = -2l, \text{ then } m = 2(l-2l) = -2l$$

The DR's are 1, -2, -2 and -2, -2, 1.

$$\text{Now, } 1(-2) - (2)(-2) - 2(1) = -2 + 4 - 2 = 0$$

Hence, lines are perpendicular, so angle between them is $\pi/2$.

5. (d) The two normal vectors are $\mathbf{m} = 2\hat{i} + 3\hat{j} + \hat{k}$

and

$$\mathbf{n} = \hat{i} + 3\hat{j} + 2\hat{k}$$

$$\text{The line } L \text{ is along, } \mathbf{m} \times \mathbf{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 1 \\ 1 & 3 & 2 \end{vmatrix}$$

$$= (6-3)\hat{i} - (4-1)\hat{j} + (6-3)\hat{k}$$

$$= 3\hat{i} - 3\hat{j} + 3\hat{k} = 3(\hat{i} - \hat{j} + \hat{k})$$

Now, the direction cosines of X-axis are (1, 0, 0).

$$\therefore \cos \alpha = \frac{3(\hat{i} - \hat{j} + \hat{k}) \cdot \hat{i}}{\sqrt{3^2(1^2 + 1^2 + 1^2)}\sqrt{1}} = \frac{3}{3\sqrt{3}} = \frac{1}{\sqrt{3}} \Rightarrow \cos \alpha = \frac{1}{\sqrt{3}}$$

6. (d) Let the parallel plane to $2x - 2y + z = 0$ be

$$2x - 2y + z + \lambda = 0$$

It passes through (1, -2, 3).

$$\therefore 2 + 4 + 3 + \lambda = 0 \Rightarrow \lambda = -9$$

The distance of (-1, 2, 0) from the plane

$$2x - 2y + z - 9 = 0 \text{ is}$$

$$\left| \frac{-2 - 4 - 9}{\sqrt{4 + 4 + 1}} \right| = \left| \frac{-15}{3} \right| = 5$$

7. (c) At the point on the line, where it intersects the curve, we have $z = 0$, so that

$$\frac{x-2}{3} = \frac{y+1}{2} = \frac{0-1}{-1}$$

$$\Rightarrow \frac{x-2}{3} = 1 \text{ and } \frac{y+1}{2} = 1 \Rightarrow x = 5 \text{ and } y = 1$$

Putting these values of x and y in $xy = c^2$, we get

$$c^2 = 5 \Rightarrow c = \pm \sqrt{5}$$

8. (a) If l, m, n are the direction cosines of the line, then

$$1 \cdot l - 1 \cdot m + 1 \cdot n = 0 \text{ and } 1 \cdot l - 3 \cdot m + 0 \cdot n = 0$$

$$\therefore \frac{l}{0+3} = \frac{m}{1-0} = \frac{n}{-3+1}$$

Hence, the direction ratios of the line are 3, 1, -2.

9. (b) Plane can be rewritten as $\frac{x}{6} + \frac{y}{-4} + \frac{z}{3} = 1$.

$\therefore$ Intercepts are 6, -4, 3.

10. (b) Given equation of line is $\frac{x-1}{3} = \frac{y+2}{4} = \frac{z-3}{-2} = k$ [say]

Any point on the line is $(3k+1, 4k-2, -2k+3)$.

If the given line intersect the plane $2x - y + 3z = 0$, then any point on the line lies in the plane.

$$\therefore 2(3k+1) - (4k-2) + 3(-2k+3) - 1 = 0$$

$$\Rightarrow -4k + 12 = 0 \Rightarrow k = 3$$

$$\therefore \text{Point is } (9+1, 12-2, -6+3) \text{ i.e. } (10, 10, -3).$$

11. (a)

Limits, Continuity and Differentiability

Limits

Let $y = f(x)$ be a function of x . If at $x = a$, $f(x)$ takes indeterminate form, then we consider the values of the function which are very near to a . If these values tend to a definite unique number as x tends to a , then the unique number, so obtained called the limit of $f(x)$ at $x = a$ and we write it as $\lim_{x \rightarrow a} f(x)$.

NOTE If a function $f(x)$ takes any of the following form, when $x = a$, then we say that $f(x)$ is indeterminate at $x = a$.
 $0/0, \infty - \infty, \infty/\infty, 0 \times \infty, 0^0, \infty^0, 1^\infty$

Left Hand and Right Hand Limits

Consider the values of the functions at the points which are very near to a on the left of a . If these values tend to definite unique number as x tends to a from left, then the unique number, so obtained is called the **left hand limit** of $f(x)$ at $x = a$ and symbolically we write it as $f(a - 0) = \lim_{x \rightarrow a^-} f(x) = \lim_{h \rightarrow 0} f(a - h)$

Similarly, **right hand limit** can be expressed as

$$f(a + 0) = \lim_{x \rightarrow a^+} f(x) = \lim_{h \rightarrow 0} f(a + h)$$

Existence of Limit

$\lim_{x \rightarrow a} f(x)$ exists when

- (i) $\lim_{x \rightarrow a^-} f(x)$ and $\lim_{x \rightarrow a^+} f(x)$ exist i.e. LHL and RHL both exist.
- (ii) $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$ i.e. LHL = RHL

Fundamental Theorems on Limits

If $\lim_{x \rightarrow a} f(x) = l$ and $\lim_{x \rightarrow a} g(x) = m$ (where, l and m are real numbers), then

- (i) $\lim_{x \rightarrow a} \{f(x) + g(x)\} = l + m$ [sum rule]
- (ii) $\lim_{x \rightarrow a} \{f(x) - g(x)\} = l - m$ [difference rule]
- (iii) $\lim_{x \rightarrow a} \{f(x) \cdot g(x)\} = l \cdot m$ [product rule]
- (iv) $\lim_{x \rightarrow a} k \cdot f(x) = k \cdot l$ [constant multiple rule]
- (v) $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{l}{m}, m \neq 0$ [quotient rule]
- (vi) If $\lim_{x \rightarrow a} f(x) = \infty$ or $-\infty$, then $\lim_{x \rightarrow a} \frac{1}{f(x)} = 0$.
- (vii) $\lim_{x \rightarrow a} \log\{f(x)\} = \log\{\lim_{x \rightarrow a} f(x)\}$
- (viii) If $f(x) \leq g(x), \forall x$, then $\lim_{x \rightarrow a} f(x) \leq \lim_{x \rightarrow a} g(x)$.
- (ix) $\lim_{x \rightarrow a} \{f(x)\}^{g(x)} = \{\lim_{x \rightarrow a} f(x)\}^{\lim_{x \rightarrow a} g(x)}$
- (x) $\lim_{x \rightarrow a} f\{g(x)\} = f\{\lim_{x \rightarrow a} g(x)\} = f(m)$ provided f is continuous at $\lim_{x \rightarrow a} g(x) = m$.

Some Important Results

1. Trigonometric Limits

- (i) $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\sin x}$ (ii) $\lim_{x \rightarrow 0} \frac{\tan x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\tan x}$
- (iii) $\lim_{x \rightarrow 0} \frac{\sin^{-1} x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\sin^{-1} x}$
- (iv) $\lim_{x \rightarrow 0} \frac{\tan^{-1} x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\tan^{-1} x}$ (v) $\lim_{x \rightarrow 0} \frac{\sin x^\circ}{x} = \frac{\pi}{180^\circ}$
- (vi) $\lim_{x \rightarrow 0} \cos x = 1$ (vii) $\lim_{x \rightarrow a} \frac{\sin(x-a)}{x-a} = 1$
- (viii) $\lim_{x \rightarrow a} \frac{\tan(x-a)}{x-a} = 1$ (ix) $\lim_{x \rightarrow a} \sin^{-1} x = \sin^{-1} a, |a| \leq 1$
- (x) $\lim_{x \rightarrow a} \cos^{-1} x = \cos^{-1} a, |a| \leq 1$
- (xi) $\lim_{x \rightarrow a} \tan^{-1} x = \tan^{-1} a, -\infty < a < \infty$
- (xii) $\lim_{x \rightarrow \infty} \frac{\sin x}{x} = \lim_{x \rightarrow \infty} \frac{\cos x}{x} = 0$ (xiii) $\lim_{x \rightarrow \infty} \frac{\sin 1/x}{1/x} = 1$

2. Logarithmic Limits

We use the series $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$, where $-1 < x \leq 1$ and expansion is true only, if base is e .

- (i) $\lim_{x \rightarrow 0} \frac{\log(1+x)}{x} = 1$
- (ii) $\lim_{x \rightarrow 0} \frac{\log(1-x)}{x} = -1$
- (iii) $\lim_{x \rightarrow 0} \frac{\log_a(1+x)}{x} = \log_a e; a > 0, \neq 1$

3. Exponential Limits

We use the series $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$.

- (i) $\lim_{x \rightarrow 0} \frac{e^x - 1}{x} = 1$
- (ii) $\lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log_e a$
- (iii) $\lim_{x \rightarrow 0} \frac{e^{\lambda x} - 1}{x} = \lambda; \lambda \neq 0$

4. Based on the Form 1^∞

To evaluate the exponential form 1^∞ , we use following results :

- (i) If $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0$, then

$$\lim_{x \rightarrow a} \{1 + f(x)\}^{1/g(x)} = e^{\lim_{x \rightarrow a} \frac{f(x)}{g(x)}}$$
- (ii) If $\lim_{x \rightarrow a} f(x) = 1$ and $\lim_{x \rightarrow a} g(x) = \infty$, then

$$\lim_{x \rightarrow a} \{f(x)\}^{g(x)} = e^{\lim_{x \rightarrow a} \{f(x) - 1\} g(x)}$$

Some Useful Expansions

- (i) $e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$
- (ii) $a^x = 1 + \frac{x \log a}{1!} + \frac{(x \log a)^2}{2!} + \dots$
- (iii) $(1+x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots, -1 < x < 1$
- (iv) $\frac{x^n - a^n}{x - a} = x^{n-1} + x^{n-2} \cdot a + x^{n-3} \cdot a^2 + \dots + a^{n-1}$
- (v) $\log_e(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$
- (vi) $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots, x \in R$
- (vii) $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \dots, x \in R$
- (viii) $\tan x = x + \frac{x^3}{3} + \frac{2}{15}x^5 + \frac{17}{315}x^7 + \dots, |x| < \frac{\pi}{2}$

L' Hospital's Rule

This result is applicable to only two indeterminate forms $\left(\frac{0}{0} \text{ or } \frac{\infty}{\infty}\right)$. This result states that, if $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$ reduces to $\frac{0}{0}$ or $\frac{\infty}{\infty}$. Then, differentiate numerator and denominator till this form is removed.

i.e. $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$, provided the later limit exists.

Continuity

If the graph of a function has no break or gap, then it is called a continuous function. A function which is not continuous is called a discontinuous function.

Consider the following graphs :

Fig. (i) shows that the function has no break, so it is continuous. Fig. (ii) and Fig. (iii) show a break at $x = c$, therefore it can be termed as discontinuous at $x = c$.

Continuity of a Function at a Point

A function $f(x)$ is said to be continuous at a point $x = a$ of its domain if and only if it satisfies the following conditions:

- (i) $f(a)$ exists (a lies in the domain of f)
- (ii) $\lim_{x \rightarrow a} f(x)$ exists i.e. $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$
or $RHL = LHL$
- (iii) $\lim_{x \rightarrow a} f(x) = f(a)$

Continuity in an Open Interval

A function $f(x)$ is said to be continuous in an open interval (a, b) , if it is continuous at each and every point of (a, b) .

Continuity in a Closed Interval

A function $f(x)$ is said to be continuous in a closed interval $[a, b]$, if

- (i) it is continuous in (a, b) .
- (ii) the value of the function at b is equal to left hand limit at b i.e. $f(b) = \lim_{x \rightarrow b^-} f(x)$.
- (iii) the value of the function at a is equal to right hand limit at a i.e. $f(a) = \lim_{x \rightarrow a^+} f(x)$.

Results on Continuous Functions

Let $f(x)$ and $g(x)$ be two continuous functions at $x = a$, then

- (i) $f(x) \pm g(x)$ is continuous at $x = a$.
- (ii) $f(x) \cdot g(x)$ is continuous at $x = a$.
- (iii) $f(x)/g(x)$ is continuous at $x = a$, provided $g(a) \neq 0$.

- (iv) the function $f(x)$ is said to be everywhere continuous, if it is continuous on the entire real line i.e. $(-\infty, \infty)$.
- (v) the integral function of a continuous function is a continuous function.
- (vi) the composition of function f and g , $(f \circ g)(x)$ is continuous at $x = a$.
- (vii) the $f(x)$ is a continuous function defined on $[a, b]$ such that $f(a)$ and $f(b)$ are of opposite signs, then there exists atleast one value of x for which $f(x)$ vanishes i.e. $f(a) > 0, f(b) < 0 \Rightarrow \exists c \in (a, b)$ such that $f(c) = 0$.

Some Important Points

- If $f(x)$ is continuous at $x = c$ and $g(x)$ is discontinuous at $x = a$, then
 - (i) $f + g$ and $f - g$ are discontinuous.
 - (ii) $f \cdot g$ may be continuous.
- If f and g are discontinuous at $x = c$, then $f + g, f - g$ and $f \cdot g$ may still be continuous.
- The function f will be discontinuous at $x = c$ in any of the following cases:
 - (i) $\lim_{x \rightarrow c^-} f(x)$ and $\lim_{x \rightarrow c^+} f(x)$ exist but are not equal.
 - (ii) $\lim_{x \rightarrow c^-} f(x)$ and $\lim_{x \rightarrow c^+} f(x)$ exist and are equal but not equal to $f(c)$.
 - (iii) $f(c)$ is not defined.
 - (iv) Atleast one of the limits does not exist.

Continuity of Some Common Functions

S.No.	Function $f(x)$	Intervals in which $f(x)$ is continuous
(i)	The constant function i.e. $f(x) = c$	$(-\infty, \infty)$
(ii)	The identity function i.e. $f(x) = x$	$(-\infty, \infty)$
(iii)	The polynomial function i.e. $f(x) = a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n$	$(-\infty, \infty)$
(iv)	$\sin x$	$(-\infty, \infty)$
(v)	$\cos x$	$(-\infty, \infty)$
(vi)	$ x - a $	$(-\infty, \infty)$
(vii)	e^x	$(-\infty, \infty)$
(viii)	x^n, n is an integer ≥ 0	$(-\infty, \infty)$
(ix)	x^{-n}, n is a positive integer	$(-\infty, \infty) - \{0\}$
(x)	$\frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials in x	$R - \{x : q(x) = 0\}$

(xiv)	$\operatorname{cosec} x$	$(-\infty, \infty) - \{n\pi : n \in \mathbb{Z}\}$
(xv)	$\log_e x$	$(0, \infty)$

Differentiability

Let f be a real valued function defined on an open interval (a, b) and $c \in (a, b)$. Then, $f(x)$ is said to be differentiable or derivable at $x = c$, if $\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$ exists finitely.

This limit is called the derivative or differential coefficient of the function $f(x)$ at $x = c$ and is denoted by $f'(c)$ or $D f(c)$ or $\left. \frac{d}{dx} f(x) \right|_{x=c}$. If we vary the point c over all numbers for

which the limit, $\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$ exists, then we obtain f' or $f'(x)$ and it is called derivative of f .

Let $f(x)$ be a function and c be a point in the domain of f . Then, the right hand derivative (RHD) denoted by $Rf'(c)$ is defined as

$$\begin{aligned} \text{RHD} = Rf'(c) &= \lim_{x \rightarrow c^+} \frac{f(x) - f(c)}{x - c} \\ \text{RHD} &= \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h} \end{aligned}$$

and the left hand derivative (LHD) denoted by $Lf'(c)$ is defined as

$$\begin{aligned} \text{LHD} = Lf'(c) &= \lim_{x \rightarrow c^-} \frac{f(x) - f(c)}{x - c} \\ \text{LHD} &= \lim_{h \rightarrow 0} \frac{f(c-h) - f(c)}{-h} \end{aligned}$$

Another Form of Differentiability

A function $f(x)$ is said to be differentiable at a point c in its domain, if

Left hand derivative = Right hand derivative

or

$$\text{LHD} = \text{RHD}$$

i.e.

$$Lf'(c) = Rf'(c)$$

$$\Rightarrow \lim_{x \rightarrow c^-} \frac{f(x) - f(c)}{x - c} = \lim_{x \rightarrow c^+} \frac{f(x) - f(c)}{x - c}$$

If $Lf'(c) \neq Rf'(c)$, then function $f(x)$ is not differentiable at $x = c$.

NOTE

- Every differentiable function is continuous.
- But the converse of this statement is not true, i.e. every continuous function may not be differentiable.
- Geometrically, $f(x)$ is differentiable at a point P , if the curve does not have P as a corner point, i.e. the function is not differentiable at those points on which function has jumps (or holes) and sharp edges.

Differentiability in an Interval

A function $y = f(x)$ defined on an **open interval** (a, b) is said to be differentiable in an open interval (a, b) , if it is differentiable at each point of (a, b) .

A function $y = f(x)$ defined on a **closed interval** $[a, b]$ is said to be differentiable in closed interval $[a, b]$, if it is differentiable at each point of an open interval (a, b)

and $\lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a}$ and $\lim_{x \rightarrow b^-} \frac{f(x) - f(b)}{x - b}$ both exist. A

function f is said to be differentiable, if it is differentiable at every point of its domain.

Some Standard Results on Differentiability

- Every polynomial function, every exponential function $a^x (a > 0)$ and every constant function are differentiable at each $x \in R$.
- The logarithmic functions, trigonometrical functions and inverse trigonometrical functions are always differentiable in their domains.
- The sum, difference, product and quotient of two differentiable functions is differentiable.
- The composite of differentiable function is a differentiable function.
- Absolute functions are always continuous throughout but not differentiable at their critical points.

Practice Exercise

- The value of $\lim_{x \rightarrow 2} \frac{2^x + 2^{3-x} - 6}{\sqrt{2^{-x}} - 2^{1-x}}$ is
 a. 16 b. 8 c. 4 d. 2
- Evaluate $\lim_{x \rightarrow 0} \frac{\sin(3x+a) - 3\sin(2x+a) + 3\sin(x+a) - \sin a}{x^3}$.
 a. 0 b. $\cos a$ c. $-\cos a$ d. $\sin a$
- If $f(x) = \frac{\sin[x]}{[x]}$, $[x] \neq 0$, where $[x]$ denotes the greatest integer less than or equal to x , then $\lim_{x \rightarrow 0} f(x)$ equals
 a. -1 b. 0 c. 1 d. None
- $\lim_{x \rightarrow 2} \left(\frac{\sqrt{1 - \{\cos 2(x-2)\}}}{x-2} \right)$ is equal to
 a. $\sqrt{2}$ b. $-\sqrt{2}$
 c. $\frac{1}{\sqrt{2}}$ d. Does not exist
- The value of $\lim_{x \rightarrow 0} \frac{1}{x} \left[\tan^{-1} \left(\frac{x+1}{2x+1} \right) - \frac{\pi}{4} \right]$ is
 a. 1 b. $-\frac{1}{2}$ c. 2 d. 0
- $\lim_{x \rightarrow \infty} \left[\sqrt{x + \sqrt{x + \sqrt{x}}} - \sqrt{x} \right]$ is equal to
 a. 0 b. $\frac{1}{2}$ c. $\log 2$ d. e^4
- $\lim_{x \rightarrow 1} [x-1]$, where $[]$ denotes the greatest integer function, is equal to
 a. 1 b. 2
 c. 0 d. Does not exist
- The value of $\lim_{x \rightarrow \pi} \frac{1 + \cos^3 x}{\sin^2 x}$ is
 a. $\frac{1}{3}$ b. $\frac{3}{2}$ c. $-\frac{1}{4}$ d. $-\frac{3}{2}$
- The value of $\lim_{x \rightarrow \infty} \frac{(x+2)! + (x+1)!}{(x+2)! - (x+1)!}$ is
 a. 1 b. 2 c. 3 d. 4
- $\lim_{a \rightarrow \infty} \left[\frac{1}{1-a^4} + \frac{8}{1-a^4} + \dots + \frac{a^3}{1-a^4} \right]$ is equal to
 a. $\frac{1}{3}$ b. $\frac{1}{4}$ c. $-\frac{1}{3}$ d. $-\frac{1}{4}$
- If $f(x) = \begin{cases} x+2, & x \leq -1 \\ cx^2, & x > -1 \end{cases}$, then find c , if $\lim_{x \rightarrow -1} f(x)$ exists.
 a. -1 b. 1 c. 0 d. 2
- The value of $\lim_{x \rightarrow \pi/4} \frac{2 - \cot x - \cot^3 x}{1 - \cot^3 x}$ is
 a. $\frac{4}{3}$ b. 1
 c. 0 d. None of these
- Find the value of $\lim_{x \rightarrow 0} \frac{\sin x - 2 \sin 3x + \sin 5x}{x}$.
 a. -1 b. 0
 c. 1 d. 3
- If $f(x) = \begin{cases} x^2 - 1, & 0 < x < 2 \\ 2x + 3, & 2 \leq x < 3 \end{cases}$, then quadratic equation whose roots are $\lim_{x \rightarrow 2^-} f(x)$ and $\lim_{x \rightarrow 2^+} f(x)$, is
 a. $x^2 - 6x + 9 = 0$ b. $x^2 - 7x + 8 = 0$
 c. $x^2 - 14x + 49 = 0$ d. $x^2 - 10x + 21 = 0$
- $\lim_{x \rightarrow 0} \frac{e^{x^2} - \cos x}{x^2}$ is equal to
 a. $\frac{3}{2}$ b. $\frac{1}{2}$
 c. $\frac{2}{3}$ d. None of these
- The value of $\lim_{x \rightarrow 0} \frac{(1+x)^{1/x} - e}{x}$ is
 a. 1 b. $\frac{e}{2}$ c. $-\frac{e}{2}$ d. $\frac{2}{e}$
- The values of a and b such that $\lim_{x \rightarrow 0} \frac{x(1+a \cos x) - b \sin x}{x^3} = 1$, are
 a. $\frac{5}{3}, \frac{3}{2}$ b. $\frac{5}{2}, -\frac{3}{2}$
 c. $-\frac{5}{2}, -\frac{3}{2}$ d. None of these
- $\lim_{n \rightarrow \infty} \sin[\pi\sqrt{n^2+1}]$ is equal to
 a. ∞ b. 0
 c. Does not exist d. None of these
- The value of $\lim_{x \rightarrow \infty} \left(\frac{3x-4}{3x+2} \right)^{\frac{x+1}{3}}$ is
 a. $e^{-1/3}$ b. $e^{-2/3}$ c. e^{-1} d. e^{-2}
- If $\lim_{x \rightarrow 1} \frac{x^4 - 1}{x - 1} = \lim_{x \rightarrow k} \frac{x^3 - k^3}{x^2 - k^2}$, then the value of k is
 a. $-\frac{8}{3}$ b. $\frac{5}{3}$
 c. $-\frac{5}{3}$ d. None of these

21. $\lim_{x \rightarrow \infty} \left(\frac{x+1}{x+2} \right)^{2x+1}$ is equal to
 a. e^3 b. e^{-3} c. e^{-2} d. e^2
22. $\lim_{x \rightarrow 0} \frac{\sin x - x}{x^3}$ is equal to
 a. $-\frac{1}{5}$ b. $-\frac{1}{6}$
 c. -1 d. -6
23. $\lim_{x \rightarrow 0} \left[\frac{1^x + 2^x + 3^x + \dots + n^x}{n} \right]^{\frac{a}{x}}$ is equal to
 a. $(n!)^{a/n}$ b. $(n!)^a$
 c. $\frac{1}{2a(n!)}$ d. None of these
24. The polynomial of least degree, such that
 $\lim_{x \rightarrow 0} \left[1 + \frac{x^2 + f(x)}{x^2} \right]^{1/x} = e^2$, is
 a. $2x^3 + x^2$ b. $2x^3 - x^2$
 c. $2x^2 + 3x^3$ d. None of these
25. $\lim_{x \rightarrow 0} \frac{\sin^{-1} x - \tan^{-1} x}{x^3}$ is equal to
 a. $\frac{1}{2}$ b. 2
 c. $-\frac{1}{2}$ d. None of these
26. The value of p for which the function

$$f(x) = \begin{cases} \frac{(4^x - 1)^3}{\sin\left(\frac{x}{p}\right) \log\left(1 + \frac{x^2}{3}\right)}, & x \neq 0 \\ 12(\log 4)^3, & x = 0 \end{cases}$$
 may be continuous at $x = 0$, is
 a. 1 b. 2
 c. 3 d. None of these
27. The value of $\lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3} \right)^{2/x}$,
 where $(a, b, c > 0)$ is
 a. $(abc)^3$ b. abc
 c. $(abc)^{1/3}$ d. None of these
28. The values of a, b and c , such that
 $\lim_{x \rightarrow 0} \frac{ae^x - b \cos x + ce^{-x}}{x \sin x} = 2$, are
 a. $a = 1, b = -2, c = 1$ b. $a = 1, b = 2, c = -1$
 c. $a = 1, b = 2, c = 1$ d. $a = -1, b = 2, c = 1$
29. If $\lim_{n \rightarrow \infty} \left(an - \frac{1+n^2}{1+n} \right) = b$, where a is finite number, then
 a. $a = 2$ b. $a = 0$ c. $b = 1$ d. $b = -1$
30. The value of $f(0)$, so that the function
 $f(x) = \frac{(27 - 2x)^{1/3} - 3}{9 - 3(243 + 5x)^{1/5}}$ ($x \neq 0$) is continuous, is given
 by
 a. $2/3$ b. 6 c. 2 d. 4
31. If $f(x) = \begin{cases} |x| \cos\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is
 a. discontinuous at $x = 0$ b. continuous at $x = 0$
 c. Does not exist d. None of these
32. For what value of k , the function

$$f(x) = \begin{cases} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}, & \text{if } -1 \leq x < 0 \\ \frac{2x+1}{x-2}, & \text{if } 0 \leq x \leq 1 \end{cases}$$
 is continuous at $x = 0$?
 a. $\frac{1}{2}$ b. 1 c. $-\frac{3}{2}$ d. $-\frac{1}{2}$
33. If $f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then
 a. $f(0+0) = 1$
 b. $f(0-0) = 1$
 c. $f(x)$ is continuous at $x = 0$
 d. None of the above
34. Let $f(x) = -1 + |x - 2|$ and $g(x) = 1 - |x|$, then the set of all points where $f \circ g$ is discontinuous, is
 a. $\{0, 2\}$ b. $\{0, 1, 2\}$
 c. $\{0\}$ d. an empty set
35. If $f(x) = \begin{cases} |x| + 3, & \text{if } x \leq -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x + 2, & \text{if } x \geq 3 \end{cases}$, then $f(x)$ is
 a. continuous at $x = -3$ and discontinuous at $x = 3$
 b. continuous at $x = -3, 3$
 c. discontinuous at $x = -3, 3$
 d. continuous at $x = 3$ and discontinuous at $x = -3$
36. If $f(x) = \frac{3x + 4 \tan x}{x}$ is to be defined to make continuous at $x = 0$, then the defined function should be
 a. $f(x) = \begin{cases} \frac{3x + 4 \tan x}{x}, & x \neq 0 \\ 7, & x = 0 \end{cases}$
 b. $f(x) = \begin{cases} \frac{3x + 4 \tan x}{x}, & x \neq 0 \\ 6, & x = 0 \end{cases}$
 c. $f(x) = \begin{cases} \frac{3x + 4 \tan x}{x}, & x \neq 0 \\ 7, & x = 0 \end{cases}$
 d. None of the above

37. The value of $f(0)$, so that the function $f(x) = \frac{2x - \sin^{-1}x}{2x + \tan^{-1}x}$ is continuous at each point in its domain, is

a. $\frac{1}{3}$ b. $-\frac{1}{3}$ c. $\frac{2}{3}$ d. $-\frac{2}{3}$

38. For what value of k , function $f(x) = \begin{cases} \frac{k \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$

is continuous at $x = \frac{\pi}{2}$?

a. 1 b. 3
c. R d. 6

39. If $f(x) = \begin{cases} |x - a| \sin \frac{1}{x - a}, & \text{if } x \neq a \\ 0, & \text{if } x = a \end{cases}$, then $f(x)$ is

a. continuous at $x = a$
b. discontinuous at $x = a$
c. discontinuous for all $x \in R$
d. None of the above

40. The values of p and q for which the function

$$f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ q, & x = 0 \\ \frac{\sqrt{x+x^2} - \sqrt{x}}{x^{3/2}}, & x > 0 \end{cases}$$

is continuous for all x in R , are

a. $p = \frac{5}{2}, q = \frac{1}{2}$ b. $p = -\frac{3}{2}, q = \frac{1}{2}$
c. $p = \frac{1}{2}, q = \frac{3}{2}$ d. $p = \frac{1}{2}, q = -\frac{3}{2}$

41. If $f(x) = \begin{cases} x^k \sin\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$ is continuous at $x = 0$,

then

a. $k \in (-\infty, 0)$ b. $k \in (1, \infty)$
c. $k \in (-1, \infty)$ d. None of these

42. If $f(x) = \frac{\sqrt{1+\sin x} - \sqrt{1-\sin x}}{x}$, then the value of f at

$x = 0$, so that f is continuous everywhere, is

a. $1/4$ b. -1 c. 1 d. 2

43. If the function $f(x)$ defined by

$$f(x) = \begin{cases} \left(x^2 + e^{\frac{1}{2-x}}\right)^{-1}, & x \neq 2 \\ c, & x = 2 \end{cases}$$

is continuous from right at $x = 2$, then c is equal to

a. $\frac{1}{2}$ b. $\frac{1}{3}$ c. $\frac{1}{4}$ d. $\frac{1}{5}$

44. If $f(x) = \frac{(3^x - 1)^2}{\sin x \cdot \log_e(1+x)}$, $x \neq 0$, is continuous at $x = 0$, then $f(0)$ is

a. $\log_e 3$ b. $2 \log_e 3$ c. $(\log_e 3)^2$ d. None

45. If a function $f: R \rightarrow R$ satisfy the equation $f(x+y) = f(x) + f(y)$, $\forall x, y$ and the function $f(x)$ is continuous at $x = 0$, then

a. $f(x)$ is continuous for all positive real values of x
b. $f(x)$ is continuous for all x
c. $f(x) = 0$ for all x
d. None of the above

46. The values of a and b such that the function f defined by

$$f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a+b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases}$$

is continuous function at $x = 4$, are

a. $a = 1$ and $b = -1$ b. $a = -1$ and $b = 1$
c. $a = 0$ and $b = -1$ d. $a = 1$ and $b = 0$

47. If $f(x) = \frac{\sqrt{2} \cos x - 1}{\cot x - 1}$, $x \neq \frac{\pi}{4}$, then the value of $f\left(\frac{\pi}{4}\right)$, so

that $f(x)$ becomes continuous at $x = \frac{\pi}{4}$, is

a. $\frac{1}{2}$ b. $-\frac{1}{2}$ c. 1 d. 9

48. If $f(x) = \begin{cases} \frac{1 - \cos 4x}{x^2}, & \text{if } x < 0 \\ a, & \text{if } x = 0 \\ \frac{\sqrt{x}}{\sqrt{16 + \sqrt{x}} - 4}, & \text{if } x > 0 \end{cases}$, then what value of a ,

f is continuous at $x = 0$?

a. 2 b. 4 c. 6 d. 8

49. If the function

$$f(x) = \begin{cases} x + a^2 \sqrt{2} \sin x, & 0 \leq x < \frac{\pi}{4} \\ x \cot x + b, & \frac{\pi}{4} \leq x < \frac{\pi}{2} \\ b \sin 2x - a \cos 2x, & \frac{\pi}{2} \leq x \leq \pi \end{cases}$$

is continuous in the interval $[0, \pi]$, then the values of a and b are respectively

a. $(0, 0)$ b. $\left(0, \frac{1}{2}\right)$ c. $(0, 1)$ d. $(-1, 1)$

50. If $f(x) = \frac{a \sin x + \sin 2x}{x^3}$, $x \neq 0$ and $f(x)$ is continuous at

$x = 0$, then

a. $a = 2$ b. $f(0) = 1$ c. $f(0) = -1$ d. $a = 1$

51. If $f(x) = 3x^{10} - 7x^8 + 5x^6 - 21x^3 + 3x^2 - 7$, then the value of $\lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{h^3 + 3h}$ is
 a. $\frac{53}{3}$ b. $\frac{22}{3}$ c. 13 d. $\frac{22}{13}$
52. If $f'(2) = 6$ and $f'(1) = 4$, then $\lim_{h \rightarrow 0} \frac{f(2h + 2 + h^2) - f(2)}{f(h - h^2 + 1) - f(1)}$ is equal to
 a. 3 b. $-3/2$
 c. $3/2$ d. Does not exist
53. If $f(x) = \begin{cases} e^x, & x \leq 0 \\ |1-x|, & x > 0 \end{cases}$, then
 a. $f(x)$ is differentiable at $x = 0$
 b. $f(x)$ is continuous at $x = 0, 1$
 c. $f(x)$ is differentiable at $x = 1$
 d. None of the above
54. The function defined by $f(x) = \begin{cases} |x-3|, & x \geq 1 \\ \frac{1}{4}x^2 - \frac{3}{2}x + \frac{13}{4}, & x < 1 \end{cases}$ is
 a. continuous at $x = 1$ b. continuous at $x = 3$
 c. differentiable at $x = 1$ d. All of these
55. If $\lim_{x \rightarrow 0} \frac{\log(a+x) - \log a}{x} + k \lim_{x \rightarrow 0} \frac{\log x - 1}{x - e} = 1$, then
 a. $k = e \left(1 - \frac{1}{a}\right)$ b. $k = e(1+a)$
 c. $k = e(2-a)$ d. equality is not possible
56. If $f(x) = \begin{cases} -\left(\frac{1}{|x|} + \frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is
 a. continuous as well as differentiable for all x
 b. continuous for all x but not differentiable at $x = 0$
 c. neither differentiable nor continuous at $x = 0$
 d. discontinuous everywhere
57. Consider the greatest integer function, defined by $f(x) = [x]$, $0 \leq x < 2$. Then,
 a. f is derivable at $x = 1$ b. f is not derivable at $x = 1$
 c. f is derivable at $x = 2$ d. None of these
58. Let $f(x) = \lambda + \mu|x| + \nu|x|^2$, where λ, μ, ν are real constants. Then, $f'(0)$ exists, if
 a. $\mu = 0$ b. $\nu = 0$ c. $\lambda = 0$ d. $\mu = \nu$
59. Consider a function $f: R \rightarrow R$ which satisfies the equation $f(x+y) = f(x) \cdot f(y)$, $\forall x, y \in R$, $f(x) \neq 0$. Suppose that the function is differentiable at $x = 0$ and $f'(0) = 2$. Then, $f'(x)$ is equal to
 a. $f(x)$ b. $2f(x)$ c. $\frac{1}{2}f(x)$ d. None
60. Consider the function $f(x)$, defined by

$$f(x) = \begin{cases} x, & x \leq 1 \\ x^2 + bx + c, & x > 1 \end{cases}$$

 Let $f'(x)$ exists finitely, $\forall x \in R$. Then,
 a. $b = -1, c \in R$
 b. $c = 1, b \in R$
 c. $b = 1, c = -1$
 d. $b = -1, c = 1$
61. Consider the function $f(x) = |\log_e x|$, $\forall x > 0$. Then,
 a. LHD does not exist at $x = 1$
 b. RHD does not exist at $x = 1$
 c. f is differentiable at $x = 1$
 d. f is not differentiable at $x = 1$
62. Consider the function $f(x)$ defined by
 $f(x) = |x-2| + |x| + |x+2|$. Then,
 a. f is derivable at $x = 0, 2$
 b. f is derivable at $x = -2, 0$
 c. f is derivable at $x = -2, 2$
 d. f is not derivable at $x = -2, 0, 2$

BITSAT Archives

1. $\lim_{x \rightarrow 0} \frac{(1+x)^8 - 1}{(1+x)^2 - 1}$ is equal to [2014]
 a. 8 b. 6 c. 4 d. 2
2. $\lim_{x \rightarrow \tan^{-1} 3} \frac{\tan^2 x - 2 \tan x - 3}{\tan^2 x - 4 \tan x + 3}$ is equal to [2014]
 a. 1 b. 2 c. 0 d. 3
3. $\lim_{x \rightarrow -\infty} \frac{x^4 \cdot \sin\left(\frac{1}{x}\right) + x^2}{1 + |x|^3}$ is equal to [2014]
 a. 0 b. -1 c. 2 d. 1
4. $\lim_{x \rightarrow 1} \frac{x^m - 1}{x^n - 1}$ is equal to [2014]
 a. $\frac{n}{m}$ b. $\frac{m}{n}$
 c. $\frac{2m}{n}$ d. $\frac{2n}{m}$
5. If $f(x) = \begin{cases} \left[\tan\left(\frac{\pi}{4} + x\right)\right]^{1/x}, & x \neq 0 \\ k, & x = 0 \end{cases}$
 For what value of k , $f(x)$ is continuous at $x = 0$? [2014]
 a. 1 b. 0 c. e d. e^2

6. The value of $\lim_{x \rightarrow 0} \left(\frac{1+5x^2}{1+3x^2} \right)^{1/x^2}$ is [2013]
 a. e^2 b. e c. $1/e$ d. $1/e^2$
7. $\lim_{x \rightarrow 0} \left(\frac{(2+x)\sin(2+x) - 2\sin 2}{x} \right)$ is equal to [2012]
 a. $\sin 2$ b. $\cos 2$ c. 1 d. $2\cos 2 + \sin 2$
8. If $f(x) = \frac{3x + \tan^2 x}{x}$ is continuous at $x = 0$, then $f(0)$ is equal to [2012]
 a. 3 b. 2 c. 4 d. 0
9. If $f(x) = \frac{\log(1+ax) - \log(1-bx)}{x}$ for $x \neq 0$ and $f(0) = k$ and $f(x)$ is continuous at $x = 0$, then k is equal to [2012]
 a. $a+b$ b. $a-b$ c. a d. b
10. $\lim_{x \rightarrow 0} \frac{\sin x}{x}$ is equal to [2011]
 a. 2 b. -1 c. 1 d. 0
11. $\lim_{x \rightarrow 0} \frac{\cos(\sin x) - 1}{x^2}$ is equal to [2011]
 a. 1 b. -1 c. $1/2$ d. $-1/2$
12. In order that the function $f(x) = (x+1)^{1/x}$ is continuous at $x = 0$, $f(0)$ must be defined as [2011]
 a. $f(0) = 0$ b. $f(0) = e$ c. $f(0) = 1/e$ d. $f(0) = 1$
13. The function $f(x) = |x|$ at $x = 0$ is [2011]
 a. continuous but non-differentiable
 b. discontinuous and differentiable
 c. discontinuous and non-differentiable
 d. continuous and differentiable
14. $\lim_{x \rightarrow 0} (\operatorname{cosec} x)^{1/\log x}$ is equal to [2010]
 a. 0 b. 1
 c. $1/e$ d. None of these
15. The value of $\lim_{x \rightarrow \infty} \left(\frac{x+6}{x+1} \right)^{x+4}$ is [2010]
 a. e b. e^2 c. e^4 d. e^5
16. The set of points, where the function $f(x) = x|x|$ is differentiable, is [2010]
 a. $(-\infty, \infty)$ b. $(-\infty, 0) \cup (0, \infty)$
 c. $(0, \infty)$ d. $[0, \infty)$
17. $\lim_{x \rightarrow 2} \frac{\sqrt{1+\sqrt{2+x}} - \sqrt{3}}{x-2}$ is equal to [2009]
 a. $\frac{1}{8\sqrt{3}}$ b. $\frac{1}{\sqrt{3}}$ c. $8\sqrt{3}$ d. $\sqrt{3}$
18. $\lim_{x \rightarrow 1} (1-x) \tan\left(\frac{\pi x}{2}\right)$ is equal to [2009]
 a. $\frac{\pi}{2}$ b. $\frac{2}{\pi}$ c. $-\frac{\pi}{2}$ d. $-\frac{2}{\pi}$
19. If $f: R \rightarrow R$ is defined by $f(x) = [x-3] + |x-4|$ for $x \in R$, then $\lim_{x \rightarrow 3^-} f(x)$ is equal to [2008]
 a. -2 b. -1 c. 0 d. 1
20. If $f: R \rightarrow R$ is defined by [2008]

$$f(x) = \begin{cases} \frac{\cos 3x - \cos x}{x^2}, & \text{for } x \neq 0 \\ \lambda, & \text{for } x = 0 \end{cases}$$
 and if f is continuous at $x = 0$, then λ is equal to
 a. -2 b. -4 c. -6 d. -8
21. If $f(2) = 4$ and $f'(2) = 1$, then $\lim_{x \rightarrow 2} \frac{x f(2) - 2f(x)}{x-2}$ is equal to [2008]
 a. -2 b. 1 c. 2 d. 3
22. If $\lim_{x \rightarrow \infty} \left[\frac{x^3+1}{x^2+1} - (ax+b) \right] = 2$, then [2007]
 a. $a = 1$ and $b = 1$ b. $a = 1$ and $b = -1$
 c. $a = 1$ and $b = -2$ d. $a = 1$ and $b = 2$
23. If $f(x) = \begin{cases} \frac{1-\cos x}{x}, & x \neq 0 \\ x, & x = 0 \end{cases}$ is continuous at $x = 0$, then the value of k is [2007]
 a. 0 b. $\frac{1}{2}$ c. $\frac{1}{4}$ d. $-\frac{1}{2}$
24. $\lim_{x \rightarrow 0} \frac{\tan x - \sin x}{x^3}$ is equal to [2006]
 a. $1/2$ b. $-1/2$ c. 0 d. 1
25. If $f(x) = \begin{cases} \frac{\sin 5x}{x^2+2x}, & x \neq 0 \\ k + \frac{1}{2}, & x = 0 \end{cases}$ is continuous at $x = 0$, then the value of k is [2006]
 a. 1 b. -2
 c. 2 d. $\frac{1}{2}$
26. The value of the constant α and β such that $\lim_{x \rightarrow \infty} \left(\frac{x^2+1}{x+1} - \alpha x - \beta \right) = 0$ are respectively [2005]
 a. (1, 1) b. (-1, 1) c. (1, -1) d. (0, 1)
27. $\lim_{\theta \rightarrow 0} \frac{4\theta(\tan \theta - 2\theta \tan \theta)}{(1 - \cos 2\theta)}$ is equal to [2005]
 a. $1\sqrt{2}$ b. $1/2$
 c. 1 d. 2
28. If $f(x) = \begin{cases} 1, & x < 0 \\ 1 + \sin x, & 0 \leq x \leq \pi/2 \end{cases}$, then what is the value of $f'(x)$ at $x = 0$? [2005]
 a. 1 b. -1
 c. ∞ d. Does not exist

Answer with Solutions

Practice Exercise

$$\begin{aligned}
 1. (b) \lim_{x \rightarrow 2} \frac{2^x + 2^{3-x} - 6}{\sqrt{2^{-x}} - 2^{1-x}} &= \lim_{x \rightarrow 2} \frac{(2^x)^2 - 6 \cdot 2^x + 8}{\sqrt{2^x} - 2} \\
 &= \lim_{x \rightarrow 2} \frac{(2^x - 4)(2^x - 2)(\sqrt{2^x} + 2)}{(\sqrt{2^x} - 2)(\sqrt{2^x} + 2)} \\
 &= \lim_{x \rightarrow 2} \frac{(2^x - 4)(2^x - 2)(\sqrt{2^x} + 2)}{(2^x - 4)} \\
 &= \lim_{x \rightarrow 2} (2^x - 2)(\sqrt{2^x} + 2) \\
 &= (4 - 2)(2 + 2) = 8 \\
 2. (c) \lim_{x \rightarrow 0} \frac{2 \sin\left(\frac{3x}{2}\right) \cos\left(\frac{3x + 2a}{2}\right) - 3\left(2 \sin \frac{x}{2} \cos \frac{3x + 2a}{2}\right)}{x^3} \\
 &= \lim_{x \rightarrow 0} \frac{2 \cos\left(\frac{3x + 2a}{2}\right) \left[3 \sin \frac{x}{2} - 4 \sin^3 \frac{x}{2} - 3 \sin \frac{x}{2}\right]}{x^3} \\
 &= \lim_{x \rightarrow 0} 2 \cos\left(\frac{3x + 2a}{2}\right) \left\{ \frac{-4(x/2)^3}{x^3} \right\} \quad [\because \lim_{\theta \rightarrow 0} \sin \theta = \theta] \\
 &= 2 \cos a \left(-\frac{4}{8}\right) = -\cos a
 \end{aligned}$$

$$\begin{aligned}
 3. (d) \text{LHL} &= \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} \frac{\sin(0 - h)}{(0 - h)} \\
 &= \lim_{h \rightarrow 0} \frac{\sin(-1)}{(-1)} = \sin 1 \\
 \text{RHL} &= \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} \frac{\sin(0 + h)}{(0 + h)} = 0 \quad [\text{given}]
 \end{aligned}$$

Thus, LHL $\neq$ RHL

Hence, limit does not exist.

$$\begin{aligned}
 4. (d) \lim_{x \rightarrow 2} \frac{\sqrt{1 - \cos 2(x - 2)}}{x - 2} &= \lim_{x \rightarrow 2} \frac{\sqrt{2 \sin^2(x - 2)}}{(x - 2)} \\
 &= \frac{\sqrt{2} |\sin(x - 2)|}{(x - 2)} = \lim_{x \rightarrow 2} \frac{\sqrt{2} |\sin(x - 2)|}{(x - 2)}
 \end{aligned}$$

RHL at $x = 2$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(2 + h - 2)|}{(2 + h) - 2} = \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin h|}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\sqrt{2} \sin h}{h} = \sqrt{2}
 \end{aligned}$$

LHL at $x = 2$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(2 - h - 2)|}{(2 - h) - 2} = \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(-h)|}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{\sqrt{2} \sin h}{-h} = -\sqrt{2}
 \end{aligned}$$

So, limit does not exist.

5. (b)

$$\begin{aligned}
 6. (b) \lim_{x \rightarrow \infty} \left[\sqrt{x + \sqrt{x + \sqrt{x}}} - \sqrt{x} \right] &= \lim_{x \rightarrow \infty} \frac{x + \sqrt{x + \sqrt{x}} - x}{\sqrt{x + \sqrt{x + \sqrt{x}}} + \sqrt{x}} \\
 &= \lim_{x \rightarrow \infty} \frac{\sqrt{x + \sqrt{x}}}{\sqrt{x + \sqrt{x + \sqrt{x}}} + \sqrt{x}} = \lim_{x \rightarrow \infty} \frac{\sqrt{1 + x^{-1/2}}}{\sqrt{1 + \sqrt{x^{-1} + x^{-3/2}}} + 1} = \frac{1}{2}
 \end{aligned}$$

7. (d) Since, $\lim_{x \rightarrow 1^+} [x - 1] = 0$ and $\lim_{x \rightarrow 1^-} [x - 1] = -1$

So, $\lim_{x \rightarrow 1} [x - 1]$ does not exist.

$$\begin{aligned}
 8. (b) \lim_{x \rightarrow \pi} \frac{1 + \cos^3 x}{\sin^2 x} &= \lim_{x \rightarrow \pi} \frac{(1 + \cos x)(1 + \cos^2 x - \cos x)}{(1 + \cos x)(1 - \cos x)} \\
 &= \lim_{x \rightarrow \pi} \frac{1 + \cos^2 x - \cos x}{1 - \cos x} = \frac{1 + (-1)^2 - (-1)}{1 - (-1)} = \frac{3}{2}
 \end{aligned}$$

$$\begin{aligned}
 9. (a) \lim_{x \rightarrow \infty} \frac{(x + 2)! + (x + 1)!}{(x + 2)! - (x + 1)!} &= \lim_{x \rightarrow \infty} \frac{(x + 2)(x + 1)! + (x + 1)!}{(x + 2)(x + 1)! - (x + 1)!} \\
 &= \lim_{x \rightarrow \infty} \frac{x + 2 + 1}{x + 2 - 1} = \lim_{x \rightarrow \infty} \frac{x + 3}{x + 1} = \lim_{x \rightarrow \infty} \frac{1 + \frac{3}{x}}{1 + \frac{1}{x}} \\
 &\quad \left[\text{as } x \rightarrow \infty, \frac{1}{x} \rightarrow 0 \right]
 \end{aligned}$$

$$= \frac{1}{1} = 1$$

$$\begin{aligned}
 10. (d) \lim_{a \rightarrow \infty} \left[\frac{1}{1 - a^4} + \frac{8}{1 - a^4} + \frac{27}{1 - a^4} + \dots + \frac{a^3}{1 - a^4} \right] \\
 &= \lim_{a \rightarrow \infty} \left[\frac{1^3}{1 - a^4} + \frac{2^3}{1 - a^4} + \frac{3^3}{1 - a^4} + \dots + \frac{a^3}{1 - a^4} \right] \\
 &= \lim_{a \rightarrow \infty} [1^3 + 2^3 + 3^3 + \dots + a^3] \times \frac{1}{1 - a^4} \\
 &= \lim_{a \rightarrow \infty} \left[\frac{a(a + 1)}{2} \right]^2 \times \frac{1}{1 - a^4} = \lim_{a \rightarrow \infty} \left[\frac{a^4 + a^2 + 2a^3}{4} \right] \times \frac{1}{1 - a^4} \\
 &= \lim_{a \rightarrow \infty} \frac{a^4 \left(1 + \frac{1}{a^2} + \frac{2}{a} \right)}{4a^4 \left(\frac{1}{a^4} - 1 \right)} = -\frac{1}{4} \quad \left[\text{as } a \rightarrow \infty, \frac{1}{a} \rightarrow 0 \right]
 \end{aligned}$$

$$11. (b) \text{ Given, } f(x) = \begin{cases} x + 2, & x \leq -1 \\ cx^2, & x > -1 \end{cases}$$

Since, at $x = -1$, limit exists.

$$\therefore \text{RHL} = \text{LHL} \Rightarrow \lim_{x \rightarrow -1^+} f(x) = \lim_{x \rightarrow -1^-} f(x)$$

$$\Rightarrow \lim_{h \rightarrow 0} f(-1 + h) = \lim_{h \rightarrow 0} f(-1 - h)$$

$$\Rightarrow \lim_{h \rightarrow 0} c(-1 + h)^2 = \lim_{h \rightarrow 0} (-1 - h + 2)$$

$$\Rightarrow c(-1 + 0)^2 = 1 - 0$$

$$\Rightarrow c = 1$$

$$\begin{aligned}
 12. (a) \lim_{x \rightarrow \pi/4} \frac{2 - \cot x - \cot^3 x}{1 - \cot^3 x} &= \lim_{x \rightarrow \pi/4} \frac{1 + (1 - \cot x) - \cot^3 x}{1 - \cot^3 x} \\
 &= \lim_{x \rightarrow \pi/4} \frac{(1 - \cot x)(1 + \cot^2 x + \cot x) + (1 - \cot x)}{(1 - \cot x)(1 + \cot^2 x + \cot x)} \\
 &= \lim_{x \rightarrow \pi/4} \frac{1 + \cot^2 x + \cot x + 1}{1 + \cot^2 x + \cot x} = \frac{4}{3}
 \end{aligned}$$

$$\begin{aligned}
 13. (b) \text{ Given, } \lim_{x \rightarrow 0} \frac{\sin x - 2 \sin 3x + \sin 5x}{x} \\
 &= \lim_{x \rightarrow 0} \frac{(\sin 5x + \sin x) - 2 \sin 3x}{x} \\
 &= \lim_{x \rightarrow 0} \frac{2 \sin \left(\frac{5x+x}{2} \right) \cdot \cos \left(\frac{5x-x}{2} \right) - 2 \sin 3x}{x} \\
 &= \lim_{x \rightarrow 0} \left[\because \sin C + \sin D = 2 \sin \left(\frac{C+D}{2} \right) \cdot \cos \left(\frac{C-D}{2} \right) \right] \\
 &= \lim_{x \rightarrow 0} \frac{2 \sin 3x \cdot \cos 2x - 2 \sin 3x}{x} \\
 &= \lim_{x \rightarrow 0} \frac{2 \sin 3x (\cos 2x - 1)}{x} \\
 &= \lim_{x \rightarrow 0} 2 \left(\frac{\sin 3x}{3x} \right) \times 3 \left[\frac{-(1 - \cos 2x)}{1} \right] \\
 &= -2 \times 1 \times 3 (1 - \cos 0) = -6 (1 - 1) = -6 \times 0 = 0
 \end{aligned}$$

$$\begin{aligned}
 14. (d) \text{ Given, } f(x) &= \begin{cases} x^2 - 1, & 0 < x < 2 \\ 2x + 3, & 2 \leq x < 3 \end{cases} \\
 \text{RHL} = \lim_{x \rightarrow 2^+} f(x) &= \lim_{h \rightarrow 0} f(2+h) = \lim_{h \rightarrow 0} 2(2+h) + 3 \\
 &= 2(2+0) + 3 = 4 + 3 = 7 = \alpha \text{ (say) } [\because f(x) = 2x + 3] \\
 \text{LHL} = \lim_{x \rightarrow 2^-} f(x) &= \lim_{h \rightarrow 0} f(2-h) \\
 &= \lim_{h \rightarrow 0} (2-h)^2 - 1 = (2-0)^2 - 1 \\
 &= 4 - 1 = 3 = \beta \quad (\text{say}) [\because f(x) = x^2 - 1]
 \end{aligned}$$

Since, quadratic equation has roots α and β , so the equation is

$$\begin{aligned}
 x^2 - (\text{Sum of roots})x + \text{Product of roots} &= 0 \\
 \Rightarrow x^2 - (\alpha + \beta)x + \alpha\beta &= 0 \Rightarrow x^2 - (7+3)x + 7 \times 3 = 0 \\
 \Rightarrow x^2 - 10x + 21 &= 0
 \end{aligned}$$

$$\begin{aligned}
 15. (a) \lim_{x \rightarrow 0} \frac{e^{x^2} - \cos x}{x^2} &= \lim_{x \rightarrow 0} \left[\frac{e^{x^2} - 1}{x^2} + \frac{1 - \cos x}{x^2} \right] \\
 &= \lim_{x \rightarrow 0} \frac{e^{x^2} - 1}{x^2} + \lim_{x \rightarrow 0} \frac{1 - \cos x}{x^2} = 1 + \frac{1}{2} = \frac{3}{2}
 \end{aligned}$$

$$\begin{aligned}
 16. (c) \text{ We know that, } (1+x)^{1/x} &= e^{\frac{\log(1+x)}{x}} = e^{\frac{1}{x} \left(x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \right)} \\
 &= e^{1 - \frac{x}{2} + \frac{x^2}{3} - \dots} = e \cdot e^{-\frac{x}{2} + \frac{x^2}{3} - \dots} \\
 \therefore \lim_{x \rightarrow 0} \frac{(1+x)^{1/x} - e}{x} &= \lim_{x \rightarrow 0} \frac{e \cdot e^{-\frac{x}{2} + \frac{x^2}{3} - \dots} - e}{x} \\
 &= e \lim_{x \rightarrow 0} \frac{[e^{-x/2 + x^2/3 - \dots} - 1]}{(-2)(-x/2)} = \frac{-1}{2} e
 \end{aligned}$$

$$\begin{aligned}
 17. (c) \lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{x^3} &= 1 \\
 &= \lim_{x \rightarrow 0} \frac{x \left[1 + a \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots \right) \right] - b \left[x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right]}{x^3} \\
 &= \lim_{x \rightarrow 0} \frac{(1+a-b) + x^2 \left(\frac{b}{3!} - \frac{a}{2!} \right) + x^4 \left(\frac{a}{4!} - \frac{b}{5!} \right) + \dots}{x^3} \quad \dots(i) \\
 &= \lim_{x \rightarrow 0} \frac{(1+a-b) + x^2 \left(\frac{b}{3!} - \frac{a}{2!} \right) + x^4 \left(\frac{a}{4!} - \frac{b}{5!} \right) + \dots}{x^2}
 \end{aligned}$$

If $1+a-b \neq 0$, then LHS $\rightarrow \infty$ as $x \rightarrow 0$ while RHS = 1.

Therefore, $1+a-b=0$

Now, from Eq. (i), we get

$$\begin{aligned}
 \lim_{x \rightarrow 0} \frac{x^2 \left(\frac{b}{3!} - \frac{a}{2!} \right) + x^4 \left(\frac{a}{4!} - \frac{b}{5!} \right)}{x^2} &= 1 \\
 \Rightarrow \frac{b}{3!} - \frac{a}{2!} &= 1 \Rightarrow b - 3a = 6
 \end{aligned}$$

On solving $1+a-b=0$ and $b-3a=6$, we get

$$a = -\frac{5}{2}, b = -\frac{3}{2}$$

$$\begin{aligned}
 18. (b) \lim_{n \rightarrow \infty} \sin \left\{ n\pi \left(1 + \frac{1}{n^2} \right)^{1/2} \right\} \\
 &= \lim_{n \rightarrow \infty} \sin \left\{ n\pi \left(1 + \frac{1}{2n^2} - \frac{1}{8n^4} + \dots \right) \right\} \\
 &= \lim_{n \rightarrow \infty} \sin \left\{ n\pi + \frac{\pi}{2n} - \frac{\pi}{8n^3} + \dots \right\} \\
 &= \lim_{n \rightarrow \infty} (-1)^n \sin \pi \left(\frac{1}{2n} - \frac{1}{8n^3} + \dots \right) = 0
 \end{aligned}$$

$$\begin{aligned}
 19. (b) \lim_{x \rightarrow \infty} \left(\frac{3x-4}{3x+2} \right)^{\frac{x+1}{3}} &= \lim_{x \rightarrow \infty} \left(\frac{3x+2-6}{3x+2} \right)^{\frac{x+1}{3}} \\
 &= \lim_{x \rightarrow \infty} \left(1 - \frac{6}{3x+2} \right)^{\frac{x+1}{3}} \\
 &= \lim_{x \rightarrow \infty} \left[\left(1 - \frac{6}{3x+2} \right)^{\frac{3x+2}{-6}} \right]^{\frac{-6}{3x+2} \cdot \frac{x+1}{3}} \\
 &= \lim_{x \rightarrow \infty} e^{\frac{-2(x+1)}{3x+2}} = e^{-2/3} \quad \left[\because \lim_{x \rightarrow \infty} \frac{-2(x+1)}{3x+2} = \frac{-2}{3} \right]
 \end{aligned}$$

$$\begin{aligned}
 20. (d) \lim_{x \rightarrow 1} \frac{x^4 - 1^4}{x - 1} &= \lim_{x \rightarrow 1} \frac{x^3 - k^3}{x^2 - k^2} \\
 \Rightarrow 4 \cdot (1)^{4-1} &= \frac{3}{2} (k)^{3-2} \Rightarrow 4 = \frac{3}{2} k \Rightarrow k = \frac{8}{3}
 \end{aligned}$$

$$\begin{aligned}
 21. (c) \lim_{x \rightarrow \infty} \left(\frac{x+1}{x+2} \right)^{2x+1} &= \lim_{x \rightarrow \infty} \left(1 - \frac{1}{x+2} \right)^{2x+1} \\
 &= \lim_{x \rightarrow \infty} \left[\left\{ 1 + \left(\frac{-1}{x+2} \right) \right\}^{-(x+2)} \right]^{\left(\frac{2x+1}{x+2} \right)}
 \end{aligned}$$

$$\begin{aligned}
 &= \lim_{x \rightarrow \infty} \left[\left\{ 1 + \left(\frac{-1}{x+2} \right) \right\}^{-(x+2)} \right]^{\left(\frac{2+1/x}{1+2/x} \right)} \\
 &= e^{-2} \left[\because \lim_{x \rightarrow \infty} \left\{ 1 + \frac{1}{f(x)} \right\}^{f(x)} = e \text{ and } \frac{1}{x} \rightarrow 0 \right] \\
 &\quad \left[\frac{0}{0} \text{ form} \right]
 \end{aligned}$$

22. (b) $\lim_{x \rightarrow 0} \frac{\sin x - x}{x^3}$

$$\begin{aligned}
 &= \lim_{x \rightarrow 0} \frac{\left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right) - x}{x^3} \\
 &= \lim_{x \rightarrow 0} \frac{\left(-\frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right)}{x^3} = -\frac{1}{6}
 \end{aligned}$$

23. (a) Let $\lim_{x \rightarrow 0} f(x) = \frac{1^0 + 2^0 + 3^0 + \dots + n^0}{n} = 1$

$$\therefore \lim_{x \rightarrow 0} [f(x)]^{g(x)} = e^{\lim_{x \rightarrow 0} g(x) \{f(x) - 1\}}$$

$$\text{So, } \lim_{x \rightarrow 0} \left[\frac{1^x + 2^x + 3^x + \dots + n^x}{n} \right]^{a/x}$$

$$= e^{\lim_{x \rightarrow 0} \frac{a}{x} \left[\frac{1^x + 2^x + 3^x + \dots + n^x}{n} - 1 \right]}$$

$$= e^{\lim_{x \rightarrow 0} \left\{ \frac{(1^x + 2^x + 3^x + \dots + n^x) - n}{x} \right\} \frac{a}{n}}$$

$$= e^{\frac{a}{n} \lim_{x \rightarrow 0} \left\{ \frac{1^x - 1}{x} + \frac{2^x - 1}{x} + \frac{3^x - 1}{x} + \dots + \frac{n^x - 1}{x} \right\}}$$

$$= e^{\frac{a}{n} [\log 1 + \log 2 + \dots + \log n]}$$

$$= e^{\frac{a}{n} \log n!} = e^{\log (n!)^{a/n}} = (n!)^{a/n}$$

24. (b)

25. (a) $\lim_{x \rightarrow 0} \frac{\sin^{-1} x - \tan^{-1} x}{x^3}$ $\left[\frac{0}{0} \text{ form} \right]$

$$= \lim_{x \rightarrow 0} \frac{\frac{1}{\sqrt{1-x^2}} - \frac{1}{1+x^2}}{3x^2} \quad [\text{applying L'Hospital's rule}]$$

$$= \lim_{x \rightarrow 0} \frac{1+x^2 - \sqrt{1-x^2}}{3x^2(1+x^2)\sqrt{1-x^2}}$$

$$= \lim_{x \rightarrow 0} \frac{2x - \frac{1(-2x)x}{2\sqrt{1-x^2}}}{\left[6x(1+x^2)\sqrt{1-x^2} + 3x^2 \cdot 2x\sqrt{1-x^2} + 3x^2(1+x^2) \cdot \frac{1(-2x)}{2\sqrt{1-x^2}} \right]}$$

$$= \lim_{x \rightarrow 0} \frac{2x + \frac{x}{\sqrt{1-x^2}}}{6x(1+x^2)\sqrt{1-x^2} + 6x^3\sqrt{1-x^2} - \frac{3x^3(1+x^2)}{\sqrt{1-x^2}}}$$

$$\begin{aligned}
 &= \lim_{x \rightarrow 0} \frac{2 + \frac{1}{\sqrt{1-x^2}}}{6(1+x^2)\sqrt{1-x^2} - \frac{3x^2(1+x^2)}{\sqrt{1-x^2}} + 6x^2\sqrt{1-x^2}} \\
 &= \frac{2+1}{6(1+0)\sqrt{1-0+0+0}} = \frac{3}{6} = \frac{1}{2}
 \end{aligned}$$

26. (d) $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{(4^x - 1)^3}{\sin\left(\frac{x}{p}\right) \log\left(1 + \frac{x^2}{3}\right)}$

$$= \lim_{x \rightarrow 0} \frac{4^x - 1}{x} \cdot \frac{\left(\frac{x}{p}\right) p(4^x - 1)^2}{\sin\left(\frac{x}{p}\right) \log\left(1 + \frac{x^2}{3}\right)}$$

$$= (\log 4) \cdot p \lim_{x \rightarrow 0} \left(\frac{4^x - 1}{x} \right)^2 \cdot \frac{x^2}{\log\left(1 + \frac{x^2}{3}\right)} \quad \left[\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

$$= p(\log 4)^3 \cdot \lim_{x \rightarrow 0} \frac{x^2}{\log\left(1 + \frac{x^2}{3}\right)} \quad \left[\frac{0}{0} \text{ form} \right]$$

$$= p(\log 4)^3 \cdot \lim_{x \rightarrow 0} \frac{2x}{\frac{1}{1 + \frac{x^2}{3}} \cdot \frac{2x}{3}} \quad [\text{using L'Hospital's rule}]$$

$$= p(\log 4)^3 \lim_{x \rightarrow 0} (3 + x^2) = 3p(\log 4)^3$$

$$= 12(\log 4)^3 \quad [\text{for continuity at } x = 0]$$

$$\therefore p = 4$$

27. (d) Let $y = \lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3} \right)^{2/x}$

$$\Rightarrow \log y = \lim_{x \rightarrow 0} \frac{2}{x} \log \left(\frac{a^x + b^x + c^x}{3} \right)$$

$$= 2 \lim_{x \rightarrow 0} \frac{\log(a^x + b^x + c^x) - \log 3}{x}$$

$$= 2 \lim_{x \rightarrow 0} \frac{a^x \log a + b^x \log b + c^x \log c}{a^x + b^x + c^x}$$

$$[\text{apply L'Hospital's rule}]$$

$$\Rightarrow \log y = \log(abc)^{2/3} \Rightarrow y = (abc)^{2/3}$$

28. (c) $\lim_{x \rightarrow 0} \frac{ae^x - b \cos x + ce^{-x}}{x \sin x}$

$$\Rightarrow ae^x - b \cos x + c \cdot e^{-x} = 0 \text{ for } x = 0$$

[as denominator is zero and limit of function exists at $x = 0$, hence numerator should be zero at $x = 0$]

$$\therefore a - b + c = 0 \quad \dots(i)$$

$$\therefore 2 = \lim_{x \rightarrow 0} \frac{ae^x - b \cos x + ce^{-x}}{x \sin x} = \lim_{x \rightarrow 0} \frac{ae^x + b \sin x - ce^{-x}}{\sin x + x \cos x}$$

$$= ae^0 + b \sin 0 - ce^{-0} = 0$$

$$\Rightarrow a - c = 0 \quad \dots(ii)$$

Also, $\lim_{x \rightarrow 0} \frac{ae^x + b \cos x + ce^{-x}}{2 \cos x - x \sin x}$ [using L' Hospital's rule]

$$\Rightarrow \frac{a+b+c}{2} = 2$$

$$\Rightarrow a+b+c=4 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$a=1, b=2, c=1$$

$$29. (c) \lim_{n \rightarrow \infty} \frac{an(1+n) - (1+n^2)}{1+n} = \lim_{n \rightarrow \infty} \frac{(a-1)n^2 + an - 1}{n+1} = \infty,$$

if $a-1 \neq 0$ and if $a-1=0$, then $\lim_{n \rightarrow \infty} \frac{an-1}{n+1} = a=b$

$$\Rightarrow a=b=1$$

30. (c) **Hint** Since, $f(x)$ is continuous at $x=0$.

$$\begin{aligned} \text{Therefore, } f(0) &= \lim_{x \rightarrow 0} f(x) \\ &= \lim_{x \rightarrow 0} \frac{(27-2x)^{1/3} - 3}{9 - 3(243+5x)^{1/5}} \quad \left[\frac{0}{0} \text{ form} \right] \end{aligned}$$

[applying L' Hospital's rule]

$$= \lim_{x \rightarrow 0} \frac{\frac{1}{3}(27-2x)^{-2/3}(-2)}{\frac{-3}{5}(243+5x)^{-4/5} \times (5)}$$

31. (b) We want to check the continuity at $x=0$.

$$\begin{aligned} \therefore \text{LHL} &= \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} |-h| \cos\left(\frac{1}{-h}\right) \\ &= \lim_{h \rightarrow 0} h \cos\left(\frac{1}{h}\right) = 0 \times \cos \frac{1}{0} = 0 \end{aligned}$$

[$\because -1 \leq \cos x \leq 1, \forall x \in \mathbb{R}$]

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow 0} f(x) = \lim_{h \rightarrow 0} |0+h| \cos\left(\frac{1}{h}\right) \\ &= \lim_{h \rightarrow 0} |h| \cos\left(\frac{1}{h}\right) = \lim_{h \rightarrow 0} h \cos \frac{1}{h} = 0 \times \cos \frac{1}{0} = 0 \end{aligned}$$

and $f(0) = 0$

Thus, $\text{LHL} = \text{RHL} = f(0) = 0$

Hence, the function is continuous at $x=0$.

32. (d) Given that, the function is continuous.

$$\text{At } x=0, \text{ LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h)$$

$$\begin{aligned} &= \lim_{h \rightarrow 0^-} \frac{\sqrt{1-kh} - \sqrt{1+kh}}{-h} \\ &= \lim_{h \rightarrow 0} \frac{(\sqrt{1-kh} - \sqrt{1+kh})}{-h} \times \frac{(\sqrt{1-kh} + \sqrt{1+kh})}{(\sqrt{1-kh} + \sqrt{1+kh})} \\ &= \lim_{h \rightarrow 0} \frac{(1-kh) - (1+kh)}{-h(\sqrt{1-kh} + \sqrt{1+kh})} = \frac{2k}{2} = k \end{aligned}$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0+h) = \lim_{h \rightarrow 0} \frac{2h+1}{h-2} = \frac{-1}{2}$$

Since, $f(x)$ is continuous, so $k = -\frac{1}{2}$.

$$33. (c) \lim_{x \rightarrow 0^+} f(x) = x^2 \sin \frac{1}{x}, -1 \leq \sin \frac{1}{x} \leq 1 \text{ as } x \rightarrow 0$$

$$\therefore \lim_{x \rightarrow 0^+} f(x) = 0, \lim_{x \rightarrow 0^-} f(x) = 0$$

Hence, $f(x)$ is continuous at $x=0$.

$$34. (d) g(x) = \begin{cases} 1+x, & x < 0 \\ 1-x, & x \geq 0 \end{cases}$$

$$\begin{aligned} \therefore f\{g(x)\} &= \begin{cases} 1+|x-1|, & x < 0 \\ 1+|-x-1|, & x \geq 0 \end{cases} \\ &= \begin{cases} 1+1-x, & x < 0 \\ 1+x+1, & x \geq 0 \end{cases} = \begin{cases} 2-x, & x < 0 \\ 2+x, & x \geq 0 \end{cases} \end{aligned}$$

It is a polynomial function, so it is continuous in everywhere except at $x=0$.

$$\text{Now, LHL} = \lim_{x \rightarrow 0^-} 2-x = 2$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} 2+x = 2$$

$$\text{Also, } f(0) = 2+0 = 2$$

Hence, it is continuous everywhere.

35. (a) Polynomial function is always continuous. So, we have to check the continuity only at $x=-3$ and 3 .

$$\text{Here, } f(x) = \begin{cases} |x|+3, & \text{if } x \leq -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x+2, & \text{if } x \geq 3 \end{cases}$$

For $x < -3$, $f(x) = |x|+3$; $-3 < x < 3$, $f(x) = -2x$ and $x > 3$, $f(x) = 6x+2$ is a polynomial function, so it is continuous in a given interval. So, we have to check the continuity only at $x=-3$ and 3 .

$$\text{At } x=-3, \text{ LHL} = \lim_{x \rightarrow -3^-} f(x) = \lim_{h \rightarrow 0} (|x|+3)$$

$$\therefore = \lim_{h \rightarrow 0} [|-3-h|+3] = \lim_{h \rightarrow 0} (6+h) = 6$$

$$\text{RHL} = \lim_{h \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0^+} (-2x)$$

$$\therefore = \lim_{h \rightarrow 0} -2(-3+h) = \lim_{h \rightarrow 0} (6-2h) = 6$$

$$\text{Also, } f(-3) = |-3|+3 = 6 \quad [\because f(x) = |x|+3]$$

$$\therefore \text{LHL} = \text{RHL} = f(-3)$$

Thus, $f(x)$ is continuous at $x=-3$.

$$\text{At } x=3, \text{ LHL} = \lim_{x \rightarrow 3^-} f(x) = \lim_{h \rightarrow 0} (-2x)$$

$$= \lim_{h \rightarrow 0} -2(3-h) = \lim_{h \rightarrow 0} (-6+2h) = -6$$

$$\text{RHL} = \lim_{x \rightarrow 3^+} f(x) = \lim_{h \rightarrow 0} (6x+2)$$

$$= \lim_{h \rightarrow 0} [6(3+h)+2] = \lim_{h \rightarrow 0} (18+6h+2)$$

$$= \lim_{h \rightarrow 0} (20+6h) = 20 \therefore \text{LHL} \neq \text{RHL}$$

Thus, $f(x)$ is discontinuous at $x=3$.

$$\begin{aligned} 36. (a) \therefore \lim_{x \rightarrow 0} f(x) &= \lim_{x \rightarrow 0} \frac{3x+4 \tan x}{x} \\ &= \lim_{x \rightarrow 0} \left[3 + 4 \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x} \right] = \lim_{x \rightarrow 0} [3+4] = 7 \end{aligned}$$

Since, $f(x)$ is not defined at $x=0$, so it cannot be continuous at $x=0$.

$\therefore$ Defined function should be

$$f(x) = \begin{cases} \frac{3x+4 \tan x}{x}, & x \neq 0 \\ 7, & x = 0 \end{cases}$$

37. (a) Since, x , $\sin^{-1} x$, $\tan^{-1} x$ are continuous functions, so the function f is clearly continuous at each point in its domain except possibly at $x = 0$.

So, for f to be continuous at $x = 0$,

$$f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{2 - \frac{\sin^{-1} x}{x}}{2 + \frac{\tan^{-1} x}{x}} = \frac{1}{3}$$

$$\left[\because \lim_{x \rightarrow 0} \frac{\sin^{-1} x}{x} = 1, \lim_{x \rightarrow 0} \frac{\tan^{-1} x}{x} = 1 \right]$$

38. (d) Here, $f(x) = \begin{cases} \frac{k \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$

$$\therefore \text{LHL} = \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^-} \frac{k \cos x}{\pi - 2x}$$

On putting $x = \frac{\pi}{2} - h$, as $x \rightarrow \frac{\pi}{2}^-$, when $h \rightarrow 0$, we get

$$\text{LHL} = \lim_{h \rightarrow 0} \frac{k \cos \left(\frac{\pi}{2} - h \right)}{\pi - 2 \left(\frac{\pi}{2} - h \right)} = \lim_{h \rightarrow 0} \frac{k \sin h}{2h}$$

$$= \lim_{h \rightarrow 0} \frac{k}{2} \times \frac{\sin h}{h} = \frac{k}{2} \times 1 = \frac{k}{2} \quad \left[\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

and $\text{RHL} = \lim_{x \rightarrow \frac{\pi}{2}^+} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^+} \frac{k \cos x}{\pi - 2x}$

On putting $x = \frac{\pi}{2} + h$, as $x \rightarrow \left(\frac{\pi}{2} \right)^+$, when $h \rightarrow 0$, we get

$$\therefore \text{RHL} = \lim_{h \rightarrow 0} \frac{k \cos \left(\frac{\pi}{2} + h \right)}{\pi - 2 \left(\frac{\pi}{2} + h \right)} = \lim_{h \rightarrow 0} \frac{-k \sin h}{-2h}$$

$$= \lim_{h \rightarrow 0} \frac{k}{2} \times \frac{\sin h}{h} = \frac{k}{2} \times 1 = \frac{k}{2} \quad \left[\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right]$$

Also, $f\left(\frac{\pi}{2}\right) = 3$

Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore \text{LHL} = \text{RHL} = f\left(\frac{\pi}{2}\right) \Rightarrow \frac{k}{2} = 3 \quad \therefore k = 6$$

39. (a) **Hint** For this, we have to prove that $\text{LHL} = \text{RHL}$.

$$\therefore \text{LHL} = \lim_{x \rightarrow a^-} f(x) = \lim_{h \rightarrow 0} f(a - h)$$

$$= \lim_{h \rightarrow 0} |a - h - a| \sin \left[\frac{1}{(a - h - a)} \right]$$

$$[\because -1 \leq \sin x \leq 1, \forall x \in R]$$

$$\text{RHL} = \lim_{x \rightarrow a^+} f(x) = \lim_{h \rightarrow 0} f(a + h)$$

$$= \lim_{h \rightarrow 0} |a + h - a| \sin \left[\frac{1}{(a + h - a)} \right]$$

40. (b) **Hint** Since, $f(x)$ is continuous for $x \in R$.

So, the function is continuous at $x = 0$.

RHL at $x = 0$,

$$= \lim_{h \rightarrow 0} \frac{\sqrt{h+h^2} - \sqrt{h}}{h^{3/2}} = \lim_{h \rightarrow 0} \frac{\sqrt{h} \{\sqrt{h+1} - 1\}}{h\sqrt{h}}$$

$$= \lim_{h \rightarrow 0} \left(\frac{\sqrt{h+1} - 1}{h} \times \frac{\sqrt{h+1} + 1}{\sqrt{h+1} + 1} \right)$$

LHL at $x = 0$,

$$= \lim_{h \rightarrow 0} \frac{\sin(p+1)(-h) + \sin(-h)}{-h}$$

$$= \lim_{h \rightarrow 0} \left[\frac{\sin(p+1)h}{h} + \frac{\sin h}{h} \right]$$

$$= (p+1) + 1 = (p+2)$$

41. (d) If $f(x)$ is continuous at $x = 0$, then

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0) = 0$$

$$\text{So, } \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0 - h) = \lim_{h \rightarrow 0} (-1)^k h^k \sin \left(-\frac{1}{h} \right)$$

$$= - \lim_{h \rightarrow 0} (-1)^k (h)^k \cdot \sin \left(\frac{1}{h} \right) = 0$$

[for $k > 0$ and $-1 \leq \sin x \leq 1$]

and $\lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0 + h)$

$$= \lim_{h \rightarrow 0} h^k \sin \left(\frac{1}{h} \right) = 0$$

[for $k > 0$ and $-1 \leq \sin x \leq 1$]

So, $f(x)$ is continuous at $x = 0$, if $k > 0$.

Hence, $k \in (0, \infty)$.

42. (c) **Hint** Since it is clear that f is continuous everywhere except possibly at $x = 0$, so at $x = 0$ for f to be continuous,

$$f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{(1 + \sin x)^{1/2} - (1 - \sin x)^{1/2}}{x}$$

$$= \lim_{x \rightarrow 0} \frac{(1 + \sin x) - (1 - \sin x)}{x} \cdot \frac{1}{(1 + \sin x)^{1/2} + (1 - \sin x)^{1/2}}$$

43. (c) Since, $f(x)$ is right continuous at $x = 2$.

$$\therefore \lim_{x \rightarrow 2^+} f(x) = f(2) \Rightarrow \lim_{h \rightarrow 0} f(2 + h) = c$$

$$\Rightarrow \lim_{h \rightarrow 0} \left\{ (2 + h)^2 + e^{\frac{1}{2 - (2 + h)}} \right\}^{-1} = c$$

$$\Rightarrow \lim_{h \rightarrow 0} (4 + h^2 + 4h + e^{-1/h})^{-1} = c$$

$$\Rightarrow (4 + 0)^{-1} = c \Rightarrow c = \frac{1}{4}$$

44. (c) Since, $f(x)$ is continuous at $x = 0$.

$$\therefore \lim_{x \rightarrow 0} f(x) = f(0) \Rightarrow \lim_{x \rightarrow 0} \frac{(3^x - 1)^2}{\sin x \cdot \log_e(1 + x)} = f(0)$$

$$\Rightarrow f(0) = \lim_{x \rightarrow 0} \frac{\left(\frac{3^x - 1}{x} \right)^2}{\frac{\sin x}{x} \cdot \log_e(1 + x)} = (\log_e 3)^2$$

45. (b) $\therefore \lim_{x \rightarrow 0} f(x) = f(0)$

Let a be any point.

Now, at $x = a$, $\lim_{x \rightarrow a} f(x) = \lim_{h \rightarrow 0} f(a + h) = \lim_{h \rightarrow 0} f(a) + \lim_{h \rightarrow 0} f(h)$

$$= f(a) + f(0) = f(a + 0) = f(a)$$

$\therefore f(x)$ is continuous at $x = a$, where a is any arbitrary point.

Hence, $f(x)$ is continuous for all x .

46. (a) Here, $f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a + b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases}$

Given that, the function is continuous at $x = 4$.

$$\text{LHL} = \text{RHL} = f(4) \quad \dots(i)$$

Now, $f(4) = a + b \quad \dots(ii)$

$$\text{LHL} = \lim_{x \rightarrow 4^-} f(x) = \lim_{h \rightarrow 0} f(4 - h) = \lim_{h \rightarrow 0} \frac{4 - h - 4}{|4 - h - 4|} + a$$

$$= \lim_{h \rightarrow 0} \frac{-h}{h} + a = a - 1 \quad \dots(iii)$$

$$\text{RHL} = \lim_{x \rightarrow 4^+} f(x) = \lim_{h \rightarrow 0} f(4 + h) = \lim_{h \rightarrow 0} \frac{4 + h - 4}{|4 + h - 4|} + b$$

$$= \lim_{h \rightarrow 0} \frac{h}{h} + b = b + 1 \quad \dots(iv)$$

From Eqs. (i), (ii) and (iii), we get $a + b = a - 1 \Rightarrow b = -1$

From Eqs. (ii) and (iv), $a + b = b + 1 \Rightarrow a = 1$

Thus, $a = 1$ and $b = -1$

47. (a) Given, $f(x) = \frac{\sqrt{2} \cos x - 1}{\cot x - 1}, x \neq \frac{\pi}{4}$

$$\begin{aligned} \text{Therefore, } \lim_{x \rightarrow \pi/4} f(x) &= \lim_{x \rightarrow \pi/4} \frac{\sqrt{2} \cos x - 1}{\cot x - 1} \\ &= \lim_{x \rightarrow \pi/4} \frac{(\sqrt{2} \cos x - 1) \sin x}{\cos x - \sin x} \end{aligned}$$

$$= \lim_{x \rightarrow \pi/4} \frac{(\sqrt{2} \cos x - 1)}{(\sqrt{2} \cos x + 1)} \cdot \frac{(\sqrt{2} \cos x + 1)}{(\cos x - \sin x)} \cdot \frac{(\cos x + \sin x)}{(\cos x + \sin x)} \cdot \sin x$$

$$= \lim_{x \rightarrow \pi/4} \frac{\cos 2x}{\cos 2x} \cdot \left(\frac{\cos x + \sin x}{\sqrt{2} \cos x + 1} \right) \cdot (\sin x)$$

$$= \lim_{x \rightarrow \pi/4} \frac{(\cos x + \sin x)}{\sqrt{2} \cos x + 1} \sin x = \frac{1}{\sqrt{2} \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right)} = \frac{1}{2}$$

$$\text{Thus, } \lim_{x \rightarrow \pi/4} f(x) = \frac{1}{2}$$

If we define $f\left(\frac{\pi}{4}\right) = \frac{1}{2}$, then $f(x)$ will become continuous at

$$x = \frac{\pi}{4}.$$

Hence, for f to be continuous at $x = \frac{\pi}{4}$, $f\left(\frac{\pi}{4}\right) = \frac{1}{2}$.

48. (d)

49. (a) At $x = \frac{\pi}{4}$,

$$\lim_{x \rightarrow \pi/4^-} f(x) = \lim_{x \rightarrow \pi/4^-} (x + a^2 \sqrt{2} \sin x) = a^2 + \frac{\pi}{4}$$

and $\lim_{x \rightarrow \pi/4^+} f(x) = \lim_{x \rightarrow \pi/4^+} (x \cot x + b) = b + \frac{\pi}{4}$

Since, $f(x)$ is continuous at $x = \frac{\pi}{4}$.

$$\therefore a^2 + \frac{\pi}{4} = b + \frac{\pi}{4} \Rightarrow a^2 = b \quad \dots(i)$$

Again at $x = \frac{\pi}{2}$,

$$\lim_{x \rightarrow \pi/2^-} f(x) = \lim_{x \rightarrow \pi/2^-} (b \sin 2x - a \cos 2x) = a$$

and $\lim_{x \rightarrow \pi/2^+} f(x) = \lim_{x \rightarrow \pi/2^+} (x \cot x + b) = b$

Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore a = b \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $(a, b) = (0, 0)$ and $(1, 1)$.

50. (c) Let $g(x) = a \sin x + \sin 2x$ and $h(x) = x^3$

$$\therefore g(0) = 0 \text{ and } h(0) = 0$$

$$\therefore \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{a \cos x + 2 \cos 2x}{3x^2}$$

[using L' Hospital's rule]

Again, $\lim_{x \rightarrow 0} x^2 = 0$ and $\lim_{x \rightarrow 0} f(x)$ exist, hence numerator should also be equal to zero.

$$\therefore a + 2 = 0 \Rightarrow a = -2$$

$$\begin{aligned} \text{So, } \lim_{x \rightarrow 0} f(x) &= \lim_{x \rightarrow 0} \frac{-2 \cos x + 2 \cos 2x}{3x^2} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin x - 4 \sin 2x}{6x} \\ &= \frac{2}{6} - \frac{4}{3} = -1 \quad [\text{using L'Hospital's rule}] \end{aligned}$$

$$\therefore a = -2 \text{ and } f(0) = -1$$

51. (a) $\lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{h^3 + 3h} = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} \cdot \frac{-1}{h^2 + 3}$

$$= f'(1) \cdot \left(\frac{-1}{3} \right) = \frac{53}{3}$$

52. (a) $\lim_{h \rightarrow 0} \frac{f(2h + 2 + h^2) - f(2)}{f(h - h^2 + 1) - f(1)} = \lim_{h \rightarrow 0} \frac{f'(2h + 2 + h^2)(2 + 2h)}{f'(h - h^2 + 1)(1 - 2h)}$

$$= \frac{f'(2) \times 2}{f'(1) \times 1} = \frac{6 \times 2}{4 \times 1} = 3$$

53. (b) $f(x) = \begin{cases} e^x, & x \leq 0 \\ 1 - x, & 0 < x \leq 1 \\ x - 1, & x > 1 \end{cases}$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{1 - h - 1}{h} = -1$$

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{e^{-h} - 1}{-h} = 1$$

So, it is not differentiable at $x = 0$.

Similarly, it is not differentiable at $x = 1$ but it is continuous at $x = 0$ and 1 .

54. (c) Since, $|x - 3| = x - 3$, if $x \geq 3$ and $|x - 3| = -x + 3$, if $x < 3$

$\therefore$ The given function can be defined as

$$f(x) = \begin{cases} \frac{1}{4}x^2 - \frac{3}{2}x + \frac{13}{4}, & x < 1 \\ 3 - x, & 1 \leq x < 3 \\ x - 3, & x \geq 3 \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} \frac{x}{2} - \frac{3}{2}, & x < 1 \\ -1, & 1 \leq x < 3 \\ 1, & x \geq 3 \end{cases}$$

At $x = 1$,

$$\text{LHD} = f'(1) = -1 \text{ and } \text{RHD} = f'(1) = -1$$

55. (a) Let $f(x) = \log x \Rightarrow f'(x) = \frac{1}{x}$

Therefore, given function $= f'(a) + kf'(e) = 1$

$$\Rightarrow \frac{1}{a} + \frac{k}{e} = 1$$

$$\therefore k = e \left(\frac{a-1}{a} \right)$$

$$k = e \left(1 - \frac{1}{a} \right)$$

56. (b) $\text{RHL} = \lim_{h \rightarrow 0} (0+h) e^{-2/h} = \lim_{h \rightarrow 0} \frac{h}{e^{2/h}} = 0$

$$\text{LHL} = \lim_{h \rightarrow 0} (0-h) e^{-\left(\frac{1}{h} - \frac{1}{h}\right)} = 0$$

Hence, $f(x)$ is continuous at $x = 0$.

$$\text{Now, } Rf'(x) = \lim_{h \rightarrow 0} \frac{(0+h) e^{-\left(\frac{1}{h} + \frac{1}{h}\right)} - 0}{h} = \lim_{h \rightarrow 0} e^{-2/h} = \infty$$

$$\text{and } Lf'(x) = \lim_{h \rightarrow 0} \frac{(0-h) e^{-\left(\frac{1}{h} - \frac{1}{h}\right)} - 0}{-h} = \lim_{h \rightarrow 0} e^{-0} = 1$$

$$\therefore Lf'(x) \neq Rf'(x)$$

Hence, $f(x)$ not differentiable at $x = 0$.

57. (b) The given function is

$$f(x) = \begin{cases} 0, & 0 \leq x < 1 \\ 1, & 1 \leq x < 2 \end{cases}$$

$$\text{Now, } \text{LHD} = \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^-} \frac{0 - 1}{x - 1}$$

which does not exist.

$\therefore f$ is not derivable at $x = 1$.

58. (a) Here, the function can be written as

$$f(x) = \begin{cases} \lambda - \mu x + vx^2, & x < 0 \\ \lambda + \mu x + vx^2, & x \geq 0 \end{cases}$$

$$\text{Now, } \text{LHD} = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{\lambda - \mu x + vx^2 - \lambda}{x - 0} = \lim_{x \rightarrow 0^-} \frac{(-\mu + vx)x}{x} = \lim_{x \rightarrow 0^-} -\mu + vx = -\mu$$

$$\text{Also, } \text{RHD} = \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{\lambda + \mu x + vx^2 - \lambda}{x} = \lim_{x \rightarrow 0^+} \frac{(\mu + vx)x}{x} = \lim_{x \rightarrow 0^+} \mu + vx = \mu$$

Thus, $f'(0)$ exists, if $\text{LHD} = \text{RHD}$.

$$\Rightarrow -\mu = \mu \Rightarrow \mu = 0$$

59. (b) Here, we are given that

$$f(x+y) = f(x) \cdot f(y)$$

$$\text{and } f'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 2$$

$$\text{Now, } f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x+0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(x) \cdot f(h) - f(x) \cdot f(0)}{h}$$

[by given condition]

$$= f(x) \cdot \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h}$$

$$= f(x) \times f'(0) = 2f(x) \quad [\because f'(0) = 2]$$

60. (d) The given function is $f(x) = \begin{cases} x, & x \leq 1 \\ x^2 + bx + c, & x > 1 \end{cases}$

Since, $f'(x)$ exists finitely, $\forall x \in R$.

$\therefore f(x)$ is differentiable at $x = 1$.

$$\Rightarrow \text{LHD} = \text{RHD}$$

$$\Rightarrow 2x + b = 1$$

$$\Rightarrow 2 + b = 1$$

[put $x = 1$]

$$\Rightarrow b = -1$$

Also, f is continuous at $x = 1$ as it is differentiable at $x = 1$.

$$\Rightarrow \text{LHL} = \text{RHL} \Rightarrow 1 = 1 + b + c \Rightarrow c = 1$$

61. (d) The given function is $f(x) = |\log_e x|$

$$= \begin{cases} -\log_e x, & \text{for } 0 < x < 1 \\ \log_e x, & \text{for } x \geq 1 \end{cases}$$

Since, f is differentiable, $\forall x > 1$ and $x < 1$

So, check its differentiability at $x = 1$.

$$\begin{aligned} \text{Now, } \text{LHD} &= \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} \\ &= \lim_{x \rightarrow 1^-} \frac{-\log x - \log 1}{x - 1} = \lim_{x \rightarrow 1^-} \frac{-\log x}{x - 1} \\ &= -\lim_{h \rightarrow 0} \frac{\log(1-h)}{-h} = -1 \end{aligned}$$

[using L' Hospital's rule]

$$\begin{aligned}\text{Now, RHD} &= \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^+} \frac{\log x - \log 1}{x - 1} \\ &= \lim_{x \rightarrow 1^+} \frac{\log x}{x - 1} \\ &= \lim_{h \rightarrow 0} \frac{\log(1+h)}{h} = 1 \quad [\text{using L' Hospital's rule}]\end{aligned}$$

$$\Rightarrow \text{RHD} = 1 \Rightarrow \text{LHD} \neq \text{RHD at } x = 1$$

$\therefore f$ is not differentiable at $x = 1$.

62. (d) The given function is $f(x) = |x - 2| + |x| + |x + 2|$

$$= \begin{cases} -(x-2) - x - (x+2) = -3x, & x < -2 \\ -(x-2) - x + (x+2) = -x + 4, & -2 \leq x < 0 \\ -(x-2) + x + (x+2) = x + 4, & 0 \leq x < 2 \\ (x-2) + x + (x+2) = 3x, & x \geq 2 \end{cases}$$

Now, at $x = -2$,

$$\begin{aligned}\text{RHD} &= \lim_{x \rightarrow -2^+} \frac{f(x) - f(-2)}{x + 2} \\ &= \lim_{x \rightarrow -2^+} \frac{-x + 4 - 6}{x + 2} = \lim_{x \rightarrow -2^+} \frac{-(x+2)}{(x+2)} = -1\end{aligned}$$

$$\text{LHD} = \lim_{x \rightarrow -2^-} \frac{f(x) - f(-2)}{x + 2} = \lim_{x \rightarrow -2^-} \frac{-3x - 6}{x + 2} = -3$$

$\therefore \text{LHD} \neq \text{RHD}$

$\therefore f$ is not derivable at $x = -2$.

At $x = 0$,

$$\text{RHD} = \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{x + 4 - 4}{x} = 1$$

$$\text{LHD} = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{-x + 4 - 4}{x} = -1$$

$\therefore \text{RHD} \neq \text{LHD}$

$\therefore f$ is not derivable at $x = 0$.

At $x = 2$,

$$\text{RHD} = \lim_{x \rightarrow 2^+} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^+} \frac{3x - 6}{x - 2} = 3$$

$$\text{LHD} = \lim_{x \rightarrow 2^-} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^-} \frac{x + 4 - 6}{x - 2} = 1$$

$\therefore \text{RHD} \neq \text{LHD}$

$\therefore f$ is not derivable at $x = 2$.

BITSAT Archives

$$\begin{aligned}1. (c) \lim_{x \rightarrow 0} \frac{(1+x)^8 - 1}{(1+x)^2 - 1} \\ = \lim_{x \rightarrow 0} \frac{[(1+x)^4 + 1][(1+x)^2 + 1][(1+x)^2 - 1]}{(1+x)^2 - 1} = 2 \times 2 = 4\end{aligned}$$

$$\begin{aligned}7. (d) \lim_{x \rightarrow 0} \frac{(2+x) \sin(2+x) - 2 \sin 2}{x} &\quad \left[\frac{0}{0} \text{ form} \right] \\ = \lim_{x \rightarrow 0} \frac{\sin(2+x) + (2+x) \cos(2+x)}{1} \\ &= \sin 2 + 2 \cos 2 \quad [\text{using L' Hospital's rule}]\end{aligned}$$

$$\begin{aligned}8. (a) \lim_{x \rightarrow 0} f(x) &= \lim_{x \rightarrow 0} \frac{3x + \tan^2 x}{x} \quad \left[\frac{0}{0} \text{ form} \right] \\ &= \lim_{x \rightarrow 0} \frac{3 + 2 \tan x \sec^2 x}{1} = 3 \quad [\text{using L' Hospital's rule}]\end{aligned}$$

Since, $f(x)$ is continuous at $x = 0$.

$$\therefore f(0) = 3$$

$$9. (a) \text{ Given, } f(x) = \frac{\log(1+ax) - \log(1-bx)}{x}$$

$f(x)$ is continuous at $x = 0$ and $f(0) = k$.

$$\therefore \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\log(1+ax) - \log(1-bx)}{x} \quad \left[\frac{0}{0} \text{ form} \right]$$

$$= \lim_{x \rightarrow 0} \left(\frac{1}{1+ax} \cdot a + \frac{b}{1-bx} \right) = a + b$$

$$\therefore a + b = f(0) = k$$

$$10. (c) \lim_{x \rightarrow 0} \frac{\sin x}{x} = \lim_{x \rightarrow 0} \frac{\cos x}{1} = \cos 0 = 1$$

$$11. (d) \lim_{x \rightarrow 0} \frac{\cos(\sin x) - 1}{x^2} = \lim_{x \rightarrow 0} \frac{-2 \sin^2\left(\frac{\sin x}{2}\right)}{x^2}$$

$$= -2 \lim_{x \rightarrow 0} \frac{\sin^2\left(\frac{\sin x}{2}\right) \cdot \left(\frac{\sin x}{2}\right)^2}{\left(\frac{\sin x}{2}\right)^2 \times x^2} = -2 \cdot (1)^2 \cdot \frac{1}{4} = -\frac{1}{2}$$

$$12. (b) \lim_{x \rightarrow 0} f(x) = f(0) = \lim_{x \rightarrow 0} (1+x)^{1/x} = e$$

$$13. (a) \text{ Given, } f(x) = |x|$$

It is clear from the graph that, $f(x)$ is continuous but non-differentiable at $x = 0$.

$$14. (c) \text{ Let } p = \lim_{x \rightarrow 0} (\operatorname{cosec} x)^{1/\log x} \quad [\infty^0 \text{ form}]$$

$$\Rightarrow \log p = \lim_{x \rightarrow 0} \frac{1}{\log x} (\log \operatorname{cosec} x)$$

$$= \lim_{x \rightarrow 0} \frac{\log (\operatorname{cosec} x)}{\log x} \quad \left[\frac{\infty}{\infty} \text{ form} \right]$$

$$\therefore \log p = \lim_{x \rightarrow 0} \left(\frac{-x \operatorname{cosec} x \cot x}{\operatorname{cosec} x} \right)$$

$$= \lim_{x \rightarrow 0} \left(-\frac{x}{\tan x} \right) = -1 \quad [\text{using L' Hospital's rule}]$$

$$\therefore p = e^{-1} = \frac{1}{e}$$

$$15. (d) \lim_{x \rightarrow \infty} \left(\frac{x+6}{x+1} \right)^{x+4} = \lim_{x \rightarrow \infty} \left(1 + \frac{5}{x+1} \right)^{x+4}$$

$$= \lim_{x \rightarrow \infty} \left\{ \left(1 + \frac{5}{x+1} \right)^{x+1} \right\}^{\frac{x+4}{x+1}} = e^{\lim_{x \rightarrow \infty} \frac{5(x+4)}{(x+1)}} = e^5$$

$$16. (a) \text{ We have, } f(x) = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$$

Clearly, $f(x)$ is differentiable for all $x > 0$ and for all $x < 0$.

So, we check the differentiability at $x = 0$.

Now, RHD at $x = 0$,

$$\text{RHD} = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(0+h)^2 - 0}{h} = \lim_{h \rightarrow 0} \frac{h^2}{h} = \lim_{h \rightarrow 0} h = 0$$

$\therefore$ LHD at $x = 0$,

$$\text{LHD} = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{-(0-h)^2 - 0}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{-h^2}{-h} = \lim_{h \rightarrow 0} h = 0$$

$\therefore$ (LHD at $x = 0$) = (RHD at $x = 0$)

So, $f(x)$ is differentiable for all x i.e. the set of all points where, $f(x)$ is differentiable in $(-\infty, \infty)$ i.e. $\mathbb{R}$.

$$17. (a) \lim_{x \rightarrow 2} \frac{\sqrt{1+\sqrt{2+x}} - \sqrt{3}}{x-2}$$

$$= \lim_{x \rightarrow 2} \frac{(1+\sqrt{2+x}-3)}{(x-2)(\sqrt{1+\sqrt{2+x}} + \sqrt{3})}$$

$$= \lim_{x \rightarrow 2} \frac{x-2}{(x-2)(\sqrt{1+\sqrt{2+x}} + \sqrt{3})(\sqrt{2+x}+2)}$$

$$= \lim_{x \rightarrow 2} \frac{1}{(\sqrt{1+\sqrt{2+x}} + \sqrt{3})(\sqrt{2+x}+2)}$$

$$= \frac{1}{(\sqrt{1+2} + \sqrt{3})(\sqrt{2+2}+2)} = \frac{1}{8\sqrt{3}}$$

$$18. (b) \lim_{x \rightarrow 1} (1-x) \tan\left(\frac{\pi x}{2}\right) \quad [0 \times \infty \text{ form}]$$

$$= \lim_{x \rightarrow 1} \frac{(1-x)}{\cot\left(\frac{\pi x}{2}\right)}$$

$$= \lim_{x \rightarrow 1} \frac{-1}{-\operatorname{cosec}^2\left(\frac{\pi x}{2}\right) \frac{\pi}{2}} \quad [\text{using L'Hospital's rule}]$$

$$= \frac{2}{\pi} \lim_{x \rightarrow 1} \sin^2\left(\frac{\pi x}{2}\right) = \frac{2}{\pi}$$

$$19. (c) \text{ Given that, } f(x) = [x-3] + |x-4|$$

$$\therefore \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^-} ([x-3] + |x-4|)$$

$$= \lim_{h \rightarrow 0} ([3-h-3] + |3-h+4|)$$

$$= \lim_{h \rightarrow 0} ([-h] + 1+h) - 1 + 1 + 0 = 0$$

$$20. (b) \text{ Given that, } f(x) = \begin{cases} \frac{\cos 3x - \cos x}{x^2}, & \text{for } x \neq 0 \\ \lambda, & \text{for } x = 0 \end{cases}$$

$$\text{Now, LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{\cos 3x - \cos x}{x^2}$$

$$= \lim_{h \rightarrow 0} \frac{\cos 3(0-h) - \cos(0-h)}{(0-h)^2}$$

$$= \lim_{h \rightarrow 0} \frac{\cos 3h - \cos h}{h^2}$$

$$= \lim_{h \rightarrow 0} \frac{-3 \sin 3h + \sin h}{2h} \quad [\text{using L'Hospital's rule}]$$

$$= \lim_{h \rightarrow 0} \frac{-9 \cos 3h + \cos h}{2} \quad [\text{using L'Hospital's rule}]$$

$$= \frac{-9 + 1}{2} = -4$$

Since, $f(x)$ is continuous at $x = 0$

$$\therefore \lim_{x \rightarrow 0^-} f(x) = f(0) \Rightarrow -4 = \lambda \Rightarrow \lambda = -4$$

21. (c) Given that, $f(2) = 4$ and $f'(2) = 1$

$$\therefore \lim_{x \rightarrow 2} \frac{xf(2) - 2f(x)}{x - 2}$$

$$= \lim_{x \rightarrow 2} \frac{xf(2) - 2f(2) + 2f(2) - 2f(x)}{x - 2}$$

$$= \lim_{x \rightarrow 2} f(2) - 2 \lim_{x \rightarrow 2} \frac{f(x) - f(2)}{x - 2} = f(2) - 2f'(2) = 4 - 2(1) = 2$$

22. (c) Given that, $\lim_{x \rightarrow \infty} \left[\frac{x^3 + 1}{x^2 + 1} - (ax + b) \right] = 2$

$$\Rightarrow \lim_{x \rightarrow \infty} \left[\frac{x^3(1-a) - bx^2 - ax + (1-b)}{x^2 + 1} \right] = 2$$

$$\Rightarrow \lim_{x \rightarrow \infty} \left[\frac{x(1-a) - b - \frac{a}{x} + \frac{(1-b)}{x^2}}{1 + \frac{1}{x^2}} \right] = 2$$

This limit will exist, if

$$1 - a = 0 \text{ and } b = -2$$

$$\Rightarrow a = 1 \text{ and } b = -2$$

23. (a) Given that, $f(x) = \begin{cases} \frac{1 - \cos x}{x}, & x \neq 0 \\ k, & x = 0 \end{cases}$

$$\text{Now, } \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{1 - \cos x}{x}$$

$$= \lim_{x \rightarrow 0} \frac{2 \sin^2 x / 2}{4(x/2)^2} \cdot x = 0 \text{ and } f(0) = k$$

Since, function is continuous at $x = 0$.

$$\therefore \lim_{x \rightarrow 0} f(x) = f(0) \Rightarrow k = 0$$

24. (a) $\lim_{x \rightarrow 0} \frac{\tan x - \sin x}{x^3} \quad \left[\frac{0}{0} \text{ form} \right]$

$$= \lim_{x \rightarrow 0} \frac{\sec^2 x - \cos x}{3x^2} \quad [\text{using L'Hospital's rule}]$$

$$= \lim_{x \rightarrow 0} \frac{2 \sec^2 x \tan x + \sin x}{6x} \quad [\text{using L'Hospital's rule}]$$

$$\left[\frac{0}{0} \text{ form} \right]$$

$$= \lim_{x \rightarrow 0} \frac{2(\sec^2 x \sec^2 x + 2 \sec x \times \sec x \tan x \tan x) + \cos x}{6}$$

[using L'Hospital's rule]

$$= \frac{2[1 \cdot 1 + 2(0)] + 1}{6} = \frac{3}{6} = \frac{1}{2}$$

$$25. (c) f(x) = \begin{cases} \frac{\sin 5x}{x^2 + 2x}, & x \neq 0 \\ k + \frac{1}{2}, & x = 0 \end{cases} \quad \text{LHL } f(0^-) = \lim_{h \rightarrow 0} f(0 - h)$$

$$= \lim_{h \rightarrow 0} \frac{\sin 5(0 - h)}{(0 - h)^2 + 2(0 - h)} = \lim_{h \rightarrow 0} \frac{\sin(-5h)}{h^2 - 2h}$$

$$= - \lim_{h \rightarrow 0} \frac{\sin 5h}{\frac{1}{5}(h - 2)} = \frac{1}{\frac{1}{5}(-2)} = \frac{5}{2}$$

Since, it is continuous at $x = 0$

$$\therefore \text{LHL} = f(0) \Rightarrow \frac{5}{2} = k + \frac{1}{2} \Rightarrow k = 2$$

26. (c) Given that, $\lim_{x \rightarrow \infty} \left(\frac{x^2 + 1}{x + 1} - \alpha x - \beta \right) = 0$

$$\Rightarrow \lim_{x \rightarrow \infty} \left(\frac{x^2 + 1 - \alpha(x^2 + x) - \beta(x + 1)}{x + 1} \right) = 0$$

Using L'Hospital's rule, we get

$$\lim_{x \rightarrow \infty} \left(\frac{2x - \alpha(2x + 1) - \beta(1)}{1} \right) = 0$$

If this limit is zero, then the function

$$2x - \alpha(2x + 1) - \beta = 0 \text{ or } x(2 - 2\alpha) - (\alpha + \beta) = 0$$

Equating the coefficient of x and constant terms, we get

$$2 - 2\alpha = 0 \text{ and } \alpha + \beta = 0$$

$$\Rightarrow \alpha = 1 \text{ and } \beta = -1$$

27. (d) $\lim_{\theta \rightarrow 0} \frac{40(\tan \theta - 2\theta \tan \theta)}{1 - \cos 2\theta}$

$$= \lim_{\theta \rightarrow 0} \frac{4(\theta \tan \theta - 2\theta^2 \tan \theta)}{1 - \cos 2\theta} \quad [\text{using L'Hospital's rule}]$$

$$= \lim_{\theta \rightarrow 0} \frac{4(\theta \sec^2 \theta + \tan \theta - 4\theta \tan \theta - 2\theta^2 \sec^2 \theta)}{2 \sin 2\theta}$$

Again using L'Hospital's rule,

$$\left[\frac{4(\sec^2 \theta + 2\theta \sec^2 \theta \tan \theta + \sec^2 \theta - 4 \tan \theta - 4\theta \sec^2 \theta - 4\theta \sec^2 \theta - 4\theta^2 \sec^2 \theta \tan \theta)}{4 \cos 2\theta} \right]$$

$$= \frac{4(1 + 0 + 1)}{4} = 2$$

28. (d) Given that, $f(x) = \begin{cases} 1, & x < 0 \\ 1 + \sin x, & 0 \leq x \leq \pi/2 \end{cases}$

At $x = 0$,

$$\text{LHD} = \lim_{h \rightarrow 0} \frac{f(0 - h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{1 - 1}{-h} = 0$$

$$\text{RHD} = \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{1 + \sin(0 + h) - 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin h}{h} = 1$$

$\therefore \text{LHD} \neq \text{RHD}$

$\therefore f'(x)$ does not exist at $x = 0$.

17

Differential Coefficients

Derivative (Differential Coefficient)

The rate of change of a quantity y with respect to another quantity x is called the derivative or differential coefficient of y with respect to x . The process of finding derivative of a function is called **differentiation**.

Some Standard Differentiations

1. Differentiation of Algebraic Functions

$$(i) \frac{d}{dx} x^n = nx^{n-1}$$

$$(ii) \frac{d}{dx} (\sqrt{x}) = \frac{1}{2\sqrt{x}}$$

$$(iii) \frac{d}{dx} \left(\frac{1}{x^n} \right) = -\frac{n}{x^{n+1}}$$

2. Differentiation of Trigonometric Functions

$$(i) \frac{d}{dx} (\sin x) = \cos x$$

$$(ii) \frac{d}{dx} (\cos x) = -\sin x$$

$$(iii) \frac{d}{dx} (\tan x) = \sec^2 x$$

$$(iv) \frac{d}{dx} (\sec x) = \sec x \tan x$$

$$(v) \frac{d}{dx} (\cot x) = -\operatorname{cosec}^2 x$$

$$(vi) \frac{d}{dx} (\operatorname{cosec} x) = -\operatorname{cosec} x \cot x$$

3. Differentiation of Logarithmic and Exponential Functions

$$(i) \frac{d}{dx} (\log x) = \frac{1}{x}, \text{ for } x > 0$$

$$(ii) \frac{d}{dx} (e^x) = e^x$$

$$(iii) \frac{d}{dx} (a^x) = a^x \log a, \text{ for } a > 0 \quad (iv) \frac{d}{dx} (\log_a x) = \frac{1}{x \log a}, \text{ for } x > 0, a > 0, a \neq 1$$

4. Differentiation of Inverse Trigonometric Functions

Sometimes the given function can be deduced with the help of inverse trigonometrical substitution and then to find the differential coefficient is very easy.

- (i) $\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}, \text{ for } -1 < x < 1$
- (ii) $\frac{d}{dx}(\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}, \text{ for } -1 < x < 1$
- (iii) $\frac{d}{dx}(\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2-1}}, \text{ for } |x| > 1$
- (iv) $\frac{d}{dx}(\operatorname{cosec}^{-1} x) = -\frac{1}{|x|\sqrt{x^2-1}}, \text{ for } |x| > 1$
- (v) $\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}, \text{ for } x \in R$
- (vi) $\frac{d}{dx}(\cot^{-1} x) = -\frac{1}{1+x^2}, \text{ for } x \in R$

5. Differentiation using Substitution

In order to find differential coefficients of complicated expression involving inverse trigonometric functions, some substitutions are very helpful, which are listed below:

S. No.	Function	Substitution
(i)	$\sqrt{a^2 - x^2}$	$x = a \sin \theta \text{ or } a \cos \theta$
(ii)	$\sqrt{x^2 - a^2}$	$x = a \sec \theta \text{ or } a \operatorname{cosec} \theta$
(iii)	$\sqrt{\frac{a^2 - x^2}{a^2 + x^2}}$	$x^2 = a^2 \cos 2\theta$
(iv)	$\sqrt{\frac{x}{a+x}}$	$x = a \tan^2 \theta$
(v)	$\sqrt{(x-a)(x-b)}$	$x = a \sec^2 \theta - b \tan^2 \theta$
(vi)	$\sqrt{x^2 + a^2}$	$x = a \tan \theta \text{ or } a \cot \theta$
(vii)	$\sqrt{\frac{a-x}{a+x}}$	$x = a \cos 2\theta$
(viii)	$\sqrt{ax - x^2}$	$x = a \sin^2 \theta$
(ix)	$\sqrt{\frac{x}{a-x}}$	$x = a \sin^2 \theta$
(x)	$\sqrt{(x-a)(b-x)}$	$x = a \cos^2 \theta + b \sin^2 \theta$

Differentiation of Implicit Functions

If the relation between the variables x and y are given by an equation containing both the variables and this equation is not immediately solvable for y , then y is called an implicit function of x . Implicit functions are given by $f(x, y) = 0$. To find the differentiation of implicit function, we differentiate each term w.r.t. x considering y as a function of x and then collect the terms of dy/dx together on left hand side and remaining terms on right hand side and find dy/dx .

Algebra of Differentiation

Algebra of differentiation is defined in following ways:

1. Differentiation of the Sum of Two Functions

Let $f(x)$ and $g(x)$ be two real valued functions. Then,
 $[f(x) + g(x)]' = f'(x) + g'(x)$

2. Differentiation of the Difference of Two Functions

Let $f(x)$ and $g(x)$ be two real valued functions. Then,
 $[f(x) - g(x)]' = f'(x) - g'(x)$

3. Differentiation of the Product of Two Functions

Let $f(x)$ and $g(x)$ be two real valued functions. Then,
 $[f(x) \cdot g(x)]' = f'(x) \cdot g(x) + f(x) \cdot g'(x)$

NOTE If three functions are given, then

$$\frac{d}{dx}[f(x) \cdot g(x) \cdot h(x)] = f(x) \cdot g(x) \cdot h'(x) + f(x) \cdot g'(x) \cdot h(x) + f'(x) \cdot g(x) \cdot h(x) = \frac{(fg)'h + (gh)'f + (hf)'g}{2}$$

4. Differentiation of the Quotient of Two Functions

Let $f(x)$ and $g(x)$ be two real valued functions. Then,

$$\left[\frac{f(x)}{g(x)}\right]' = \frac{f'(x) \cdot g(x) - g'(x) \cdot f(x)}{[g(x)]^2}, \text{ provided } g(x) \neq 0$$

while applying the quotient rule, think twice and check whether the given function could be simplified prior to differentiation.

5. Chain/Composite Rule

If $y = f\{g(x)\}$, then $\frac{dy}{dx} = f'\{g(x)\}g'(x)$

Derivative of Function in Parametric Form

A relation expressed between two variables x and y in the form $x = f(t)$, $y = g(t)$ is said to be parametric form, where t is a parameter. The derivative dy/dx of such function is given by

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{g'(t)}{f'(t)}$$

provided $f'(t) \neq 0$.

Logarithmic Differentiation

When a function consists of product or quotient of number of functions, then we take the logarithm and then differentiate.

The functions which can be evaluated by using this method are of following types

$$(i) y = \{f_1(x)\}^{\{f_2(x)\}} \quad (ii) y = f_1(x), f_2(x), f_3(x), \dots$$

$$(iii) y = \frac{f_1(x) \cdot f_2(x) \cdot f_3(x) \dots}{\phi_1(x) \cdot \phi_2(x) \cdot \phi_3(x) \dots}$$

NOTE If $y = \{f(x)\}^{g(x)}$, then $\frac{dy}{dx} = \text{Differentiation of } \{f(x)\}^{g(x)} \text{ w.r.t. } x$
 [taking $g(x)$ as a constant] + Differentiation of $\{f(x)\}^{g(x)}$ w.r.t. x
 [taking $f(x)$ as a constant]

$$\frac{dy}{dx} = g(x) \cdot \{f(x)\}^{g(x)-1} \cdot \frac{d}{dx} f(x) + \{f(x)\}^{g(x)} \cdot \log f(x) \cdot \frac{d}{dx} g(x)$$

Differentiation of a Function of x with Respect to Another Function of x

If $y = f(x)$ and $z = g(x)$

$$\Rightarrow \frac{dy}{dz} = \frac{dy/dx}{dz/dx} = \frac{f'(x)}{g'(x)}$$

Differentiation of a Determinant

$$\text{If } y = \begin{vmatrix} p & q & r \\ u & v & w \\ l & m & n \end{vmatrix}, \text{ then}$$

$$\frac{dy}{dx} = \begin{vmatrix} \frac{dp}{dx} & \frac{dq}{dx} & \frac{dr}{dx} \\ u & v & w \\ l & m & n \end{vmatrix} + \begin{vmatrix} p & q & r \\ \frac{du}{dx} & \frac{dv}{dx} & \frac{dw}{dx} \\ l & m & n \end{vmatrix} + \begin{vmatrix} p & q & r \\ u & v & w \\ \frac{dl}{dx} & \frac{dm}{dx} & \frac{dn}{dx} \end{vmatrix}$$

Derivative of Order Two

For given $y = f(x)$, the process of finding its higher derivatives is called successive differentiation. The derivative of order two is denoted by $\frac{d^2y}{dx^2}$ or y_2 or y'' and is obtained by differentiating dy/dx again w.r.t. x or differentiating $y = f(x)$ twice w.r.t. x .

NOTE • The derivative of order three is obtained by differentiating $\frac{d^2y}{dx^2}$ again w.r.t. x and it is denoted by $\frac{d^3y}{dx^3}$ or y_3 or y''' .
 • In order to find second order derivative of parametric function, we can also use the following formulae

$$\text{Let } x = \phi(t), y = \psi(t)$$

$$\begin{aligned} \text{Then, } \frac{d^2y}{dx^2} &= \frac{d}{dx} \left(\frac{dy}{dx} \right) \\ &= \frac{d}{dx} \left(\frac{\psi'(t)}{\phi'(t)} \right) \\ &= \frac{\frac{d}{dt} \left(\frac{\psi'(t)}{\phi'(t)} \right)}{\frac{dx}{dt}} \end{aligned}$$

Practice Exercise

- If $f(x)$ is an odd differentiable function defined on $(-\infty, \infty)$ such that $f'(3) = 2$, then $f'(-3)$ equals
 a. 0 b. 1 c. 2 d. 4
- If $x^2 + y^2 = t - \frac{1}{t}$, $x^4 + y^4 = t^2 + \frac{1}{t^2}$, then $x^3y \frac{dy}{dx}$ is equal to
 a. 1 b. 2 c. 3 d. 4
- If $f(x) = |\cos x|$, then $f'\left(\frac{3\pi}{4}\right)$ is equal to
 a. $\frac{1}{\sqrt{2}}$ b. $\sqrt{2}$ c. $\frac{1}{2}$ d. $2\sqrt{2}$
- If $f(x) = |\cos x - \sin x|$, then $f'\left(\frac{\pi}{2}\right)$ is equal to
 a. 1 b. -1 c. 0 d. None
- If $f'(x) = \phi(x)$ and $\phi'(x) = f(x)$ for all x . Also, $f(3) = 5$ and $f'(3) = 4$. Then, the value of $[f(3)]^2 - [\phi(3)]^2$ is
 a. 0 b. 9
 c. 41 d. None of these
- If $f(x) = x^n$, then the value of $f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!}$ is
 a. 2^n b. 0
 c. 2^{n-1} d. None of these
- Let $f(x) = x^2 + x g'(1) + g''(2)$ and $g(x) = x^2 + x f'(2) + f''(3)$, then
 a. $f'(1) = 4 - f'(2)$ b. $g'(2) = 8 - g'(1)$
 c. $g''(2) + f''(3) = 4$ d. None of these

8. If $2^x + 2^y = 2^{x+y}$, then $\frac{dy}{dx}$ is equal to
 a. $\frac{2^x + 2^y}{2^x - 2^y}$ b. $\frac{2^x + 2^y}{1 + 2^{x+y}}$
 c. $2^{x-y} \left(\frac{2^y - 1}{1 - 2^x} \right)$ d. $\frac{2^{x+y} - 2^x}{2^y}$
9. The solution set of $f'(x) > g'(x)$, where $f(x) = \frac{1}{2}(5)^{2x+1}$ and $g(x) = 5^x + 4x \log_e 5$, is
 a. $(1, \infty)$ b. $(0, 1)$
 c. $(\infty, 0)$ d. $(0, \infty)$
10. If $y = \sec^{-1} \left(\frac{\sqrt{x} + 1}{\sqrt{x} - 1} \right) + \sin^{-1} \left(\frac{\sqrt{x} - 1}{\sqrt{x} + 1} \right)$, then $\frac{dy}{dx}$ is equal to
 a. 0 b. $\frac{1}{\sqrt{x} + 1}$ c. 1 d. 3
11. If $y = \tan^{-1} \left(\frac{4x}{1 + 5x^2} \right) + \tan^{-1} \left(\frac{2 + 3x}{3 - 2x} \right)$, then $\frac{dy}{dx}$ is equal to
 a. $\frac{1}{1 + x^2}$ b. $\frac{5}{1 + 25x^2}$ c. 1 d. 2
12. Let $g(x)$ be the inverse of the function $f(x)$ and $f'(x) = \frac{1}{1 + x^3}$, then $g'(x)$ is equal to
 a. $\frac{1}{1 + [g(x)]^3}$ b. $\frac{1}{1 + [f(x)]^3}$
 c. $1 + [g(x)]^3$ d. $1 + [f(x)]^3$
13. If $f(x) = e^x g(x)$, $g(0) = 2$, $g'(0) = 1$, then $f'(0)$ equals
 a. 1 b. 3 c. 2 d. 0
14. If $y = \log x \cdot e^{(\tan x + x^2)}$, then $\frac{dy}{dx}$ is equal to
 a. $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + x) \log x \right]$
 b. $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x - x) \log x \right]$
 c. $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + 2x) \log x \right]$
 d. $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x - 2x) \log x \right]$
15. If $f(x) = \cos x \cdot \cos 2x \cdot \cos 4x \cdot \cos 8x \cdot \cos 16x$, then $f' \left(\frac{\pi}{4} \right)$ is equal to
 a. $\sqrt{2}$ b. $\frac{1}{\sqrt{2}}$ c. 1 d. $\frac{\sqrt{3}}{2}$
16. The derivative of $y = (1-x)(2-x) \dots (n-x)$ at $x = 1$ is
 a. 0 b. $(-1)(n-1)!$
 c. $n! - 1$ d. $(-1)^{n-1}(n-1)!$
17. If f and g are differentiable functions satisfying $g'(a) = 2, g(a) = b$ and $f \circ g = I$ (identity function). Then, $f'(b)$ is equal to
 a. $\frac{1}{2}$ b. 2 c. $\frac{2}{3}$ d. None
18. If $f(x) = \sqrt{1 + \cos^2(x^2)}$, then $f' \left(\frac{\sqrt{\pi}}{2} \right)$ is equal to
 a. $\sqrt{\pi}/6$ b. $-\sqrt{\pi}/6$ c. $1/\sqrt{6}$ d. $\pi/\sqrt{6}$
19. If $y = (1-x)(1+x^2)(1+x^4) \dots (1+x^{2^n})$, then $\frac{dy}{dx}$ at $x = 0$ is equal to
 a. -1 b. $\frac{1}{(1+x)^2}$ c. $\frac{x}{(1+x^2)}$ d. $\frac{x}{(1-x)^2}$
20. If $f(x) = \frac{x^2 - x}{x^2 + 2x}$, where $x \neq 0, -2$, then $\frac{d}{dx} [f^{-1}(x)]$ (wherever it is defined) is equal to
 a. $\frac{-1}{(1-x)^2}$ b. $\frac{3}{(1-x)^2}$ c. $\frac{1}{(1-x)^2}$ d. $\frac{-3}{(1-x)^2}$
21. If $y = \sin[\cos(x^2)]$, then $\frac{dy}{dx}$ is equal to
 a. $-2x \sin x^2 \cdot \cos(\cos x^2)$ b. $-2x \sin x^2 \cdot \cos x^2$
 c. $2x^2 \sin x^2 \cdot \cos x^2$ d. None of these
22. If $F(x) = f(x) \cdot g(x)$ and $f'(x) \cdot g'(x) = c$, then
 a. $F' = c \left[\frac{f}{f'} + \frac{g}{g'} \right]$ b. $F' = c \left[\frac{f}{f'} - \frac{g}{g'} \right]$
 c. $\frac{F''}{F} = \frac{f''}{f} + \frac{g''}{g} + \frac{2c}{fg}$ d. None of these
23. If $y \cos x + x \cos y = \pi$, then $\frac{dy}{dx}$ is equal to
 a. $\frac{y \sin x - \cos y}{\cos x - x \sin y}$ b. $\frac{\cos y - y \sin x}{x \sin y + \cos x}$
 c. $\frac{y \sin x + \cos y}{\cos x - x \sin y}$ d. $\frac{y \sin x + \cos y}{\cos x + x \sin y}$
24. If $f: (-1, 1) \rightarrow \mathbb{R}$ is a differentiable function with $f(0) = -1$ and $f'(0) = 1$. Let $g(x) = [f(2f(x) + 2)]^2$, then $g'(0)$ is equal to
 a. 4 b. -4 c. 0 d. -2
25. If $y = \frac{a^{\cos^{-1} x}}{1 + a^{\cos^{-1} x}}$ and $z = a^{\cos^{-1} x}$, then $\frac{dy}{dz}$ is equal to
 a. $-\frac{1}{1 + a^{\cos^{-1} x}}$ b. $\frac{1}{1 + a^{\cos^{-1} x}}$
 c. $\frac{1}{(1 + a^{\cos^{-1} x})^2}$ d. None of these
26. If $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$, then $\frac{dy}{dx}$ is equal to
 a. $\sqrt{\frac{1-x^2}{1-y^2}}$ b. $\sqrt{\frac{1-y^2}{1-x^2}}$ c. $\sqrt{\frac{x^2-1}{1-y^2}}$ d. $\sqrt{\frac{y^2-1}{1-x^2}}$

27. If $y = \sin^{-1}(x\sqrt{1-x} + \sqrt{x}\sqrt{1-x^2})$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{-2x}{\sqrt{1-x^2}} + \frac{1}{2\sqrt{x-x^2}}$ b. $\frac{-1}{\sqrt{1-x^2}} - \frac{1}{2\sqrt{x-x^2}}$
 c. $\frac{1}{\sqrt{1-x^2}} + \frac{1}{2\sqrt{x-x^2}}$ d. None of these

28. If $y = \sec(\tan^{-1} x)$, then $\frac{dy}{dx}$ at $x = 1$ is equal to

- a. $\frac{1}{\sqrt{2}}$ b. $\frac{1}{2}$ c. 1 d. $\sqrt{2}$

29. If $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$; $-1 \leq x \leq 1$, then $\frac{dy}{dx}$ is

- a. 0 b. $\frac{\pi}{2}$ c. 1 d. 4

30. If $x = \frac{2t}{1+t^2}$ and $y = \frac{1-t^2}{1+t^2}$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{2t}{t^2+1}$ b. $\frac{2t}{t^2-1}$ c. $\frac{2t}{1-t^2}$ d. None

31. If $x = a \cos t \sqrt{\cos 2t}$ and $y = a \sin t \sqrt{\cos 2t}$

(where, $a > 0$), then $\left| \frac{1 + \left(\frac{dy}{dx}\right)^2}{\frac{d^2y}{dx^2}} \right|^{\frac{3}{2}}$ at $\frac{\pi}{6}$ is given by

- a. $\frac{a}{3}$ b. $a\sqrt{2}$ c. $\frac{\sqrt{2}}{3a}$ d. $\frac{\sqrt{2}a}{3}$

32. If $x = a(\theta + \sin \theta)$ and $y = a(1 - \cos \theta)$, then $\frac{dy}{dx}$ is equal to

- a. $\tan \frac{\theta}{2}$ b. $\cot \frac{\theta}{2}$ c. $\tan \theta$ d. $\cot \theta$

33. If $x = e^{-t^2}$ and $y = \tan^{-1}(2t + 1)$, then $\frac{dy}{dx}$ equals

- a. $\frac{e^{t^2}}{2t(t^2 + 2t + 1)}$ b. $\frac{-e^{t^2}}{2t(2t^2 + 2t + 1)}$
 c. $\frac{e^{-t^2}}{2t(t^2 + 2t + 1)}$ d. None of these

34. If $\sqrt{(x^2 + y^2)} = ae^{\tan^{-1}(y/x)}$, $a > 0$, then $y''(0)$ equals

- a. $\frac{a}{2}e^{\pi/2}$ b. $ae^{\pi/2}$ c. $\frac{-2}{a}e^{-\pi/2}$ d. $\frac{a}{2}e^{-\pi/2}$

35. The expression of $\frac{dy}{dx}$ of the function $y = a^{x^{a^x}}$ equals

- a. $\frac{y^2}{x(1-y \log x)}$ b. $\frac{y^2 \log y}{x(1-y \log x)}$
 c. $\frac{y^2 \log y}{x(1-y \log x \log y)}$ d. $\frac{y^2 \log y}{x(1+y \log x \log y)}$

36. Derivative of $(\sin x)^x + \sin^{-1} \sqrt{x}$ with respect to x is

- a. $(x \cot x + \log \sin x) + \frac{1}{2\sqrt{x-x^2}}$
 b. $(x \cot x + \log \sin x) + \frac{1}{\sqrt{x-x^2}}$
 c. $(\sin x)(x \cot x + \log x) + \frac{1}{\sqrt{x-x^2}}$
 d. $(\sin x)^x(x \cot x + \log \sin x) + \frac{1}{2\sqrt{x-x^2}}$

37. If $x^m y^n = (x+y)^{m+n}$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{x+y}{xy}$ b. xy c. $\frac{x}{y}$ d. $\frac{y}{x}$

38. Let $y = \sqrt{x + \sqrt{x + \sqrt{x + \dots}}}$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{1}{2y-1}$ b. $\frac{y}{2x+y}$ c. $\frac{1}{\sqrt{1+4x}}$ d. All

39. Let y be an implicit function of x defined by $x^{2x} - 2x^x \cot y - 1 = 0$. Then, $y'(1)$ equals

- a. -1 b. 1 c. $\log 2$ d. $-\log 2$

40. The derivative of $\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right)$ with respect to

$\tan^{-1}\left(2x \frac{\sqrt{1-x^2}}{1-2x^2}\right)$ at $x = 0$ is

- a. $1/8$ b. $1/4$ c. $1/2$ d. 1

41. If $f(x) = \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix}$, then $f'(\theta)$ is

- a. zero b. -1
 c. independent of θ d. None of these

42. If $f(x) = \begin{vmatrix} x^3 & \sin x & \cos x \\ 6 & -1 & 0 \\ P & P^2 & P^3 \end{vmatrix}$, where P is a constant.

Then, $\frac{d^3}{dx^3} \{f(x)\}$ at $x = 0$ is equal to

- a. P b. $P + P^2$
 c. $P + P^3$ d. independent of P

43. If $y = ae^{-kt} \cos(pt + c)$ and $\frac{d^2y}{dt^2} + 2k \frac{dy}{dt} + n^2y = 0$, then n^2 equals

- a. $p^2 - k^2$ b. p^2 c. k^2 d. $p^2 + k^2$

44. If $\sqrt{x+y} + \sqrt{y-x} = c$, then $\frac{d^2y}{dx^2}$ equals

- a. $2/c$ b. $-2/c^2$ c. $2/c^2$ d. None

BITSAT Archives

1. If x is measured in degree, then $\frac{d}{dx}(\cos x)$ is equal to [2012]
 - a. $-\sin x$
 - b. $-\frac{180}{\pi} \sin x$
 - c. $-\frac{\pi}{180} \sin x$
 - d. $\sin x$
2. $\left(\frac{d}{dx}\right)[\log(\sec x - \tan x)]$ is equal to [2012]
 - a. $-\sec x$
 - b. $\sec x + \tan x$
 - c. $\sec x$
 - d. $\sec x - \tan x$
3. If $x = \cos^3 \theta$ and $y = \sin^3 \theta$, then $1 + \left(\frac{dy}{dx}\right)^2$ is equal to [2012]
 - a. $\tan^2 \theta$
 - b. $\cot^2 \theta$
 - c. $\sec^2 \theta$
 - d. $\operatorname{cosec}^2 \theta$
4. If $x = at^2$, $y = 2at$, then $\frac{d^2y}{dx^2}$ is equal to [2012]
 - a. $-\frac{1}{t^2}$
 - b. $-\frac{1}{2at^3}$
 - c. $\frac{1}{t^2}$
 - d. $-\frac{a}{2t^3}$
5. If $\Delta_1 = \begin{vmatrix} x & a & b \\ b & x & a \\ a & b & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$ are the given determinants, then [2012]
 - a. $\Delta_1 = 3(\Delta_2)^2$
 - b. $\left(\frac{d}{dx}\right)(\Delta_1) = 3\Delta_2$
 - c. $\left(\frac{d}{dx}\right)(\Delta_1) = 3(\Delta_2)^2$
 - d. $\Delta_1 = 3(\Delta_2)^{3/2}$
6. $\frac{d}{dx}(x^x)$ is equal to [2011]
 - a. $x^x \log(e/x)$
 - b. $x^x \log ex$
 - c. $\log ex$
 - d. $x^x \log x$
7. If $y^2 = P(x)$ is a cubic polynomial, then $2 \frac{d}{dx} \left(y^3 \frac{d^2y}{dx^2} \right)$ is equal to [2010]
 - a. $P'''(x) P'(x)$
 - b. $P''(x) P'''(x)$
 - c. $P(x) P'''(x)$
 - d. constant
8. If $f(x) = (1-x)^n$, then the value of $f(0) + f'(0) + \frac{f''(0)}{2!} + \dots + \frac{f^n(0)}{n!}$ is equal to [2009]
 - a. 2^n
 - b. 0
 - c. 2^{n-1}
 - d. 1
9. If $f(x) = \log_x(\ln x)$, then $f'(x)$ at $x = e$ is [2009]
 - a. $1/e$
 - b. e
 - c. $-1/e$
 - d. 0
10. Let $f(x) = 2^{2x-1}$ and $\phi(x) = -2^x + 2x \log 2$. If $f'(x) > \phi'(x)$, then [2009]
 - a. $0 < x < 1$
 - b. $0 \leq x < 1$
 - c. $x > 0$
 - d. $x \geq 0$
11. If $y = \sin^{-1}\left(\frac{5x + 12\sqrt{1-x^2}}{13}\right)$, then $\frac{dy}{dx}$ is equal to [2009]
 - a. $\frac{1}{\sqrt{1-x^2}}$
 - b. $-\frac{1}{\sqrt{1-x^2}}$
 - c. $\frac{3}{\sqrt{1-x^2}}$
 - d. $\sqrt{1-x^2}$
12. If $x = a \left\{ \cos \theta + \log \tan\left(\frac{\theta}{2}\right) \right\}$ and $y = a \sin \theta$, then $\frac{dy}{dx}$ is equal to [2008]
 - a. $\cot \theta$
 - b. $\tan \theta$
 - c. $\sin \theta$
 - d. $\cos \theta$
13. The derivative of $\sin^{-1}\left(\frac{2x}{1+x^2}\right)$ with respect to $\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ is [2007]
 - a. -1
 - b. 1
 - c. 2
 - d. 4
14. If $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2}$, then $\frac{dy}{dx}$ is equal to [2007]
 - a. $\frac{x}{y}$
 - b. $-\frac{x}{y}$
 - c. $\frac{y}{x}$
 - d. $-\frac{y}{x}$
15. If $y = \tan^{-1} \frac{\sqrt{1+x^2} - \sqrt{1-x^2}}{\sqrt{1+x^2} + \sqrt{1-x^2}}$, then $\frac{dy}{dx}$ is equal to [2006]
 - a. $\frac{x^2}{\sqrt{1-x^4}}$
 - b. $\frac{x^2}{\sqrt{1+x^4}}$
 - c. $\frac{x}{\sqrt{1+x^4}}$
 - d. $\frac{x}{\sqrt{1-x^4}}$
16. If $x = \sin t$, $y = \cos pt$, then [2006]
 - a. $(1-x^2)y_2 + xy_1 + p^2y = 0$
 - b. $(1-x^2)y_2 + xy_1 - p^2y = 0$
 - c. $(1+x^2)y_2 - xy_1 + p^2y = 0$
 - d. $(1-x^2)y_2 - xy_1 + p^2y = 0$
17. If $r = [2\phi + \cos^2(2\phi + \pi/4)]^{1/2}$, then what is the value of the derivative of $dr/d\phi$ at $\phi = \pi/4$? [2005]
 - a. $2\left(\frac{1}{\pi+1}\right)^{1/2}$
 - b. $2\left(\frac{2}{\pi+1}\right)^2$
 - c. $\left(\frac{2}{\pi+1}\right)^{1/2}$
 - d. $2\left(\frac{2}{\pi+1}\right)^{1/2}$

Answer with Solutions

Practice Exercise

1. (c) Since, $f(x)$ is odd.

$$\begin{aligned}\therefore f(-x) &= -f(x) \\ \therefore f'(-x)(-1) &= -f'(x) \\ \Rightarrow f'(-x) &= f'(x) \Rightarrow f'(-3) = f'(3) = 2\end{aligned}$$

2. (a) $x^4 + y^4 = \left(t - \frac{1}{t}\right)^2 + 2 = (x^2 + y^2)^2 + 2$

$$\Rightarrow x^2 y^2 = -1 \Rightarrow y^2 = -\frac{1}{x^2}$$

On differentiating, we get

$$2y \frac{dy}{dx} = \frac{2}{x^3} \Rightarrow x^3 y \frac{dy}{dx} = 1$$

3. (a) When $\frac{\pi}{2} < x < \pi$, $\cos x < 0$

So that, $|\cos x| = -\cos x$ i.e. $f(x) = -\cos x$, $f'(x) = \sin x$

Hence, $f'\left(\frac{3\pi}{4}\right) = \sin\left(\frac{3\pi}{4}\right) = \frac{1}{\sqrt{2}}$

4. (a) When $0 < x < \frac{\pi}{4}$, $\cos x > \sin x$

$$\therefore \cos x - \sin x > 0$$

Also, when $\frac{\pi}{4} < x < \pi$, $\cos x < \sin x$

When $\frac{\pi}{4} < x < \pi$, $\cos x - \sin x < 0$

$$\therefore |\cos x - \sin x| = -(\cos x - \sin x), \text{ when } \frac{\pi}{4} < x < \pi$$

$$\Rightarrow f'(x) = \sin x + \cos x$$

$$\Rightarrow f'\left(\frac{\pi}{2}\right) = \sin \frac{\pi}{2} + \cos \frac{\pi}{2} = 1 + 0 = 1$$

5. (b) $\frac{d}{dx} \{[f(x)]^2 - [\phi(x)]^2\} = 2[f(x) \cdot f'(x) - \phi(x) \cdot \phi'(x)]$

$$= 2[f(x) \cdot \phi(x) - \phi(x) \cdot f(x)]$$

$$= 0 \quad [\because f'(x) = \phi(x) \text{ and } \phi'(x) = f(x)]$$

$$\Rightarrow [f(x)]^2 - [\phi(x)]^2 = \text{Constant}$$

$$\therefore [f(3)]^2 - [\phi(3)]^2 = [f(3)]^2 - [f'(3)]^2 = 25 - 16 = 9$$

6. (b) We have, $f(x) = x^n \Rightarrow f(1) = 1 = {}^nC_0$

$$\frac{f'(1)}{1!} = \frac{n}{1!} = {}^nC_1$$

$$\frac{f''(1)}{2!} = \frac{n(n-1)}{2!} = {}^nC_2$$

$$\frac{f'''(1)}{3!} = \frac{n(n-1)(n-2)}{3!} = {}^nC_3$$

$$\vdots$$

$$\frac{f^n(1)}{n!} = \frac{n!}{n!} = {}^nC_n$$

$$\begin{aligned}\therefore f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!} \\ = {}^nC_0 - {}^nC_1 + {}^nC_2 - {}^nC_3 + \dots + (-1)^n {}^nC_n = (1-1)^n = 0\end{aligned}$$

7. (c) Given that,

$$f(x) = x^2 + xg'(1) + g''(2)$$

and

$$g(x) = x^2 + xg'(2) + f''(3)$$

Now,

$$f'(x) = 2x + g'(1); f''(x) = 2$$

Also,

$$g'(x) = 2x + f'(2)$$

$$g''(x) = 2$$

Now, at $x = 1$,

$$f'(1) = 2 + g'(1)$$

and

$$g'(1) = 2 + f'(2)$$

$\Rightarrow$

$$f'(1) = 4 + f'(2)$$

Also, at $x = 2$,

$$f'(2) = 4 + g'(1) \text{ and } g'(2) = 4 + f'(2)$$

$\therefore$

$$g'(2) = 4 + 4 + g'(1) = 8 + g'(1)$$

$$\Rightarrow g'(2) = 8 + g'(1) \text{ and } g''(2) + f''(3) = 2 + 2 = 4$$

8. (c) $2^x + 2^y = 2^{x+y}$

[given]

$$\Rightarrow 2^x \log 2 + 2^y \log 2 \frac{dy}{dx} = 2^{x+y} \log 2 \left[1 + \frac{dy}{dx}\right]$$

$$\Rightarrow 2^x + 2^y \frac{dy}{dx} = 2^{x+y} + 2^{x+y} \frac{dy}{dx}$$

$$\Rightarrow (2^y - 2^{x+y}) \frac{dy}{dx} = 2^{x+y} - 2^x$$

$$\Rightarrow 2^y(1 - 2^x) \frac{dy}{dx} = 2^x(2^y - 1)$$

$$\Rightarrow \frac{dy}{dx} = \frac{2^x(2^y - 1)}{2^y(1 - 2^x)} = 2^{x-y} \frac{(2^y - 1)}{(1 - 2^x)}$$

9. (d) Hint Since, $f'(x) > g'(x)$

$$\Rightarrow \left(\frac{1}{2}\right) 5^{2x+1} \log_e 5 \times 2 > 5^x \log_e 5 + 4 \log_e 5$$

$$\Rightarrow 5^{2x} \cdot 5 > 5^x + 4$$

$$\Rightarrow 5 \cdot 5^{2x} - 5^x - 4 > 0$$

$$\Rightarrow (5^x - 1)(5 \cdot 5^x + 4) > 0$$

$$\therefore 5^x > 1$$

$$\Rightarrow x > 0$$

10. (a) $\therefore y = \sec^{-1} \left[\frac{\sqrt{x} + 1}{\sqrt{x} - 1} \right] + \sin^{-1} \left[\frac{\sqrt{x} - 1}{\sqrt{x} + 1} \right]$

$$= \cos^{-1} \left[\frac{\sqrt{x} - 1}{\sqrt{x} + 1} \right] + \sin^{-1} \left[\frac{\sqrt{x} - 1}{\sqrt{x} + 1} \right] = \frac{\pi}{2}$$

$$\Rightarrow \frac{dy}{dx} = 0 \quad \left[\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \right]$$

11. (b) $\tan^{-1} \frac{4x}{1+5x^2} = \tan^{-1} \left(\frac{5x-x}{1+5x \cdot x} \right) = \tan^{-1} 5x - \tan^{-1} x$

$$\text{and } \tan^{-1} \left(\frac{2+3x}{3-2x} \right) = \tan^{-1} \left(\frac{\frac{2}{3} + x}{1 - \frac{2}{3}x} \right) = \tan^{-1} \frac{2}{3} + \tan^{-1} x$$

$$\therefore y = \tan^{-1} 5x + \tan^{-1} \frac{2}{3} \Rightarrow \frac{dy}{dx} = \frac{5}{1+25x^2}$$

12. (c) Since,
- $g(x)$
- is the inverse
- $f(x)$
- .

$$\begin{aligned} \therefore f(x) = y &\Rightarrow g(y) = x \\ \Rightarrow g'[f(x)] &= \frac{1}{f'(x)}, \forall x \Rightarrow g'[f(x)] = 1 + x^3, \forall x \\ \Rightarrow g'(y) &= 1 + [g(y)]^3 \\ &\quad [\text{using } f(x) = y \Leftrightarrow x = g(y)] \\ \Rightarrow g'(x) &= 1 + [g(x)]^3 \end{aligned}$$

13. (b)
- $f(x) = e^x g(x)$

$$\begin{aligned} \Rightarrow f'(x) &= e^x g(x) + e^x g'(x) \\ \Rightarrow f'(0) &= g(0) + g'(0) = 2 + 1 = 3 \end{aligned}$$

14. (c) Given,
- $y = \log x \cdot e^{(\tan x + x^2)}$

$$\begin{aligned} \therefore \frac{dy}{dx} &= e^{(\tan x + x^2)} \cdot \frac{1}{x} + \log x \cdot e^{(\tan x + x^2)} (\sec^2 x + 2x) \\ &= e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + 2x) \log x \right] \end{aligned}$$

15. (a)
- $f(x) = \frac{2 \sin x \cdot \cos x \cdot \cos 2x \cdot \cos 4x \cdot \cos 8x \cdot \cos 16x}{2 \sin x}$

$$\begin{aligned} &= \frac{\sin 2x \cos 2x \cos 4x \cdot \cos 8x \cdot \cos 16x}{2 \sin x} = \frac{\sin 32x}{2^5 \sin x} \\ \therefore f'(x) &= \frac{1}{32} \cdot \frac{32 \cos 32x \cdot \sin x - \cos x \cdot \sin 32x}{\sin^2 x} \\ \Rightarrow f'\left(\frac{\pi}{4}\right) &= \frac{32 \times \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}} \times 0}{32 \left[\frac{1}{\sqrt{2}}\right]^2} = \sqrt{2} \end{aligned}$$

16. (b)
- $\frac{dy}{dx} = -[(2-x)(3-x) \dots (n-x) + (1-x)(3-x) \dots (n-x)$

$$\begin{aligned} &\quad + \dots + (1-x)(2-x) \dots (n-1-x)] \\ \Rightarrow \left(\frac{dy}{dx}\right)_{x=1} &= -[(n-1)! + 0 + \dots + 0] = (-1)(n-1)! \end{aligned}$$

17. (a) Since,
- $f \circ g = I \Rightarrow f \circ g(x) = x, \forall x$

$$\begin{aligned} \Rightarrow f'[g(x)] g'(x) &= 1, \forall x \\ \Rightarrow f'[g(a)] &= \frac{1}{g'(a)} = \frac{1}{2} \\ \Rightarrow f'(b) &= \frac{1}{2} \quad [\because g(a) = b] \end{aligned}$$

18. (b)
- $f(x) = \sqrt{1 + \cos^2(x^2)}$

$$\begin{aligned} \Rightarrow f'(x) &= \frac{1}{2\sqrt{1 + \cos^2(x^2)}} (2 \cos x^2) \cdot (-\sin x^2) \cdot (2x) \\ \Rightarrow f'(x) &= \frac{-x \sin 2x^2}{\sqrt{1 + \cos^2(x^2)}} \end{aligned}$$

$$\text{At } x = \frac{\sqrt{\pi}}{2}, f'\left(\frac{\sqrt{\pi}}{2}\right) = \frac{-\frac{\sqrt{\pi}}{2} \cdot \sin \frac{2\pi}{4}}{\sqrt{1 + \cos^2 \frac{\pi}{4}}} = \frac{-\frac{\sqrt{\pi}}{2} \cdot 1}{\sqrt{\frac{3}{2}}}$$

$$\therefore f'\left(\frac{\sqrt{\pi}}{2}\right) = -\sqrt{\frac{\pi}{6}}$$

19. (a) Given,
- $y = (1-x)(1+x^2)(1+x^4) \dots (1+x^{2^n})$

$$\begin{aligned} \text{or } y &= \frac{(1-x^2)(1+x^2) \dots (1+x^{2^n})}{(1+x)} = \frac{1-x^{4n}}{(1+x)} \\ \therefore \frac{dy}{dx} &= \frac{(1+x) \cdot (0 - 4n \cdot x^{4n-1}) - (1-x^{4n}) \cdot 1}{(1+x)^2} \\ \therefore \left(\frac{dy}{dx}\right)_{x=0} &= -1 \end{aligned}$$

20. (b) Let
- $y = \frac{x^2 - x}{x^2 + 2x}$

$$\begin{aligned} \Rightarrow x &= \frac{2y+1}{-y+1}; x \neq 0 \Rightarrow f^{-1}(x) = \frac{2x+1}{-x+1} \\ \therefore \frac{d}{dx} \{f^{-1}(x)\} &= \frac{(-x+1) \cdot 2 - (2x+1)(-1)}{(-x+1)^2} = \frac{3}{(-x+1)^2} \end{aligned}$$

21. (a) Here,
- $y = \sin[\cos(x^2)]$

$$\text{So, } \frac{dy}{dx} = \frac{d}{dx} [\sin \{\cos(x^2)\}]$$

On applying chain rule, we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{d \cos x^2} \sin \{\cos(x^2)\} \times \frac{d}{dx^2} \cos(x^2) \times \frac{d}{dx} x^2 \\ &= \cos(\cos x^2) \times (-\sin x^2) \times 2x \\ &= -2x \sin x^2 \cdot \cos(\cos x^2) \end{aligned}$$

22. (a) It is given that,
- $F(x) = f(x) \cdot g(x)$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} F'(x) &= f'(x) \cdot g(x) + f(x) \cdot g'(x) \\ &= f'(x) \cdot g'(x) \left[\frac{f(x)}{f'(x)} + \frac{g(x)}{g'(x)} \right] \end{aligned}$$

$$\Rightarrow F' = c \left[\frac{f}{f'} + \frac{g}{g'} \right]$$

23. (a) It is given that,
- $y \cos x + x \sin y = \pi$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} \cos x - y \sin x + \cos y - x \sin y \frac{dy}{dx} &= 0 \\ \Rightarrow (\cos x - x \sin y) \frac{dy}{dx} &= y \sin x - \cos y \\ \Rightarrow \frac{dy}{dx} &= \frac{y \sin x - \cos y}{\cos x - x \sin y} \end{aligned}$$

24. (b) We have,
- $f: (-1, 1) \rightarrow R$

$$f(0) = -1, f'(0) = 1$$

$$g(x) = [f(2f(x) + 2)]^2$$

$$\begin{aligned} \Rightarrow g'(x) &= 2[f(2f(x) + 2)] \times f'(2f(x) + 2) \times 2f'(x) \\ \Rightarrow g'(0) &= 2[f(2f(0) + 2)] \times f'(2f(0) + 2) \times 2f'(0) \\ &= 2[f(0)] \times f'(0) \times 2f'(0) \\ &= 2 \times (-1) \times 1 \times 2 \times 1 = -4 \end{aligned}$$

25. (c)
- $y = \frac{a^{\cos^{-1} x}}{1 + a^{\cos^{-1} x}}, z = a^{\cos^{-1} x} \Rightarrow y = \frac{z}{1+z}$

$$\Rightarrow \frac{dy}{dz} = \frac{(1+z)1 - z(1)}{(1+z)^2} = \frac{1}{(1+z)^2} = \frac{1}{(1 + a^{\cos^{-1} x})^2}$$

26. (b) On putting $x = \sin \theta$ and $y = \sin \phi$, we get

Given equation becomes

$$\begin{aligned} \cos \theta + \cos \phi &= a(\sin \theta - \sin \phi) \\ \Rightarrow 2 \cos \left(\frac{\theta + \phi}{2} \right) \cos \left(\frac{\theta - \phi}{2} \right) &= a \left\{ 2 \cos \left(\frac{\theta + \phi}{2} \right) \sin \left(\frac{\theta - \phi}{2} \right) \right\} \\ \Rightarrow \frac{\theta - \phi}{2} &= \cot^{-1} a \Rightarrow \theta - \phi = 2 \cot^{-1} a \\ \Rightarrow \sin^{-1} x - \sin^{-1} y &= 2 \cot^{-1} a \\ \Rightarrow \frac{1}{\sqrt{1-x^2}} - \frac{1}{\sqrt{1-y^2}} \frac{dy}{dx} &= 0 \quad \therefore \frac{dy}{dx} = \sqrt{\frac{1-y^2}{1-x^2}} \end{aligned}$$

27. (c) On putting $x = \sin A$ and $\sqrt{x} = \sin B$

$$\begin{aligned} y &= \sin^{-1}(\sin A \sqrt{1-\sin^2 B} + \sin B \sqrt{1-\sin^2 A}) \\ &= \sin^{-1}(\sin A \cos B + \sin B \cos A) \\ &= \sin^{-1}[\sin(A+B)] = A+B = \sin^{-1} x + \sin^{-1} \sqrt{x} \\ \Rightarrow \frac{dy}{dx} &= \frac{1}{\sqrt{1-x^2}} + \frac{1}{2\sqrt{x-x^2}} \end{aligned}$$

28. (a) **Hint** Given, $y = \sec(\tan^{-1} x)$

Let $\tan^{-1} x = \theta \Rightarrow x = \tan \theta$

$$\therefore y = \sec \theta = \sqrt{1+x^2}$$

29. (a) **Hint** Here, $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$

Put $x = \sin \theta \Rightarrow \theta = \sin^{-1} x$

$$\Rightarrow y = \sin^{-1}(\sin \theta) + \sin^{-1} \sqrt{1-\sin^2 \theta} = \theta + \sin^{-1} \sqrt{\cos^2 \theta}$$

30. (b) We have, $x = \frac{2t}{1+t^2}$, $y = \frac{1-t^2}{1+t^2}$

Put $t = \tan \theta$

$$\therefore x = \frac{2 \tan \theta}{1 + \tan^2 \theta} = \sin 2\theta \text{ and } y = \frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} = \cos 2\theta$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{dy/d\theta}{dx/d\theta} = \frac{-2 \sin 2\theta}{2 \cos 2\theta} = -\tan 2\theta \\ &= \frac{-2 \tan \theta}{1 - \tan^2 \theta} = \frac{-2t}{1 - t^2} = \frac{2t}{t^2 - 1} \end{aligned}$$

31. (d) We have,

$$\frac{dx}{dt} = a \left[-\sin t \sqrt{\cos 2t} - \frac{\cos t \cdot \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{-a \sin 3t}{\sqrt{\cos 2t}}$$

$$\text{and } \frac{dy}{dt} = a \left[\cos t \sqrt{\cos 2t} - \frac{\sin t \cdot \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{a \cos 3t}{\sqrt{\cos 2t}}$$

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = -\cot 3t$$

$$\begin{aligned} \Rightarrow \frac{d^2 y}{dx^2} &= 3 \operatorname{cosec}^2 3t \cdot \frac{dt}{dx} \\ &= \frac{-3 \operatorname{cosec}^2 3t \cdot \sqrt{\cos 2t}}{a \sin 3t} \\ &= -\left(\frac{3}{a}\right) \operatorname{cosec}^3 3t \cdot \sqrt{\cos 2t} \end{aligned}$$

$$\begin{aligned} \therefore \left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2} \bigg/ \frac{d^2 y}{dx^2} &= (1 + \cot^2 3t)^{3/2} \bigg/ \left(\frac{-3}{a} \right) \operatorname{cosec}^3 3t \sqrt{\cos 2t} \\ \Rightarrow \left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2} \bigg/ \frac{d^2 y}{dx^2} \bigg|_{t=\frac{\pi}{6}} &= \frac{a}{3 \sqrt{\cos \frac{\pi}{3}}} = \frac{\sqrt{2}a}{3} \end{aligned}$$

32. (a) **Hint** $\frac{dx}{d\theta} = a(1 + \cos \theta)$ and $\frac{dy}{d\theta} = a(\sin \theta)$

33. (b) **Hint** $x = e^{-t^2}$ and $y = \tan^{-1}(2t + 1)$

$$\begin{aligned} \Rightarrow \frac{dx}{dt} &= -e^{-t^2} \times 2t \\ \text{and } \frac{dy}{dt} &= \frac{1}{1 + (2t + 1)^2} \quad (2) \\ \Rightarrow \frac{dx}{dt} &= -2t e^{-t^2} \text{ and } \frac{dy}{dt} = \frac{1}{4t^2 + 1 + 4t + 1} \quad (2) \\ \Rightarrow \frac{dx}{dt} &= -2t e^{-t^2} \text{ and } \frac{dy}{dt} = \frac{1}{4t^2 + 4t + 2} \times 2 \end{aligned}$$

34. (c) Given that, $\sqrt{x^2 + y^2} = ae^{\tan^{-1}(y/x)}$... (i)

Taking log on both sides, we get

$$\begin{aligned} \frac{1}{2} \log(x^2 + y^2) &= \log a + \tan^{-1} \left(\frac{y}{x} \right) \log_e e \quad [\because \log_e e = 1] \\ \Rightarrow \frac{1}{2} \times \frac{1}{(x^2 + y^2)} \left(2x + 2y \frac{dy}{dx} \right) &= 0 + \frac{1}{1 + \left(\frac{y}{x} \right)^2} \cdot \frac{d}{dx} \left(\frac{y}{x} \right) \end{aligned}$$

$$\begin{aligned} \Rightarrow \frac{x + y \frac{dy}{dx}}{x^2 + y^2} &= \frac{x^2}{x^2 + y^2} \cdot \frac{\left(x \frac{dy}{dx} - y \times 1 \right)}{x^2} \\ \Rightarrow x + y \frac{dy}{dx} &= x \frac{dy}{dx} - y \\ \Rightarrow \frac{dy}{dx} &= \frac{x + y}{x - y} \quad \dots (ii) \end{aligned}$$

$$\frac{d^2 y}{dx^2} = \frac{(x - y) \left(1 + \frac{dy}{dx} \right) - (x + y) \left(1 - \frac{dy}{dx} \right)}{(x - y)^2} \quad \dots (iii)$$

From Eq. (i) at $x = 0$, we get

$$y = ae^{\tan^{-1} \infty} = ae^{\pi/2} \Rightarrow y = ae^{\pi/2} \quad \dots (iv)$$

Now, from Eq. (ii) at $x = 0$, we get

$$\frac{dy}{dx} = \frac{0 + ae^{\pi/2}}{0 - ae^{\pi/2}} = -1$$

$$\Rightarrow \frac{dy}{dx} = -1$$

Now, from Eq. (iii), at $x = 0$, we get

$$\begin{aligned} \frac{d^2 y}{dx^2} &= \frac{(0 - ae^{\pi/2})(1 - 1) - (0 + ae^{\pi/2}) \times (1 + 1)}{(0 - ae^{\pi/2})^2} \\ &= \frac{0 - 2ae^{\pi/2}}{(0 - ae^{\pi/2})^2} = \frac{-2}{ae^{\pi/2}} = \frac{-2}{a} e^{-\pi/2} \end{aligned}$$

35. (c) **Hint** Given, $y = a^{x^{a^{x^{\dots}}}}$

$$y = (a^{x^y}) \Rightarrow \log y = \log a^{x^y} \Rightarrow \log y = x^y \log a$$

$$\Rightarrow \log(\log y) = y \log x + \log(\log a)$$

36. (d) Let $y = (\sin x)^x + \sin^{-1} \sqrt{x}$

$$\text{and } u = (\sin x)^x, v = \sin^{-1} \sqrt{x} \therefore y = u + v$$

$$\frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx}$$

Now,

$$u = (\sin x)^x$$

$$\log u = x \log(\sin x)$$

$$\Rightarrow \frac{1}{u} \cdot \frac{du}{dx} = x \frac{d}{dx} \log(\sin x) + \log(\sin x) \frac{d}{dx} (x)$$

$$= \frac{x}{\sin x} \cos x + \log(\sin x)$$

$$\frac{du}{dx} = u [x \cot x + \log \sin x]$$

$$= (\sin x)^x [x \cot x + \log \sin x]$$

Again,

$$v = \sin^{-1} \sqrt{x}$$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{\sqrt{1-(\sqrt{x})^2}} \frac{d}{dx} (x^{1/2})$$

$$= \frac{1}{\sqrt{1-x}} \cdot \frac{1}{2} x^{-1/2} \quad [\text{using chain rule}]$$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{\sqrt{1-x}} \times \frac{1}{2\sqrt{x}} = \frac{1}{2\sqrt{x}\sqrt{1-x}}$$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{2\sqrt{x-x^2}}$$

$$\therefore \frac{dy}{dx} = (\sin x)^x (x \cot x + \log \sin x) + \frac{1}{2\sqrt{x-x^2}}$$

37. (d) **Hint** Taking log on the given equation, we get

$$m \log x + n \log y = (m+n) \log(x+y)$$

38. (d) It is given that, $y = \sqrt{x + \sqrt{x + \sqrt{x + \dots}}}$

$$\Rightarrow y = \sqrt{x+y} \Rightarrow y^2 = x+y \quad \dots(i)$$

On differentiating both sides w.r.t. x , we get

$$2y \frac{dy}{dx} = 1 + \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{1}{2y-1}$$

Now, from Eq.(i), we get

$$y^2 = x+y$$

$$\Rightarrow y^2 - y - x = 0$$

$$\Rightarrow y = \frac{1 \pm \sqrt{1+4x}}{2} \Rightarrow y = \frac{1 + \sqrt{1+4x}}{2} \quad [\text{as } y > 0]$$

Now, again differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1+4x}} \times \frac{4}{2} = \frac{1}{\sqrt{1+4x}}$$

$$\text{Also, } y^2 = x+y \Rightarrow y = 1 + \frac{x}{y} \quad \dots(ii)$$

On differentiating Eq. (ii) w.r.t. x , we get

$$\frac{dy}{dx} = \frac{y-x}{y^2} \frac{dy}{dx} = \frac{1}{y} - \frac{x}{y^2} \frac{dy}{dx}$$

$$\Rightarrow \left(1 + \frac{x}{y^2}\right) \frac{dy}{dx} = \frac{1}{y}$$

$$\Rightarrow (y^2 + x) \frac{dy}{dx} = y$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{y^2 + x} = \frac{y}{x + x + y} \quad [\text{from Eq. (i)}]$$

$$\therefore \frac{dy}{dx} = \frac{y}{2x + y}$$

39. (a) **Hint** Given, $x^{2x} - 2x^x \cot y - 1 = 0 \quad \dots(i)$

$$\text{Now, at } x = 1, 1 - 2 \cot y - 1 = 0$$

$$\Rightarrow \cot y = 0 \Rightarrow y = \frac{\pi}{2}$$

On differentiating Eq. (i) w.r.t. x , we get

$$2x^{2x} (1 + \log x) - 2[x^x (-\operatorname{cosec}^2 y) \frac{dy}{dx} + \cot y x^x (1 + \log x)] = 0$$

40. (b) **Hint** Suppose $y = \tan^{-1} \left[\frac{\sqrt{1+x^2}-1}{x} \right] \quad \dots(i)$

$$\text{and } z = \tan^{-1} \left[\frac{2x\sqrt{1-x^2}}{1-2x^2} \right] \quad \dots(ii)$$

Putting $x = \tan \theta$ in Eq. (i) and $x = \sin \theta$ in Eq. (ii), we get

$$y = \tan^{-1} \left[\frac{\sec \theta - 1}{\tan \theta} \right] = \tan^{-1} \left[\tan \frac{\theta}{2} \right] = \frac{1}{2} \tan^{-1} x$$

$$z = \tan^{-1} \left[\frac{2 \sin \theta \cos \theta}{\cos 2\theta} \right]$$

$$= 2\theta = 2 \sin^{-1} x$$

$$41. (b) \text{ We have, } f(x) = \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix}$$

$$\Rightarrow f'(x) = \begin{vmatrix} 0 & 0 & 0 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix}$$

$$+ \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x \tan x & \sec^2 x & 1 \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix}$$

$$+ \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 0 & \sec^2 x & 0 \end{vmatrix}$$

$$\therefore f'(\theta) = 0 + \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec \theta \tan \theta & \sec^2 \theta & 1 \\ 1 & 0 & 0 \end{vmatrix}$$

$$+ \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec \theta & \tan \theta & \theta \\ 0 & \sec^2 \theta & 0 \end{vmatrix}$$

$$= \tan^2 \theta - \sec^2 \theta + \sec^2 \theta (\theta \sec \theta - \theta \sec \theta) = -1$$

$$42. (d) f'''(x) = \begin{vmatrix} \frac{d^3}{dx^3}(x^3) & \frac{d^3}{dx^3}(\sin x) & \frac{d^3}{dx^3}(\cos x) \\ 6 & -1 & 0 \\ P & P^2 & P^3 \end{vmatrix}$$

$$= \begin{vmatrix} 6 & -\cos x & \sin x \\ 6 & -1 & 0 \\ P & P^2 & P^3 \end{vmatrix} \therefore f'''(0) = \begin{vmatrix} 6 & -1 & 0 \\ 6 & -1 & 0 \\ P & P^2 & P^3 \end{vmatrix} = 0$$

which is independent of P .

$$43. (d) \frac{dy}{dt} = -kae^{-kt} \cos(pt + c) - pa e^{-kt} \sin(pt + c)$$

$$\Rightarrow \frac{dy}{dt} = -ky - pa e^{-kt} \sin(pt + c) \quad \dots (i)$$

Now, $\frac{d^2y}{dt^2} + k \frac{dy}{dt} = pa[-ke^{-kt} \sin(pt + c) + pe^{-kt} \cos(pt + c)]$

$$\Rightarrow \frac{d^2y}{dt^2} + k \frac{dy}{dt} = k \left(-ky - \frac{dy}{dt} \right) - p^2 y \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \frac{d^2y}{dt^2} + 2k \frac{dy}{dt} + (p^2 + k^2)y = 0 \Rightarrow n^2 = p^2 + k^2$$

BITSAT Archives

$$1. (c) \frac{d}{dx}(\cos x) = -\frac{\pi}{180} \sin x$$

$$2. (a) \frac{d}{dx}[\log(\sec x - \tan x)]$$

$$= \frac{1}{\sec x - \tan x} [\sec x \tan x - \sec^2 x]$$

$$= \frac{\sec x [\tan x - \sec x]}{\sec x - \tan x} = -\sec x$$

$$3. (c) \text{ Given, } x = \cos^3 \theta, y = \sin^3 \theta$$

On differentiating w.r.t. θ respectively, we get

$$\frac{dx}{d\theta} = -3 \cos^2 \theta \sin \theta$$

and

$$\frac{dy}{d\theta} = 3 \sin^2 \theta \cos \theta$$

Now,

$$\frac{dy}{dx} = -\frac{3 \sin^2 \theta \cos \theta}{3 \cos^2 \theta \sin \theta} = -\tan \theta$$

$$\therefore 1 + \left(\frac{dy}{dx} \right)^2 = 1 + \tan^2 \theta = \sec^2 \theta$$

$$4. (b) \text{ Hint } x = at^2, y = 2at$$

On differentiating w.r.t. t respectively, we get

$$\frac{dx}{dt} = 2at, \frac{dy}{dt} = 2a \therefore \frac{dy}{dx} = \frac{2a}{2at} = \frac{1}{t}$$

$$5. (b) \text{ Given, } \Delta_1 = \begin{vmatrix} x & a & b \\ b & x & a \\ a & b & x \end{vmatrix}, \Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$$

$$\therefore \frac{d}{dx}(\Delta_1) = \begin{vmatrix} 1 & 0 & 0 \\ b & x & a \\ a & b & x \end{vmatrix} + \begin{vmatrix} x & a & b \\ 0 & 1 & 0 \\ a & b & x \end{vmatrix} + \begin{vmatrix} x & a & b \\ b & x & a \\ 0 & 0 & 1 \end{vmatrix}$$

$$44. (c) \text{ If the given relation is } l + m = c, \text{ then } l^2 - m^2 = 2x$$

$$\text{Dividing, } l - m = \frac{2x}{c}$$

$$\text{Adding, } 2\sqrt{x+y} = c + \frac{2x}{c}$$

$$\text{Squaring, } 4(x+y) = c^2 + \frac{4x^2}{c^2} + 4x$$

$$\Rightarrow 4y = c^2 + \frac{4x^2}{c^2}$$

Differentiate with respect to y , we get

$$\frac{4dy}{dx} = 0 + \frac{8x}{c^2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{2x}{c^2}$$

Again differentiate, we get

$$\frac{d^2y}{dx^2} = \frac{2}{c^2}$$

$$= \begin{vmatrix} x & a \\ b & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & a \\ b & x \end{vmatrix} = 3\Delta_2$$

$$\therefore \frac{d}{dx}(\Delta_1) = 3\Delta_2$$

$$6. (b) \text{ Hint Let } y = x^x$$

$$\Rightarrow \log y = x \log x$$

$$7. (c) P'(x) = 2yy', P''(x) = 2yy'' + 2y'^2$$

$$\Rightarrow P'''(x) = 2yy''' + 6y'y''$$

$$\therefore 2 \frac{d}{dx}(y^3 y'') = 2[y^3 y''' + 3y^2 y' y'']$$

$$= y^2 [2yy''' + 6y'y''] = P(x) P'''(x)$$

$$8. (b) \text{ We have, } f(x) = (1-x)^n, f'(x) = -n(1-x)^{n-1}$$

$$f''(x) = n(n-1)(1-x)^{n-2}$$

$$f'''(x) = -n(n-1)(n-2)(1-x)^{n-3}$$

$$\vdots$$

$$f^n(x) = (-1)^n n(n-1)(n-2) \dots 1$$

$$\Rightarrow f(0) = 1, f'(0) = -n, f''(0) = n(n-1),$$

$$f'''(0) = -n(n-1)(n-2), \dots, f^n(0) = (-1)^n n!$$

$$\therefore f(0) + f'(0) + \frac{f''(0)}{2!} + \dots + \frac{f^n(0)}{n!}$$

$$= 1 - n + \frac{n(n-1)}{2!} - \dots + \frac{(-1)^n n!}{n!}$$

$$= {}^nC_0 - {}^nC_1 + {}^nC_2 - \dots + (-1)^n {}^nC_n$$

$$= (1-1)^n = 0$$

$$9. (a) \text{ Hint } f(x) = \log_x (\log x) = \frac{\log (\log x)}{\log (x)}$$

10. (c) Since, $f'(x) > \phi'(x)$

$$\begin{aligned} \therefore 2^{2x-1} \log 2 &> -2^x \log 2 + 2 \log 2 \\ \Rightarrow 2^{2x} &> -2^x + 2 \\ \Rightarrow 2^{2x} + 2^x - 2 &> 0 \\ \Rightarrow (2^x - 1)(2^x + 2) &> 0 \\ \Rightarrow 2^x - 1 &> 0 & [\because 2^x + 2 > 0, \forall x] \\ \Rightarrow 2^x &> 1 \\ \therefore x &> 0 \end{aligned}$$

11. (a) Given, $y = \sin^{-1} \left(\frac{5x + 12\sqrt{1-x^2}}{13} \right)$

Putting $x = \sin \theta$, $5 = r \cos \alpha$ and $12 = r \sin \alpha$, we get

$$\begin{aligned} y &= \sin^{-1} \left(\frac{r \cos \alpha \sin \theta + r \sin \alpha \cos \theta}{13} \right) \\ &= \sin^{-1} \left(\frac{13 \sin(\theta + \alpha)}{13} \right) \quad [\because r = \sqrt{25 + 144} = 13] \\ &= \theta + \alpha = \sin^{-1} x + \tan^{-1} \frac{12}{5} \quad \left[\because \tan \alpha = \frac{12}{5} \right] \end{aligned}$$

$$\therefore \frac{dy}{dx} = \frac{1}{\sqrt{1-x^2}}$$

12. (b) Given that, $x = a \left(\cos \theta + \log \tan \left(\frac{\theta}{2} \right) \right)$ and $y = a \sin \theta$

On differentiating w.r.t. θ respectively, we get

$$\begin{aligned} \frac{dx}{d\theta} &= a \left(-\sin \theta + \frac{1}{\tan \left(\frac{\theta}{2} \right)} \cdot \sec^2 \frac{\theta}{2} \cdot \frac{1}{2} \right) \\ &= a \left(-\sin \theta + \frac{1}{\sin \theta} \right) = \frac{a \cos^2 \theta}{\sin \theta} \end{aligned}$$

and $\frac{dy}{d\theta} = a \cos \theta$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{dy/d\theta}{dx/d\theta} \\ &= \frac{a \cos \theta}{a \cos^2 \theta / \sin \theta} = \tan \theta \end{aligned}$$

13. (b) Hint Let $p = \sin^{-1} \frac{2x}{1+x^2} = 2 \tan^{-1} x$

and $q = \cos^{-1} \frac{1-x^2}{1+x^2} = 2 \tan^{-1} x$

14. (b) Hint Given that, $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2}$

$$\therefore \sin^{-1} x = \cos^{-1} y \Rightarrow y = \sqrt{1-x^2}$$

15. (d) $y = \tan^{-1} \frac{\sqrt{1+x^2} - \sqrt{1-x^2}}{\sqrt{1+x^2} + \sqrt{1-x^2}}$

Put $x^2 = \cos 2\theta$

$$\begin{aligned} \therefore y &= \tan^{-1} \frac{\sqrt{1+\cos 2\theta} - \sqrt{1-\cos 2\theta}}{\sqrt{1+\cos 2\theta} + \sqrt{1-\cos 2\theta}} \\ &= \tan^{-1} \frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} = \tan^{-1} \tan \left(\frac{\pi}{4} - \theta \right) \end{aligned}$$

$$\Rightarrow y = \frac{\pi}{4} - \theta = \frac{\pi}{4} - \frac{1}{2} \cos^{-1} x^2$$

On differentiating both sides, we get

$$\frac{dy}{dx} = 0 - \frac{1}{2} \left(-\frac{(2x)}{\sqrt{1-x^4}} \right) = \frac{x}{\sqrt{1-x^4}}$$

16. (d) Hint Given that, $x = \sin t$, $y = \cos pt$

$$\Rightarrow \frac{dx}{dt} = \cos t, \frac{dy}{dt} = -p \sin pt$$

$$\therefore \frac{dy}{dx} = -\frac{p \sin pt}{\cos t}$$

$$\Rightarrow y_1 = \frac{-p \sqrt{1-y^2}}{\sqrt{1-x^2}}$$

17. (d) Hint $\frac{dr}{d\phi} = \frac{\left[2 - 2 \cos \left(2\phi + \frac{\pi}{4} \right) \sin \left(2\phi + \frac{\pi}{4} \right) \cdot 2 \right]}{2 \sqrt{2\phi + \cos^2 \left(2\phi + \frac{\pi}{4} \right)}}$
- $$= \frac{\left[1 - \sin \left(4\phi + \frac{\pi}{2} \right) \right]}{\sqrt{2\phi + \cos^2 \left(2\phi + \frac{\pi}{4} \right)}}$$

18

Applications of Derivatives

Geometrical Interpretation of Derivative

Geometrically derivative of a function at a point $x = c$ is the slope of the tangent to the curve $y = f(x)$ at the point $\{c, f(c)\}$. Thus, slope of tangent $= f'(c) = \tan \theta$

Rate of Change of Quantities

The derivative $\frac{dy}{dx}$ represents the rate of change of variable y with respect to x . So, the rate of change of any physical quantity at any time is obtained by differentiating the physical quantity with respect to time.

If two variables are varying with respect to another variable t , i.e. $y = f(t)$, $x = g(t)$. Then, rate of

change of y with respect to x is $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$ provided $\frac{dx}{dt} \neq 0$ or $\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx}$ [by chain rule of derivative]

Thus, the rate of change of y with respect to x can be calculated using the rate of change of y and that of x both with respect to t .

NOTE If $y = f(x)$ and δy is an increment in y , corresponding to an increment δx in x , then we have $\delta y = \left(\frac{dy}{dx}\right) \delta x$.

Tangent and Normal of a Curve

1. If a tangent is drawn to the curve $y = f(x)$ at a point $P(x_1, y_1)$ and this tangent makes an angle ψ with positive x -direction, then

- (i) The slope of the tangent is $\left(\frac{dy}{dx}\right)_{(x_1, y_1)} = \tan \psi$

- (ii) Equation of tangent is $y - y_1 = \left(\frac{dy}{dx}\right)_{(x_1, y_1)} (x - x_1)$

- (iii) Length of tangent $PA = y \operatorname{cosec} \psi = \left| y \frac{\sqrt{1 + \left(\frac{dy}{dx}\right)^2}}{\left(\frac{dy}{dx}\right)} \right|$

- (iv) Length of subtangent $AC = y \cot \psi = \left| \frac{y}{dy/dx} \right|$

2. The normal to a curve at a point $P(x_1, y_1)$ is a line perpendicular to tangent at P and passing through P , then

- (i) The slope of the normal is $-\frac{1}{\frac{dy}{dx}}$

- (ii) Equation of normal is $y - y_1 = -\frac{1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}} (x - x_1)$

- (iii) Length of normal $PB = y \sec \psi = \left| y \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \right|$

- (iv) Length of subnormal $BC = y \tan \psi = \left| y \left(\frac{dy}{dx}\right) \right|$

Some Important Points

- (i) If the tangent at P is parallel to X -axis, then $\theta = 0$.

$$\Rightarrow \tan \theta = 0 \Rightarrow \left(\frac{dy}{dx}\right)_{(x_1, y_1)} = 0$$

- (ii) If the tangent at P is perpendicular to X -axis or parallel to Y -axis, then

$$\theta = \frac{\pi}{2} \text{ and } \cot \theta = 0$$

$$\Rightarrow \frac{1}{\tan \theta} = 0 \Rightarrow \left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0$$

- (iii) If equation of the curve is in parametric form i.e. $x = f(t)$ and $y = g(t)$.

$$\text{Then, } \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{g'(t)}{f'(t)}$$

- (a) Equation of tangent is $y - g(t) = \frac{g'(t)}{f'(t)} \{x - f(t)\}$

- (b) Equation of normal is $y - g(t) = \frac{-f'(t)}{g'(t)} \{x - f(t)\}$

- (iv) If the tangent at any point on the curve is equally inclined to both the axes, then

$$\frac{dy}{dx} = \pm 1$$

If the tangent at any point makes an equal intercept on the coordinate axes.

$$\text{Then, } \frac{dy}{dx} = -1$$

Angle of Intersection of Two Curves

The angle of intersection of two curves is defined to be the angle between the tangents to the two curves at their point of intersection. Thus, the angle between the tangents of the two curves $y = f_1(x)$ and $y = f_2(x)$ is given by

$$\tan \phi = \left| \frac{\left(\frac{dy}{dx}\right)_{I(x_1, y_1)} - \left(\frac{dy}{dx}\right)_{II(x_1, y_1)}}{1 + \left(\frac{dy}{dx}\right)_{I(x_1, y_1)} \left(\frac{dy}{dx}\right)_{II(x_1, y_1)}} \right| \text{ or } \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

- NOTE**
- Curves intersect orthogonally, if $m_1 m_2 = -1$
 - Curves touch each other, if $m_1 = m_2$.

Monotonic Function

A function f is said to be monotonic in an interval, if it is either increasing or decreasing in that interval.

Increasing and Decreasing Functions (Monotonicity)

Let $y = f(x)$ be a given function with its domain D . Let $D_1 \subseteq D$.

Increasing Function $f(x)$ is said to be increasing function in D_1 , $\forall x_1, x_2 \in D_1$, if $x_1 > x_2 \Rightarrow f(x_1) \geq f(x_2)$

Strictly Increasing Function $f(x)$ is said to be strictly increasing function in D_1 , $\forall x_1, x_2 \in D_1$, if $x_1 < x_2$, $f(x_1) < f(x_2)$

$$\text{or } x_1 > x_2 \Rightarrow Nf(x_1) > f(x_2)$$

Decreasing Function $f(x)$ is said to be decreasing function in $D_1, \forall x_1, x_2 \in D_1$,

if $x_1 < x_2$
 $\Rightarrow f(x_1) \geq f(x_2)$

Strictly Decreasing Function $f(x)$ is said to strictly decreasing function in $D_1, \forall x_1, x_2 \in D_1$,

if $x_1 < x_2, f(x_1) > f(x_2)$
 or $x_1 > x_2 \Rightarrow f(x_1) < f(x_2)$

Some Important Points

Let $f(x)$ be a function that is continuous in $[a, b]$ and differentiable in (a, b) . Then,

- $f(x)$ is an increasing function in $[a, b]$, if $f'(x) \geq 0$ in (a, b) .
- $f(x)$ is a strictly increasing function in $[a, b]$, if $f'(x) > 0$ in (a, b) .
- $f(x)$ is a decreasing function in $[a, b]$, if $f'(x) \leq 0$ in (a, b) .
- $f(x)$ is a strictly decreasing function in $[a, b]$, if $f'(x) < 0$ in (a, b) .
- If $f(x)$ is a strictly increasing function on an interval $[a, b]$, then f^{-1} exists and it is also a strictly increasing function.
- If $f(x)$ is strictly increasing function on an interval $[a, b]$ such that it is continuous, then f^{-1} is continuous on $[f(a), f(b)]$.

NOTE The points for which $f'(x) = 0$ or $f'(x)$ does not exist are called critical points.

Maxima and Minima of Function

Let $y = f(x)$ be a function defined at $x = a$ and also in the vicinity of the point $x = a$. Then, $f(x)$ is said to have a local maximum at $x = a$, if the value of the function at $x = a$ is greater than the value of the function at the neighbouring points of $x = a$. Mathematically,

$$f(a) > f(a-h) \text{ and } f(a) > f(a+h), \text{ where } h > 0 \text{ (very small quantity)}$$

Similarly, $f(x)$ is said to have a local minimum at $x = a$, if the value of the function at $x = a$ is less than the value of the function at the neighbouring points of $x = a$. Mathematically,

$$f(a) < f(a-h) \text{ and } f(a) < f(a+h), \text{ where } h > 0.$$

A local maximum or a local minimum is also called a local extremum.

Method to Find Local Maxima or Local Minima

There are three tests under which local maxima and local minima can be found out. These three tests are first derivative test, second derivative test and n th derivative test.

The tests are given below:

First Derivative Test

Let f be a function defined on an open interval I and f be continuous at a critical point c in I . Then,

- If $f'(x)$ changes sign from positive to negative as x increases through c , i.e. if $f'(x) > 0$ at every point sufficiently close to and to the left of c and $f'(x) < 0$ at every point sufficiently close to and to the right of c , then c is a point of **local maxima**.
- If $f'(x)$ changes sign from negative to positive as x increases through point c , i.e. if $f'(x) < 0$ at every point sufficiently close to and to the left of c and $f'(x) > 0$ at every point sufficiently close to and to the right of c , then c is a point of **local minima**.
- If $f'(x)$ does not change sign as x increases through c , then c is neither a point of local maxima nor a point of local minima. Infact, such a point is called **point of inflection**.

If c is a point of local maxima of f , then $f(c)$ is a local maximum value of f . Similarly, if t is a point of local minima of f , then $f(t)$ is a local minimum value of f .

Second or Higher Order Derivative Test

- Find $f'(x)$ and equate it to zero. Solve $f'(x) = 0$ and let its roots be $x = a_1, a_2, \dots$.
- Find $f''(x)$ and at $x = a_1$.
 - If $f''(a_1)$ is positive, then $f(x)$ is minimum at $x = a_1$.
 - If $f''(a_1)$ is negative, then $f(x)$ is maximum at $x = a_1$.
- (i) If at $x = a_1, f''(a_1) = 0$, then find $f'''(x)$. If $f'''(a_1) \neq 0$, then $f(x)$ is neither maximum nor minimum at $x = a$.
 - If $f'''(a_1) = 0$, then find $f^{iv}(x)$.

(iii) If $f^{iv}(x)$ is positive (minimum value) and $f^{iv}(x)$ is negative (maximum value).

4. If at $x = a_1, f^{iv}(a_1) = 0$, then find $f^v(x)$ and proceed similarly.

n th Derivative Test

It says that if, $f'(a) = f''(a) = f'''(a) = \dots = f^n(a) = 0$ and $f^{n+1}(a) \neq 0$ (all derivatives of the function up to order n vanishes and $(n+1)$ th order derivative does not vanish at $x = a$, then $f(x)$ would have a local maximum or local minimum at $x = a$.

If n is even and $f^n(a) < 0$, then $x = a$ is a point of local maximum. If n is even and $f^n(a) > 0$, then $x = a$ is a point of local minimum. If n is odd, then $x = a$ is a point of local maximum nor a point of local minimum.

Concept of Global Maximum/Minimum

Let $y = f(x)$ be a continuous function with domain D . Let $[a, b] \subseteq D$. Global maximum/minimum of $f(x)$ in $[a, b]$ is basically the greatest/least value of $f(x)$ in $[a, b]$.

Global maximum and minimum in $[a, b]$ would always occur at critical points of $f(x)$ within $[a, b]$ or at the end points of the interval.

Method of Global Maximum/Minimum in $[a, b]$

In order to find the global maximum/minimum of $f(x)$ in $[a, b]$, find out all the critical points of $f(x)$ in $[a, b]$, i.e. all points at which $f'(x) = 0$.

Let $c_1, c_2, c_3, \dots, c_n$ be the points at which $f'(x) = 0$ and $f(c_1), f(c_2), \dots, f(c_n)$ be the values of function at these points, say

$$M_1 = \max\{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$$

and $M_2 = \min\{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$

Then, M_1 is the greatest value of $f(x)$ in $[a, b]$ and M_2 is the least value of $f(x)$ in $[a, b]$.

Method of Global Maximum/Minimum in $[a, b]$

Method for obtaining the greatest and least values of $f(x)$ in (a, b) is almost same as the method used for obtaining the greatest and least values in $[a, b]$.

(i) Let $y = f(x)$ be a function and $c_1, c_2, \dots, c_n$ be different critical points of the function in (a, b) .

$$\text{Let } M_1 = \max\{f(c_1), f(c_2), \dots, f(c_n)\}$$

$$\text{and } M_2 = \min\{f(c_1), f(c_2), \dots, f(c_n)\}$$

Now, if $\lim_{x \rightarrow a+0 \text{ or } x \rightarrow b-0} f(x) > M_1$ or $M_2 > \lim_{x \rightarrow a+0 \text{ (and } x \rightarrow b-0)} f(x)$

$f(x)$ would not have global maximum/minimum in (a, b) . This means that the limiting values at the end points are greater than M_1 or less than M_2 , then global maximum/minimum does not exist.

(ii) If $M_1 > \lim_{x \rightarrow a+0 \text{ (and } x \rightarrow b-0)} f(x)$ and $M_2 < \lim_{x \rightarrow a+0 \text{ (and } x \rightarrow b-0)} f(x)$,

then M_1 and M_2 would respectively be the global maximum/minimum of $f(x)$ in (a, b) .

Rolle's Theorem

Let f be a real-valued function defined in the closed interval $[a, b]$, such that

- $f(x)$ is continuous in the closed interval $[a, b]$.
- $f(x)$ is differentiable in the open interval (a, b) .
- $f(a) = f(b)$, then there is some point c in the open interval (a, b) , such that $f'(c) = 0$.

Geometrically Under the assumptions of Rolle's theorem, the graph of $f(x)$ starts at point $(a, 0)$ and ends at point $(b, 0)$ as shown in figures.

The conclusion is that there is atleast one point c between a and b , such that the tangent to the graph at $\{c, f(c)\}$ is parallel to the X -axis.

Lagrange's Mean Value Theorem

Let f be a real function, continuous on the closed interval $[a, b]$ and differentiable in the open interval (a, b) . Then, there is atleast one point c in the open interval (a, b) , such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Geometrically Any chord of the curve $y = f(x)$, there is a point on the graph, where the tangent is parallel to this chord.

Practice Exercise

- If the surface area of a sphere of radius r is increasing uniformly at the rate $8 \text{ cm}^2/\text{s}$, then the rate of change of its volume is
 - constant
 - proportional to $\sqrt{r}$
 - proportional to r^2
 - proportional to r
- A kite is moving horizontally at a height of 151.5 m. If the speed of kite is 10 m/s, how fast is the string being let out, when the kite is 250 m away from the boy who is flying the kite, if the height of boy is 1.5 m?
 - 8 m/s
 - 12 m/s
 - 16 m/s
 - 19 m/s
- If the tangent at $(1, 1)$ on $y^2 = x(2-x)^2$ meets the curve again at P , is
 - $(4, 4)$
 - $(-1, 2)$
 - $(\frac{9}{4}, \frac{3}{8})$
 - None
- Line joining the points $(0, 3)$ and $(5, -2)$ is a tangent to the curve $y = \frac{ax}{1+x}$, then
 - $a = 1 \pm \sqrt{3}$
 - $a \in \phi$
 - $a = -1 \pm \sqrt{3}$
 - $a = -2 \pm 2\sqrt{3}$
- If m is the slope of a tangent to the curve $e^y = 1+x^2$, then
 - $|m| \leq 1$
 - $m > -1$
 - $m > 1$
 - $|m| > 1$
- The point on the curve $3y = 6x - 5x^3$ the normal at which it passes through the origin, is
 - $(\frac{1}{3}, 1)$
 - $(\frac{1}{3}, 1)$
 - $(2, -\frac{28}{3})$
 - $(-1, -\frac{1}{3})$
- If the normal to the curve $y^2 = 5x - 1$ at the point $(1, -2)$ is of the form $ax - 5y + b = 0$, then a and b are
 - 4, -14
 - 4, 14
 - 4, 14
 - 4, 2
- Coordinates of a point of the curve $y = x \log x$ at which the normal is parallel to the line $2x - 2y = 3$ are
 - $(0, 0)$
 - (e, e)
 - $(e^2, 2e^2)$
 - $(e^{-2}, -2e^{-2})$
- If the line $ax + by + c = 0$ is normal to curve $xy + 5 = 0$, then
 - $a + b = 0$
 - $a > 0$
 - $a < 0, b < 0$
 - $a = -2b$
- The length of subnormal to the curve $y = \frac{x}{1-x^2}$ at the point having abscissa $\sqrt{2}$ is
 - $5\sqrt{2}$
 - $3\sqrt{3}$
 - $\sqrt{3}$
 - $3\sqrt{2}$
- If the curve $y = a^x$ and $y = b^x$ intersect at angle α , then $\tan \alpha$ is equal to
 - $\frac{a-b}{1+ab}$
 - $\frac{\log a - \log b}{1 + \log a \log b}$
 - $\frac{a+b}{1-ab}$
 - $\frac{\log a + \log b}{1 - \log a \log b}$
- The parabolas $y^2 = 4ax$ and $x^2 = 4by$ intersect orthogonally at point $P(x_1, y_1)$, where $x_1, y_1 \neq 0$, then
 - $b = a^2$
 - $b = a^3$
 - $b^3 = a^2$
 - None of these
- If the curves $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ and $y^3 = 16x$ intersect at right angles, then a value of α is
 - 2
 - $\frac{4}{3}$
 - $\frac{1}{2}$
 - $\frac{3}{4}$
- The two curves $x^3 - 3xy^2 + 2 = 0$ and $3x^2y - y^3 = 2$
 - touch each other
 - cut at right angle
 - cut at an angle $\frac{\pi}{3}$
 - cut at an angle $\frac{\pi}{4}$
- If $a < 0$, the function $f(x) = e^{ax} + e^{-ax}$ is monotonically decreasing for all values of x , where
 - $x > 0$
 - $x < 0$
 - $x > 1$
 - $x < 1$
- The value of k in order that $f(x) = \sin x - \cos x - kx + b$ decreases for all real values, is given by
 - $k < 1$
 - $k > 1$
 - $k > \sqrt{2}$
 - $k < \sqrt{2}$
- The set of all x for which $\log(1+x) \leq x$ is
 - $(0, \infty)$
 - $(-1, \infty)$
 - $(-1, 0)$
 - None of these
- The function $f(x) = \sin^4 x + \cos^4 x$ increases, if
 - $0 < x < \frac{\pi}{8}$
 - $\frac{\pi}{8} < x < \frac{3\pi}{8}$
 - $\frac{3\pi}{8} < x < \frac{5\pi}{8}$
 - $\frac{5\pi}{8} < x < \frac{3\pi}{x}$
- The value of a for which the function $f(x) = (4a - 3)(x + \log 5) + 2(a - 7) \cot \frac{x}{2} \sin^2 \frac{x}{2}$ does not possess critical points is
 - $(-\infty, \frac{4}{3})$
 - $(-\infty, -1)$
 - $[1, \infty)$
 - $[2, \infty)$
- The function $f(x) = \cos x - 2px$ is monotonically decreasing for
 - $p < \frac{1}{2}$
 - $p > \frac{1}{2}$
 - $p < 2$
 - $p > 2$

21. The values of a for which the function $(a+2)x^3 - 3ax^2 + 9ax - 1 = 0$ decreases monotonically throughout for all real x , are
 a. $a < -2$ b. $a > -2$
 c. $-3 < a < 0$ d. $-\infty < a \leq -3$
22. The function $\frac{a \sin x + b \cos x}{c \sin x + d \cos x}$ is decreasing, if
 a. $ad - bc > 0$ b. $ad - bc < 0$
 c. $ab - cd > 0$ d. $0 \leq x \leq -2$
23. The length of a longest interval in which the function $3 \sin x - 4 \sin^3 x$ is increasing, is
 a. $\frac{\pi}{3}$ b. $\frac{\pi}{2}$ c. $\frac{3\pi}{2}$ d. π
24. If $f(x) = xe^{x(1-x)}$, then $f(x)$ is
 a. increasing in $\left[-\frac{1}{2}, 1\right]$
 b. decreasing in R
 c. increasing in R
 d. decreasing in $\left[-\frac{1}{2}, 1\right]$
25. How many real solutions does the equation $x^7 + 14x^5 + 16x^3 + 30x - 560 = 0$ have?
 a. 5 b. 7 c. 1 d. 3
26. The function $f(x) = 2x + \cot^{-1} x + \log_e (\sqrt{1+x^2} - x)$ is increasing in
 a. $x \in (2, 4)$ b. R c. $[2, 6]$ d. $[-3, 5]$
27. The function $f(x) = \tan x - 4x$ is strictly decreasing on
 a. $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$ b. $\left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$ c. $\left[-\frac{\pi}{3}, \frac{\pi}{2}\right]$ d. $\left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$
28. The number of solutions of the equation $x^3 + 2x^2 + 5x + 2 \cos x = 0$ in $[0, 2\pi]$ is
 a. 0 b. 1 c. 2 d. 3
29. Let $f(x) = -2x^3 + 21x^2 - 60x + 41$, then
 a. $f(x)$ is decreasing in $(-\infty, 1)$
 b. $f(x)$ is decreasing in $(-\infty, 2)$
 c. $f(x)$ is increasing in $(-\infty, 1)$
 d. $f(x)$ is increasing in $(-\infty, 2)$
30. Divide 20 into two parts such that the product of one part and the cube of the other is maximum. The two parts are
 a. (10, 10) b. (5, 15) c. (13, 7) d. None
31. The minimum value of $4e^{2x} + 9e^{-2x}$ is
 a. 11 b. 12 c. 10 d. 14
32. The maximum value of $f(x) = x + \sin 2x$, $x \in [0, 2\pi]$ is
 a. $\frac{\pi}{2}$ b. 2π c. $\frac{3\pi}{4}$ d. $\frac{3\pi}{2}$
33. The value of a for which the function $f(x) = a \sin x + \frac{1}{3} \sin 3x$ has an extremum at $x = \frac{\pi}{3}$, is
 a. 1 b. -1 c. 0 d. 2
34. The difference between the greatest and least values of the function $f(x) = \sin 2x - x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ is
 a. π b. 2π
 c. 3π d. $\frac{\pi}{2}$
35. The function $f(x) = x^2 + \frac{\lambda}{x}$ has a
 a. minimum at $x = 2$, if $\lambda = 16$
 b. minimum at $x = 2$, if $\lambda = 15$
 c. maximum for all real values of λ
 d. maximum at $x = 2$, if $\lambda = 4$
36. If the function $f(x) = \frac{ax+b}{(x-1)(x-4)}$ has a local maxima at $(2, -1)$, then
 a. $b = 1, a = 0$ b. $a = 1, b = 0$
 c. $b = -1, a = 0$ d. $a = -1, b = 0$
37. If $y = a \log x + bx^2 + x$ has its extremum value at $x = 1$ and $x = 2$, then (a, b) is equal to
 a. $\left(1, \frac{1}{2}\right)$ b. $\left(\frac{1}{2}, 2\right)$ c. $\left(2, \frac{-1}{2}\right)$ d. $\left(\frac{-2}{3}, \frac{-1}{6}\right)$
38. If the function $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$, where $a > 0$ attains its maximum and minimum at p and q respectively such that $p^2 = q$, then a is equal to
 a. 3 b. 1 c. 2 d. $\frac{1}{2}$
39. If the function $y = a \log |x| + bx^2 + x$ has its extreme values at $x = -1$ and $x = +2$, then
 a. $a = 2, b = 1$ b. $a = 2, b = -\frac{1}{2}$
 c. $b = -\frac{1}{2}, a = 3$ d. None of these
40. Let $\begin{cases} x+2 & -1 \leq x < 0 \\ 1 & x = 0 \\ \frac{x}{2} & 0 < x \leq 1 \end{cases}$
 Then, on $[-1, 1]$, this function has
 a. a minimum
 b. a maximum
 c. either a maximum or a minimum
 d. neither a maximum nor a minimum
41. If the function $f(x) = x^3 - 6x^2 + ax + b$ defined on $[1, 3]$ satisfies the Rolle's theorem for $c = \frac{2\sqrt{3}+1}{\sqrt{3}}$, then
 a. $a = 11, b = 6$ b. $a = -11, b = 6$
 c. $a = 11, b \in R$ d. None of these

42. If $3(a+2c) = 4(b+3d)$, then the equation $ax^3 + bx^2 + cx + d = 0$ will have
 a. no real solution
 b. atleast one real root in $(-1, 0)$
 c. atleast one real root in $(0, 1)$
 d. None of the above
43. The function $f(x) = x(x+3)e^{-(1/2)x}$ satisfies all the conditions of Rolle's theorem in $[-3, 0]$. The value of c is
 a. 0
 b. -1
 c. -2
 d. -3
44. If $a + b + c = 0$, then the equation $3ax^2 + 2bx + c = 0$ has
 a. atleast one real root in $(0, 1)$
 b. one root in $(-1, 0)$ and other in $(1, 2)$
 c. both imaginary roots
 d. two coincident roots
45. A value of c for which the conclusion of mean value theorem holds for the function $f(x) = \log_e x$ on the interval $[1, 3]$, is
 a. $2\log_3 e$ b. $\frac{1}{2}\log_e 3$ c. $\log_3 e$ d. $\log_e 3$
46. $x(x-2)(x-4)$, $1 \leq x \leq 4$ will satisfy mean value theorem at
 a. 1 b. 2 c. 3 d. 4
47. In the mean value theorem, $f(b) - f(a) = (b-a)f'(c)$, if $a = 4$, $b = 9$ and $f(x) = \sqrt{x}$, then the value of c is
 a. 8.00 b. 5.25 c. 4.00 d. 6.25
48. The function $f(x) = (x-3)^2$ satisfies all the conditions of mean value theorem in $[3, 4]$. A point on $y = (x-3)^2$, where the tangent is parallel to the chord joining $(3, 0)$ and $(4, 1)$ is
 a. $(\frac{7}{2}, \frac{1}{2})$ b. $(\frac{7}{2}, \frac{1}{4})$ c. $(1, 4)$ d. $(4, 1)$

BITSAT Archives

1. The value of a , so that the sum of squares of the roots of the equation $x^2 - (a-2)x - a + 1 = 0$ assume the least value, is [2014]
 a. 2 b. 0
 c. 3 d. 1
2. Function $f: (-\infty, -1] \rightarrow (0, e^5]$ defined by $f(x) = e^{x^3 - 3x + 2}$ is [2013]
 a. many-one and onto b. many-one and into
 c. one-one and onto d. one-one and into
3. If $f(x) = (\tan^{-1} x)^2 + \frac{2}{\sqrt{x^2 + 1}}$, then $f(x)$ is increasing in [2013]
 a. $(0, \infty)$ b. $(-\infty, 0)$
 c. $(-\infty, -5)$ d. None of these
4. The maximum value of $f(x) = \frac{\log x}{x}$ is [2013]
 a. 1 b. $\frac{2}{e}$ c. e d. $\frac{1}{e}$
5. What are the values of c for which Rolle's theorem for the function $f(x) = x^3 - 3x^2 + 2x$ in the interval $[0, 2]$ is verified? [2013]
 a. $c = \pm 1$ b. $c = 1 \pm \frac{1}{\sqrt{3}}$
 c. $c = \pm 2$ d. None of these
6. If the rate of change in the circumference of a circle of 0.3 cm/s, then the rate of change in the area of the circle when the radius is 5 cm, is [2012]
 a. 1.5 sq cm/s b. 0.5 sq cm/s
 c. 5 sq cm/s d. 3 sq cm/s
7. If $y = x^3 - ax^2 + 48x + 7$ is an increasing function for all real values of x , then a lies in [2012]
 a. $(-14, 14)$ b. $(-12, 12)$
 c. $(-16, 16)$ d. $(-21, 21)$
8. Rolle's theorem is not applicable for the function $f(x) = |x|$ in the interval $[-1, 1]$ because [2012]
 a. $f'(1)$ does not exist
 b. $f'(-1)$ does not exist
 c. $f(x)$ is discontinuous at $x = 0$
 d. $f'(0)$ does not exist
9. The function $f(x) = x^{1/x}$ is [2011]
 a. increasing in $(1, \infty)$
 b. decreasing in $(1, \infty)$
 c. increasing in $(1, e)$, decreasing in (e, ∞)
 d. decreasing in $(1, e)$, increasing in (e, ∞)
10. The point $(0, 5)$ is closer to the curve $x^2 = 2y$ at [2011]
 a. $(2\sqrt{2}, 0)$ b. $(0, 0)$
 c. $(2, 2)$ d. None of these
11. The intersection angle of the curve $xy = a^2$ and $x^2 - y^2 = a^2$ is [2010]
 a. $\frac{\pi}{3}$ b. $\frac{\pi}{6}$ c. $\frac{\pi}{2}$ d. $\frac{5\pi}{6}$
12. On which of the following intervals is the function $f(x) = 2x^2 - \log|x|$, $x \neq 0$ increasing? [2010]
 a. $(\frac{1}{2}, \infty)$ b. $(-\infty, -\frac{1}{2}) \cup (\frac{1}{2}, \infty)$
 c. $(-\infty, -\frac{1}{2}) \cup (0, \frac{1}{2})$ d. $(-\frac{1}{2}, 0) \cup (\frac{1}{2}, \infty)$

13. The greatest value of $f(x) = (x+1)^{1/3} - (x-1)^{1/3}$ on $[0, 1]$ is [2010]
 a. 1 b. 2 c. 3 d. $\frac{1}{3}$
14. If $f'(x) = (x-a)^{2m} (x-b)^{2n+1}$, where $m, n \in \mathbb{N}$, then [2010]
 a. $x = b$ is a point of minimum
 b. $x = b$ is a point of maximum
 c. $x = b$ is a point of inflexion
 d. None of the above
15. The equation of the normal to the curve $y^4 = ax^3$ at (a, a) is [2008]
 a. $x + 2y = 3a$ b. $3x - 4y + a = 0$
 c. $4x + 3y = 7a$ d. $4x - 3y = 0$
16. The length of the subtangent at $(2, 2)$ to the curve $x^5 = 2y^4$ is [2008]
 a. $\frac{5}{2}$ b. $\frac{8}{5}$ c. $\frac{2}{5}$ d. $\frac{5}{8}$
17. The radius of a cylinder is increasing at the rate of 3 m/s and its altitude is decreasing at the rate of 4 m/s. The rate of change of volume when radius is 4 m and altitude is 6 m, is [2007]
 a. 80π cu m/s b. 144π cu m/s
 c. 80 cu m/s d. 64 cu m/s
18. The minimum value of $2x + 3y$, when $xy = 6$ is [2007]
 a. 9 b. 12 c. 8 d. 6
19. If ST and SN are the lengths of the subtangent and the subnormal at the point $\theta = \frac{\pi}{2}$ on the curve $x = a(\theta + \sin\theta)$, $y = a(1 - \cos\theta)$, $a \neq 1$, then [2006]
 a. $ST = SN$ b. $ST = 2SN$
 c. $ST^2 = aSN^3$ d. $ST^3 = aSN$
20. If θ is the acute angle of intersection at a real point of intersection of the circle $x^2 + y^2 = 5$ and the parabola $y^2 = 4x$, the $\tan\theta$ is equal to [2006]
 a. 1 b. $\sqrt{3}$ c. 3 d. $\frac{1}{\sqrt{3}}$
21. A population $p(t)$ of 1000 bacteria introduced into nutrient medium grows according to the relation $p(t) = 1000 + \frac{1000t}{100 + t^2}$. The maximum size of the this bacterial population is [2006]
 a. 1100 b. 1250 c. 1050 d. 5250
22. Given function $f(x) = \left(\frac{e^{2x} - 1}{e^{2x} + 1} \right)$ is [2005]
 a. increasing b. decreasing
 c. even d. None of these

Answer with Solutions

Practice Exercise

1. (d) Surface area, $s = 4\pi r^2$

$$\frac{ds}{dt} = 8\pi r \cdot \frac{dr}{dt} \Rightarrow 8\pi r \cdot \frac{dr}{dt} = 8 \quad \left[\because \frac{ds}{dt} = 8 \text{ cm}^2 / \text{s} \right]$$

$$\Rightarrow \frac{dr}{dt} = \frac{1}{\pi r}$$

$$\text{Now, } V = \frac{4\pi r^3}{3}$$

$$\Rightarrow \frac{dV}{dt} = 4\pi r^2 \cdot \frac{dr}{dt} = 4\pi r^2 \cdot \frac{1}{\pi r} = 4r$$

$$\therefore \frac{dV}{dt} \propto r$$

2. (a) Let AB be the position of boy who is flying the kite and C be the position of the kite at any time t .

Let $BD = x$ and $AC = y$, then $AE = x$

Given, $AB = 1.5 \text{ m}$,
 $CD = 151.5 \text{ m}$
 $\therefore CE = 150 \text{ m}$

Given, $\frac{dx}{dt} = 10 \text{ m/s}$

Here, we have to find $\frac{dy}{dt}$, when

$y = 250 \text{ m}$

Now, from $\triangle CAE$,

$$y^2 = x^2 + 150^2$$

On differentiating, we get

$$2y \frac{dy}{dt} = 2x \frac{dx}{dt}$$

$$\frac{dy}{dt} = \frac{x}{y} \cdot \frac{dx}{dt} = \frac{x}{y} \cdot 10 \quad \dots (i)$$

$$\text{In } \triangle ACE, x = \sqrt{250^2 - 150^2} = 200 \text{ m}$$

$$[\because y = 250]$$

$$\text{From Eq. (i), } \frac{dy}{dt} = \frac{200}{250} \times 10 = 8 \text{ m/s}$$

3. (c) $y^2 = x(2-x)^2$

$$\Rightarrow y^2 = x^3 - 4x^2 + 4x \quad \dots (i)$$

$$\Rightarrow 2y \frac{dy}{dx} = 3x^2 - 8x + 4$$

$$\Rightarrow \frac{dy}{dx} = \frac{3x^2 - 8x + 4}{2y}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(1,1)} = \frac{3-8+4}{2} = -\frac{1}{2}$$

$\therefore$ The equation of the tangent at (1, 1) is

$$y - 1 = -\frac{1}{2}(x - 1)$$

$$\Rightarrow x + 2y - 3 = 0 \quad \dots(ii)$$

Solving Eqs. (i) and (ii), we get $x = \frac{9}{2}$ and $y = \frac{3}{8}$

Hence, the coordinates of P are $\left(\frac{9}{4}, \frac{3}{8}\right)$.

4. (b) Equation of line joining the points (0, 3) and (5, -2) is

$y = 3 - x$. If this line is tangent to $y = \frac{ax}{(x+1)}$, then

$(3-x)(x+1) = ax$ should have equal roots. Thus,
 $(a-2)^2 + 12 = 0 \Rightarrow$ No value of $a \Rightarrow a \in \phi$.

5. (a) We have, $e^y = 1 + x^2$

$$\Rightarrow e^y \frac{dy}{dx} = 2x \Rightarrow \frac{dy}{dx} = \frac{2x}{1+x^2}$$

$$\Rightarrow m = \frac{2x}{1+x^2}, |m| = \frac{2|x|}{1+x^2}$$

$$\therefore |x|^2 + 1 - 2|x| \geq 0 \Rightarrow (|x| - 1)^2 \geq 0$$

$$\Rightarrow |x|^2 + 1 \geq 2|x| \Rightarrow 1 \geq \frac{2|x|}{1+|x|^2}$$

$$\therefore |m| \leq 1$$

6. (a) Let the required point be (x_1, y_1) .

$$\text{Now, } 3y = 6x - 5x^3 \Rightarrow 3 \frac{dy}{dx} = 6 - 15x^2$$

$$\Rightarrow \frac{dy}{dx} = 2 - 5x^2 \Rightarrow \left(\frac{dy}{dx}\right)_{(x_1, y_1)} = 2 - 5x_1^2$$

The equation of the normal at (x_1, y_1) is

$$y - y_1 = -\frac{1}{2 - 5x_1^2}(x - x_1)$$

$$0 - y_1 = -\frac{1}{2 - 5x_1^2}(0 - x_1)$$

$$\Rightarrow -y_1 = \frac{-x_1}{2 - 5x_1^3} \quad \dots(i)$$

Since, (x_1, y_1) lies on the given curve. Therefore,

$$3y_1 = 6x_1 - 5x_1^3 \quad \dots(ii)$$

Solving Eqs. (i) and (ii), we get

$$x_1 = 1 \text{ and } y_1 = \frac{1}{3}$$

Hence, the required point is $\left(1, \frac{1}{3}\right)$.

7. (a) We have,

$$y^2 = 5x - 1 \quad \dots(i)$$

$$\text{At } (1, -2), \frac{dy}{dx} = \left(\frac{5}{2y}\right)_{(1, -2)} = \frac{-5}{4}$$

$\therefore$ Equation of normal at the point (1, -2) is

$$[y - (-2)] \left(\frac{-5}{4}\right) + x - 1 = 0$$

$$\therefore 4x - 5y - 14 = 0 \quad \dots(ii)$$

As the normal is of the form

$$ax - 5y + b = 0$$

On comparing this with Eq. (ii), we get

$$a = 4 \text{ and } b = -14$$

8. (a) Hint $y = x \log x \Rightarrow \frac{dy}{dx} = 1 + \log x$

$$\text{The slope of the normal} = -\frac{1}{(dy/dx)} = \frac{-1}{1 + \log x}$$

The slope of the line $2x - 2y = 3$ is 1.

$$\therefore \frac{-1}{1 + \log x} = 1$$

9. (c) The curve, $xy = -5 < 0$

$$\Rightarrow x \frac{dy}{dx} + y = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-y}{x} > 0 \quad [\because xy = -5 < 0]$$

$$\text{Slope of normal} = \frac{-1}{\frac{dy}{dx}} = \frac{x}{y} < 0 \quad [\because xy = -5 < 0]$$

Hence, slope of normal will be negative.

The line $ax + by + c = 0$

$$\Rightarrow by = -ax - c \Rightarrow y = \frac{-a}{b}x - \frac{c}{b}$$

Slope of normal $\frac{-a}{b}$ is negative.

$$\Rightarrow \frac{-a}{b} < 0 \Rightarrow \frac{a}{b} > 0$$

$$\Rightarrow a > 0, b > 0 \text{ or } a < 0, b < 0$$

10. (d) Given, $y = \frac{x}{1-x^2}$

At $x = \sqrt{2}$, $y = -\sqrt{2}$ point is $(\sqrt{2}, -\sqrt{2})$.

$$\therefore \frac{dy}{dx} = \frac{1+x^2}{(1-x^2)^2}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{\text{at } (\sqrt{2}, -\sqrt{2})} = \frac{1+2}{(1-2)^2} = 3 = m \quad [\text{say}]$$

$$\text{Equation of normal, } y + \sqrt{2} = -\frac{1}{3}(x - \sqrt{2})$$

It intersects X-axis at $N(-2\sqrt{2}, 0)$.

Length of subnormal, $MN = 3\sqrt{2}$

11. (b) Clearly, the point of intersection of curves is (0, 1).

Now, slope of tangent of first curve,

$$m_1 = \frac{dy}{dx} = a^x \log a \Rightarrow \left(\frac{dy}{dx}\right)_{(0,1)} = m_1 = \log a$$

Slope of tangent of second curve,

$$m_2 = \frac{dy}{dx} = b^x \log b$$

$$\Rightarrow m_2 = \left(\frac{dy}{dx} \right)_{(0,1)} = \log b$$

$$\therefore \tan \alpha = \frac{m_1 - m_2}{1 + m_1 m_2} = \frac{\log a - \log b}{1 + \log a \log b}$$

12. (d)

13. (b) Slope of the curve $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ is $m_1 = \frac{-4x}{\alpha y}$.

Now, slope of the curve $y^3 = 16x$ is $m_2 = \frac{16}{3y^2}$.

Now, apply the condition of perpendicularity of two curves, i.e.

$$m_1 \cdot m_2 = -1$$

and get $\alpha = \frac{4}{3}$ with the help of equation of curves.

14. (b) Differentiating first equation of the curve, we have

$$3x^2 - 3y^2 - 6xy \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^2 - y^2}{2xy} = m_1 \quad [\text{say}]$$

and differentiating second equation of the curve gives

$$6xy + 3x^2 \frac{dy}{dx} - 3y^2 \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-2xy}{x^2 - y^2} = m_2 \quad [\text{say}]$$

$$\text{Since, } m_1 \cdot m_2 = -1$$

So, the two curves cut at right angle.

15. (b) Hint $f'(x) = ae^{ax} - ae^{-ax} = a[e^{ax} - e^{-ax}]$

Since, $f(x)$ is decreasing for all values of x .

$$\therefore f'(x) < 0$$

16. (c) $f(x) = \sin x - \cos x - kx + b$

$$f'(x) = \cos x + \sin x - k$$

For decreasing function, put $f'(x) < 0$

$$\text{So, } \cos x + \sin x - k < 0$$

$\therefore$ Maximum value of $\cos x + \sin x$ is $\sqrt{2}$.

$$\Rightarrow \sqrt{2} - k < 0 \Rightarrow k > \sqrt{2}$$

17. (b) Let $f(x) = \log(1+x) - x$

Clearly, $f(x)$ is defined for $x > -1$

$$\text{Now, } f(x) = \log(1+x) - x \Rightarrow f'(x) = \frac{1}{1+x} - 1 = \frac{-x}{1+x}$$

$$\Rightarrow f'(x) < 0 \text{ for } x > 0$$

$$\text{and } f'(x) > 0 \text{ for } -1 < x < 0$$

$\Rightarrow f(x)$ is decreasing on $[0, \infty)$ and increasing on $(-1, 0)$

$$\Rightarrow f(x) \leq f(0) \text{ for } 0 \leq x < \infty$$

$$\text{and } f(x) \leq f(0) \text{ for } -1 < x < 0$$

$$\Rightarrow f(x) \leq f(0) \text{ for } -1 < x < \infty$$

$$\Rightarrow \log(1+x) - x \leq 0 \text{ for } -1 < x < \infty$$

$$\Rightarrow \log(1+x) \leq x \text{ for } x \in (-1, \infty)$$

18. (b) $y = f(x) = \sin^4 x + \cos^4 x$

$$\therefore \frac{dy}{dx} = 4 \sin^3 x \cos x - 4 \cos^3 x \sin x$$

$$= 4 \sin x \cos x (\sin^2 x - \cos^2 x) = -\sin 4x$$

If $4x$ lies between π and 2π , $\sin 4x$ is negative, i.e. if x lies between $\frac{\pi}{4}$ and $\frac{\pi}{2}$, $\sin 4x$ is negative, so that $\frac{dy}{dx} > 0$.

$$\therefore f(x) \text{ increases, if } \frac{\pi}{4} < x < \frac{\pi}{2}$$

$$\therefore f(x) \text{ increases, if } \frac{\pi}{8} < x < \frac{3\pi}{8}$$

19. (d) We have,

$$f(x) = (4a-3)(x + \log 5) + 2(a-7) \cot \frac{x}{2} \sin^2 \frac{x}{2}$$

$$= (4a-3)(x + \log 5) + (a-7) \sin x$$

$$\therefore f'(x) = (4a-3) + (a-7) \cos x$$

If $f(x)$ does not have critical points, then

$f'(x) = 0$ does not have any solution in R .

$$\text{Now, } f'(x) = 0 \Rightarrow \cos x = \frac{4a-3}{7-a}$$

$$\left| \frac{4a-3}{7-a} \right| \leq 1 \Rightarrow -1 \leq \frac{4a-3}{7-a} \leq 1$$

$$\Rightarrow a-7 \leq 4a-3 \leq 7-a \Rightarrow a \geq -\frac{4}{3} \text{ or } a \leq 2$$

Thus, $f'(x) = 0$ has solutions in R , if

$$a \geq -\frac{4}{3} \text{ or } a \leq 2$$

So, $f'(x) = 0$ is not solution in R , if

$$a < -\frac{4}{3} \text{ or } a > 2$$

$$\text{i.e. } a \in \left(-\infty, -\frac{4}{3} \right) \cup (2, \infty)$$

20. (b) $f(x)$ will be monotonically decreasing, if $f'(x) < 0$.

$$\Rightarrow f'(x) = -\sin x - 2p < 0$$

$$\Rightarrow \frac{1}{2} \sin x + p > 0$$

$$\Rightarrow p > \frac{1}{2} \quad [\because -1 \leq \sin x \leq 1]$$

21. (d) Let $f(x) = (a+2)x^3 - 3ax^2 + 9ax - 1$ decreases monotonically for all $x \in R$, then $f'(x) \leq 0$ for all $x \in R$.

$$\Rightarrow 3(a+2)x^2 - 6ax + 9a \leq 0, \forall x \in R$$

$$\Rightarrow (a+2)x^2 - 2ax + 3a \leq 0, \forall x \in R$$

$$\Rightarrow a+2 < 0 \text{ and discriminant } \leq 0$$

$$\Rightarrow a < -2, -8a^2 - 24a \leq 0$$

$$\Rightarrow a < -2 \text{ and } a(a+3) \geq 0$$

$$\Rightarrow a < -2, a \leq -3 \text{ or } a \geq 0$$

$$\Rightarrow a \leq -3$$

$$\therefore -\infty < a \leq -3$$

22. (b) Let $y = \frac{a \sin x + b \cos x}{c \sin x + d \cos x}$

The function will be decreasing when $\frac{dy}{dx} < 0$.

$$\therefore \frac{(c \sin x + d \cos x)(a \cos x - b \sin x) - (a \sin x + b \cos x)(c \cos x - d \sin x)}{(c \sin x + d \cos x)^2} < 0$$

$$\begin{aligned} &\Rightarrow ac \sin x \cos x - bc \sin^2 x + ad \cos^2 x - bd \sin x \cos x \\ &- ac \sin x \cos x + ad \sin^2 x - bc \cos^2 x + bd \sin x \cos x < 0 \\ &\Rightarrow ad (\sin^2 x + \cos^2 x) - bc (\sin^2 x + \cos^2 x) < 0 \\ &\therefore (ad - bc) < 0 \end{aligned}$$

23. (a) Let $f(x) = \sin 3x$

Thus, $\sin x$ is increasing in $-\frac{\pi}{2}$ to $\frac{\pi}{2}$ is of length π .

Hence, the length of largest interval in which $f(x) = \sin 3x$ is increasing, is $\frac{\pi}{3}$.

24. (a) $f'(x) = e^{x(1-x)} + xe^{x(1-x)}(1-2x)$
 $= e^{x(1-x)}(1+x-2x^2) = -e^{x(1-x)}(x-1)(2x+1)$

Hence, $f(x)$ is increasing in $\left[-\frac{1}{2}, 1\right]$.

25. (c) Let $f(x) = x^7 + 14x^5 + 16x^3 + 30x - 560$

$$\Rightarrow f'(x) = 7x^6 + 70x^4 + 48x^2 + 30 > 0, \forall x \in R$$

Since, $f(x)$ is increasing.

So, $f(x) = 0$ has only one solution.

26. (b) Given that, $f(x) = 2x + \cot^{-1} x + \log_e(\sqrt{1+x^2} - x)$

$$\begin{aligned} \Rightarrow f'(x) &= 2 - \frac{1}{1+x^2} + \frac{1}{\sqrt{1+x^2}-x} \left(\frac{2x}{2\sqrt{1+x^2}} - 1 \right) \\ &= 2 - \frac{1}{1+x^2} + \frac{x - \sqrt{1+x^2}}{(\sqrt{1+x^2}-x) \cdot \sqrt{1+x^2}} \\ &= 2 - \frac{1}{1+x^2} - \frac{1}{\sqrt{1+x^2}} = \frac{2x^2+1}{1+x^2} - \frac{1}{\sqrt{1+x^2}} \\ &= \frac{(2x^2+1) - \sqrt{1+x^2}}{(1+x^2)} \end{aligned}$$

So, $f'(x) \geq 0$ for all real values of x .

Hence, $f(x) = 2x + \cot^{-1} x + \log_e(\sqrt{1+x^2} - x)$ is increasing in R .

27. (a) Given, $f(x) = \tan x - 4x \Rightarrow f'(x) = \sec^2 x - 4$

When $-\frac{\pi}{3} < x < \frac{\pi}{3}$, then $1 < \sec x < 2$

Therefore, $1 < \sec^2 x < 4 \Rightarrow -3 < (\sec^2 x - 4) < 0$

Thus, for $-\frac{\pi}{3} < x < \frac{\pi}{3}$, $f'(x) < 0$

Hence, f is strictly decreasing on $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$.

28. (a) Given, $f(x) = x^3 + 2x^2 + 5x + 2 \cos x$

$$\Rightarrow f'(x) = 3x^2 + 4x + 5 - 2 \sin x$$

$$\text{Least value of } 3x^2 + 4x + 5, \left(\frac{-D}{4a}\right) = -\frac{(4)^2 - 4(3)(5)}{4(3)} = \frac{11}{3}$$

and $-2 \sin x \in [-2, 2] \therefore f'(x) > 0, \forall x \in R$
 $\Rightarrow f(x)$ is strictly increasing function, also $f(0) = 2$.

Thus, $f(x) \neq 0, \forall x \in R$

So, number of root is zero.

29. (b) Given, $f(x) = -2x^3 + 21x^2 - 60x + 41$... (i)

On differentiating Eq. (i) w.r.t. x , we get

$$f'(x) = -6x^2 + 42x - 60$$

$$= -6(x^2 - 7x + 10) = -6(x-2)(x-5)$$

If $x < 2$, $f'(x) < 0$, i.e. $f(x)$ is decreasing, then $f'(x) < 0$ for $x < 2$.

30. (b) Let one part be x and other part be $(20-x)$.

$$\text{So, } P = (20-x)x^3 = 20x^3 - x^4$$

$$\Rightarrow \frac{dP}{dx} = 60x^2 - 4x^3 = 4x^2(15-x)$$

$$\Rightarrow \frac{d^2P}{dx^2} = 120x - 12x^2 = 12x(10-x)$$

For maximum or minimum value of P , put $\frac{dP}{dx} = 0$

$$\Rightarrow 4x^2(15-x) = 0 \Rightarrow x = 0 \text{ and } x = 15$$

$\therefore x = 0$ is not possible.

$$\begin{aligned} \left(\frac{d^2P}{dx^2}\right)_{\text{at } x=15} &= 12 \times 15(10-15) = 12 \times 15 \times (-5) \\ &= \text{Negative value} \end{aligned}$$

$\Rightarrow$ At $x = 15$, P is maximum.

Other part is $20 - 15 = 5$

$\therefore$ Two part of 20 is (5, 15).

31. (b) Let $f(x) = 4e^{2x} + 9e^{-2x}$

$$\therefore f'(x) = 8e^{2x} - 18e^{-2x}$$

Put $f'(x) = 0$

$$\Rightarrow 8e^{2x} - 18e^{-2x} = 0$$

$$\Rightarrow e^{2x} = 3/2$$

$$\Rightarrow x = \log(3/2)^{1/2}$$

$$\text{Again, } f''(x) = 16e^{2x} + 36e^{-2x} > 0$$

$$\begin{aligned} \text{Now, } f(\log(3/2)^{1/2}) &= 4e^{2[\log(3/2)]^{1/2}} + 9e^{-2[\log(3/2)]^{1/2}} \\ &= 4 \times \frac{3}{2} + 9 \times \frac{2}{3} = 6 + 6 = 12 \end{aligned}$$

Hence, the minimum value is 12.

32. (b) Given, $f(x) = x + \sin 2x$

$$\Rightarrow f'(x) = 1 + 2 \cos 2x$$

$$\Rightarrow f'(x) = 0 \Rightarrow 1 + 2 \cos 2x = 0$$

$$\Rightarrow \cos 2x = -\frac{1}{2} \Rightarrow 2x = 2m\pi \pm \frac{2\pi}{3}$$

$$\Rightarrow x = m\pi \pm \frac{\pi}{3} \Rightarrow x = \frac{4\pi}{3}, \frac{2\pi}{3}, \frac{5\pi}{3}$$

$$\text{Find } f(0), f\left(\frac{2\pi}{3}\right), f\left(\frac{4\pi}{3}\right), f\left(\frac{5\pi}{3}\right), f(2\pi)$$

$$\Rightarrow f(0) = 0, f\left(\frac{2\pi}{3}\right) = \frac{2\pi}{3} - 0.8$$

$$\Rightarrow f\left(\frac{4\pi}{3}\right) = \frac{4\pi}{3} + 0.8, f\left(\frac{5\pi}{3}\right) = \frac{5\pi}{3} - 0.8$$

$$\Rightarrow f(2\pi) = 2\pi + 0 = 2\pi$$

$\therefore$ Maximum value of $f(x) = 2\pi$

33. (d) Hint Now, $f'(x) = a \cos x + \frac{1}{3}(3 \cos 3x)$

put $f'\left(\frac{\pi}{3}\right) = 0$

34. (a)

35. (a) Given, $f(x) = x^2 + \frac{\lambda}{x} \Rightarrow f'(x) = 2x - \frac{\lambda}{x^2}$

$\therefore f'(x) = 0$

$2x - \frac{\lambda}{x^2} = 0 \Rightarrow x = \left(\frac{\lambda}{2}\right)^{1/3}$

If $\lambda = 16$, then $x = 2$

Now, $f''(x) = 2 + \frac{2\lambda}{x^3}$

If $\lambda = 16$, $f''(x) > 0$, i.e. $f(x)$ has a minimum at $x = 2$.

Also, $f''\left\{\left(\frac{\lambda}{2}\right)^{1/3}\right\} = 2 + \frac{2\lambda}{\lambda} = 2 + 4 > 0$

Hence, $f(x)$ has maximum for no real value of λ .

So, $f''(x) > 0$ for all real values of λ .

36. (b) Clearly, $f(2) = -1$

$\Rightarrow -1 = \frac{2a+b}{(2-1)(2-4)} \Rightarrow 2a+b=2$

Now, $f'(x) = \frac{4a+5b-2bx-ax^2}{(x-1)^2(x-4)^2}$, $f'(2) = 0$

$\Rightarrow b=0 \Rightarrow a=1$

$\Rightarrow f'(x) = -\frac{(x-2)(x+2)}{(x-1)^2(x-4)^2}$

Clearly, for $x > 2$, $f'(x) < 0$ and for $x < 2$, $f'(x) > 0$. Thus, $x = 2$ is indeed the point of local maxima for $y = f(x)$.

37. (d) Hint $\frac{dy}{dx} = \frac{a}{x} + 2bx + 1$

$\Rightarrow \left(\frac{dy}{dx}\right)_{x=1} = a + 2b + 1 = 0$

$\Rightarrow a = -2b - 1$

and $\left(\frac{dy}{dx}\right)_{x=2} = \frac{a}{2} + 4b + 1 = 0$

38. (c) $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$

$\Rightarrow f'(x) = 6x^2 - 18ax + 12a^2$

$\Rightarrow f''(x) = 12x - 18a$

For maximum and minimum, put $f'(x) = 0$.

$\therefore 6x^2 - 18ax + 12a^2 = 0$

$\Rightarrow x^2 - 3ax + 2a^2 = 0$

$\Rightarrow x = a \text{ or } x = 2a$

At $x = a$ maximum and at $x = 2a$ minimum.

$\therefore p^2 = q$

$\therefore a^2 = 2a \Rightarrow a = 2 \text{ or } a = 0$

But $a > 0$, therefore $a = 2$.

39. (b) Given, $f(x) \equiv y = a \log|x| + bx^2 + x$... (i)

On differentiating Eq.(i) w.r.t. x , we get

$$\frac{dy}{dx} = \frac{a}{x} + 2bx + 1$$

For extremum values, $\frac{dy}{dx} = 0$

$\therefore \frac{a}{-1} + 2b(-1) + 1 = 0$

$\Rightarrow a + 2b - 1 = 0$... (ii)

and $\frac{a}{2} + 2b(2) + 1 = 0$

$\Rightarrow a + 8b + 2 = 0$... (iii)

From Eqs. (ii) and (iii), we get $a = 2$ and $b = -\frac{1}{2}$

40. (d) $f'(x) = 1$, if $-1 \leq x < 0$

$$L'f'(0) = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^-} \frac{x + 2 - 1}{x} = \lim_{x \rightarrow 0^-} \left(1 + \frac{1}{x}\right)$$

which does not exist.

$\therefore f'(0)$ does not exist.

Again $f'(x) = \frac{1}{2}$ when $0 < x \leq 1$

In all the cases, $f'(x) \neq 0$ for any $x \in [-1, 1]$

$\therefore f(x)$ has neither a maximum nor a minimum.

41. (c) Since, $f(x)$ satisfies conditions of Rolle's theorem on $[1, 3]$.

$\therefore f(1) = f(3)$

$\therefore 1 - 6 + a + b = 27 - 54 + 3a + b$

$\Rightarrow 2a = 22 \text{ or } a = 11$

Since, $f(1) = f(3)$ is independent of b .

$\therefore a = 11 \text{ and } b \in R$

42. (b) Let $f(x) = \frac{ax^4}{4} + \frac{bx^3}{3} + \frac{cx^2}{2} + dx$

which is continuous and differentiable.

Then, $f(0) = 0$ and $f(-1) = \frac{a}{4} - \frac{b}{3} + \frac{c}{2} - d$

$$= \frac{1}{4}(a + 2c) - \frac{1}{3}(b + 3d) = 0$$

So, by Rolle's theorem, there exists atleast one real root of $f'(x) = 0$ in $(-1, 0)$.

43. (c) To determine c in Rolle's theorem, $f'(c) = 0$.

Here, $f'(x) = (x^2 + 3x)e^{-(1/2)x} \left(-\frac{1}{2}\right) + (2x + 3)e^{-(1/2)x}$

$$= e^{-(1/2)x} \left\{-\frac{1}{2}(x^2 + 3x) + 2x + 3\right\}$$

$$= -\frac{1}{2}e^{-(x/2)}(x^2 - x - 6)$$

$\therefore f'(c) = 0 \Rightarrow c^2 - c - 6 = 0 \Rightarrow c = 3, -2$

$\therefore c = 3 \notin [-3, 0]$

$\therefore c = -2$

44. (a) Let $f(x) = ax^3 + bx^2 + cx$ in $[0, 1]$

Apply Rolle's theorem on $f(x)$ in $[0, 1]$

$\therefore f(x)$ has atleast one real root in $(0, 1)$

45. (a) Using mean value theorem,

$$f'(c) = \frac{f(3) - f(1)}{3 - 1} \Rightarrow \frac{1}{c} = \frac{\log_e 3 - \log_e 1}{3 - 1}$$

$$\therefore c = \frac{2}{\log_e 3} = 2 \log_3 e$$

46. (c) **Hint** $f(x) = x^3 - 6x^2 + 8x \Rightarrow f'(x) = 3x^2 - 12x + 8$

Since, polynomial function is everywhere continuous and differentiable, therefore $f(x)$ is continuous on $(1, 4)$ and differentiable on $(1, 4)$. Both conditions of mean value theorem are satisfied, therefore there exists atleast one number $c \in (1, 4)$ such that

$$f'(c) = \frac{f(4) - f(1)}{4 - 1}$$

47. (d) $\therefore f(x) = \sqrt{x}$

$$\therefore f(a) = \sqrt{4} = 2$$

$$f(b) = \sqrt{9} = 3, f'(x) = \frac{1}{2\sqrt{x}}$$

$$\text{Also, } f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{3 - 2}{9 - 4} = \frac{1}{5}$$

$$\therefore \frac{1}{2\sqrt{c}} = \frac{1}{5}$$

$$\Rightarrow c = \frac{25}{4} = 6.25$$

48. (b) **Hint** Let the point be (x_1, y_1) .

$$\text{Therefore, } y_1 = (x_1 - 3)^2 \quad \dots(i)$$

Now, slope of the tangent at (x_1, y_1) is $2(x_1 - 3)$ but it is equal to 1.

$$\text{Therefore, } 2(x_1 - 3) = 1$$

BITSAT Archives

1. (d) Let α and β be the roots of the equation

$$x^2 - (a - 2)x - a + 1 = 0$$

$$\therefore \alpha + \beta = a - 2 \text{ and } \alpha\beta = -(a - 1)$$

$$\begin{aligned} \text{Let } s &= \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta \\ &= (a - 2)^2 + 2(a - 1) \\ &= a^2 - 4a + 4 + 2a - 2 = a^2 - 2a + 2 \end{aligned}$$

$$\text{Now, } \frac{ds}{da} = 2a - 2$$

For maximum and minimum, $ds / da = 0$

$$\Rightarrow 2a - 2 = 0 \Rightarrow a = 1$$

$$\text{Also, } \frac{d^2s}{da^2} = 2 > 0$$

Hence, at $a = 1$, s will have minimum value.

2. (d) We have, $f(x) = e^{x^3 - 3x + 2}$

$$\text{Let } h(x) = x^3 - 3x + 2$$

$$\therefore h'(x) = 3x^2 - 3 = 3(x^2 - 1)$$

$$\Rightarrow h'(x) \geq 0 \text{ for } x \in (-\infty, -1]$$

$\therefore f(x)$ is an increasing function.

$\therefore f(x)$ is one-one.

$$\text{Now, range of } f(x) = (0, e^4]$$

$$\text{But codomain of } f(x) = (0, e^5]$$

$\therefore f(x)$ is an into function.

3. (a) $f(x) = (\tan^{-1} x)^2 + \frac{2}{\sqrt{x^2 + 1}}$

$$\Rightarrow f'(x) = \frac{2}{1 + x^2} \left[\tan^{-1} x - \frac{x}{\sqrt{1 + x^2}} \right]$$

$$\text{Let } g(x) = \tan^{-1} x - \frac{x}{\sqrt{x^2 + 1}}$$

$$\Rightarrow g'(x) = \frac{1}{1 + x^2} \left[1 - \frac{1}{\sqrt{x^2 + 1}} \right] > 0, \forall x \in R$$

$\Rightarrow g(x)$ is increasing, $\forall x \in R$.

$$\text{But } g(0) = 0$$

$$\Rightarrow g(x) > 0 \text{ for } x > 0$$

$$\text{So, } f'(x) > 0 \text{ for } x > 0$$

Hence, $f(x)$ is increasing in $(0, \infty)$.

4. (d) For maximum value, find $f'(x)$.

$$f'(x) = \frac{1}{x^2} (1 - \log x)$$

$$f'(x) > 0 \text{ for } x < e \text{ and } f'(x) < 0 \text{ for } x > e$$

$\Rightarrow f(x)$ is increasing for $x < e$ and decreasing for $x > e$

$\Rightarrow x = e$ is the point of local maxima.

$$\therefore \text{Maximum value of } f(x) = \frac{1}{e}$$

5. (b) Here, we observe that

(i) $f(x)$ is a polynomial, so it is continuous in the interval $[0, 2]$.

(ii) $f'(x) = 3x^2 - 6x + 2$ exists for all $x \in (0, 2)$.

So, $f(x)$ is differentiable for all $x \in (0, 2)$

$$(iii) f(0) = 0, f(2) = 2^3 - 3(2)^2 + 2(2) = 0$$

$$\therefore f(0) = f(2)$$

Thus, all the three conditions of Rolle's theorem are satisfied.

So, there must exist $c \in (0, 2)$ such that $f'(c) = 0$

$$\Rightarrow f'(c) = 3c^2 - 6c + 2 = 0$$

$$\Rightarrow c = 1 \pm \frac{1}{\sqrt{3}} \Rightarrow c \in (0, 2)$$

6. (a) Circumference of circle, $C = 2\pi r$

$$\Rightarrow \frac{dC}{dt} = 2\pi \frac{dr}{dt}$$

$$\Rightarrow \frac{0.3}{2\pi} = \frac{dr}{dt} \quad \left[\because \frac{dC}{dt} = 0.3 \text{ cm/s, given} \right]$$

$$\text{Now, } A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r \frac{dr}{dt}$$

$$\Rightarrow \frac{dA}{dt} = r \times 0.3$$

$$\Rightarrow \left[\frac{dA}{dt} \right]_{r=5} = 5 \times 0.3 = 1.5 \text{ sq cm/s}$$

7. (b) $\frac{dy}{dx} = 3x^2 - 2ax + 48 > 0$ [$\because y$ is an increasing function]

$$\therefore \text{Discriminant, } D < 0$$

$$\Rightarrow 4a^2 - 4 \times 3 \times 48 < 0$$

$$\Rightarrow a^2 - 144 < 0$$

$$\Rightarrow a \in (-12, 12)$$

8. (d) Rolle's theorem is not applicable for the function

$$f(x) = |x| \text{ in } [-1, 1]$$

$$\because f'(0) \text{ does not exist.}$$

9. (c) Let $y = x^{1/x}$

$$\Rightarrow \log y = \frac{\log x}{x} \Rightarrow \frac{1}{y} \frac{dy}{dx} = \frac{1}{x^2} - \frac{\log_e x}{x^2}$$

$$\Rightarrow \frac{dy}{dx} = x^{1/x} \left(\frac{1 - \log_e x}{x^2} \right)$$

$$\text{For } 1 < x < \infty, x^{1/x} > 0$$

$$\text{and } \frac{1 - \log_e x}{x^2} > 0 \text{ in } (1, e) \text{ and } \frac{1 - \log_e x}{x^2} < 0 \text{ in } (e, \infty)$$

$$\text{Hence, } f(x) \text{ is increasing in } (1, e) \text{ and decreasing in } (e, \infty).$$

10. (d) Let any point on the curve be (h, k) .

$$\text{Then, } h^2 = 2k$$

$$\therefore \text{Distance, } D = \sqrt{h^2 + (k - 5)^2}$$

$$\Rightarrow D = \sqrt{2k + (k - 5)^2}$$

$$\Rightarrow \frac{dD}{dk} = \frac{1}{2\sqrt{2k + (k - 5)^2}} \times \{2 + 2(k - 5)\} = 0$$

$$\text{Then, point will be } (\pm 2\sqrt{2}, 4).$$

11. (c) $xy = a^2$

$$\therefore x \frac{dy}{dx} + y = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$$

$$\therefore \left(\frac{dy}{dx} \right)_1 = -\frac{y}{x}$$

$$x^2 - y^2 = 2a^2 \Rightarrow 2x - 2y \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{x}{y}$$

$$\therefore \left(\frac{dy}{dx} \right)_2 = \frac{x}{y}$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_1 \times \left(\frac{dy}{dx} \right)_2 = -\frac{y}{x} \times \frac{x}{y} = -1$$

$$\therefore \text{Intersection angle} = \frac{\pi}{2}$$

12. (d) $f(x) = 2x^2 - \log|x|$

$$= \begin{cases} 2x^2 - \log x, & x > 0 \\ 2x^2 - \log(-x), & x < 0 \end{cases}$$

$$\Rightarrow f'(x) = 4x - \frac{1}{x}, \forall x \neq 0$$

$$\text{For } f(x) \text{ to be increasing,}$$

$$f'(x) > 0 \Rightarrow 4x - \frac{1}{x} > 0$$

$$\Rightarrow \frac{4x^2 - 1}{x} > 0 \Rightarrow \frac{(2x - 1)(2x + 1)}{x} > 0$$

$$\Rightarrow x \in \left(-\frac{1}{2}, 0 \right) \cup \left(\frac{1}{2}, \infty \right)$$

13. (b) We have, $f(x) = (x + 1)^{1/3} - (x - 1)^{1/3}$

$$\therefore f'(x) = \frac{1}{3} \left[\frac{1}{(x + 1)^{2/3}} - \frac{1}{(x - 1)^{2/3}} \right]$$

$$= \frac{(x - 1)^{2/3} - (x + 1)^{2/3}}{3(x^2 - 1)^{2/3}}$$

$$\text{Clearly, } f'(x) \text{ does exist at } x = \pm 1.$$

$$\therefore f'(x) = 0 \Rightarrow (x - 1)^{2/3} = (x + 1)^{2/3}$$

$$\Rightarrow x = 0$$

$$\text{Clearly, } f'(x) \neq 0 \text{ for any other value of } x \in [0, 1]. \text{ The value of } f(x) \text{ at } x = 0 \text{ is } 2.$$

$$\text{Hence, the greatest value of } f(x) \text{ is } 2.$$

14. (a) We have, $f'(x) = (x - a)^{2n} (x - b)^{2m+1}$

$$\therefore f'(x) = 0 \Rightarrow x = a, b$$

$$\text{Now, for } x = b - h$$

$$f'(x) = (b - h - a)^{2n} (-h)^{2m+1} < 0$$

$$\text{and for } n = b + h,$$

$$f'(x) = (b + h - a)^{2n} h^{2m+1} > 0$$

$$\text{Thus, as } x \text{ passes through } b, f'(x) \text{ changes sign from negative to positive. Hence, } x = b \text{ is a point of minimum.}$$

15. (c) Hint $4y^3 \frac{dy}{dx} = 3ax^2$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{(a, a)} = \frac{3a^3}{4a^3} = \frac{3}{4}$$

16. (b) Hint Length of subtangent $= \frac{y}{\frac{dy}{dx}} = \frac{2}{\frac{5}{4}} = \frac{8}{5}$

17. (a) Let h and r be the height and radius of cylinder.

$$\text{Given that, } \frac{dr}{dt} = 3 \text{ m/s} \Rightarrow \frac{dh}{dt} = -4 \text{ m/s}$$

$$\text{Also, } V = \pi r^2 h$$

$$\text{On differentiating w.r.t. } t, \text{ we get}$$

$$\frac{dV}{dt} = \pi \left[r^2 \frac{dh}{dt} + h \cdot 2r \frac{dr}{dt} \right]$$

$$\text{At } r = 4 \text{ m and } h = 6 \text{ m,}$$

$$\frac{dV}{dt} = \pi [-64 + 144]$$

$$= 80\pi \text{ cu m/s}$$

18. (b) **Hint** $f'(x) = 2 - \frac{18}{x^2}$

For maximum or minima, put $f'(x) = 0$

$$\Rightarrow x = \pm 3 \text{ and } f''(3) = \frac{36}{3^3} > 0, \text{ minimum}$$

19. (a) **Hint**

$$\Rightarrow \frac{dx}{d\theta} = a(1 + \cos\theta) \text{ and } \frac{dy}{d\theta} = a \sin\theta$$

$$\frac{dy}{dx} = \tan \frac{\theta}{2}$$

$$\text{Now, length of subtangent} = \left| \frac{y}{dy/dx} \right|_{\theta=\frac{\pi}{2}}$$

$$\text{and length of subnormal} = \left| y \frac{dy}{dx} \right|_{\theta=\frac{\pi}{2}}$$

20. (c) **Hint** The point of intersection of give curves are (1, 2) and (1, -2).

$$\text{Now, } 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

$$\therefore m_1 = \left(\frac{dy}{dx} \right)_{(1,2)} = -\frac{1}{2}$$

$$\text{And } 2y \frac{dy}{dx} = 4 \Rightarrow \frac{dy}{dx} = \frac{2}{y}, m_2 = \left(\frac{dy}{dx} \right)_{(1,2)} = \frac{2}{2} = 1$$

21. (c) $p(t) = 1000 + \frac{1000t}{100 + t^2}$... (i)

On differentiating both sides w.r.t. t , we get

$$\begin{aligned} p'(t) &= 0 + \frac{(100 + t^2)(1000) - 1000t(2t)}{(100 + t^2)^2} \\ &= 1000 \frac{(100 - t^2)}{(100 + t^2)^2} \end{aligned} \quad \dots (ii)$$

For maxima or minima, put $p'(t) = 0$

$$\Rightarrow 100 - t^2 = 0$$

$$\Rightarrow t = \pm 10$$

Again differentiating Eq. (ii) w.r.t. x , we get

$$\begin{aligned} p''(t) &= 1000 \times \left[\frac{(100 + t^2)^2(-2t) - (100 - t^2)2(100 + t^2)2t}{(100 + t^2)^4} \right] \\ &= 1000t \frac{[(100 + t^2)(-2) - (100 - t^2)(4)]}{(100 + t^2)^3} \\ &= -1000t \frac{[600 - 2t^2]}{(100 + t^2)^3} \end{aligned}$$

At $t = 10$, $p''(t) < 0$

$\therefore$ The maximum value is

$$\begin{aligned} p(10) &= 1000 + \frac{10000}{100 + 100} \\ &= 1000 + \frac{10000}{200} \\ &= 1000 + 50 \\ &= 1050 \end{aligned}$$

22. (a) Given that, $f(x) = \frac{e^{2x} - 1}{e^{2x} + 1}$

On differentiating w.r.t. x , we get

$$\begin{aligned} f'(x) &= \frac{2(e^{2x} + 1)(e^{2x}) - 2(e^{2x} - 1)(e^{2x})}{(e^{2x} + 1)^2} \\ &= \frac{2(e^{2x} + e^{2x})}{(e^{2x} + 1)} \\ &= \frac{4e^{2x}}{(e^{2x} + 1)^2} > 0 \end{aligned}$$

$\therefore$ Function is increasing.

19

Indefinite Integral

Introduction

Integration is the inverse process of differentiation, i.e. the process of finding $f(x)$, when its derivative $f'(x)$ is given. If $f(x)$ is a differentiable function such that $f'(x) = g(x)$, then integration of $g(x)$ w.r.t. x is $f(x) + C$. Symbolically, it is written as

$$\int g(x)dx = f(x) + C$$

where, $f(x)$ is an anti-derivative of $g(x)$, $g(x)$ is an integrand and C is an arbitrary constant known as the constant of integration.

Properties of Integral

- (i) $\int cf(x) dx = c \int f(x) dx$, where c is any constant.
- (ii) $\int [f_1(x) \pm f_2(x) \pm f_3(x) \pm f_4(x) \pm \dots] dx = \int f_1(x) dx \pm \int f_2(x) dx \pm \int f_3(x) dx \pm \int f_4(x) dx \pm \dots$
- (iii) If $\int f(x) dx = g(x) + C$, then $\int f(ax \pm b) dx = \frac{1}{a} g(ax \pm b) + C$

Fundamental Integration Formulae

1. Algebraic Formulae

- (i) $\int x^n dx = \frac{x^{n+1}}{n+1} + C, n \neq -1$
- (ii) $\int (ax + b)^n dx = \frac{1}{a} \cdot \frac{(ax + b)^{n+1}}{n+1} + C, n \neq -1$
- (iii) $\int \frac{1}{x} dx = \log |x| + C$
- (iv) $\int \frac{1}{ax + b} dx = \frac{1}{a} (\log |ax + b|) + C$
- (v) $\int \frac{1}{a^2 - x^2} dx = \frac{1}{2a} \log \left| \frac{a+x}{a-x} \right| + C$
- (vi) $\int \frac{1}{x^2 - a^2} dx = \frac{1}{2a} \log \left| \frac{x-a}{x+a} \right| + C$

- (vii) $\int \frac{1}{\sqrt{a^2 - x^2}} dx = \sin^{-1} \frac{x}{a} + C$
- (viii) $\int \frac{-1}{\sqrt{a^2 - x^2}} dx = \cos^{-1} \frac{x}{a} + C$
- (ix) $\int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$
- (x) $\int \frac{-1}{a^2 + x^2} dx = \frac{1}{a} \cot^{-1} \frac{x}{a} + C$
- (xi) $\int \frac{1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \sec^{-1} \left(\frac{x}{a} \right) + C$
- (xii) $\int \frac{-1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \operatorname{cosec}^{-1} \left(\frac{x}{a} \right) + C$
- (xiii) $\int \frac{1}{\sqrt{x^2 - a^2}} dx = \log |x + \sqrt{x^2 - a^2}| + C$
- (xiv) $\int \frac{1}{\sqrt{x^2 + a^2}} dx = \log |x + \sqrt{x^2 + a^2}| + C$
- (xv) $\int \sqrt{a^2 - x^2} dx = \frac{1}{2} x \sqrt{a^2 - x^2} + \frac{1}{2} a^2 \sin^{-1} \left(\frac{x}{a} \right) + C$
- (xvi) $\int \sqrt{x^2 - a^2} dx = \frac{1}{2} x \sqrt{x^2 - a^2} - \frac{1}{2} a^2 \log |x + \sqrt{x^2 - a^2}| + C$
- (xvii) $\int \sqrt{x^2 + a^2} dx = \frac{1}{2} x \sqrt{x^2 + a^2} + \frac{1}{2} a^2 \log |x + \sqrt{x^2 + a^2}| + C$

2. Trigonometric Formulae

- (i) $\int \sin x dx = -\cos x + C$
- (ii) $\int \cos x = \sin x + C$
- (iii) $\int \tan x dx = -\log |\cos x| + C = \log |\sec x| + C$
- (iv) $\int \cot x dx = \log |\sin x| + C = -\log |\operatorname{cosec} x| + C$
- (v) $\int \sec x dx = \log |\sec x + \tan x| + C = \log \left| \tan \left(\frac{\pi}{4} + \frac{x}{2} \right) \right| + C$
- (vi) $\int \operatorname{cosec} x dx = \log |\operatorname{cosec} x - \cot x| + C = \log \left| \tan \frac{x}{2} \right| + C$
- (vii) $\int \sec^2 x dx = \tan x + C$
- (viii) $\int \operatorname{cosec}^2 x dx = -\cot x + C$
- (ix) $\int \sec x \tan x dx = \sec x + C$
- (x) $\int \operatorname{cosec} x \cot x dx = -\operatorname{cosec} x + C$

3. Exponential Formulae

- (i) $\int e^x dx = e^x + C$ (ii) $\int e^{(ax+b)} dx = \frac{1}{a} \cdot e^{(ax+b)} + C$
- (iii) $\int a^x dx = \frac{a^x}{\log_e a} + C$ (iv) $\int a^{(bx+c)} dx = \frac{1}{b} \cdot \frac{a^{(bx+c)}}{\log_e a} + C$

Different Methods of Integration

Mainly, there are three methods of integration which are given below:

1. Integration by Substitution

(i) Direct Substitution

If $\int f(x) dx = g(x) + C$, then to solve $I = \int f\{h(x)\} \cdot h'(x) dx$ we put $h(x) = t \Rightarrow h'(x) dx = dt$
So, $I = \int f(t) dt = g(t) + C \Rightarrow g\{h(x)\} + C$

Some Standard Integral

- $\int f(x)' \cdot f'(x) dx = \frac{[f(x)]^{n+1}}{n+1} + C$
- $\int \frac{f'(x)}{f(x)} dx = \log |f(x)| + C$
- $\int \frac{f'(x)}{\sqrt{f(x)}} dx = 2\sqrt{f(x)} + C$

(ii) Standard Substitution

Some standard integrands or a part of it have standard substitution. Some standard substitutions are given below:

S.No.	Integrand form	Substitution
(i)	$\sqrt{a^2 - x^2}, \frac{1}{\sqrt{a^2 - x^2}}, a^2 - x^2$	$x = a \sin \theta$ or $x = a \cos \theta$
(ii)	$\sqrt{x^2 + a^2}, \frac{1}{\sqrt{x^2 + a^2}}, x^2 + a^2$	$x = a \tan \theta$ or $x = a \cot \theta$
(iii)	$\sqrt{x^2 - a^2}, \frac{1}{\sqrt{x^2 - a^2}}, x^2 - a^2$	$x = a \sec \theta$ or $x = a \operatorname{cosec} \theta$
(iv)	$\frac{x}{\sqrt{a+x}}, \frac{\sqrt{a+x}}{x}, \sqrt{x(a+x)}, \frac{1}{\sqrt{x(a+x)}}$	$x = a \tan^2 \theta$ or $x = a \cot^2 \theta$
(v)	$\frac{x}{\sqrt{a-x}}, \frac{\sqrt{a-x}}{x}, \sqrt{x(a-x)}, \frac{1}{\sqrt{x(a-x)}}$	$x = a \sin^2 \theta$ or $x = a \cos^2 \theta$
(vi)	$\frac{x}{\sqrt{x-a}}, \frac{\sqrt{x-a}}{x}, \sqrt{x(x-a)}, \frac{1}{\sqrt{x(x-a)}}$	$x = a \sec^2 \theta$ or $x = a \operatorname{cosec}^2 \theta$
(vii)	$\frac{\sqrt{a-x}}{\sqrt{a+x}}, \frac{\sqrt{a+x}}{\sqrt{a-x}}$	$x = a \cos 2\theta$
(viii)	$\frac{\sqrt{x-\alpha}}{\sqrt{\beta-x}}, \sqrt{(x-\alpha)(\beta-x)}, (\beta > \alpha)$	$x = \alpha \cos^2 \theta + \beta \sin^2 \theta$

(iii) Indirect Substitution

If integrand $f(x)$ can be rewritten as product of two functions, i.e. $f(x) = f_1(x) \cdot f_2(x)$, where $f_2(x)$ is a function of integral of $f_1(x)$, then put integral of $f_1(x) = t$.

2. Integration by Parts

If integrand $f(x)$ can be expressed as product of two functions, i.e. $f(x) = f_1(x) \cdot f_2(x)$, then we use the following formula:

$$\int f_1(x) \cdot f_2(x) dx = f_1(x) \int f_2(x) dx - \int \{f_1'(x) [\int f_2(x) dx]\} dx$$

where, $f_1(x)$ and $f_2(x)$ are known as first and second functions respectively.

i.e. The integral of the product of two functions

$$= (\text{First function}) \times (\text{Integral of the second function})$$

$$- \text{Integral of } \{(\text{Differentiation of first function}) \times (\text{Integral of second function})\}$$

Some Important Points

- We do not put constant of integration in 1st integral. We put this only, once at the end.
- Order of $f_1(x)$ and $f_2(x)$ is normally, decided by the rule ILATE, where,
 I = Inverse function
 L = Logarithmic function
 A = Algebraic function
 T = Trigonometric function
 E = Exponential function
- Normally, we have to suppose 2nd function as that function, which can be integrated easily.

3. Integration by Partial Fractions

If integrand is a rational function, i.e. of the form $\frac{f(x)}{g(x)}$,

where $f(x)$ and $g(x)$ are the polynomial functions of x and $g(x) \neq 0$, then use method of partial fractions, if degree of $f(x)$ is less than the degree of $g(x)$. Otherwise, first reduced to the proper rational function by long division process. The following table indicates the types of simpler partial fractions that are associated with various kinds of rational functions.

Form of the rational function	Form of the partial fraction
$\frac{px + q}{(x - a)(x - b)}$	$\frac{A}{x - a} + \frac{B}{x - b}$
$\frac{px + q}{(x - a)^2}$	$\frac{A}{x - a} + \frac{B}{(x - a)^2}$
$\frac{px^2 + qx + r}{(x - a)(x - b)(x - c)}$	$\frac{A}{x - a} + \frac{B}{x - b} + \frac{C}{x - c}$
$\frac{px^2 + qx + r}{(x - a)^2(x - b)}$	$\frac{A}{x - a} + \frac{B}{(x - a)^2} + \frac{C}{x - b}$
$\frac{px^2 + qx + r}{(x - a)(x^2 + bx + c)}$	$\frac{A}{x - a} + \frac{Bx + C}{x^2 + bx + c}$, where $x^2 + bx + c$ cannot be factorised further.

Here A , B and C are the real constants and these can be determined by reducing both sides of the equation as identity in polynomial form and by comparing the coefficients of like powers.

Integration of Logarithmic Functions

$$(i) \int f(x) dx = \int f(x) \cdot 1 dx$$

Now, integrate taking $f(x)$ as a first and 1 as a second function.

$$(ii) \int \frac{f(x)}{[g(x)]^n} dx = \int \frac{f(x)}{g'(x)} \cdot \frac{g'(x)}{[g(x)]^n} dx$$

Now, integrate by taking $\frac{f(x)}{g'(x)}$ as first function and

$\frac{g'(x)}{[g(x)]^n}$ as a second function.

Here, $f(x)$ and $g(x)$ both are logarithmic functions.

Integration of the Form $\int e^x \{g(x) + g'(x)\} dx$

If integrand is of the form $e^x \{g(x) + g'(x)\}$, then

$$\int e^x \cdot [g(x) + g'(x)] dx = e^x g(x) + C$$

Integration of Different Types of Functions

$$1. \int \frac{dx}{ax^2 + bx + c} \text{ we write, } \int \frac{dx}{ax^2 + bx + c} = \frac{1}{a} \int \frac{dx}{x^2 + \frac{b}{a}x + \frac{c}{a}}$$

$$= \frac{1}{a} \int \frac{dx}{\left(x + \frac{b}{2a}\right)^2 + \frac{c}{a} - \frac{b^2}{4a^2}}, \text{ which is of the form}$$

$$\int \frac{dx}{X^2 - A^2}, \int \frac{dx}{X^2 + A^2} \text{ or } \int \frac{dx}{A^2 - X^2}$$

$$2. \int \frac{dx}{\sqrt{ax^2 + bx + c}} \text{ or } \int \sqrt{ax^2 + bx + c} dx$$

This can be reduced to one of the form of

$$\int \frac{dx}{\sqrt{A^2 - X^2}}, \int \frac{dx}{\sqrt{X^2 - A^2}}, \int \frac{dx}{\sqrt{X^2 + A^2}}$$

$$\text{or } \int \sqrt{A^2 - X^2} dx, \int \sqrt{X^2 - A^2} dx, \int \sqrt{A^2 + X^2} dx$$

$$3. \int \frac{(px + q)}{ax^2 + bx + c} dx, \int \frac{(px + q)}{\sqrt{ax^2 + bx + c}} dx, \int (px + q) \sqrt{ax^2 + bx + c} dx$$

Put $px + q = A \{ \text{differentiation of } (ax^2 + bx + c) \} + B$. Find A and B by comparing the coefficients of like powers of x on the two sides and split the integral into sum of two integrals.

$$4. \int \frac{ax^2 + bx + c}{(px^2 + qx + r)} dx, \int \frac{ax^2 + bx + c}{\sqrt{px^2 + qx + r}} dx,$$

$$\int (ax^2 + bx + c) \sqrt{px^2 + qx + r} dx$$

$$\text{Substitute } ax^2 + bx + c = \lambda (px^2 + qx + r) + \mu \left\{ \frac{d}{dx} (px^2 + qx + r) \right\} + \gamma$$

Find λ, μ and γ and reduce the integral integration of three independent functions.

$$5. \int e^{ax} \sin(bx + c) dx = \frac{e^{ax}}{a^2 + b^2} \{ a \sin(bx + c) - b \cos(bx + c) \} + C$$

$$6. \int e^{ax} \cos(bx + c) dx = \frac{e^{ax}}{a^2 + b^2} \{ a \cos(bx + c) + b \sin(bx + c) \} + C$$

NOTE • $\int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) + C$

• $\int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx) + C$

$$7. \int \frac{dx}{a + b \cos^2 x}, \int \frac{dx}{a + b \sin^2 x}, \int \frac{dx}{a \sin^2 x + b \cos^2 x},$$

$$\int \frac{dx}{(a \sin x + b \cos x)^2}, \int \frac{dx}{a + b \sin^2 x + c \cos^2 x}$$

(i) Divide both the numerator and denominator by $\cos^2 x$.

(ii) Replace $\sec^2 x$ by $1 + \tan^2 x$ in the denominator, if any.

(iii) Put $\tan x = t \Rightarrow \sec^2 x dx = dt$. Further integrate it.

$$8. \int \frac{1}{a \sin x + b \cos x} dx, \int \frac{1}{a + b \sin x} dx,$$

$$\int \frac{1}{a + b \cos x} dx, \int \frac{1}{a \sin x + b \cos x + c} dx$$

$$(i) \text{ Put } \sin x = \frac{2 \tan \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}, \cos x = \frac{1 - \tan^2 \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}$$

(ii) Replace $1 + \tan^2 \frac{x}{2} = \sec^2 \frac{x}{2}$ in numerator.

(iii) Put $\tan \frac{x}{2} = t$, then $\sec^2 \frac{x}{2} dx = 2 dt$.

(iv) Hence, integral reduces to the form $\int \frac{dt}{at^2 + bt + c}$

$$9. \int \frac{a \sin x + b \cos x}{p \sin x + q \cos x} dx$$

(i) Consider numerator = $A \times$ (Derivative of denominator) + B (denominator)

(ii) Find A and B by comparing coefficients of $\sin x$ and $\cos x$.

$$10. \int \frac{p \cos x + q \sin x + r}{a \cos x + b \sin x + c} dx. \text{ Express numerator as, } \lambda$$

$$(\text{denominator}) + \mu (\text{differentiation of denominator}) + \gamma$$

Find λ, μ and γ by comparing coefficients of $\sin x$, $\cos x$ and constant term and split the integral into sum of three integrals.

$$11. \int \frac{x^2 + 1}{x^4 + kx^2 + 1} dx, \int \frac{x^2 - 1}{x^4 + kx^2 + 1} dx, \int \frac{dx}{x^4 + kx^2 + 1}$$

Here, we divide the numerator and denominator by x^2 and put $x + \frac{1}{x} = t$ or $x - \frac{1}{x} = t$ as required.

NOTE In case of $\int \frac{dx}{x^4 + kx^2 + 1}$, we first write it as

$$\int \frac{dx}{x^4 + kx^2 + 1} = \frac{1}{2} \int \frac{(x^2 + 1) - (x^2 - 1)}{x^4 + kx^2 + 1} dx$$

$$12. \int \frac{x^2 + a^2}{x^4 + kx^2 + a^4} dx, \int \frac{x^2 - a^2}{x^4 + kx^2 + a^4} dx,$$

Here, we divide numerator and denominator by x^2 and put $x - \frac{a^2}{x} = t$ or $x + \frac{a^2}{x} = t$, respectively.

$$13. \int \frac{dx}{(ax + b)\sqrt{cx + d}} \text{ Here, put } cx + d = t^2$$

$$14. \int \frac{dx}{(ax^2 + bx + c)\sqrt{px + q}} \text{ Here, put } px + q = t^2$$

$$15. \int \frac{dx}{(ax + b)\sqrt{px^2 + qx + r}} \text{ Here, put } ax + b = \frac{1}{t}$$

$$16. \int \frac{x}{(ax^2 + b)\sqrt{px^2 + q}} dx \text{ Here, put } px^2 + q = t^2$$

$$17. \int \frac{dx}{(ax^2 + b)\sqrt{px^2 + q}}$$

Here, first put $x = 1/t$, to obtain the similar expression as given in previous form and then put the expression inside the square root as y^2 .

18. To evaluate integrals of the form $\int \sin mx \cdot \cos nx dx$, $\int \sin mx \cdot \sin nx dx$, $\int \cos mx \cdot \cos nx dx$ and $\int \cos mx \cdot \sin nx dx$, we use the trigonometrical identities.

Practice Exercise

- If $\int \frac{f(x)}{\log \sin x} dx = \log \log \sin x$, then $f(x)$ is equal to
 a. $\sin x$ b. $\cos x$ c. $\log \sin x$ d. $\cot x$
- If $\int f(x) dx = f(x)$, then $\int \{f(x)\}^2 dx$ is equal to
 a. $\frac{1}{2}\{f(x)\}^2$ b. $\{f(x)\}^3$
 c. $\frac{\{f(x)\}^3}{3}$ d. $\{f(x)\}^2$
- If $x = f''(t) \cos t + f'(t) \sin t$, $y = -f''(t) \sin t + f'(t) \cos t$, then $\int \left[\left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 \right]^{1/2} dt$ equals
 a. $f'(t) + f''(t) + C$ b. $f''(t) + f'''(t) + C$
 c. $f(t) + f''(t) + C$ d. $f'''(t) - f''(t) + C$
- If $f(x) = \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$, then $\int f(x) dx$ is equal to
 a. $\frac{x^3}{3} - x^2 \sin x + \sin 2x + C$
 b. $\frac{x^3}{3} - x^2 \sin x - \cos 2x + C$
 c. $\frac{x^3}{3} - x^2 \cos x - \cos 2x + C$
 d. None of the above
- $\int \frac{\sin^8 x - \cos^8 x}{1 - 2 \sin^2 x \cos^2 x} dx$ is equal to
 a. $\sin 2x + C$ b. $-\frac{1}{2} \sin 2x + C$
 c. $\frac{1}{2} \sin 2x + C$ d. $-\sin 2x + C$
- $\int \tan(x - \alpha) \cdot \tan(x + \alpha) \cdot \tan 2x dx$ is equal to
 a. $\ln \left| \frac{\sqrt{\sec 2x} \cdot \sec(x - \alpha)}{\sec(x - \alpha)} \right| + C$
 b. $\ln \left| \frac{\sqrt{\sec 2x}}{\sec(x - \alpha) \cdot \sec(x + \alpha)} \right| + C$
 c. $\ln \left| \frac{\sqrt{\sec 2x} \cdot \sec(x - \alpha)}{\sec(x + \alpha)} \right| + C$
 d. $\ln \left| \frac{\sec 2x}{\sec(x - \alpha) \cdot \sec(x + \alpha)} \right| + C$
- $\int \frac{x^2 + \cos^2 x}{x^2 + 1} \cdot \operatorname{cosec}^2 x dx$ is equal to
 a. $\cot x + \cot^{-1} x + C$ b. $-e^{\ln \tan^{-1} x} - \cot x + C$
 c. $C - \cot x + \cot^{-1} x$ d. $-\tan^{-1} x - \frac{\operatorname{cosec} x}{\sec x} + C$
- $\int e^{3 \log x} (x^4 + 1)^{-1} dx$ is equal to
 a. $\log(x^4 + 1) + C$ b. $\frac{1}{4} \log(x^4 + 1) + C$
 c. $-\log(x^4 + 1) + C$ d. None of these
- If $\int \frac{2^x}{\sqrt{1 - 4^x}} dx = k \sin^{-1}(2^x) + C$, then k is equal to
 a. $\log 2$ b. $\frac{1}{2} \log 2$ c. $\frac{1}{2}$ d. $\frac{1}{\log 2}$
- $\int \frac{(\sin \theta + \cos \theta)}{\sqrt{\sin 2\theta}} d\theta$ is equal to
 a. $\log |\cos \theta - \sin \theta + \sqrt{\sin 2\theta}| + C$
 b. $\log |\sin \theta - \cos \theta + \sqrt{\sin 2\theta}| + C$
 c. $\sin^{-1}(\sin \theta - \cos \theta) + C$
 d. $\sin^{-1}(\sin \theta + \cos \theta) + C$
- $\int \frac{\ln(x+1) - \ln x}{x(x+1)} dx$ is equal to
 a. $-\frac{1}{2} \left[\ln \left(\frac{x+1}{x} \right) \right]^2 + C$ b. $-\ln(x+1)^2 - (\ln x)^2 + C$
 c. $-\ln \left[\ln \frac{x+1}{x} \right] + C$ d. $-\ln \left(\frac{x+1}{x} \right) + C$
- $\int \frac{(x - x^5)^{1/5}}{x^6} dx$ is equal to
 a. $\frac{5}{24} \left(\frac{1}{x^4} - 1 \right)^{6/5} + C$ b. $\frac{5}{24} \left(1 - \frac{1}{x^4} \right)^{6/5} + C$
 c. $\frac{-5}{24} \left(\frac{1}{x^4} - 1 \right)^{6/5} + C$ d. $\frac{5}{12} \left(1 + \frac{1}{x^4} \right)^{6/5} + C$
- $\int \frac{x^3}{(1+x^2)^{1/3}} dx$ is equal to
 a. $\frac{20}{3} (1+x^2)^{2/3} (2x^2 - 3) + C$
 b. $\frac{3}{20} (1+x^2)^{2/3} (2x^2 - 3) + C$
 c. $\frac{3}{20} (1+x^2)^{2/3} (2x^2 + 3) + C$
 d. $\frac{3}{20} (1+x^2)^{3/2} (2x^2 - 3) + C$

14. $\int \frac{\sqrt{1+\sqrt{x}}}{x} dx$ is equal to

a. $2\sqrt{1+\sqrt{x}} - 2\ln \left| \frac{\sqrt{1+\sqrt{x}}+1}{\sqrt{1+\sqrt{x}}-1} \right| + C$

b. $4\sqrt{1+\sqrt{x}} - 2\ln \left| \frac{\sqrt{1+\sqrt{x}}+1}{\sqrt{1+\sqrt{x}}-1} \right| + C$

c. $4\sqrt{1+\sqrt{x}} + 2\ln \left| \frac{\sqrt{1+\sqrt{x}}-1}{\sqrt{1+\sqrt{x}}+1} \right| + C$

d. None of the above

15. $\int \frac{x + \sqrt[3]{x^2} + \sqrt[6]{x}}{x(1 + \sqrt[3]{x})} dx$ is equal to

a. $\frac{3}{2}x^{2/3} + 6\tan^{-1}x^{1/6} + C$ b. $\frac{3}{2}x^{2/3} - 6\tan^{-1}x^{1/6} + C$

c. $-\frac{3}{2}x^{2/3} + 6\tan^{-1}x^{1/6} + C$ d. $\frac{1}{2}x^{2/3} - 6\tan^{-1}x^{1/6} + C$

16. $\int \frac{\tan x}{\sqrt{\sin^4 x + \cos^4 x}} dx$ is equal to

a. $\ln(\tan^2 x + \sqrt{1 + \tan^2 x}) + C$

b. $\sec x + C$

c. $\sqrt{1 - \tan^2 x} + C$

d. None of the above

17. If $x \in \left(\frac{\pi}{4}, \frac{3\pi}{4}\right)$, then $\int \frac{\sin x - \cos x}{\sqrt{1 - \sin 2x}} e^{\sin x} \cos x dx$ is equal to

a. $e^{\sin x} + C$

b. $e^{\sin x - \cos x} + C$

c. $e^{\sin x + \cos x} + C$

d. $e^{\cos x - \sin x} + C$

18. Integral of $f(x) = \sqrt{1+x^2}$ with respect to x^2 is

a. $\frac{2}{3} \frac{(1+x^2)^{3/2}}{x} + C$

b. $\frac{2}{3} x(1+x^2)^{3/2} + C$

c. $\frac{2}{3} (1+x^2)^{3/2} + C$

d. None of these

19. If $\int f(x) \sin x \cos x dx = \frac{1}{2(b^2 - a^2)} \log \{f(x)\} + C$, then $f(x)$ is equal to

a. $\frac{1}{a^2 \sin^2 x + b^2 \cos^2 x}$

b. $\frac{1}{a^2 \sin^2 x - b^2 \cos^2 x}$

c. $\frac{1}{a^2 \cos^2 x + b^2 \sin^2 x}$

d. $\frac{1}{a^2 \cos^2 x - b^2 \sin^2 x}$

20. Let $x^2 \neq n\pi - 1, n \in \mathbb{N}$, then

$\int x \sqrt{\frac{2 \sin(x^2 + 1) - \sin 2(x^2 + 1)}{2 \sin(x^2 + 1) + \sin 2(x^2 + 1)}} dx$ equals

a. $\log \left| \frac{1}{2} \sec(x^2 + 1) \right| + C$ b. $\log \left| \sec \left(\frac{1}{2}(x^2 + 1) \right) \right| + C$

c. $\frac{1}{2} \log \left| \sec(x^2 + 1) \right| + C$ d. None of these

21. If $\int \frac{xe^x}{\sqrt{1+e^x}} dx = f(x)\sqrt{1+e^x} - 2 \log g(x) + C$, then $g(x)$

is equal to

a. $x - 1$ b. $\frac{\sqrt{1+e^x} - 1}{\sqrt{1+e^x} + 1}$

c. $\frac{\sqrt{1+e^x} + 1}{\sqrt{1+e^x} - 1}$ d. $2(x - 2)$

22. $\int \frac{\sqrt{(x^2 + 1)} [\log(x^2 + 1) - 2 \log x]}{x^4} dx$ is equal to

a. $\frac{1}{3} \left(1 + \frac{1}{x^2}\right)^{1/2} \left[\log \left(1 + \frac{1}{x^2}\right) + \frac{2}{3} \right] + C$

b. $-\frac{1}{3} \left(1 + \frac{1}{x^2}\right)^{3/2} \left[\log \left(1 + \frac{1}{x^2}\right) - \frac{2}{3} \right] + C$

c. $\frac{2}{3} \left(1 + \frac{1}{x^2}\right)^{3/2} \left[\log \left(1 + \frac{1}{x^2}\right) + \frac{2}{3} \right] + C$

d. None of the above

23. If $\int \frac{e^{4x} - 1}{e^{2x}} \log \left(\frac{e^{2x} + 1}{e^{2x} - 1} \right) dx = \frac{t^2}{2} \log t - \frac{t^2}{4} - \frac{u^2}{2} \log u + \frac{u^2}{4} + C$, then

a. $t = u = e^x + e^{-x}$

b. $t = e^x - e^{-x}, u = e^x + e^{-x}$

c. $t = e^x + e^{-x}, u = e^x - e^{-x}$

d. None of the above

24. If an anti-derivative of $f(x)$ is e^x and that of $g(x)$ is $\cos x$, then $\int f(x) \cos x dx + \int g(x) e^x dx$ is equal to

a. $f(x) \cdot g(x) + C$

b. $f(x) + g(x) + C$

c. $e^x \cos x + C$

d. $f(x) - g(x) + C$

25. $\int \cos 2\theta \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) d\theta$ is equal to

a. $(\cos \theta - \sin \theta)^2 \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) + C$

b. $(\cos \theta + \sin \theta)^2 \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) + C$

c. $\frac{(\cos \theta - \sin \theta)^2}{2} \log \left(\frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} \right) + C$

d. $\frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \frac{1}{2} \log \sec 2\theta + C$

26. $\int \frac{x^2 + 1}{x(x^2 - 1)} dx$ is equal to

a. $\log \left(\frac{x^2 - 1}{x} \right) + C$ b. $-\log \left(\frac{x^2 - 1}{x} \right) + C$

c. $\log \left(\frac{x}{x^2 + 1} \right) + C$ d. $-\log \left(\frac{x}{x^2 + 1} \right) + C$

27. $\int \frac{dx}{1+x+x^2+x^3}$ is equal to
 a. $\log \sqrt{1+x} - \frac{1}{2} \log \sqrt{1+x^2} + \frac{1}{2} \tan^{-1} x + C$
 b. $\log \sqrt{1+x} - \log \sqrt{1+x^2} + \tan^{-1} x + C$
 c. $\log \sqrt{1+x^2} - \log \sqrt{1+x} + \frac{1}{2} \tan^{-1} x + C$
 d. $\log \sqrt{1+x} + \tan^{-1} x + \log \sqrt{1+x^2} + C$
28. If $\int \frac{dx}{x+x^7} = p(x)$, then $\int \frac{x^6}{x+x^7} dx$ is equal to
 a. $\log |x| - p(x) + C$ b. $\log |x| + p(x) + C$
 c. $x - p(x) + C$ d. $x + p(x) + C$
29. $\int \frac{(x+3)e^x}{(x+4)^2} dx$ is equal to
 a. $\frac{1}{(x+4)^2} + C$ b. $\frac{e^x}{(x+4)^2} + C$
 c. $\frac{e^x}{x+4} + C$ d. $\frac{e^x}{x+3} + C$
30. $\int e^{\tan^{-1} x} \left(\frac{1+x+x^2}{1+x^2} \right) dx$ is equal to
 a. $x e^{\tan^{-1} x} + C$ b. $x^2 e^{\tan^{-1} x} + C$
 c. $\frac{1}{x} e^{\tan^{-1} x} + C$ d. None of these
31. If $\int \left[\ln(\ln x) + \frac{1}{(\ln x)^2} \right] dx = x[f(x) - g(x)] + C$, then
 a. $f(x) = \ln(\ln x), g(x) = \frac{1}{\ln(x)}$ b. $f(x) = \ln x, g(x) = \frac{1}{\ln x}$
 c. $f(x) = \frac{1}{\ln x}, g(x) = \ln(\ln x)$ d. $f(x) = \ln x, g(x) = \ln(\ln x)$
32. $\int \frac{x^2-1}{x^4+x^2+1} dx$ is equal to
 a. $\frac{1}{2} \log \left(\frac{x^2+x+1}{x^2-x+1} \right) + C$ b. $\frac{1}{2} \log \left(\frac{x^2-x-1}{x^2+x+1} \right) + C$
 c. $\log \left(\frac{x^2-x+1}{x^2+x+1} \right) + C$ d. $\frac{1}{2} \log \left(\frac{x^2-x+1}{x^2+x+1} \right) + C$
33. If $\int \frac{\cos 8x + 1}{\cot 2x - \tan 2x} dx = A \cos 8x + k$, where k is an arbitrary constant, then A is equal to
 a. $-\frac{1}{16}$ b. $\frac{1}{16}$ c. $\frac{1}{8}$ d. $-\frac{1}{8}$

BITSAT Archives

1. If $\int f(x) \cos x dx = \frac{1}{2} f^2(x) + C$, then $f(x)$ can be [2013]
 a. x b. 1 c. $\cos x$ d. $\sin x$
2. If $\int \frac{4}{\sin^4 x + \cos^4 x} dx$ [2013]
 $= a \tan^{-1} \left(\frac{\tan x - \frac{1}{\tan x}}{b} \right) + C$, then find the values of a and b , respectively.
 a. $2\sqrt{2}, \sqrt{2}$ b. $\sqrt{2}, 2$ c. $\sqrt{3}, \sqrt{2}$ d. $\sqrt{2}, 4$
3. $\int \frac{2}{(e^x + e^{-x})^2} dx$ is equal to [2012]
 a. $-\frac{e^{-x}}{(e^x + e^{-x})} + C$ b. $-\frac{1}{(e^x + e^{-x})} + C$
 c. $\frac{1}{(e^x + 1)^2} + C$ d. $\frac{1}{(e^x - e^{-x})^2} + C$
4. $\int \frac{\sin 2x}{\sin^4 x + \cos^4 x} dx$ is equal to [2011]
 a. $2 \tan^{-1}(\tan^2 x) + C$ b. $\tan^{-1}(x \tan^2 x) + C$
 c. $\tan^{-1}(\tan^2 x) + C$ d. None of these
5. If $\int \frac{1}{1+\sin x} dx = \tan \left(\frac{x}{2} + a \right) + b$, then [2010]
 a. $x e^{\tan^{-1} x} + C$ b. $x^2 e^{\tan^{-1} x} + C$
 c. $\frac{1}{x} e^{\tan^{-1} x} + C$ d. None of these
6. $\int \frac{d(\cos \theta)}{\sqrt{1 - \cos^2 \theta}}$ is equal to [2009]
 a. $\cos^{-1} \theta + C$ b. $\theta + C$
 c. $\sin^{-1} \theta + C$ d. $\sin^{-1}(\cos \theta) + C$
7. If $2f(x) = f'(x)$ and $f(0) = 3$, then $f(2)$ equals [2009]
 a. $4e^3$ b. $3e^4$
 c. $2e^3$ d. $3e^2$
8. If $\int \frac{dx}{x^4 + x^3} = \frac{a}{x^2} + \frac{b}{x} + \log \left| \frac{x}{x+1} \right| + C$, then [2009]
 a. $a = \frac{1}{2}, b = 1$ b. $a = -\frac{1}{2}, b = 1$
 c. $a = 1, b = -\frac{1}{2}$ d. $a = 1, b = 1$
9. $\int e^x \left(\frac{1-x}{1+x} \right)^2 dx$ is equal to [2009]
 a. $e^x \left(\frac{1-x}{1+x^2} \right) + C$ b. $e^x \left(\frac{x-1}{1+x^2} \right) + C$
 c. $e^x \left(\frac{1}{1+x^2} \right) + C$ d. $e^x \left(\frac{1}{1-x^2} \right) + C$

10. If $\int e^x(1+x) \cdot \sec^2(xe^x) dx = f(x) + C$, then $f(x)$ is equal to [2008]

a. $\cos(xe^x)$ b. $\sin(xe^x)$ c. $2 \tan^{-1}(x)$ d. $\tan(xe^x)$

11. If $\int e^x \left(\frac{1 - \sin x}{1 - \cos x} \right) dx = f(x) + C$, then $f(x)$ is equal to [2008]

a. $e^x \cot\left(\frac{x}{2}\right)$ b. $e^{-x} \cot\left(\frac{x}{2}\right)$ c. $-e^x \cot\left(\frac{x}{2}\right)$ d. $-e^{-x} \cot\left(\frac{x}{2}\right)$

12. $\int \frac{1 + \tan^2 x}{1 - \tan^2 x} dx$ is equal to [2007]

a. $\log\left(\frac{1 - \tan x}{1 + \tan x}\right) + C$ b. $\log\left(\frac{1 + \tan x}{1 - \tan x}\right) + C$
 c. $\frac{1}{2} \log\left(\frac{1 - \tan x}{1 + \tan x}\right) + C$ d. $\frac{1}{2} \log\left(\frac{1 + \tan x}{1 - \tan x}\right) + C$

13. $\int \frac{e^x(1 + \sin x)}{1 + \cos x} dx$ is equal to [2007]

a. $e^x \tan\left(\frac{x}{2}\right) + C$ b. $e^x \tan x + C$
 c. $e^x \left(\frac{1 + \sin x}{1 - \cos x} \right) + C$ d. $C - e^x \cot\left(\frac{x}{2}\right)$

14. $\int \frac{\sin(2x)}{1 + \cos^2 x} dx$ is equal to [2006]

a. $-\frac{1}{2} \log(1 + \cos^2 x) + C$
 b. $2 \log(1 + \cos^2 x) + C$
 c. $\frac{1}{2} \log(1 + \cos 2x) + C$
 d. $C - \log(1 + \cos^2 x)$

Answer with Solutions

Practice Exercise

1. (a) $\int \frac{f(x)}{\log \sin x} dx = \log \log \sin x$

On differentiating both sides w.r.t. x , we get

$$\frac{f(x)}{\log \sin x} = \frac{\cot x}{\log \sin x}$$

$$\therefore f(x) = \cot x$$

2. (a) We have, $\int f(x) dx = f(x)$

$$\Rightarrow \frac{d}{dx} \{f(x)\} = f(x) \Rightarrow \frac{1}{f(x)} d\{f(x)\} = dx$$

$$\Rightarrow \log \{f(x)\} = x + \log C \Rightarrow f(x) = Ce^x$$

$$\Rightarrow \{f(x)\}^2 = C^2 e^{2x}$$

$$\therefore \int \{f(x)\}^2 dx = \int C^2 e^{2x} = \frac{C^2 e^{2x}}{2} = \frac{1}{2} \{f(x)\}^2$$

3. (c) $\frac{dx}{dt} = f'''(t) \cos t - f''(t) \sin t + f'(t) \sin t + f(t) \cos t$

$$= [f'''(t) + f'(t)] \cos t$$

$$\frac{dy}{dt} = -f'''(t) \sin t - f''(t) \cos t + f''(t) \cos t - f'(t) \sin t$$

$$= -[f'''(t) + f'(t)] \sin t$$

$$\therefore \int \left[\left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 \right]^{1/2} dt = f''(t) + f(t) + C$$

4. (a) We have, $f(x) = \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$

$$\Rightarrow f(x) = \begin{vmatrix} 0 & \sin x - x^2 & 2 - \cos x \\ x^2 - \sin x & 0 & 2x - 1 \\ \cos x - 2 & 1 - 2x & 0 \end{vmatrix}$$

[interchanging rows and columns]

$$\Rightarrow f(x) = (-1)^3 \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$$

[taking (-1) common from each column]

$$\Rightarrow f(x) = -f(x)$$

$$\Rightarrow f(x) = 0$$

$$\therefore \int f(x) dx = 0$$

5. (b) $\int \frac{(\sin^4 x + \cos^4 x)(\sin^4 x - \cos^4 x)}{(\sin^2 x + \cos^2 x)^2 - 2 \sin^2 x \cos^2 x} dx$
 $= \int (\sin^4 x - \cos^4 x) dx = \int (\sin^2 x - \cos^2 x) dx$
 $= \int -\cos 2x dx$
 $= -\frac{\sin 2x}{2} + C$

6. (b) $\tan 2x = \tan [(x - \alpha) + (x + \alpha)]$

$$= \frac{\tan(x - \alpha) + \tan(x + \alpha)}{1 - \tan(x - \alpha) \cdot \tan(x + \alpha)}$$

$$\Rightarrow \tan(x - \alpha) \cdot \tan(x + \alpha) \cdot \tan 2x$$

$$= \tan 2x - \tan(x - \alpha) - \tan(x + \alpha)$$

$$\Rightarrow \int \tan(x - \alpha) \cdot \tan(x + \alpha) \cdot \tan 2x dx$$

$$= \int [\tan 2x - \tan(x - \alpha) - \tan(x + \alpha)] dx$$

$$= \frac{1}{2} \ln |\sec 2x| - \ln |\sec(x - \alpha)| - \ln |\sec(x + \alpha)| + C$$

$$= \ln \left| \frac{\sqrt{\sec 2x}}{\sec(x - \alpha) \cdot \sec(x + \alpha)} \right| + C$$

7. (c) Hint $I = \int \frac{x^2 + 1 + \cos^2 x - 1}{x^2 + 1} \operatorname{cosec}^2 x dx$

$$= \int \left(1 - \frac{\sin^2 x}{x^2 + 1} \right) \cdot \operatorname{cosec}^2 x dx = \int \left(\operatorname{cosec}^2 x - \frac{1}{x^2 + 1} \right) dx$$

$$8. (b) \text{ Hint } I = \int e^{3 \log x} (x^4 + 1)^{-1} dx = \int e^{\log x^3} \cdot \frac{dx}{x^4 + 1}$$

$$= \int \frac{x^3}{x^4 + 1} dx$$

$$\text{Put } (x^4 + 1) = t \Rightarrow 4x^3 dx = dt \Rightarrow x^3 dx = \frac{dt}{4}$$

$$9. (d) \text{ Let } I = \int \frac{2^x}{\sqrt{1-4^x}} dx$$

$$\text{Put } 2^x = t \Rightarrow 2^x \log 2 dx = dt$$

$$\therefore I = \frac{1}{\log 2} \sin^{-1} t + C = \frac{1}{\log 2} \sin^{-1} (2^x) + C$$

$$\text{Hence, } k = \frac{1}{\log 2}$$

$$10. (c) \text{ Hint Let } I = \int \frac{\sin \theta + \cos \theta}{\sqrt{1-(1-2 \sin \theta \cos \theta)}} d\theta$$

$$= \int \frac{\sin \theta + \cos \theta}{\sqrt{1-(\sin \theta - \cos \theta)^2}} d\theta$$

$$\text{Put } \sin \theta - \cos \theta = t$$

$$11. (a) \text{ Let } I = \int \frac{\ln(x+1) - \ln x}{x(x+1)} dx$$

$$= - \int [\ln(x+1) - \ln(x)] \cdot \frac{1}{-x(x+1)} dx$$

$$\text{Put } \ln(x+1) - \ln(x) = t \Rightarrow \frac{-1}{x(x+1)} dx = dt$$

$$\therefore I = - \int t dt = \frac{-t^2}{2} + C = \frac{-1}{2} [\ln(x+1) - \ln(x)]^2 + C$$

$$= \frac{-1}{2} \left[\ln \left(\frac{x+1}{x} \right) \right]^2 + C$$

$$12. (c) \text{ Hint } I = \int \frac{(x - x^5)^{1/5}}{x^6} dx = \int \frac{\left(\frac{1}{x^4} - 1 \right)^{1/5}}{x^5} dx$$

$$\text{Put } \frac{1}{x^4} - 1 = t \Rightarrow \frac{dx}{x^5} = \frac{-1}{4} dt$$

$$13. (b) \text{ Hint Let } I = \int \frac{x^3}{(1+x^2)^{1/3}} dx = \int \frac{x^2 \cdot x}{(1+x^2)^{1/3}} dx$$

$$\text{Put } 1+x^2 = t^3 \Rightarrow 2x dx = 3t^2 dt$$

$$\therefore I = \frac{3}{2} \int (t^3 - 1)t dt$$

$$14. (c) \text{ Hint Put } 1 + \sqrt{x} = z^2 \Rightarrow dx = 4z\sqrt{x} dz$$

$$\therefore I = \int \frac{z}{x} (4z\sqrt{x}) dz = 4 \int \frac{z^2}{z^2-1} dz = 4 \int \left(1 + \frac{1}{z^2-1} \right) dz$$

$$15. (a) \text{ Let } I = \int \frac{x + \sqrt[3]{x^2} + \sqrt[6]{x}}{x(1 + \sqrt[3]{x})} dx$$

$$\text{Put } x = t^6 \Rightarrow dx = 6t^5 dt$$

$$\therefore I = \int \frac{t^6 + t^4 + t}{t^6(1+t^2)} 6t^5 dt = 6 \int \left(t^3 + \frac{1}{t^2+1} \right) dt$$

$$= \frac{3}{2} x^{2/3} + 6 \tan^{-1} x^{1/6} + C$$

$$16. (d) \text{ Hint } I = \int \frac{\tan x}{\sqrt{\sin^4 x + \cos^4 x}} dx = \int \frac{\tan x \cdot \sec^2 x}{\sqrt{1 + \tan^4 x}} dx$$

$$\text{Put } \tan^2 x = t \Rightarrow 2 \tan x \sec^2 x dx = dt$$

$$17. (a) \int \frac{\sin x - \cos x}{\sin x - \cos x} e^{\sin x} \cdot \cos x dx$$

$$= \int e^{\sin x} \cdot \cos x dx = e^{\sin x} + C$$

$$18. (c) \int \sqrt{1+x^2} d(x^2) = \int (1+x^2)^{1/2} (2x) dx$$

$$= \frac{(1+x^2)^{3/2}}{3/2} + C = \frac{2}{3} (1+x^2)^{3/2} + C$$

$$19. (a) \int f(x) \sin x \cos x dx = \frac{1}{2(b^2 - a^2)} \log f(x) + C$$

$$\Rightarrow f(x) \sin x \cos x = \frac{1}{2(b^2 - a^2)} \cdot \frac{1}{f(x)} f'(x)$$

$$\Rightarrow 2(b^2 - a^2) \sin x \cos x = \frac{f'(x)}{\{f(x)\}^2}$$

$$\Rightarrow \int (2b^2 \sin x \cos x - 2a^2 \sin x \cos x) dx = \int \frac{f'(x)}{\{f(x)\}^2}$$

$$\Rightarrow -b^2 \cos^2 x - a^2 \sin^2 x = -\frac{1}{f(x)}$$

$$\Rightarrow f(x) = \frac{1}{a^2 \sin^2 x + b^2 \cos^2 x}$$

$$20. (b) \int x \sqrt{\frac{2 \sin(x^2+1) - \sin 2(x^2+1)}{2 \sin(x^2+1) + \sin 2(x^2+1)}} dx$$

$$= \int x \sqrt{\frac{2 \sin(x^2+1) - 2 \sin(x^2+1) \cos(x^2+1)}{2 \sin(x^2+1) + 2 \sin(x^2+1) \cos(x^2+1)}} dx$$

$$= \int x \sqrt{\frac{1 - \cos(x^2+1)}{1 + \cos(x^2+1)}} dx$$

$$= \int x \sqrt{\frac{2 \sin^2 \left(\frac{x^2+1}{2} \right)}{2 \cos^2 \left(\frac{x^2+1}{2} \right)}} dx = \int x \cdot \tan \left(\frac{x^2+1}{2} \right) dx$$

$$= \int \tan z dz \quad \left[\text{put } \frac{x^2+1}{2} = z \Rightarrow x dx = dz \right]$$

$$= \log |\sec z| + C = \log \left| \sec \left(\frac{x^2+1}{2} \right) \right| + C$$

$$21. (b) \text{ Let } I = \int x \frac{e^x}{\sqrt{1+e^x}} dx$$

$$\text{Put } 1 + e^x = t^2 \Rightarrow e^x = 2t dt \Rightarrow x = \log(t^2 - 1)$$

$$\therefore I = 2 \int \log(t^2 - 1) dt$$

$$= 2 \left[t \log(t^2 - 1) - 2 \int \frac{t^2}{t^2 - 1} dt \right]$$

$$= 2 \left[t \log(t^2 - 1) - 2 \int 1 + \left(\frac{1}{t^2 - 1} \right) dt \right]$$

$$= 2 \left[t \log(t^2 - 1) - 2t - \log \left(\frac{t-1}{t+1} \right) + C \right]$$

$$= 2x \sqrt{1+e^x} - 4\sqrt{1+e^x} - 2 \log \left(\frac{\sqrt{1+e^x} - 1}{\sqrt{1+e^x} + 1} \right) + C$$

$$\text{Hence, } f(x) = 2x - 4 = 2(x - 2) \text{ and } g(x) = \frac{\sqrt{1+e^x} - 1}{\sqrt{1+e^x} + 1}$$

$$22. (b) \text{ Let } I = \int \frac{\sqrt{x^2+1} [\log(x^2+1) - 2 \log x]}{x^4} dx$$

$$= \int \sqrt{1+\frac{1}{x^2}} \log \left(1+\frac{1}{x^2} \right) \cdot \frac{1}{x^3} dx$$

$$\text{Put } 1+\frac{1}{x^2} = t \Rightarrow -\frac{2}{x^3} dx = dt$$

$$\therefore I = -\frac{1}{2} \int \sqrt{t} \log t dt = -\frac{1}{2} \left[\frac{2 \log t \cdot t^{3/2}}{3} - \int \frac{1}{t} \cdot \frac{t^{3/2}}{3/2} dt \right]$$

$$= -\frac{1}{2} \left[\frac{2}{3} (\log t) t^{3/2} - \frac{2}{3} \int t^{1/2} dt \right]$$

$$= -\frac{1}{3} (\log t) t^{3/2} + \frac{1}{3} \frac{t^{3/2}}{3/2} + C$$

$$= -\frac{1}{3} \left(1+\frac{1}{x^2} \right)^{3/2} \left[\log \left(1+\frac{1}{x^2} \right) - \frac{2}{3} \right] + C$$

$$23. (c) \int \frac{e^{4x}-1}{e^{2x}} \cdot \log \left(\frac{e^{2x}+1}{e^{2x}-1} \right) dx$$

$$= \int (e^{2x} - e^{-2x}) \log(e^x + e^{-x}) dx$$

$$- \int (e^{2x} - e^{-2x}) \log(e^x - e^{-x}) dx$$

$$= \int (e^x + e^{-x}) \log(e^x + e^{-x}) (e^x - e^{-x}) dx$$

$$- \int (e^x - e^{-x}) \log(e^x - e^{-x}) \cdot (e^x + e^{-x}) dx$$

$$= \int t \log t dt - \int u \log u du$$

$$\text{where, } t = e^x + e^{-x} \text{ and } u = e^x - e^{-x}$$

$$= \left[\log t \cdot \frac{t^2}{2} - \int \frac{1}{t} \cdot \frac{t^2}{2} dt \right] - \left[\log u \cdot \frac{u^2}{2} - \int \frac{1}{u} \cdot \frac{u^2}{2} du \right]$$

$$= \frac{t^2}{2} \log t - \frac{t^2}{4} - \frac{u^2}{2} \log u + \frac{u^2}{4} + C$$

$$24. (c) \int f(x) \cos x dx + \int g(x) e^x dx$$

$$= \frac{e^x}{2} (\cos x + \sin x) - \frac{e^x}{2} (\sin x - \cos x) + C$$

$$= \frac{e^x}{2} (2 \cos x) + C = e^x \cos x + C$$

$$25. (d) \text{ Since, } \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) = \log \tan \left(\frac{\pi}{4} + \theta \right)$$

$$\text{and } \int \sec \theta d\theta = \log \tan \left(\frac{\pi}{4} + \frac{\theta}{2} \right)$$

$$\text{or } \int \sec 2\theta d\theta = \frac{1}{2} \log \tan \left(\frac{\pi}{4} + \theta \right)$$

$$\Rightarrow 2 \sec 2\theta = \frac{d}{d\theta} \log \tan \left(\frac{\pi}{4} + \theta \right)$$

$$\therefore I = \frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \int \tan 2\theta d\theta$$

$$= \frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \frac{1}{2} \log \sec 2\theta + C$$

$$26. (a) \text{ Hint } \int \frac{x^2+1}{x(x^2-1)} dx = \int \frac{x^2+1}{x(x-1)(x+1)} dx$$

$$= \int \left(-\frac{1}{x} + \frac{1}{x-1} + \frac{1}{x+1} \right) dx$$

$$27. (a) \int \frac{dx}{(1+x)(1+x^2)} = \frac{1}{2} \int \frac{1}{1+x^2} dx + \frac{1}{2} \int \frac{1}{1+x} dx$$

$$- \frac{1}{2} \int \frac{x}{1+x^2} dx$$

$$= \frac{1}{2} \tan^{-1} x + \frac{1}{2} \log(1+x) - \frac{1}{4} \log(1+x^2) + C$$

$$= \frac{1}{2} \tan^{-1} x + \log \sqrt{1+x} - \frac{1}{2} \log \sqrt{1+x^2} + C$$

$$28. (a) \text{ Let } I = \int \frac{x^6}{x+x^7} dx = \int \frac{x^6}{x(1+x^6)} dx = \int \frac{(1+x^6)-1}{x(1+x^6)} dx$$

$$\Rightarrow I = \int \frac{dx}{x} - \int \frac{dx}{x+x^7} = \log|x| - p(x) + C$$

$$29. (c) \text{ Let } I = \int \frac{(x+3)e^x}{(x+4)^2} dx = \int \frac{(x+4-1)e^x}{(x+4)^2} dx$$

$$= \int e^x \left(\frac{1}{x+4} - \frac{1}{(x+4)^2} \right) dx = \frac{e^x}{x+4} + C$$

$$30. (a) \text{ Let } I = \int e^{\tan^{-1} x} \left(\frac{1+x+x^2}{1+x^2} \right) dx$$

$$\text{Put } \tan^{-1} x = t \Rightarrow \frac{dx}{1+x^2} = dt$$

$$\therefore I = \int e^t (\tan t + \sec^2 t) dt = e^t \tan t + C = x e^{\tan^{-1} x} + C$$

$$31. (a) \int \left\{ \ln(\ln x) + \frac{1}{(\ln x)^2} \right\} dx$$

$$\text{Put } \log x = t \Rightarrow \int \left(\ln t + \frac{1}{t^2} \right) \cdot e^t dt$$

$$= \int e^t \left[\left(\ln t - \frac{1}{t} \right) + \frac{d}{dt} \left(\ln t - \frac{1}{t} \right) \right] dt$$

$$= x \left(\ln(\ln x) - \frac{1}{\ln x} \right) + C$$

$$\therefore f(x) = \ln[\ln x] \text{ and } g(x) = \frac{1}{\ln(x)}$$

$$32. (d) \text{ Hint } I = \int \frac{\left(1 - \frac{1}{x^2} \right)}{\left(x + \frac{1}{x} \right)^2 - 1} dx$$

$$33. (a) \text{ LHS} = \int \frac{2 \cos^2 4x}{\cos^2 2x - \sin^2 2x} dx$$

$$= \int \frac{2 \cos^2 4x \cos 2x \sin 2x}{\cos 4x} dx = \int \cos 4x \sin 4x dx$$

$$= \frac{1}{2} \int \sin 8x dx = \frac{-1}{2} \cdot \frac{\cos 8x}{8} + k$$

$$\therefore A = -\frac{1}{16}$$

BITSAT Archives

1. (d) Given that, $\int f(x) \cos x \, dx = \frac{1}{2} f^2(x) + C$

On differentiating both sides w.r.t. x , we get

$$f(x) \cos x = \frac{1}{2} \cdot 2f(x) \cdot f'(x)$$

$$\Rightarrow \cos x = f'(x) \Rightarrow \cos x = \frac{d}{dx} \{f(x)\}$$

Now, integrating both sides, we get

$$\int \cos x \, dx = f(x)$$

$$\therefore f(x) = \sin x + C$$

2. (a) Let $I = \int \frac{4}{\sin^4 x + \cos^4 x} \, dx = \int \frac{4}{\cos^4 x (\tan^4 x + 1)} \, dx$
 $= \int \frac{4 \sec^4 x}{1 + \tan^4 x} \, dx = 4 \int \frac{\sec^2 x (1 + \tan^2 x)}{1 + \tan^4 x} \, dx$

Put $\tan x = t \Rightarrow \sec^2 x \, dx = dt$

$$\therefore I = 4 \int \frac{1+t^2}{1+t^4} \, dt = 4 \int \frac{1+1/t^2}{t^2+1/t^2} \, dt \Rightarrow I = 4 \int \frac{1+1/t^2}{\left(t-\frac{1}{t}\right)^2 + 2} \, dt$$

Now, put $t - \frac{1}{t} = z \Rightarrow \left(1 + \frac{1}{t^2}\right) dt = dz$

$$\therefore I = 4 \int \frac{dz}{z^2 + (\sqrt{2})^2} = \frac{4}{\sqrt{2}} \tan^{-1} \left(\frac{z}{\sqrt{2}} \right) + C$$

$$\Rightarrow I = 2\sqrt{2} \tan^{-1} \left(\frac{\tan x - \frac{1}{\tan x}}{\sqrt{2}} \right) + C$$

$$\therefore a = 2\sqrt{2} \text{ and } b = \sqrt{2}$$

3. (a) Hint $I = \int \frac{2}{(e^x + e^{-x})^2} \, dx$
 $= \int \frac{2}{e^{2x} + e^{-2x} + 2} \, dx = \int \frac{2e^{2x}}{e^{4x} + 2e^{2x} + 1} \, dx$

Put $e^{2x} = t \Rightarrow 2e^{2x} \, dx = dt$

4. (d) Hint $I = \int \frac{\sin 2x}{(\sin^2 x + \cos^2 x)^2 - 2 \sin^2 x \cos^2 x} \, dx$
 $= \int \frac{\sin 2x}{1 - \frac{1}{2} (\sin 2x)^2} \, dx = \int \frac{\sin 2x}{2(1 + \cos^2 2x)} \, dx$

Put $\cos 2x = t \Rightarrow -2 \sin 2x \, dx = dt$

5. (a) Hint $\int \frac{1}{1 + \sin x} \, dx = \int \frac{1}{1 + \cos \left(\frac{\pi}{2} - x \right)} \, dx$
 $= \frac{1}{2} \int \sec^2 \left(\frac{\pi}{4} - \frac{x}{2} \right) \, dx$

where $b = \text{constant}$

$$\therefore a = -\frac{\pi}{4}, b \in R$$

6. (d) $\int \frac{d(\cos \theta)}{\sqrt{1 - \cos^2 \theta}} = \sin^{-1}(\cos \theta) + C$

7. (b) We have, $2f(x) = f'(x) \Rightarrow \frac{f'(x)}{f(x)} = 2$

On integrating, we get

$$\log f(x) = 2x + C_1 \Rightarrow f(x) = e^{2x + C_1} = e^{C_1} e^{2x} = C e^{2x}$$

where, $C = e^{C_1}$

Putting $x = 0$, $f(0) = 3$, we get $C = 3$

$$\therefore f(x) = 3e^{2x} \Rightarrow f(2) = 3e^4$$

8. (b) Hint $\int \frac{dx}{x^4 + x^3} = \int \frac{(x+1) - x}{x^3(x+1)} \, dx$
 $= \int \left(\frac{1}{x^3} - \frac{1}{x^2(x+1)} \right) \, dx = \int \left(\frac{1}{x^3} - \frac{1}{x^2} + \frac{1}{x} - \frac{1}{x+1} \right) \, dx$

9. (c) $\int e^x \left(\frac{1-x}{1+x^2} \right)^2 \, dx = \int e^x \cdot \frac{1+x^2-2x}{(1+x^2)^2} \, dx$
 $= \int e^x \left[\frac{1}{1+x^2} - \frac{2x}{(1+x^2)^2} \right] \, dx$
 $= \int e^x \left[\frac{1}{1+x^2} + \frac{d}{dx} \left(\frac{1}{1+x^2} \right) \right] \, dx = \frac{e^x}{1+x^2} + C$

10. (d) Given that, $\int e^x (1+x) \cdot \sec^2(xe^x) \, dx = f(x) + C$

Put $xe^x = t$ in LHS $\Rightarrow (e^x + xe^x) \, dx = dt$

$$\therefore \text{LHS} = \int \sec^2 t \, dt = \tan t + C$$

$$\Rightarrow \tan(xe^x) + C = f(x) + C \Rightarrow f(x) = \tan(xe^x)$$

11. (c) $\int e^x \left(\frac{1 - \sin x}{1 - \cos x} \right) \, dx = \int e^x \left(\frac{1 - 2 \sin \frac{x}{2} \cos \frac{x}{2}}{2 \sin^2 \frac{x}{2}} \right) \, dx$
 $= \frac{1}{2} \int e^x \left(\text{cosec}^2 \frac{x}{2} \right) \, dx - \int e^x \cot \frac{x}{2} \, dx$
 $= \frac{1}{2} \left[-e^x \cot \frac{x}{2} \cdot 2 + \int e^x \cot \frac{x}{2} \cdot 2 \, dx \right] - \int e^x \cot \frac{x}{2} \, dx + C$
 $= -e^x \cot \frac{x}{2} + C \Rightarrow f(x) = -e^x \cot \frac{x}{2}$

12. (d) Hint $I = \int \frac{1 + \tan^2 x}{1 - \tan^2 x} \, dx = \int \frac{\sec^2 x}{1 - \tan^2 x} \, dx$

Put $\tan x = t \Rightarrow \sec^2 x \, dx = dt$

13. (a) Let $I = \int e^x \left(\frac{1 + \sin x}{1 + \cos x} \right) \, dx = \int e^x \left(\frac{1 + 2 \sin \frac{x}{2} \cos \frac{x}{2}}{2 \cos^2 x/2} \right) \, dx$
 $= \int \frac{1}{2} e^x \sec^2 \frac{x}{2} \, dx + \int e^x \tan \frac{x}{2} \, dx$
 $= \frac{1}{2} \left[2e^x \tan \frac{x}{2} - \int 2e^x \tan \frac{x}{2} \, dx + \int e^x \tan \frac{x}{2} \, dx \right]$
 $= e^x \tan \frac{x}{2} - \int e^x \tan \frac{x}{2} \, dx + \int e^x \tan \frac{x}{2} \, dx + C$
 $= e^x \tan \frac{x}{2} + C$

14. (d) Hint $I = \int \frac{2 \sin x \cos x}{1 + \cos^2 x} \, dx$

Put $1 + \cos^2 x = t \Rightarrow -2 \cos x \sin x \, dx = dt$

20

Definite Integrals and Its Applications

Definite Integral

Let $f(x)$ be the primitive or anti-derivative of a function $g(x)$ define on $[a, b]$, i.e. $\frac{d}{dx} f(x) = g(x)$, then definite integral of $g(x)$ over $[a, b]$ is denoted by $\int_a^b g(x) dx$ and defined as $[f(b) - f(a)]$.

$$\therefore \int_a^b g(x) dx = f(b) - f(a)$$

Here, a and b are called the limits of integration, where a is called the lower limit and b is called the upper limit.

NOTE

- In definite integral, there is no need to keep the constant of integration.
- $\int_a^b f(x) dx$ is read as the integral from a to b .

Fundamental Theorem of Calculus

The fundamental theorem of Calculus is a theorem that links the concept of the derivative of a function with the concept of the integral.

First Fundamental Theorem of Calculus

Let f be a continuous real valued function defined on a closed interval $[a, b]$. If F is the function defined, for all x in $[a, b]$, then $F(x) = \int_a^x f(t) dt$

NOTE

- F is continuous on $[a, b]$, differentiable on the open interval (a, b) and $F'(x) = f(x)$ for all x in (a, b) .
- The integral function of integrable function is continuous.

Second Fundamental Theorem of Calculus

Let f and g be real valued functions defined on a closed interval $[a, b]$ such that the derivative of g is f i.e. f and g are functions such that for all x in $[a, b]$,

$$f(x) = g'(x)$$

Then,

$$\int_a^b f(x) dx = g(b) - g(a)$$

Properties of Definite Integral

Here, we will study some fundamental properties of definite integrals, which are very useful in evaluating integrals.

Property 1

$$\int_a^b f(x) dx = \int_a^b f(t) dt = \int_a^b f(u) du$$

i.e. integration is independent of change in variable.

Property 2

$$\int_a^b f(x) dx = - \int_b^a f(x) dx$$

i.e. if the limits of definite integral are interchanged, then its value is changed by negative sign only.

Property 3

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx, \text{ where } a < c < b$$

The above property can be generalised into the following form

$$\int_a^b f(x) dx = \int_a^{c_1} f(x) dx + \int_{c_1}^{c_2} f(x) dx + \int_{c_2}^{c_3} f(x) dx + \dots + \int_{c_n}^b f(x) dx$$

where, $a < c_1 < c_2 < \dots < c_n < b$

Property 4

$$\int_a^b f(x) dx = \int_a^b f(a+b-x) dx \text{ or } \int_0^a f(x) dx = \int_0^a f(a-x) dx$$

Property 5

$$\int_{-a}^a f(x) dx = \int_0^a f(x) dx + \int_0^a f(-x) dx$$

$$\text{or } \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(-x) = f(x) \\ 0, & \text{if } f(-x) = -f(x) \end{cases}$$

NOTE A function $f(x)$ is said to be an even function, if $f(x) = f(-x)$ and a function $f(x)$ is said to be an odd function, if $f(-x) = -f(x)$

Property 6

$$\int_0^{2a} f(x) dx = \int_0^a f(x) dx + \int_0^a f(2a-x) dx$$

$$\Rightarrow \int_0^{2a} f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(2a-x) = f(x) \\ 0, & \text{if } f(2a-x) = -f(x) \end{cases}$$

Property 7

If $f(x)$ is a periodic function with period T , then

$$\int_0^{nT} f(x) dx = n \int_0^T f(x) dx.$$

Property 8

If $f(x)$ is a periodic function with period T , then $\int_a^{a+T} f(x) dx$ will be independent of a , i.e. $\int_a^{a+T} f(x) dx = \int_0^T f(x) dx$.

Inequalities in Definite Integrals

1. If $f(x) \geq 0$ in the interval $[\alpha, \beta]$, then $\int_{\alpha}^{\beta} f(x) dx \geq 0$.
2. If f is continuous on $[\alpha, \beta]$, then $\left| \int_{\alpha}^{\beta} f(x) dx \right| \leq \int_{\alpha}^{\beta} |f(x)| dx$
3. If f is continuous on $[\alpha, \beta]$ and $l \leq f(x) \leq M, \forall x \in [\alpha, \beta]$, then $l(\beta - \alpha) \leq \int_{\alpha}^{\beta} f(x) dx \leq M(\beta - \alpha)$
4. If $f(x) \leq g(x)$ on $[\alpha, \beta]$, then $\int_{\alpha}^{\beta} f(x) dx \leq \int_{\alpha}^{\beta} g(x) dx$.
5. If $f_1(x), f(x)$ and $f_2(x)$ are continuous functions in $[\alpha, \beta]$ such that $f_1(x) \leq f(x) \leq f_2(x), \forall x \in [\alpha, \beta]$, then $\int_{\alpha}^{\beta} f_1(x) dx \leq \int_{\alpha}^{\beta} f(x) dx \leq \int_{\alpha}^{\beta} f_2(x) dx$

Leibnitz's Theorem

If functions $\phi(x)$ and $\psi(x)$ are defined on $[\alpha, \beta]$ and differentiable at a point (α, β) and $f(t)$ is continuous on $[\phi(\alpha), \phi(\beta)]$, then

$$\frac{d}{dx} \left[\int_{\phi(x)}^{\psi(x)} f(t) dt \right] = \left\{ \frac{d}{dt} \psi(x) \right\} f\{\psi(x)\} - \left\{ \frac{d}{dx} \{\phi(x)\} \right\} f\{\phi(x)\}$$

Integral as a Limit of Sum

If $f(x)$ is a continuous function on $[a, b]$, then

$$\int_a^b f(x) dx = \lim_{h \rightarrow 0} h \sum_{r=1}^n f(a+rh), \text{ where } nh = b-a.$$

Since, $h = \frac{b-a}{n}$, where $n \rightarrow \infty, h \rightarrow 0$

$$\therefore \int_a^b f(x) dx = \lim_{n \rightarrow \infty} \frac{b-a}{n} \sum_{r=1}^n f \left[a + r \left\{ \frac{(b-a)}{n} \right\} \right]$$

On putting $a = 0, b = 1$, we get

$$\int_0^1 f(x) dx = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n f \left(\frac{r}{n} \right)$$

Method to Express the Infinite Series as Definite Integral

- (i) Express the given series in the form $\sum \frac{1}{n} f \left(\frac{r}{n} \right)$.
- (ii) Then, the limit is its sum when $n \rightarrow \infty$, i.e. $\lim_{n \rightarrow \infty} \sum \frac{1}{n} f \left(\frac{r}{n} \right)$.
- (iii) Replace $\frac{r}{n}$ by x and $\frac{1}{n}$ by dx and $\lim_{n \rightarrow \infty} \sum$ by the sign of $\int$.
- (iv) The lower and the upper limits of integration are limiting values of $\frac{r}{n}$ for the first and the last terms of r , respectively.

Determining Areas of the Regions Bounded by Simple Curves in Standard Form

- (i) The area bounded by the continuous curve $y = f(x)$, X-axis and lines $x = a, x = b$ ($b > a$) is given by the formula

$$A = \int_a^b f(x) dx = \int_a^b y dx$$

- (ii) The area bounded by the straight lines $x = a, x = b$ ($a < b$) and the curves $y = f(x)$ and $y = g(x)$, provided $f(x) \geq g(x)$ and $a \leq x \leq b$, is given by

$$A = \int_a^b [f(x) - g(x)] dx$$

- (iii) If the curves $y = f(x)$ and $y = g(x)$ intersect, then the bounded area is given by

$$A = \int_a^b [f(x) - g(x)] dx$$

where, a and b are the roots of the equation $f(x) = g(x)$.

- (iv) The area bounded by $y = f(x)$ and $y = g(x)$, where $a \leq x \leq b$ intersecting at $x = c \in (a, b)$, is given by

$$A = \int_a^b |f(x) - g(x)| dx$$

$$\text{or } A = \int_a^c [f(x) - g(x)] dx + \int_c^b [g(x) - f(x)] dx$$

- (v) The area bounded by the curve $y = f(x)$ and the lines $x = a, x = b$ on crossing the X-axis at c (where, $b > a$), is given by

$$A = \left| \int_a^c f(x) dx \right| + \left| \int_c^b f(x) dx \right|$$

$$\text{or } A = \int_a^c f(x) dx - \int_c^b f(x) dx$$

$$\left[\because \int_a^c f(x) dx > 0 \text{ and } \int_c^b f(x) dx < 0 \right]$$

NOTE • If some part of the curve lies below X-axis, then its area is negative and since area cannot be negative, so we consider the magnitude only by taking its modulus.

Practice Exercise

- $\int_0^{\pi/2} \frac{\tan^2 x}{1 + \tan^2 x} dx$ is equal to
a. ∞ b. 0 c. $\frac{\pi}{4}$ d. $\frac{\pi}{2}$
- Let $\frac{d}{dx} f(x) = \frac{e^{\sin x}}{x}$, $x > 0$. If $\int_1^4 \frac{2e^{\sin x^2}}{x} dx = F(k) - F(1)$ then, one of the possible values of k is
a. 15 b. 16 c. 10 d. None of these
- If $I_{1(n)} = \int_0^{\pi/2} \frac{\sin(2n-1)x}{\sin x} dx$ and $I_{2(n)} = \int_0^{\pi/2} \frac{\sin^2 nx}{\sin^2 x} dx$, $n \in N$, then
a. $I_{2(n+1)} - I_{2(n)} = I_{1(n)}$ b. $I_{2(n+1)} - I_{2(n)} = I_{1(n+1)}$
c. $I_{2(n+1)} + I_{1(n)} = I_{2(n)}$ d. $I_{2(n+1)} + I_{1(n+1)} = I_{2(n)}$
- $\int_0^{\pi/4} [\sqrt{\tan x} + \sqrt{\cot x}] dx$ is equal to
a. $\sqrt{2}\pi$ b. $\frac{\pi}{2}$ c. $\frac{\pi}{\sqrt{2}}$ d. 2π
- $\int_0^1 \sin\left(2 \tan^{-1} \sqrt{\frac{1+x}{1-x}}\right) dx$ is equal to
a. $\pi/6$ b. $\pi/4$ c. $\pi/2$ d. π
- $\int_0^{\pi/4} \frac{\sin^2 x \cdot \cos^2 x}{(\sin^3 x + \cos^3 x)^2} dx$ is equal to
a. $\frac{1}{6}$ b. $\frac{1}{12}$ c. $\frac{1}{4}$ d. $\frac{1}{24}$
- The value of $\int_0^{\pi/4} \frac{\sin x + \cos x}{\cos^2 x + \sin^4 x} dx$ is
a. $\frac{1}{2} \log\left(\frac{\sqrt{3}-1}{\sqrt{2}}\right)$ b. $\frac{1}{2\sqrt{3}} \log\left(\frac{\sqrt{3}+1}{\sqrt{2}}\right) + \frac{\pi}{4}$
c. $\frac{1}{2} \log\left(\frac{\sqrt{3}+1}{\sqrt{2}}\right) + \frac{\pi}{4}$ d. $\frac{1}{\sqrt{3}} \log\left(\frac{\sqrt{3}+1}{\sqrt{2}}\right) + \frac{\pi}{4}$
- The value of $\int_0^{2\pi} e^x \sin\left(\frac{\pi}{4} + \frac{x}{2}\right) dx$ is
a. $\frac{\sqrt{2}}{5} (e^{2\pi} + 1)$ b. $-\frac{\sqrt{2}}{5} (e^{2\pi} + 1)$
c. $\frac{-\sqrt{2}}{5} (e^{2\pi} - 1)$ d. $\frac{\sqrt{2}}{5} (e^{2\pi} - 1)$
- If $\phi'(x) = \frac{\log \sin x}{x}$, $x \neq n\pi$, $n \in I$ and $\int_1^3 \frac{3 \log(\sin x^3)}{x} dx = \phi(k) - \phi(1)$, then the possible values of k is
a. 27 b. 18 c. 9 d. 36
- The value of $\int_3^5 e^{f[\phi(x)]} \cdot f'[\phi(x)] \cdot \phi'(x) dx$, where $\phi(3) = \phi(5)$, is
a. 1 b. 0 c. 3 d. 4
- $\int_0^{\pi/2} \frac{dx}{\sin\left(x - \frac{\pi}{3}\right) \sin\left(x - \frac{\pi}{6}\right)}$ is equal to
a. $4 \log \sqrt{3}$ b. $-4 \log \sqrt{3}$ c. $2 \log \sqrt{3}$ d. $-2 \log \sqrt{3}$
- $\int_{-2}^2 \frac{dx}{1+|x-1|}$ is equal to
a. $\log 2$ b. $2 \log 2$ c. $3 \log 2$ d. $4 \log 2$
- The value of $\int_{\pi/6}^{5\pi/6} \sqrt{4 - 4 \sin^2 t} dt$ is
a. 0 b. 2 c. 1 d. None of these
- The integral $\int_0^{1.5} [x^2] dx$, where $[x^2]$ denotes the greatest integer less than or equal to x , is equal to
a. $2 + \sqrt{2}$ b. $2 - \sqrt{2}$ c. 1.5 d. None
- Let a, b and c be non-zero real numbers such that $\int_0^3 (3ax^2 + 2bx + c) dx = \int_1^3 (3ax^2 + 2bx + c) dx$, then
a. $a + b + c = 3$ b. $a + b + c = 1$
c. $a + b + c = 0$ d. $a + b + c = 2$
- The value of $\sum_{k=1}^n \int_0^1 f(k-1+x) dx$ is
a. $\int_0^1 f(x) dx$ b. $\int_0^2 f(x) dx$
c. $\int_0^n f(x) dx$ d. $n \int_0^1 f(x) dx$
- If $\int_{-2}^x |2t| dt = f(x)$, then for any $x \geq 0$, $f(x)$ is equal to
a. $4 + x^2$ b. $4 - x^2$
c. $\frac{1}{2}(4 + x^2)$ d. $\frac{1}{4}(4 - x^2)$
- The correct evaluation of $\int_0^{\pi/2} \left| \sin\left(x - \frac{\pi}{4}\right) \right| dx$ is
a. $2 + \sqrt{2}$ b. $2 - \sqrt{2}$ c. $-2 + \sqrt{2}$ d. 0
- $\int_{-\pi/2}^{\pi/2} \frac{\cos x}{1+e^x} dx$ is equal to
a. 1 b. 0 c. -1 d. None
- The value of $\int_{7\pi/4}^{7\pi/3} \sqrt{\tan^2 x} dx$ is
a. $\log 2\sqrt{2}$ b. $\log 2$
c. $2 \log 2$ d. $\log \sqrt{2}$

21. The value of $\int_1^3 |(x-1)(x-2)(x-3)| dx$ is
 a. $\frac{1}{3}$ b. $\frac{1}{2}$ c. $\frac{9}{4}$ d. $\frac{9}{5}$
22. $\int_0^1 |\sin 2\pi x| dx$ is equal to
 a. 0 b. $-\frac{1}{\pi}$
 c. $\frac{1}{\pi}$ d. $\frac{2}{\pi}$
23. The value of $\int_0^{\pi/2} \frac{\psi(x)}{\psi(x) + \psi\left(\frac{\pi}{2} - x\right)} dx$ is
 a. $\pi/4$ b. $\pi/2$ c. π d. None
24. The value of $\int_0^1 \cot^{-1}(1-x+x^2) dx$ is
 a. $\pi - \log 2$ b. $\pi/2 - \log 2$
 c. $\pi + \log 2$ d. $\pi/2 + \log 2$
25. The value of $\int_{-\pi}^{\pi} \frac{\cos^2 x}{1+a^x} dx, a > 0$, is
 a. π b. $a\pi$ c. $\pi/2$ d. 2π
26. If f and g are continuous functions in $[0, 1]$ satisfying $f(x) = f(a-x)$ and $g(x) + g(a-x) = a$, then $\int_0^a f(x) \cdot g(x) dx$ is equal to
 a. $\frac{a}{2}$ b. $\frac{a}{2} \int_0^a f(x) dx$
 c. $\int_0^a f(x) dx$ d. $a \int_0^a f(x) dx$
27. The value of $\int_0^{\pi} e^{\cos^2 x} \cos^5 3x dx$ is
 a. 1 b. -1 c. 0 d. None
28. The value of $\int_0^{\pi} \frac{\sin 2kx}{\sin x} dx$, where $k \in I$, is
 a. $\frac{\pi}{2}$ b. π c. $\frac{3\pi}{2}$ d. 0
29. $\int_{-1/2}^{1/2} (\cos x) \left[\log \left(\frac{1-x}{1+x} \right) \right] dx$ is equal to
 a. 0 b. 1
 c. $e^{1/2}$ d. $2e^{1/2}$
30. The value of $\int_{-1}^1 \frac{\sin x - x^2}{3-|x|} dx$ is
 a. 0 b. $2 \int_0^1 \frac{\sin x}{3-|x|} dx$
 c. $2 \int_0^1 \frac{-x^2}{3-|x|} dx$ d. $2 \int_0^1 \frac{\sin x - x^2}{3-|x|} dx$
31. $\int_{-1}^1 \frac{x^3 + |x| + 1}{x^2 + 2|x| + 1} dx$ is equal to
 a. $\ln 2$ b. $2 \ln 2$ c. $\frac{1}{2} \ln 2$ d. $4 \ln 2$
32. $\int_{-\pi/2}^{\pi/2} \sin^{10} x (6x^9 - 25x^7 + 4x^3 - 2x) dx$ is equal to
 a. π b. 0 c. 25 d. $\frac{\pi}{2}$
33. If f and g are two continuous functions, then the value of $\int_{-\pi/4}^{\pi/4} \{f(x) + f(-x)\} \{g(x) - g(-x)\} dx$ is
 a. $\frac{\pi}{4}$ b. 0 c. $-\frac{\pi}{4}$ d. π
34. If $P = \int_0^{3\pi} f(\cos^2 x) dx$ and $Q = \int_0^{\pi} f(\cos^2 x) dx$, then
 a. $P - Q = 0$ b. $P - 2Q = 0$
 c. $P - 3Q = 0$ d. $P - 5Q = 0$
35. If $f(2-x) = f(2+x)$ and $f(4-x) = f(4+x)$ for all x and $f(x)$ is a function for which $\int_0^2 f(x) dx = 5$, then $\int_0^{50} f(x) dx$ is equal to
 a. 125 b. $\int_{-4}^{46} f(x) dx$ c. $\int_1^{51} f(x) dx$ d. $\int_2^{52} f(x) dx$
36. If $I_1 = \int_1^2 \frac{dx}{\sqrt{1+x^2}}$ and $I_2 = \int_1^2 \frac{dx}{x}$, then
 a. $I_1 > I_2$ b. $I_2 > I_1$ c. $I_1 = I_2$ d. $I_1 > 2I_2$
37. If $\phi(x) = \int_{1/x}^{\sqrt{x}} \sin(t^2) dt$, then $\phi'(1)$ is equal to
 a. $\sin 1$ b. $2 \sin 1$ c. $3/2 \sin 1$ d. None
38. Let $f(x) = \int_1^x \sqrt{2-t^2} dt$, then the real roots of the equation $x^2 - f'(x) = 0$ are
 a. ± 1 b. $\pm 1/\sqrt{2}$ c. $\pm 1/2$ d. 0 and 1
39. If $f(x) = \frac{1}{x^2} \int_4^x [4t^2 - 2f'(t)] dt$, then $f'(4)$ is equal to
 a. 32 b. $\frac{32}{3}$ c. $\frac{32}{9}$ d. None
40. If $f(x)$ is differentiable and $\int_0^{t^2} x f(x) dx = \frac{2}{5} t^5$, then $f\left(\frac{4}{25}\right)$ is equal to
 a. $\frac{2}{5}$ b. $-\frac{5}{2}$ c. 1 d. $\frac{5}{2}$
41. $\lim_{n \rightarrow \infty} \frac{(r)^{1/n}}{n}$ equals
 a. e b. e^{-1} c. 1 d. None
42. The value of $\lim_{n \rightarrow \infty} \left(\frac{n}{(n+1)\sqrt{2n+1}} + \frac{n}{(n+2)\sqrt{2(2n+2)}} + \frac{n}{(n+3)\sqrt{3(2n+3)}} + \dots + \frac{1}{2n\sqrt{3}} \right)$ is
 a. $\frac{\pi}{3}$ b. $\frac{\pi}{2}$
 c. $\frac{\pi}{4}$ d. None of these

43. $\lim_{n \rightarrow \infty} \left[\frac{1}{n+1} + \frac{1}{n+2} + \frac{1}{n+3} + \dots + \frac{1}{n+n} \right]$ is equal to
 a. $3 \log 2$ b. $\log 2$ c. $2 \log 2$ d. $4 \log 2$
44. $\lim_{n \rightarrow \infty} \left[\frac{1}{n} + \frac{n^2}{(n+1)^3} + \frac{n^2}{(n+2)^3} + \dots + \frac{1}{8n} \right]$
 is equal to
 a. $\frac{3}{8}$ b. $\frac{1}{4}$ c. $\frac{1}{8}$ d. $\frac{1}{2}$
45. The value of $\lim_{n \rightarrow 0} \left[\frac{\sqrt{n}}{(3+4\sqrt{n})^2} + \frac{\sqrt{n}}{\sqrt{2}(3\sqrt{2}+4\sqrt{n})^2} + \frac{\sqrt{n}}{\sqrt{3}(3\sqrt{3}+4\sqrt{n})^2} + \dots + \frac{1}{49n} \right]$ is
 a. 1 b. $\frac{1}{14}$ c. $\frac{1}{7}$ d. $\frac{2}{7}$
46. The area of the region lying between the line $x - y + 2 = 0$ and the curve $x = \sqrt{y}$, is
 a. 9 b. $\frac{9}{2}$ c. $\frac{10}{3}$ d. None
47. The area bounded by the curve $y = x \sin x$ and X -axis between $x = 0$ and $x = 2\pi$, is
 a. 2π b. 3π c. 4π d. None
48. The area bounded by the parabola $y^2 = x$, straight line $y = 4$ and Y -axis, is
 a. $\frac{16}{3}$ sq units b. $\frac{64}{3}$ sq units
 c. $7\sqrt{2}$ sq units d. None of these
49. The area enclosed by the curves $y = x^3$ and $y = \sqrt{x}$ is
 a. $\frac{5}{3}$ sq units b. $\frac{5}{4}$ sq units
 c. $\frac{5}{12}$ sq unit d. $\frac{12}{5}$ sq units
50. The area of smaller segment cut-off from the circle $x^2 + y^2 = 9$ by $x = 1$ is
 a. $\frac{1}{2}(9 \sec^{-1} 3 - \sqrt{x})$ b. $9 \sec^{-1} 3 - \sqrt{8}$
 c. $\sqrt{8} - 9 \sec^{-1} 3$ d. None of these
51. Sketch the graph of $y = |x + 3|$ and the area bounded by $\int_{-6}^0 (x+3) dx$ is
 a. 9 sq units b. $\frac{9}{2}$ sq units
 c. 3 sq units d. 11 sq units
52. If $y = f(x)$ makes positive intercepts of 2 and 1 unit on x and y -coordinates axes and encloses an area of $\frac{3}{4}$ sq unit with the axes, then $\int_0^2 x f'(x) dx$ equals
 a. $\frac{3}{2}$ b. 1 c. $\frac{5}{4}$ d. $-\frac{3}{4}$
53. The area in the first quadrant between $x^2 + y^2 = \pi^2$ and $y = \sin x$, is
 a. $\frac{\pi^3 - 8}{4}$ b. $\frac{\pi^3}{4}$ c. $\frac{\pi^3 - 16}{4}$ d. $\frac{\pi^3 - 8}{2}$
54. The area of the region $\{(x, y) : x^2 + y^2 \leq 1 \leq x + y\}$, is
 a. $\frac{\pi^2}{5}$ b. $\frac{\pi^2}{2}$
 c. $\frac{\pi^2}{3}$ d. $\frac{\pi}{4} - \frac{1}{2}$
55. The area bounded by the curve $y = \ln(x)$ and the lines $y = 0$, $y = \ln(3)$ and $x = 0$, is equal to
 a. 3 b. $3 \ln(3) - 2$ c. $3 \ln(3) + 2$ d. 2
56. The area under the curve $y = |\cos x - \sin x|$, $0 \leq x \leq \frac{\pi}{2}$ and above X -axis, is
 a. $2\sqrt{2}$ b. $2\sqrt{2} - 2$ c. $2\sqrt{2} + 2$ d. 0
57. The area of the region enclosed by the curves $y = x$, $x = e$, $y = \frac{1}{x}$ and the positive X -axis, is
 a. 1 sq unit b. $\frac{3}{2}$ sq units
 c. $\frac{5}{2}$ sq units d. $\frac{1}{2}$ sq unit
58. The area bounded by the curves $y = \cos x$ and $y = \sin x$ between the ordinates $x = 0$ and $x = \frac{3\pi}{2}$, is
 a. $(4\sqrt{2} - 2)$ sq units b. $(4\sqrt{2} + 2)$ sq units
 c. $(4\sqrt{2} - 1)$ sq units d. $(4\sqrt{2} + 1)$ sq units
59. The area bounded by the curves $y^2 = 4x$ and $x^2 = 4y$, is
 a. 0 b. $\frac{32}{3}$ sq units
 c. $\frac{16}{3}$ sq units d. $\frac{8}{3}$ sq units
60. The area bounded by $y = xe^{|x|}$ and lines $|x| = 1$, $y = 0$, is
 a. 1 sq unit b. 2 sq units
 c. 3 sq units d. None of these
61. The area bounded by the curves $y^2 = x^3$ and $|y| = 2x$ is
 a. $\frac{5}{16}$ sq unit b. $\frac{16}{5}$ sq units
 c. $\frac{3}{8}$ sq unit d. None of these
62. The area bounded by the curves $y = x|x|$, X -axis and the coordinates $x = -1$, $x = 1$, is given by
 a. 0 b. $\frac{1}{3}$
 c. $\frac{2}{3}$ d. $\frac{4}{3}$

BITSAT Archives

1. The value of $x > 1$ satisfying the equation $\int_1^x t \log t dt = \frac{1}{4}$, is [2014]
 a. $\sqrt{e}$ b. $e^{3/2}$ c. e^2 d. $2e - 1$
2. If $\int_0^{25} e^{x-[x]} dx = k(e - 1)$, then the value of k is [2014]
 a. 12 b. 25 c. 23 d. 24
3. The area bounded by the curves $y = -\sqrt{-x}$ and $x = -\sqrt{-y}$, where $x, y \leq 0$, is [2014]
 a. $1/3$ b. $1/4$ c. $1/5$ d. $1/2$
4. The value of $\int_0^{10\pi} ([\sec^{-1} x] + [\cot^{-1} x]) dx$, where $[\]$ denotes the greatest integer function, is [2013]
 a. $10\pi - \tan^{-1} x$ b. $8\pi - \sec 1$
 c. $10\pi - \sec 1$ d. $10\pi + \sec 1$
5. The area of the figure bounded by two branches of the curve $(y - x)^2 = x^3$ and straight line $x = 1$, is [2013]
 a. $\frac{4}{5}$ sq unit b. $\frac{4}{7}$ sq unit c. $\frac{4}{9}$ sq unit d. $\frac{4}{11}$ sq unit
6. $\int_0^{\pi/2} \frac{\sin^n \theta}{\sin^n \theta + \cos^n \theta} d\theta$ is equal to [2012]
 a. 1 b. 0 c. $\frac{\pi}{2}$ d. $\frac{\pi}{4}$
7. $\int_0^{\pi} \cos^{101} x dx$ is equal to [2012]
 a. $\frac{\pi}{4}$ b. $\frac{1}{102}$ c. $\left(\frac{\pi}{3}\right)^{101}$ d. 0
8. $\lim_{n \rightarrow \infty} \left[\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{6n} \right]$ equals [2012]
 a. $\log 2$ b. $\log(1 + \sqrt{5})$ c. $\log 6$ d. 0
9. If $\frac{d}{dx} \{\phi(x)\} = f(x)$, then $\int_1^2 f(x) dx$ is equal to [2011]
 a. $f(1) - f(2)$ b. $\phi(1) - \phi(2)$ c. $f(2) - f(1)$ d. $\phi(2) - \phi(1)$
10. $\int_0^2 |1 - x| dx$ is equal to [2011]
 a. 0 b. 1 c. $\frac{3}{2}$ d. $\frac{1}{2}$
11. The area bounded by X-axis and the curve $y = \sin x$ and $x = 0, x = \pi$, is [2011]
 a. 1 sq unit b. 2 sq units c. 0 d. 4 sq units
12. $\int_0^1 |5x - 3| dx$ is equal to [2010]
 a. $\frac{10}{13}$ b. $\frac{31}{10}$
 c. $\frac{13}{10}$ d. None of these
13. The area of the region bounded by $y = |x - 1|$ and $y = 1$ is [2010]
 a. 1 b. 2 c. $1/2$ d. None
14. $\int_{-1}^2 |x|^3 dx$ is equal to [2009]
 a. $\frac{5}{4}$ b. $\frac{17}{4}$ c. $\frac{15}{4}$ d. $\frac{4}{5}$
15. $\int_{-\pi/2}^{\pi/2} \sin|x| dx$ is equal to [2008]
 a. 0 b. 1 c. 2 d. π
16. The area (in sq units) of the region bounded by the curve $2x = y^2 - 1$ and $x = 0$ is [2008]
 a. $1/3$ b. $2/3$ c. 1 d. 2
17. $\int_0^8 |x - 5| dx$ is equal to [2007]
 a. 17 b. 9 c. 12 d. 18
18. If $I_1 = \int_0^1 2^x dx, I_2 = \int_0^1 2^{x^3} dx, I_3 = \int_1^2 2^{x^2} dx$ and $I_4 = \int_1^2 2^{x^3} dx$, then [2007]
 a. $I_3 > I_4$ b. $I_3 = I_4$ c. $I_1 > I_2$ d. $I_2 > I_1$
19. The area of the region satisfying $x \leq 2, y \leq |x|$ and $x \geq 0$ is [2007]
 a. 4 sq units b. 1 sq unit c. 2 sq units d. None
20. $\int_0^{\pi/4} \log(1 + \tan x) dx$ is equal to [2006]
 a. $\frac{\pi}{8} \log_e 2$ b. $\frac{\pi}{4} \log_2 e$ c. $\frac{\pi}{4} \log_e 2$ d. $\frac{\pi}{8} \log_e \left(\frac{1}{2}\right)$
21. The area bounded by the parabola $y^2 = 4ax$ and the lines $x = a$ and $x = 4a$, is [2006]
 a. $\frac{35a^2}{3}$ b. $\frac{4a^2}{3}$ c. $\frac{7a^2}{3}$ d. $\frac{56a^2}{3}$
22. If $\int_{\log 2}^x \frac{du}{(e^u - 1)^{1/2}} = \frac{\pi}{6}$, then e^x is equal to [2005]
 a. 1 b. 2 c. 4 d. -1
23. $\int_0^{2\pi} \left\{ |\sin x| - \left| \frac{1}{2} \sin x \right| \right\} dx$ equals [2005]
 a. n b. $2n$ c. $-2n$ d. None
24. The value of $\left[\int_0^{\sin^2 \theta} \sin^{-1} \sqrt{\phi} d\phi + \int_0^{\cos^2 \theta} \cos^{-1} \sqrt{\phi} d\phi \right]$ is [2005]
 a. π b. $\pi/2$ c. $\pi/3$ d. $\pi/4$
25. The area bounded by the curves $y = x^2$ and $y = 2 - x^2$ is [2005]
 a. $8/3$ sq units b. $3/8$ sq unit
 c. $3/2$ sq units d. None of these

Answer with Solutions

Practice Exercise

$$\begin{aligned} 1. (c) \text{ Let } I &= \int_0^{\pi/2} \frac{\tan^2 x}{1 + \tan^2 x} dx = \int_0^{\pi/2} \tan^2 x \cos^2 x dx \\ &= \int_0^{\pi/2} \sin^2 x dx = \int_0^{\pi/2} \frac{1 - \cos 2x}{2} dx \\ &= \left[\frac{1}{2}x - \frac{\sin 2x}{4} \right]_0^{\pi/2} = \frac{\pi}{4} \end{aligned}$$

$$\begin{aligned} 2. (b) \text{ Let } I &= \int_1^4 \frac{2e^{\sin x^2}}{x} dx = F(k) - F(1) = [F(x)]_1^k \\ \text{Put } x^2 &= t \Rightarrow 2x dx = dt \\ \therefore I &= \int_1^{16} \frac{e^{\sin t}}{t} dt = [F(t)]_1^{16} \Rightarrow k = 16 \end{aligned}$$

$$\begin{aligned} 3. (b) I_{2(n)} - I_{2(n-1)} &= \int_0^{\pi/2} \frac{[\sin^2 nx - \sin^2(n-1)x]}{\sin^2 x} dx \\ &= \int_0^{\pi/2} \frac{\sin(2n-1)x \cdot \sin x}{\sin^2 x} dx \\ &= \int_0^{\pi/2} \frac{\sin(2n-1)x}{\sin x} dx = I_{1(n)} \end{aligned}$$

Put $n = n + 1$, we get

$$\begin{aligned} I_{2(n+1)} - I_{2(n)} &= I_{1(n+1)} \\ 4. (c) \text{ Hint } I &= \int_0^{\pi/4} [\sqrt{\tan x} + \sqrt{\cot x}] dx \\ &= \int_0^{\pi/4} \frac{\sin x + \cos x}{\sqrt{\sin x \cos x}} dx \\ &= \sqrt{2} \int_0^{\pi/4} \frac{\sin x + \cos x}{\sqrt{1 - (\sin x - \cos x)^2}} dx \end{aligned}$$

Put $\sin x - \cos x = t \Rightarrow (\cos x + \sin x) dx = dt$

$$5. (b) \text{ Let } I = \int_0^1 \sin \left[2 \tan^{-1} \sqrt{\frac{1+x}{1-x}} \right] dx$$

Put $x = \cos \theta$

$$\begin{aligned} \Rightarrow \sin \left[2 \tan^{-1} \sqrt{\frac{1+\cos \theta}{1-\cos \theta}} \right] \\ = \sin \left[2 \tan^{-1} \left(\cot \frac{\theta}{2} \right) \right] &= \sin \left[2 \tan^{-1} \left\{ \tan \left(\frac{\pi}{2} - \frac{\theta}{2} \right) \right\} \right] \\ = \sin \left[2 \left(\frac{\pi}{2} - \frac{\theta}{2} \right) \right] &= \sin(\pi - \theta) = \sin \theta = \sqrt{1 - \cos^2 \theta} = \sqrt{1 - x^2} \\ \therefore I &= \int_0^1 \sqrt{1 - x^2} dx = \left[\frac{1}{2} x \sqrt{1 - x^2} \right]_0^1 + \frac{1}{2} [\sin^{-1} x]_0^1 = \frac{\pi}{4} \end{aligned}$$

$$6. (a) \text{ Let } I = \int_0^{\pi/4} \frac{\sin^2 x \cdot \cos^2 x}{(\sin^3 x + \cos^3 x)^2} dx = \int_0^{\pi/4} \frac{\tan^2 x \cdot \sec^2 x}{(1 + \tan^3 x)^2} dx$$

Put $1 + \tan^3 x = t$

$$\Rightarrow 3 \tan^2 x \cdot \sec^2 x dx = dt \Rightarrow \tan^2 x \cdot \sec^2 x dx = \frac{dt}{3}$$

When $x = 0$, then $t = 1$ and when $x = \frac{\pi}{4}$, then $t = 2$

$$\therefore I = \int_1^2 \frac{dt}{3t^2} = -\frac{1}{3} \left(\frac{1}{2} - 1 \right) = \frac{1}{6}$$

$$\begin{aligned} 7. (d) \text{ Hint } I &= \int_0^{\pi/4} \frac{\sin x + \cos x}{\cos^2 x + \sin^4 x} dx \\ &= \int_0^{\pi/4} \frac{4(\sin x + \cos x)}{2(1 + \cos 2x) + (1 - \cos 2x)^2} dx \\ &= 4 \int_0^{\pi/4} \frac{\sin x + \cos x}{3 + \cos^2 2x} dx \\ &= 4 \int_0^{\pi/4} \frac{(\sin x + \cos x)}{4 - \sin^2 2x} dx \end{aligned}$$

Put $\sin x - \cos x = t$

$\Rightarrow (\cos x + \sin x) dx = dt$ and $1 - \sin 2x = t^2$

When $x = 0$, then $t = -1$ and when $x = \frac{\pi}{4}$, then $t = 0$

$$\begin{aligned} \therefore I &= 4 \int_{-1}^0 \frac{dt}{4 - (1 - t^2)^2} = 4 \int_{-1}^0 \frac{dt}{(3 - t^2)(1 + t^2)} \\ &= 4 \int_{-1}^0 \frac{dt}{(3 - t^2)(1 + t^2)} \\ &= 4 \int_{-1}^0 \left[\frac{1}{4(3 - t^2)} + \frac{1}{4(1 + t^2)} \right] dt \end{aligned}$$

$$\begin{aligned} 8. (b) \text{ Let } I &= \int_0^{2\pi} e^x \sin \left(\frac{\pi}{4} + \frac{x}{2} \right) dx \\ &= \left[\sin \left(\frac{\pi}{4} + \frac{x}{2} \right) e^x \right]_0^{2\pi} - \int_0^{2\pi} \frac{e^x}{2} \cos \left(\frac{\pi}{4} + \frac{x}{2} \right) dx \\ &= \sin \left(\pi + \frac{\pi}{4} \right) e^{2\pi} - \sin \frac{\pi}{4} - \frac{1}{2} \left[\left\{ e^x \cos \left(\frac{\pi}{4} + \frac{x}{2} \right) \right\}_0^{2\pi} \right. \\ &\quad \left. - \frac{1}{2} \int_0^{2\pi} \sin \left(\frac{\pi}{4} + \frac{x}{2} \right) e^x dx \right] \end{aligned}$$

After substituting the values, we get

$$I = \frac{-\sqrt{2}}{5} (e^{2\pi} + 1)$$

$$\begin{aligned} 9. (a) \text{ Let } I &= \int_1^3 \frac{3 \log(\sin x^3)}{x} dx = \int_1^{27} \frac{\log \sin t}{t} dt \\ &\quad [\text{put } x^3 = t \Rightarrow 3x^2 dx = dt] \\ \Rightarrow \int_1^{27} \phi'(t) dt &= [\phi(t)]_1^{27} = \phi(27) - \phi(1) \end{aligned}$$

$$\therefore k = 27$$

$$10. (b) \text{ Let } I = \int_3^5 e^{f[\phi(x)]} f'[\phi(x)] \cdot \phi'(x) dx$$

Put $\phi(x) = t \Rightarrow \phi'(x) dx = dt$

$$\therefore I = [e^{f(t)}]_{\phi(3)}^{\phi(5)} = e^{f[\phi(5)]} - e^{f[\phi(3)]} = 0 \quad [\because \phi(5) = \phi(3)]$$

$$\begin{aligned} 11. (b) \text{ Let } I &= \int_0^{\pi/2} \frac{dx}{\sin \left(x - \frac{\pi}{3} \right) \sin \left(x - \frac{\pi}{6} \right)} \\ &= 2 \int_0^{\pi/2} \frac{\sin \left(\frac{\pi}{3} - \frac{\pi}{6} \right)}{\sin \left(x - \frac{\pi}{3} \right) \sin \left(x - \frac{\pi}{6} \right)} dx \end{aligned}$$

$$\begin{aligned}
 &= 2 \int_0^{\pi/2} \frac{\sin \left[\left(x - \frac{\pi}{6} \right) - \left(x - \frac{\pi}{3} \right) \right]}{\sin \left(x - \frac{\pi}{3} \right) \sin \left(x - \frac{\pi}{6} \right)} dx \\
 &= 2 \left[\log \frac{\sin \left(x - \frac{\pi}{3} \right)}{\sin \left(x - \frac{\pi}{6} \right)} \right]_0^{\pi/2} = -4 \log \sqrt{3}
 \end{aligned}$$

12. (c) Hint $f(x) = \frac{1}{1 + |x - 1|}$

$$f(x) = \begin{cases} \frac{1}{1 + x - 1} = \frac{1}{x}, & \text{if } x > 1 \\ \frac{1}{1 - x + 1} = \frac{1}{2 - x}, & \text{if } x < 1 \end{cases}$$

Therefore, $\int_{-2}^2 \frac{dx}{1 + |x - 1|} = \int_{-2}^1 \frac{1}{2 - x} dx + \int_1^2 \frac{1}{x} dx$

13. (b) Hint $I = \int_{\pi/6}^{5\pi/6} \sqrt{4 - 4 \sin^2 t} dt = 2 \int_{\pi/6}^{5\pi/6} |\cos t| dt$

$$\begin{aligned}
 &= 2 \left[\int_{\pi/6}^{\pi/2} |\cos t| dt + \int_{\pi/2}^{5\pi/6} |\cos t| dt \right] \\
 &= 2 \left[\int_{\pi/6}^{\pi/2} \cos t dt - \int_{\pi/2}^{5\pi/6} \cos t dt \right]
 \end{aligned}$$

14. (b) We have, $\int_0^{1.5} [x^2] dx$

The value of x^2 at $x = 0$ and $x = 1.5$ are 0 and 2.25.

Hence, $x^2 = 0, 1, 2$

$$\Rightarrow 0 < x < 1 \Rightarrow 0 < x^2 < 1 \Rightarrow [x^2] = 0$$

$$\text{Also, } 1 < x < \sqrt{2} \Rightarrow 1 < x^2 < 2 \Rightarrow [x^2] = 1$$

$$\text{and } \sqrt{2} < x^2 < 1.5 \Rightarrow 2 < x^2 < 2.25 \Rightarrow [x^2] = 2$$

$$\begin{aligned}
 \therefore \int_0^{1.5} [x^2] dx &= \int_0^1 [x^2] dx + \int_1^{\sqrt{2}} [x^2] dx + \int_{\sqrt{2}}^{1.5} [x^2] dx \\
 &= \int_0^1 0 dx + \int_1^{\sqrt{2}} 1 dx + \int_{\sqrt{2}}^{1.5} 2 dx \\
 &= 0 + [x]_1^{\sqrt{2}} + 2[x]_{\sqrt{2}}^{1.5} \\
 &= (\sqrt{2} - 1) + 2(1.5 - \sqrt{2}) \\
 &= \sqrt{2} - 1 + 3 - 2\sqrt{2} \\
 &= 2 - \sqrt{2}
 \end{aligned}$$

15. (c) $\int_0^3 (3ax^2 + 2bx + c) dx = \int_1^3 (3ax^2 + 2bx + c) dx$

$$\begin{aligned}
 &\Rightarrow \int_0^1 (3ax^2 + 2bx + c) dx + \int_1^3 (3ax^2 + 2bx + c) dx \\
 &= \int_1^3 (3ax^2 + 2bx + c) dx \\
 &\Rightarrow \int_0^1 (3ax^2 + 2bx + c) dx = 0 \Rightarrow \left[\frac{3ax^3}{3} + \frac{2bx^2}{2} + cx \right]_0^1 = 0 \\
 &\therefore a + b + c = 0
 \end{aligned}$$

16. (c) Let $I = \int_0^1 f(k - 1 + x) dx$

$$\Rightarrow I = \int_{k-1}^k f(t) dt, \text{ where, } t = k - 1 + x$$

$$\Rightarrow I = \int_{k-1}^k f(x) dx$$

$$\begin{aligned}
 \therefore \sum_{k=1}^n \int_{k-1}^k f(x) dx &= \int_0^1 f(x) dx + \int_1^2 f(x) dx \\
 &\quad + \dots + \int_{n-1}^n f(x) dx \\
 &= \int_0^n f(x) dx
 \end{aligned}$$

17. (a) $\int_{-2}^x |2t| dt = f(x) = \int_{-2}^0 |2t| dt + \int_0^x 2t dt$

$$\begin{aligned}
 &= -2 \left[\frac{t^2}{2} \right]_{-2}^0 + 2 \left[\frac{t^2}{2} \right]_0^x \\
 &= -2[0 - 2] + 2 \left[\frac{x^2}{2} - 0 \right] \\
 &= 4 + x^2
 \end{aligned}$$

18. (b) Hint $I = \int_0^{\pi/2} \left| \sin \left(x - \frac{\pi}{4} \right) \right| dx$

$$= - \int_0^{\pi/4} \sin \left(x - \frac{\pi}{4} \right) dx + \int_{\pi/4}^{\pi/2} \sin \left(x - \frac{\pi}{4} \right) dx$$

19. (a) Let $I = \int_{-\pi/2}^{\pi/2} \frac{\cos x}{1 + e^x} dx$

$$= \int_{-\pi/2}^0 \frac{\cos x}{1 + e^x} dx + \int_0^{\pi/2} \frac{\cos x}{1 + e^x} dx \quad \dots(i)$$

On putting $x = -x$ in 1st integral, we get

$$\int_{-\pi/2}^0 \frac{\cos x}{1 + e^x} dx = \int_0^{\pi/2} \frac{e^x \cos x}{1 + e^x} dx$$

$$\begin{aligned}
 \therefore I &= \int_0^{\pi/2} \frac{e^x \cos x}{1 + e^x} dx + \int_0^{\pi/2} \frac{\cos x}{1 + e^x} dx \\
 &= \int_0^{\pi/2} \frac{(1 + e^x) \cos x}{(1 + e^x)} dx \\
 &= \int_0^{\pi/2} \cos x dx \\
 &= [\sin x]_0^{\pi/2} = 1
 \end{aligned}$$

20. (a) Let $I = \int_{7\pi/4}^{7\pi/3} \sqrt{\tan^2 x} dx = \int_{7\pi/4}^{2\pi} |\tan x| dx + \int_{2\pi}^{7\pi/3} |\tan x| dx$

$$\begin{aligned}
 &= - \int_{7\pi/4}^{2\pi} \tan x dx + \int_{2\pi}^{7\pi/3} \tan x dx \\
 &= [\log \cos x]_{7\pi/4}^{2\pi} - [\log \cos x]_{2\pi}^{7\pi/3} \\
 &= \left(\log \cos 2\pi - \log \cos \frac{7\pi}{4} \right) - \left(\log \cos \frac{7\pi}{3} - \log \cos 2\pi \right) \\
 &= \left[0 - \log \frac{1}{\sqrt{2}} \right] - [-\log 2 - 0] \\
 &= \log \sqrt{2} + \log 2 = \frac{3}{2} \log 2 = \log 2\sqrt{2}
 \end{aligned}$$

21. (b) Hint $I = \int_1^3 |(x - 1)(x - 2)(x - 3)| dx$

$$\begin{aligned}
 &= \int_1^2 |(x - 1)(x - 2)(x - 3)| dx \\
 &\quad + \int_2^3 |(x - 1)(x - 2)(x - 3)| dx \\
 &= \int_1^2 (x^3 - 6x^2 + 11x - 6) dx \\
 &\quad - \int_2^3 (x^3 - 6x^2 + 11x - 6) dx
 \end{aligned}$$

22. (d) Since, $\sin 2\pi x$ is positive, when $0 < x \leq \frac{1}{2}$ and

negative, when $\frac{1}{2} < x < 1$.

$$\therefore |\sin 2\pi x| = \begin{cases} \sin 2\pi x, & 0 < x \leq \frac{1}{2} \\ -\sin 2\pi x, & \frac{1}{2} < x < 1 \end{cases}$$

$$\Rightarrow \int_0^1 |\sin 2\pi x| dx = \int_0^{1/2} \sin 2\pi x dx + \int_{1/2}^1 -\sin 2\pi x dx = \frac{2}{\pi}$$

23. (a) Let $I = \int_0^{\pi/2} \frac{\psi(x)}{\psi(x) + \psi\left(\frac{\pi}{2} - x\right)} dx \quad \dots(i)$

$$\therefore I = \int_0^{\pi/2} \frac{\psi\left(\frac{\pi}{2} - x\right)}{\psi\left(\frac{\pi}{2} - x\right) + \psi\left(\frac{\pi}{2} - \frac{\pi}{2} + x\right)} dx$$

$$\Rightarrow I = \int_0^{\pi/2} \frac{\psi\left(\frac{\pi}{2} - x\right)}{\psi\left(\frac{\pi}{2} - x\right) + \psi(x)} dx \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} dx = \frac{\pi}{2} \Rightarrow I = \frac{\pi}{4}$$

24. (b) Let $I = \int_0^1 \cot^{-1}(1-x+x^2) dx$

$$= \int_0^1 \tan^{-1}\left(\frac{1}{1-x(1-x)}\right) dx = \int_0^1 \tan^{-1}\left(\frac{x+(1-x)}{1-x(1-x)}\right) dx$$

$$= \int_0^1 \tan^{-1} x dx - \int_0^1 \tan^{-1}(1-x) dx$$

$$= \int_0^1 \tan^{-1} x dx - \int_0^1 \tan^{-1}[1-(1-x)] dx$$

$$= \int_0^1 \tan^{-1} x dx + \int_0^1 \tan^{-1} x dx = 2 \int_0^1 \tan^{-1} x dx = \frac{\pi}{2} - \log 2$$

25. (c) Hint $I = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1+a^x} dx \quad \dots(i)$

$$\Rightarrow I = \int_{-\pi}^{\pi} \frac{\cos^2(0-x)}{1+a^{-x}} dx = \int_{-\pi}^{\pi} \frac{a^x \cos^2 x}{1+a^x} dx \quad \dots(ii)$$

Now, adding Eqs. (i) and (ii)

26. (b) $\therefore I = \int_0^a f(x) \cdot g(x) dx$

$$\therefore I = \int_0^a f(a-x) g(a-x) dx = \int_0^a f(x) \{a-g(x)\} dx$$

$$= a \int_0^a f(x) dx - \int_0^a f(x) \cdot g(x) dx = a \int_0^a f(x) dx - I$$

$$\therefore I = \frac{a}{2} \int_0^a f(x) dx$$

27. (c) Let $I = \int_0^{\pi} e^{\cos^2 x} \cos^5 3x dx$

$$\Rightarrow I = \int_0^{\pi} e^{\cos^2(\pi-x)} \cos^5 3(\pi-x) dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = - \int_0^{\pi} e^{\cos^2 x} \cos^5 3x dx = -I \Rightarrow 2I = 0$$

$$\therefore I = 0$$

28. (d) Let $I = \int_0^{\pi} \frac{\sin 2kx}{\sin x} dx = \int_0^{\pi} \frac{\sin 2k(\pi-x)}{\sin(\pi-x)} dx$

$$\Rightarrow I = \int_0^{\pi} \frac{\sin(2k\pi - 2kx)}{\sin x} dx \Rightarrow I = - \int_0^{\pi} \frac{\sin 2kx}{\sin x} dx$$

$$\Rightarrow I = -I \Rightarrow 2I = 0 \Rightarrow I = 0$$

29. (a) Let $I = \int_{-1/2}^{1/2} \cos x \left[\log \left(\frac{1-x}{1+x} \right) \right] dx \quad \dots(i)$

$$\therefore I = \int_{-1/2}^{1/2} \cos(-x) \left[\log \left(\frac{1+x}{1-x} \right) \right] dx \quad [\text{put } x = -x]$$

$$\Rightarrow I = - \int_{-1/2}^{1/2} \cos x \left[\log \left(\frac{1-x}{1+x} \right) \right] dx \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_{-1/2}^{1/2} \cos x \left[\log \left(\frac{1-x}{1+x} \right) \right] dx - \int_{-1/2}^{1/2} \cos x \left[\log \left(\frac{1-x}{1+x} \right) \right] dx$$

$$\Rightarrow 2I = 0 \Rightarrow I = 0$$

30. (c) Let $I = \int_{-1}^1 \frac{\sin x - x^2}{3-|x|} dx$

$$\Rightarrow I = \int_{-1}^1 \frac{\sin x}{3-|x|} dx - \int_{-1}^1 \frac{x^2}{3-|x|} dx$$

Here, $f(x) = \frac{\sin x}{3-|x|}$ is an odd function.

But $f(x) = \frac{x^2}{3-|x|}$ is an even function.

$$\therefore I = - \int_{-1}^1 \frac{x^2}{3-|x|} dx = 2 \int_0^1 \frac{-x^2}{3-|x|} dx$$

31. (b) $\int_{-1}^1 \frac{x^3 + |x| + 1}{x^2 + 2|x| + 1} dx$

$$= \int_{-1}^1 \frac{x^3}{x^2 + 2|x| + 1} dx + \int_{-1}^1 \frac{|x| + 1}{x^2 + 2|x| + 1} dx$$

$$= 0 + 2 \int_0^1 \frac{|x| + 1}{(|x| + 1)^2} dx = 2 \int_0^1 \frac{x + 1}{(x + 1)^2} dx$$

$$= 2 \int_0^1 \frac{1}{1+x} dx = 2 \ln 2 \quad [\because x > 0, \text{ from } 0 \text{ to } 1]$$

32. (b) $f(x) = \sin^{10} x (6x^9 - 25x^7 + 4x^3 - 2x)$

$$\therefore f(-x) = -f(x) \text{ is odd function.}$$

$$\therefore \int_{-\pi/2}^{\pi/2} \sin^{10} x (6x^9 - 25x^7 + 4x^3 - 2x) dx = 0$$

33. (b) Since, $f(x) + f(-x)$ is an even function and $g(x) - g(-x)$ is an odd function.

So, $\{f(x) + f(-x)\} \{g(x) - g(-x)\}$ is an odd function.

$$\therefore \int_{-\pi/4}^{\pi/4} [f(x) + f(-x)] [g(x) - g(-x)] dx = 0$$

34. (c) Given, $P = \int_0^{3\pi} f(\cos^2 x) dx$

and $Q = \int_0^{\pi} f(\cos^2 x) dx$

Also, $P = 3 \int_0^{\pi} f(\cos^2 x) dx = 3Q$

$$\therefore P - 3Q = 0$$

35. (a) Given, $f(2-x) = f(2+x)$, $f(4-x) = f(4+x)$

$$\begin{aligned} f(4+x) &= f(4-x) = f(2+2-x) \\ &= f\{2-(2-x)\} = f(x) \\ \therefore \int_0^{50} f(x) dx &= \int_0^{48} f(x) dx + \int_{48}^{50} f(x) dx \\ &= 12 \int_0^4 f(x) dx + \int_0^2 f(x) dx \\ &= 12 \left[\int_0^2 f(x) dx + \int_0^2 f(4-x) dx \right] + 5 \\ &= 24 \int_0^2 f(x) dx + 5 = 24(5) + 5 = 125 \end{aligned}$$

36. (b) We have, $(1+x^2) > x^2, \forall x$

$$\Rightarrow \sqrt{1+x^2} > x, \forall x \in (1, 2) \Rightarrow \frac{1}{\sqrt{1+x^2}} < \frac{1}{x}, \forall x \in (1, 2)$$

$$\therefore \int_1^2 \frac{dx}{\sqrt{1+x^2}} < \int_1^2 \frac{dx}{x} \Rightarrow I_1 < I_2 \Rightarrow I_2 > I_1$$

37. (c) By Leibnitz's rule, we have

$$\begin{aligned} \phi'(x) &= \frac{1}{2\sqrt{x}} \sin x - \left[-\frac{1}{x^2} \right] \sin \frac{1}{x^2} \\ \therefore \phi'(1) &= \frac{1}{2} \sin 1 + \sin 1 = \frac{3}{2} \sin 1 \end{aligned}$$

38. (a) $f(x) = \int_1^x \sqrt{2-t^2} dt$

$$\begin{aligned} \Rightarrow f'(x) &= \sqrt{2-x^2} \cdot 1 - \sqrt{2-1} \cdot 0 = \sqrt{2-x^2} \\ \therefore x^2 &= f'(x) = \sqrt{2-x^2} \\ \text{or } x^4 + x^2 - 2 &= 0 \text{ or } (x^2+2)(x^2-1) = 0 \\ \therefore x &= \pm 1 \end{aligned}$$

39. (c) We have, $f(x) = \frac{1}{x^2} \int_4^x [4t^2 - 2f'(t)] dt$

$$\begin{aligned} \therefore f'(x) &= \frac{1}{x^2} [4x^2 - 2f'(x)] - \frac{2}{x^3} \int_4^x [4t^2 - 2f'(t)] dt \\ \Rightarrow f'(4) &= \frac{1}{16} [64 - 2f'(4)] - 0 \therefore f'(4) = \frac{32}{9} \end{aligned}$$

40. (a) Using Newton-Leibnitz's formula, we get

$$\begin{aligned} t^2 \{f(t^2)\} \left\{ \frac{d}{dt}(t^2) \right\} - 0 \cdot f(0) \left\{ \frac{d}{dt}(0) \right\} &= 2t^4 \\ \Rightarrow t^2 \{f(t^2)\} 2t &= 2t^4 \Rightarrow f(t^2) = t \\ \Rightarrow f\left(\frac{4}{25}\right) &= \pm \frac{2}{5} \quad \left[\text{put } t = \pm \frac{2}{5} \right] \\ \therefore f\left(\frac{4}{25}\right) &= \frac{2}{5} \quad [\text{neglecting negative sign}] \end{aligned}$$

41. (b) Let $A = \lim_{n \rightarrow \infty} \frac{(r)^{1/n}}{n}$

$$\begin{aligned} \log A &= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n \log \frac{r}{n} = \int_0^1 \log x dx = [x \log x - x]_0^1 \\ \therefore A &= e^{-1} \end{aligned}$$

42. (a) $S = \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{n}{(n+r)\sqrt{r(2n+r)}}$
- $$= \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n\left(1+\frac{r}{n}\right)\sqrt{\frac{r}{n}\left(2+\frac{r}{n}\right)}}$$

$$\begin{aligned} &= \int_0^1 \frac{dx}{(1+x)\sqrt{2x+x^2}} = \int_0^1 \frac{dx}{(1+x)\sqrt{(1+x)^2-1}} \\ &= [\sec^{-1}(1+x)]_0^1 = \sec^{-1} 2 - \sec^{-1} 1 = \frac{\pi}{3} \end{aligned}$$

43. (b) $\lim_{n \rightarrow \infty} \left[\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{n+n} \right] = \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{r+n}$
- $$= \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} \cdot \frac{1}{1+\frac{r}{n}} = \int_0^1 \frac{1}{1+x} dx$$
- $$= [\log(1+x)]_0^1 = \log 2$$

44. (a) $\lim_{n \rightarrow \infty} \left[\frac{1}{n} + \frac{n^2}{(n+1)^3} + \frac{n^2}{(n+2)^3} + \dots + \frac{1}{8n} \right]$

$$= \lim_{n \rightarrow \infty} \sum_{r=0}^n \frac{n^2}{(n+r)^3} = \lim_{n \rightarrow \infty} \sum_{r=0}^n \frac{1}{n} \cdot \frac{1}{\left(1+\frac{r}{n}\right)^3}$$

$$= \int_0^1 \frac{dx}{(1+x)^3} = \left[-\frac{1}{2(1+x)^2} \right]_0^1 = -\frac{1}{2} \left(\frac{1}{4} - 1 \right) = \frac{3}{8}$$

45. (b) $\lim_{n \rightarrow \infty} \left[\frac{\sqrt{n}}{(3+4\sqrt{n})^2} + \frac{\sqrt{n}}{\sqrt{2}(3\sqrt{2}+4\sqrt{n})^2} + \frac{\sqrt{n}}{\sqrt{3}(3\sqrt{3}+4\sqrt{n})^2} + \dots + \frac{1}{49n} \right]$

$$= \lim_{n \rightarrow \infty} \left[\frac{\sqrt{n}}{(3\sqrt{1}+4\sqrt{n})^2} + \frac{\sqrt{n}}{\sqrt{2}(3\sqrt{2}+4\sqrt{n})^2} + \dots + \frac{\sqrt{n}}{\sqrt{n}(3\sqrt{n}+4\sqrt{n})^2} \right]$$

$$= \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{\sqrt{n}}{\sqrt{r}(3\sqrt{r}+4\sqrt{n})^2} = \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{\sqrt{\frac{r}{n}} \left(3\sqrt{\frac{r}{n}} + 4 \right)^2} \cdot \frac{1}{n}$$

$$= \int_0^1 \frac{dx}{\sqrt{x}(3\sqrt{x}+4)^2}$$

Put $3\sqrt{x}+4=t$

$$= \frac{2}{3} \int_4^7 \frac{dt}{t^2} = \frac{2}{3} \left[-\frac{1}{t} \right]_4^7 = \frac{2}{3} \left(\frac{1}{4} - \frac{1}{7} \right) = \frac{1}{14}$$

46. (c) Required area = $\int_0^2 (y_1 - y_2) dx$

$$\begin{aligned} \therefore \int_0^2 [(x+2) - x^2] dx &= \left[\frac{x^2}{2} + 2x - \frac{x^3}{3} \right]_0^2 \\ &= 2 + 4 - \frac{8}{3} = \frac{10}{3} \end{aligned}$$

47. (c) $y = x \sin x$ is positive for $0 < x < \pi$ and negative for $\pi < x < 2\pi$.

$$\therefore \text{Required area} = \int_0^{\pi} x \sin x \, dx + \left| \int_{\pi}^{2\pi} x \sin x \, dx \right|$$

$$= \pi + 3\pi = 4\pi$$

48. (b) $y = 4$ meet the parabola

$$y^2 = x \text{ at } B.$$

$$\text{At } 16 = x$$

$$\Rightarrow B \text{ is } (16, 4)$$

$$\therefore \text{Required area} = \int_0^4 y^2 \, dy$$

$$= \left[\frac{y^3}{3} \right]_0^4 = \frac{64}{3} \text{ sq units}$$

49. (c) Since, the intersection of two curves $y = x^3$ and $y = \sqrt{x}$ are $x = 0$ and $x = 1$.

$$\therefore A = \left| \int_0^1 (x^3 - \sqrt{x}) \, dx \right|$$

$$= \left| \left[\frac{x^4}{4} - \frac{2x^{3/2}}{3} \right]_0^1 \right| = \left| \left[\frac{1}{4} - \frac{2}{3} \right] \right|$$

$$= \frac{5}{12} \text{ sq unit}$$

50. (b) **Hint** Required area, $A = 2 \int_1^3 \sqrt{9 - x^2} \, dx$

$$= 2 \cdot \frac{1}{2} \left[x \sqrt{9 - x^2} + 9 \sin^{-1} \frac{x}{3} \right]_1^3$$

51. (a) **Hint** Required area

$$= \int_{-6}^{-3} |x+3| \, dx + \int_{-3}^0 |x+3| \, dx$$

$$= \int_{-6}^{-3} (-x-3) \, dx + \int_{-3}^0 (x+3) \, dx$$

52. (d) Clearly, $y = f(x)$ passes through $(2, 0)$ and $(0, 1)$.

$$\therefore 0 = f(2) \text{ and } 1 = f(0)$$

Also, $\int_0^2 f(x) \, dx = \frac{3}{4}$ [given]

Now, $\int_0^2 x f'(x) \, dx = [x f(x)]_0^2 - \int_0^2 f(x) \, dx$

$$\Rightarrow \int_0^2 x f'(x) \, dx = [2f(2) - 0f(0)] - \frac{3}{4}$$

$$\Rightarrow \int_0^2 x f'(x) \, dx = 2 \times 0 - 0 \times 1 - \frac{3}{4} = -\frac{3}{4}$$

53. (a) Area of the circle in 1st quadrant is $\frac{\pi(\pi^2)}{4} = \frac{\pi^3}{4}$.

Also, area of curve $y = \sin x$ and X-axis is 2 sq units.

$$\therefore \text{Required area, } A = \frac{\pi^3}{4} - 2 = \frac{\pi^3 - 8}{4}$$

54. (d) Given curves, $x^2 + y^2 = 1$,

$$x + y = 1 \text{ meet when}$$

$$x^2 + (1-x)^2 = 1$$

$$\Rightarrow x^2 + 1 + x^2 - 2x = 1$$

$$\Rightarrow 2x^2 - 2x = 0$$

$$\Rightarrow 2x(x-1) = 0$$

$$\Rightarrow x = 0, x = 1 \Rightarrow y = 1, y = 0$$

$$\therefore A = \int_0^1 [\sqrt{1-x^2} - (1-x)] \, dx$$

$$= \left[\frac{x \sqrt{1-x^2}}{2} + \frac{1}{2} \sin^{-1} x - x + \frac{x^2}{2} \right]_0^1 = \frac{1}{2} \cdot \frac{\pi}{2} - 1 + \frac{1}{2}$$

$$= \frac{\pi}{4} - \frac{1}{2}$$

55. (d) Required area $= \int_0^{\log 3} x \, dy = \int_0^{\log 3} e^y \, dy$

$$= [e^y]_0^{\log 3} = [e^{\log 3} - e^0] = 3 - 1 = 2$$

56. (b) Required area $= \int_0^{\pi/2} |\cos x - \sin x| \, dx$

$$= \int_0^{\pi/4} (\cos x - \sin x) \, dx + \int_{\pi/4}^{\pi/2} (\sin x - \cos x) \, dx$$

$$= [\sin x + \cos x]_0^{\pi/4} + [-\cos x - \sin x]_{\pi/4}^{\pi/2}$$

$$= (\sqrt{2} - 1) - (1 - \sqrt{2}) = 2\sqrt{2} - 2$$

57. (b) Given, $y = x$, $x = e$ and $y = \frac{1}{x}$, $x \geq 0$

Since, $y = x$ and $x \geq 0 \Rightarrow y \geq 0$

$\therefore$ Area to be calculated in 1st quadrant is shown in figure.

$$\therefore \text{Required area} = \text{Area of } \triangle ODA + \text{Area of } DABCD$$

$$= \frac{1}{2} (1 \times 1) + \int_1^e \frac{1}{x} \, dx$$

$$= \frac{1}{2} + [\log |x|]_1^e = \frac{1}{2} + [\log |x|]_1^e$$

$$= \frac{1}{2} + 1 = \frac{3}{2} \text{ sq units}$$

58. (a) Required area

$$= \int_0^{\pi/4} (\cos x - \sin x) dx + \int_{\pi/4}^{5\pi/4} (\sin x - \cos x) dx + \int_{5\pi/4}^{3\pi/2} (\cos x - \sin x) dx$$

$$= [\sin x + \cos x]_0^{\pi/4} + [-\cos x - \sin x]_{\pi/4}^{5\pi/4} + [\sin x + \cos x]_{5\pi/4}^{3\pi/2} = (4\sqrt{2} - 2) \text{ sq units}$$

59. (c) **Hint** Area bounded between curves

$$= \int_0^4 \left(\sqrt{4x} - \frac{x^2}{4} \right) dx$$

60. (b) Required area $= 2 \int_0^1 x e^x dx$

$$= 2[xe^x - e^x]_0^1 = 2 \text{ sq units}$$

61. (d) $y^2 = x^3$ and $|y| = 2x$ are symmetric about Y-axis.

BITSAT Archives

1. (a) **Hint** Consider, $I = \int_1^x t \log t dt$

$$= \left[\log t \cdot \frac{t^2}{2} \right]_1^x - \int_1^x \frac{1}{t} \cdot \frac{t^2}{2} dt$$

$$\Rightarrow \frac{1}{4} = \frac{x^2}{2} \log x - \frac{1}{2} \left[\frac{t^2}{2} \right]_1^x$$

2. (b) We know that, $x - [x]$ is periodic function with period one.

$\Rightarrow$
 $\Rightarrow$

$$4x^2 = x^3 \\ x = 0, 4$$

$$\begin{aligned} \therefore \text{Required area} &= 2 \int_0^4 (2x - x^{3/2}) dx \\ &= 2 \left[x^2 - \frac{x^{5/2} \times 2}{5} \right]_0^4 \\ &= 2 \times \frac{16}{5} \\ &= \frac{32}{5} \\ &= 6 \frac{2}{5} \text{ sq units} \end{aligned}$$

62. (c) **Hint** Given, $y = x|x| = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

$$\begin{aligned} \text{Required area} &= 2 \int_0^1 x|x| dx \\ &= 2 \int_0^1 x^2 dx \end{aligned}$$

$\therefore e^{x-[x]}$ has period one.

[since, $f(x)$ is periodic with period T , then $\int_0^{nT} f(x) dx = n \int_0^T f(x) dx$]

$$\begin{aligned} \therefore \int_0^{25 \times 1} e^{x-[x]} dx &= 25 \int_0^1 e^{x-[x]} dx \\ &= 25 \int_0^1 e^{x-0} dx = 25[e^x]_0^1 = 25[e - 1] \end{aligned}$$

$$\begin{aligned} \therefore 25(e - 1) &= k(e - 1) \\ \text{Hence, } k &= 25 \end{aligned}$$

3. (a) Given that, $y = -\sqrt{-x}$
 $\Rightarrow y^2 = -x$, where x and y
 both are negative.

Now, $x = -\sqrt{-y}$

$\Rightarrow x^2 = -y$, where x and y
 both are negative.

$\therefore$ Required area

$$= \left| \int_{-1}^0 -\sqrt{-x} \, dx - \int_{-1}^0 -x^2 \, dx \right|$$

$$= \frac{1}{3}$$

4. (c) Given that, $I = \int_0^{10\pi} ([\sec^{-1} x] + [\cot^{-1} x]) \, dx$

$$= \int_0^{\sec^{-1} 1} ([\sec^{-1} x] + [\cot^{-1} x]) \, dx + \int_{\sec^{-1} 1}^{10\pi} ([\sec^{-1} x] + [\cot^{-1} x]) \, dx$$

$$= \int_0^{\sec^{-1} 1} (0 + 0) \, dx + \int_{\sec^{-1} 1}^{10\pi} (1 + 0) \, dx$$

$$= 0 + [x]_{\sec^{-1} 1}^{10\pi} = 10\pi - \sec^{-1} 1$$

5. (a) Given curve is

$$(y - x)^2 = x^3$$

$$\Rightarrow y - x = \pm x\sqrt{x}$$

$$\Rightarrow y = x + x\sqrt{x} \quad \dots(i)$$

$$\Rightarrow y = x - x\sqrt{x} \quad \dots(ii)$$

and $x = 1$

From the figure, required area

$$= \int_0^1 \{(x + x\sqrt{x}) - (x - x\sqrt{x})\} \, dx$$

$$= \int_0^1 2x\sqrt{x} \, dx = 2 \int_0^1 x^{3/2} \, dx$$

$$= 2 \left[\frac{x^{5/2}}{5/2} \right]_0^1 = \frac{4}{5} [1 - 0] = \frac{4}{5} \text{ sq unit}$$

6. (d) Hint $I = \int_0^{\pi/2} \frac{\sin^n \theta}{\sin^n \theta + \cos^n \theta} \, d\theta \quad \dots(i)$
- $$= \int_0^{\pi/2} \frac{\sin^n(\pi/2 - \theta)}{\sin^n(\pi/2 - \theta) + \cos^n(\pi/2 - \theta)} \, d\theta$$
- $$= \int_0^{\pi/2} \frac{\cos^n \theta}{\cos^n \theta + \sin^n \theta} \, d\theta \quad \dots(ii)$$

Now, add Eqs. (i) and (ii).

7. (d) Hint $I = \int_0^\pi \cos^{101} x \, dx$

$$\Rightarrow I = \int_0^\pi [\cos(\pi - x)]^{101} \, dx \Rightarrow I = \int_0^\pi -\cos^{101} x \, dx$$

8. (c) $\lim_{n \rightarrow \infty} \left[\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{n+5n} \right]$

$$= \lim_{n \rightarrow \infty} \sum_{r=0}^{5n} \frac{1}{n+r} = \lim_{n \rightarrow \infty} \left[\frac{1}{n} \sum_{r=0}^{5n} \frac{n}{n+r} \right]$$

$$= \lim_{n \rightarrow \infty} \left[\frac{1}{n} \sum_{r=0}^{5n} \frac{1}{1+(r/n)} \right]$$

$$= \int_0^5 \frac{1}{1+x} \, dx = [\log(1+x)]_0^5 = \log 6 - \log 1 = \log 6$$

9. (d) $\int_1^2 f(x) \, dx = \int_1^2 \frac{d}{dx} \{\phi(x)\} \, dx = [\phi(x)]_1^2 = \phi(2) - \phi(1)$

10. (b) Hint $\int_0^2 |1-x| \, dx = \int_0^1 (1-x) \, dx + \int_1^2 (x-1) \, dx$

11. (b) Required area $= \int_0^\pi \sin x \, dx$

$$= [-\cos x]_0^\pi = [1 + 1] = 2 \text{ sq units}$$

12. (c) Hint Let $I = \int_0^1 |5x-3| \, dx$

$$\text{Now, } |5x-3| = \begin{cases} 5x-3, & x \geq \frac{3}{5} \\ -(5x-3), & x < \frac{3}{5} \end{cases}$$

$$\therefore I = \int_0^{3/5} -(5x-3) \, dx + \int_{3/5}^1 (5x-3) \, dx$$

13. (a) Required area

$$= \int_0^1 (x_1 - x_2) \, dx$$

$$= \int_0^1 \{(-x+1) - (x-1)\} \, dx$$

$$= \int_0^1 (-2x+2) \, dx$$

$$= [-x^2 + 2x]_0^1$$

$$= -1 + 2 - 0 + 0$$

$$= 1$$

14. (b) Hint $\int_{-1}^2 |x|^3 \, dx = \int_{-1}^0 -x^3 \, dx + \int_0^2 x^3 \, dx$

15. (c) Let $I = \int_{-\pi/2}^{\pi/2} \sin |x| \, dx$

$$= 2 \int_0^{\pi/2} \sin x \, dx = 2[-\cos x]_0^{\pi/2} = 2$$

16. (b) Hint

$$\therefore \text{Required area} = \int_{-1}^0 x \, dy$$

$$= 2 \int_0^1 \frac{y^2 - 1}{2} \, dy$$

17. (a) Let $I = \int_0^8 |x-5| \, dx$

$$= \int_0^5 -(x-5) \, dx + \int_5^8 (x-5) \, dx = 25 - 8 = 17$$

18. (c) Given that, $I_1 = \int_0^1 2^{x^2} \, dx$, $I_2 = \int_0^1 2^{x^3} \, dx$, $I_3 = \int_1^2 2^{x^2} \, dx$

$$\text{and } I_4 = \int_1^2 2^{x^3} \, dx$$

$$\therefore 2^{x^3} < 2^{x^2}, 0 < x < 1$$

$$\text{and } 2^{x^3} > 2^{x^2}, x > 1$$

$$\therefore I_4 > I_3 \text{ and } I_2 < I_1$$

19. (c) Required area = Area of shaded region OAB

$$= \int_0^2 y dx = \int_0^2 x dx = \left[\frac{x^2}{2} \right]_0^2 = 2 \text{ sq units}$$

Alternate Solution

Required area = Area of $\triangle OAB$

$$= \frac{1}{2} \times 2 \times 2$$

$$= 2 \text{ sq units}$$

20. (a) Let $I = \int_0^{\pi/4} \log(1 + \tan x) dx$... (i)

$$\Rightarrow I = \int_0^{\pi/4} \log \left[1 + \tan \left(\frac{\pi}{4} - x \right) \right] dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^{\pi/4} \log \left[1 + \frac{1 - \tan x}{1 + \tan x} \right] dx$$

$$= \int_0^{\pi/4} \log \left[\frac{2}{1 + \tan x} \right] dx$$

$$= \int_0^{\pi/4} \log 2 dx - \int_0^{\pi/4} \log(1 + \tan x) dx$$

$$\Rightarrow I = \log 2 [x]_0^{\pi/4} - I \quad [\text{from Eq. (i)}]$$

$$\Rightarrow 2I = \frac{\pi}{4} \log_e 2 \Rightarrow I = \frac{\pi}{8} \log_e 2$$

21. (d) Required area = Area of curve $PSMRQP$

$$= 2 \times \text{Area of curve } PSRQP$$

$$= 2 \int_a^{4a} \sqrt{4ax} dx$$

$$= 4\sqrt{a} \left[\frac{x^{3/2}}{3/2} \right]_a^{4a} = \frac{8}{3} \sqrt{a} [(4a)^{3/2} - a^{3/2}]$$

$$= \frac{8}{3} \sqrt{a} (8a^{3/2} - a^{3/2}) = \frac{56}{3} a^2$$

22. (c) Hint $I = \int_{\log 2}^x \frac{du}{(e^u - 1)^{1/2}}$ or $I = \int_{\log 2}^x \frac{e^u}{e^u (e^u - 1)^{1/2}} du$

$$\text{Put } e^u - 1 = t^2 \Rightarrow e^u du = 2t dt$$

$$\therefore I = \int_1^{\sqrt{e^x - 1}} \frac{2t}{(t^2 + 1)t} dt = 2 \int_1^{\sqrt{e^x - 1}} \frac{dt}{(1 + t^2)}$$

$$= [\tan^{-1} t]_1^{\sqrt{e^x - 1}} = 2 \tan^{-1} \sqrt{e^x - 1} - \tan^{-1} 1$$

23. (b) Let $I = \int_0^{2\pi} \left\{ |\sin x| - \frac{1}{2} \sin x \right\} dx$
- $$= \int_0^{2\pi} \left\{ |\sin x| - \frac{1}{2} \sin x \right\} dx = \int_0^{2\pi} \frac{1}{2} |\sin x| dx$$
- $$= \frac{1}{2} \left[\int_0^{2\pi} |\sin x| dx + \int_{2\pi}^{4\pi} |\sin x| dx \right.$$
- $$\left. + \dots + \int_{2(n-1)\pi}^{2n\pi} |\sin x| dx \right]$$

$$\text{Now, } I_1 = \int_0^{2\pi} |\sin x| dx$$

$$I_1 = \int_0^{\pi} \sin x dx - \int_{\pi}^{2\pi} \sin x dx$$

$$= [-\cos x]_0^{\pi} + [\cos x]_{\pi}^{2\pi} = -[1 - 1] + [1 + 1]$$

$$= 2 + 2 = 4$$

$$\therefore I = \frac{1}{2} [4 + 4 + 4 + \dots n \text{ times}] = \frac{1}{2} (4n) = 2n$$

24. (d) Let $f(\theta) = \left[\int_0^{\sin^2 \theta} \sin^{-1} \sqrt{\phi} d\phi + \int_0^{\cos^2 \theta} \cos^{-1} \sqrt{\phi} d\phi \right]$

$$\Rightarrow f'(\theta) = \frac{d}{d\theta} \sin^2 \theta [\sin^{-1} \sqrt{\sin^2 \theta}]$$

$$+ \frac{d}{d\theta} \cos^2 \theta [\cos^{-1} \sqrt{\cos^2 \theta}]$$

$$= (2 \sin \theta \cos \theta) \theta - (2 \sin \theta \cos \theta) \theta = 0$$

$$\therefore f(\theta) = \text{constant} = a \quad [\text{say}]$$

$$\therefore f\left(\frac{\pi}{4}\right) = a$$

$$\Rightarrow \int_0^{1/2} \sin^{-1} \sqrt{\phi} d\phi + \int_0^{1/2} \cos^{-1} \sqrt{\phi} d\phi = a$$

$$\Rightarrow \int_0^{1/2} (\sin^{-1} \sqrt{\phi} + \cos^{-1} \sqrt{\phi}) d\phi = a$$

$$\Rightarrow \frac{\pi}{2} [\phi]_0^{1/2} = a \Rightarrow \frac{\pi}{4} = a$$

25. (a) Hint

$$\therefore \text{Required area} = \text{Area of curve } OABCO$$

$$= 2 \times \text{Area of curve } OABO$$

$$= 2 \int_0^1 y dx$$

$$= 2 \int_0^1 [(2 - x^2) - (x^2)] dx$$

21

Differential Equations

Differential Equation

An equation that involves independent variables, dependent variables, derivatives of the dependent variables w.r.t. independent variables and constant, is called a differential equation.

Types of Differential Equations

Ordinary Differential Equation Ordinary differential equations are those equations which contain only one independent variable.

In particular, an equation involving only one independent variable (say x), dependent variable (say y) and the differential coefficients $\frac{dy}{dx}, \frac{d^2y}{dx^2}, \dots$, is called ordinary differential equation.

Partial Differential Equation Partial differential equations are those equations which contain two or more independent variables.

Order and Degree of a Differential Equation

The **order** of a differential equation is the order of the highest derivative occurring in the differential equation.

By the **degree** of differential equation, when it is polynomial equation in derivatives, then the greatest exponent (positive integral index) of the highest order derivative, occurring in the differential equation.

- The order and degree of a differential equation is always a positive integer.
- The degree of the differential equation is found only when the equation is polynomial in derivatives.

Solution of Differential Equation

A primitive or solution of a differential equation is a functional relation between x and y which is free from derivatives and this relation on substitution satisfies the differential equation.

There are two types of solutions of a differential equation

1. General Solution

A general solution of a differential equation is a relation between the variables (not involving the derivatives) which contains the same number of the arbitrary constants as the order of the differential equation.

2. Particular Solution

Particular solution of the differential equation obtained from the general solution by assigning particular values to the arbitrary constant in the general solution.

Formation of Differential Equation whose General Solution is Given

Formulating differential equation that represent the family of given curves, means finding a differential equation whose solution is the given equation.

Suppose an equation contains n arbitrary constants, then differentiate the given equation n times to obtain n equations. The equation so obtained by eliminating arbitrary constant is the differential equation of order n for the family of given curves.

Solution of Ordinary Differential Equation of the First Order and First Degree

An ordinary differential equation of the first order and first degree is of the form

$$M + N \frac{dy}{dx} = 0 \text{ or } Mdx + Ndy = 0$$

where, M and N are functions of x and y or constant. The general solution of such equation will contain only one arbitrary constant.

Differential equation of first degree and first order can be classified into following types

Variables Separable Differential Equation

If the differential equation can be put in the form $f(x)dx + \phi(y)dy = 0$ will be termed as variable separable. Such equation will be solved by integrating and adding arbitrary constant in side.

Hence, complete general solution of $f(x)dx + \phi(y)dy = 0$ will be $\int f(x)dx + \int \phi(y)dy = C$

where, C is an arbitrary constant or constant of integration.

Reducible to Variable Separable Form

Differential equations of the form $\frac{dy}{dx} = f(ax + by + c)$ can be reduced to variable separable form by the substitution

$$\begin{aligned} \therefore \quad & ax + by + c = z \\ & a + b \frac{dy}{dx} = \frac{dz}{dx} \\ \Rightarrow \quad & \left(\frac{dz}{dx} - a \right) \frac{1}{b} = f(z) \\ \Rightarrow \quad & \frac{dz}{dx} = a + bf(z) \end{aligned}$$

Homogeneous Differential Equation of First Order and First Degree

A differential equation of the form

$$\frac{dy}{dx} = \frac{f(x, y)}{\phi(x, y)}$$

where, $f(x, y)$ and $\phi(x, y)$ are both homogeneous functions of x and y of the same degree, is called a homogeneous differential equation.

The solution of this equation is obtained by substituting, $y = vx$ or $x = vy$ according as $f(x, y)$ and $\phi(x, y)$ is converted into function of $\left(\frac{y}{x}\right)$ or $\left(\frac{x}{y}\right)$.

This substitution reduces the given equation to the variable separable form.

Reducible to Variable Separable Form

(i) Consider the differential equation of the form

$$\frac{dy}{dx} = \frac{ax + by + c}{a'x + b'y + c'}, \text{ where } \frac{a}{a'} \neq \frac{b}{b'}$$

This equation is not homogeneous. In order to reduced this equation to the homogeneous form substitute $x = X + h$, $y = Y + k$, where h and k , are constants which are to be determined.

$$\Rightarrow \quad \frac{dy}{dx} = \frac{dY}{dX}$$

and the above equation becomes

$$\frac{dY}{dX} = \frac{a(X + h) + b(Y + k) + c}{a'(X + h) + b'(Y + k) + c'} \quad \dots(i)$$

$$\frac{dY}{dX} = \frac{(aX + bY) + ah + bk + c}{(a'X + b'Y) + a'h + b'k + c'} \quad \dots(ii)$$

Now, h and k will be chosen such that

$$\begin{aligned} ah + bk + c &= 0 \\ a'h + b'k + c' &= 0 \\ \frac{h}{bc' - b'c} &= \frac{k}{ca' - c'a} \\ &= \frac{1}{ab' - a'b} \end{aligned}$$

For these values of h and k in Eq. (ii) reduces to

$$\frac{dY}{dX} = \frac{aX + bY}{a'X + b'Y}$$

which is a homogeneous equation in X, Y and can be solved by the substitution $Y = vX$.

$$\frac{dY}{dX} = v + X \cdot \frac{dv}{dX}$$

Replacing, X and Y in the solution so obtained by $x - h$ and $y - k$, respectively, we can obtain the required solution in term of x and y .

(ii) If $\frac{dy}{dx} = \frac{ax + by + c}{a'x + b'y + c'}$ and $\frac{a}{a'} = \frac{b}{b'} = m$ [say]

then, $\frac{dy}{dx} = \frac{m(a'x + b'y) + c}{a'x + b'y + c'}$

where, m is any number.

In such case substitute $a'x + b'y = v$

So that, $a' + b' \frac{dy}{dx} = \frac{dv}{dx}$

Transform the differential equation of the form

$$\frac{1}{b'} \left(\frac{dv}{dx} - a' \right) = \frac{mv + c}{v + c'}, \text{ we get}$$

$$\frac{dv}{dx} = a' + b' \left(\frac{mv + c}{v + c'} \right)$$

which is a differential equation in variable separable form and it can easily be solved.

Linear Differential Equation of First Order

A differential equation of the form

$$\frac{dy}{dx} + Py = Q$$

where, P and Q are either constants or functions of x (and not of y) is said to be linear differential equation of first order.

To obtain the solution of this equation, we first obtain an integrating factor (IF) as

$$\text{IF} = e^{\int P dx}$$

The solution of the given equation is given by

$$y \cdot (\text{IF}) = \int Q(\text{IF}) dx + C$$

- NOTE**
- If the equation is given by $\frac{dx}{dy} + Px = Q$, where P and Q are functions of y (not of x), then $\text{IF} = e^{\int P dy}$ and solution will be $x \cdot (\text{IF}) = \int Q(\text{IF}) dy + C$.
 - Before solving linear differential equation, make the coefficient of $\frac{dy}{dx}$ or $\frac{dx}{dy}$ equal to 1.

Extended Form of Linear Equations

(i) Bernoulli's Equation

An equation of the form $\frac{dy}{dx} + Py = Qy^n$, where P and Q are functions of x alone or constant and n is constant, other than 0 and 1, is called a Bernoulli's equation.

This equation can be reduced to the linear form by dividing y^n , we get

$$y^{-n} \frac{dy}{dx} + P \cdot y^{-n+1} = Q$$

Now, put $y^{-n+1} = v$, so that

$$(-n+1)y^{-n} \frac{dy}{dx} = \frac{dv}{dx}$$

$$\frac{dv}{dx} + (1-n)Pv = (1-n)Q$$

which is a linear differential equation.

(ii) If the equation of the form

$$\frac{dy}{dx} + P\phi(y) = Q\psi(y)$$

where, P and Q are functions of x alone or constant. Dividing the given equation by $\psi(y)$, we get

$$\frac{1}{\psi(y)} \cdot \frac{dy}{dx} + \frac{\phi(y)}{\psi(y)} P = Q$$

Now, put $\frac{\phi(y)}{\psi(y)} = v$ so that $\frac{d}{dx} \left[\frac{\theta(y)}{\psi(y)} \right] = \frac{dv}{dx}$

or $\frac{dy}{dx} = k \cdot \frac{1}{\psi(y)} \cdot \frac{dy}{dx}$, where k is constant.

We get $\frac{dv}{dx} + kPv = kQ$

which is a linear differential equation.

Practice Exercise

1. If m and n are the order and degree of the differential

equation $\left(\frac{d^2y}{dx^2}\right)^5 + \frac{4\left(\frac{d^2y}{dx^2}\right)^3}{\frac{d^3y}{dx^3}} + \frac{d^3y}{dx^3} = x^2 - 1$, then

- a. $m = 3, n = 3$ b. $m = 3, n = 2$
c. $m = 3, n = 5$ d. $m = 3, n = 1$

2. The degree of the differential equation

$$\frac{d^2y}{dx^2} + 3\left[\frac{dy}{dx}\right]^2 = x^2 \log\left[\frac{d^2y}{dx^2}\right], \text{ is}$$

- a. 1 b. 2
c. 3 d. None of these

3. The order and degree of the differential equation

$$\sqrt{\frac{d^2y}{dx^2}} = 3\sqrt{\frac{dy}{dx}} + 5 \text{ are respectively}$$

- a. 2 and 3 b. 3 and 2
c. 2 and 1 d. 2 and 2

4. The order and degree of the differential equation

$$\left(\frac{d^2y}{dx^2}\right)^{3/2} - \sqrt{\left(\frac{dy}{dx}\right)} - 4 = 0 \text{ are respectively}$$

- a. 2 and 6 b. 3 and 6
c. 1 and 4 d. 2 and 4

5. The differential equation whose solution is $(x-h)^2 + (y-k)^2 = a^2$, is given by

a. $\left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2\left(\frac{d^2y}{dx^2}\right)$ b. $\left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2\left(\frac{d^2y}{dx^2}\right)^2$
c. $\left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2\left(\frac{d^2y}{dx^2}\right)^2$ d. None of these

6. The differential equation of all parabolas with axis parallel to Y-axis, is

- a. $y_2 = 2y_1 + x$ b. $y_3 = 2y_1$
c. $y_2^3 = y_1$ d. None of these

7. The degree of the differential equation of all circles of radius r , having centre on Y-axis and passing through the origin, is

- a. 1 b. 2 c. 3 d. 4

8. The order of the differential equation whose general solution is given by

$$y = (c_1 + c_2) \cos(x + c_3) - c_4 e^{x+c_5}, \quad \text{where}$$

c_1, c_2, c_3, c_4, c_5 are arbitrary constants, is

- a. 5 b. 4 c. 3 d. 2

9. The degree of the differential equation satisfying

$$(\sqrt{1+x^2} + \sqrt{1+y^2} = A(x\sqrt{1+y^2} - y\sqrt{1+x^2})) \text{ is}$$

- a. 2 b. 3 c. 4 d. None

10. The differential equation of all straight lines which are at a constant distance p from the origin is

- a. $(y - xy_1)^2 = p^2(1-x)^2$ b. $(y - xy_1)^2 = p^2(1+x^2)$
c. $(y - xy_1)^2 = p^2(1+y_1^2)$ d. $(y + xy_1)^2 = p^2(1+y_1^2)$

11. The differential equation corresponding to the family of curves $y = e^x (a \cos x + b \sin x)$, where a and b are arbitrary constants, is

- a. $2y_2 + y_1 - 3y = 0$ b. $y_2 - 2y_1 + 2y = 0$
c. $2y_2 + 2y_1 - y = 0$ d. $2y_2 - y_1 + 2y = 0$

12. The number of straight lines which satisfy the differential equation $\frac{dy}{dx} + x\left(\frac{dy}{dx}\right)^2 - y = 0$, is

- a. 3 b. 2 c. 4 d. None

13. If the slope of a curve at any point is the reciprocal of twice the ordinate at the point and it passes through the point (4, 3). Then, the equation of the curve is

- a. $x^2 = y + 5$ b. $y^2 = x - 5$ c. $y^2 = x + 5$ d. $x^2 = y - 5$

14. The solution of $\frac{dy}{dx} = \frac{ax+h}{by+k}$ represents a parabola when

- a. $a = 0, b = 0$ b. $a + 1, b = 2$ c. $a = 0, b \neq 0$ d. $a = 2, b = 1$

15. The solution of the differential equation $2x \frac{dy}{dx} - y = 3$ represents

- a. a straight line b. a circle
c. a parabola d. an ellipse

16. If $M \frac{dV}{dt} = F - kV$ and $V = 0$ when $t = 0$, then V is given by

- a. $V = \frac{k}{F}(1 - e^{-kt/M})$ b. $V = \frac{F}{k}(1 + e^{-kt/M})$
c. $V = \frac{F}{k}(1 - e^{-kt/M})$ d. None of these

17. The differential equation $\frac{dy}{dx} = \frac{\sqrt{1-y^2}}{y}$ determines family of circles with

- a. variable radii and a fixed centre at (0, 1)
b. variable radii and a fixed centre at (0, -1)
c. fixed radius 1 and variable centres along the X-axis
d. fixed radius 1 and variable centres along the Y-axis

18. The equation of a curve passing through $(2, 7/2)$ and having gradient $1 - \frac{1}{x^2}$ at (x, y) , is
 a. $y = x^2 + x + 1$ b. $xy = x^2 + x + 1$
 c. $xy = x + 1$ d. None of these
19. The solution of the differential equation $(x^2 - yx^2) \frac{dy}{dx} + y^2 + xy^2 = 0$, is
 a. $\log\left(\frac{x}{y}\right) = \frac{1}{x} + \frac{1}{y} + C$ b. $\log\left(\frac{y}{x}\right) = \frac{1}{x} + \frac{1}{y} + C$
 c. $\log(xy) = \frac{1}{x} + \frac{1}{y} + C$ d. $\log(xy) + \frac{1}{x} + \frac{1}{y} = C$
20. The solution of $\frac{dy}{dx} = \frac{x \log x^2 + x}{\sin y + y \cos y}$, is
 a. $y \sin y = x^2 \log x + C$ b. $y \sin y = x^2 + C$
 c. $y \sin y = x^2 + \log x + C$ d. $y \sin y = x \log x + C$
21. A function $y = f(x)$ has a second order derivative $f''(x) = 6(x - 1)$. If its graph passes through the point $(2, 1)$ and at the point, the tangent to the graph is $y = 3x - 5$, then the function is
 a. $(x + 1)^3$ b. $(x - 1)^3$
 c. $(x + 1)^2$ d. $(x - 1)^2$
22. The population $p(t)$ at time t of a certain mouse species satisfies the differential equation $\frac{dp(t)}{dt} = 0.5(t) - 450$. If $p(0) = 850$, then the time at which the population becomes zero is
 a. $2 \log 18$ b. $\log 9$ c. $\frac{1}{2} \log 18$ d. $\log 18$
23. If $\frac{dy}{dx} = y + 3 > 0$ and $y(0) = 2$, then at $x = \log_e 2$ the value of y is equal to
 a. 5 b. 13 c. -2 d. 7
24. The solution of $\frac{dy}{dx} = \cos(x + y) + \sin(x + y)$, is
 a. $\log\left[1 + \tan\left(\frac{x+y}{2}\right)\right] + C = 0$
 b. $\log\left[1 + \tan\left(\frac{x+y}{2}\right)\right] = x + C$
 c. $\log\left[1 - \tan\left(\frac{x+y}{2}\right)\right] = x + C$
 d. None of the above
25. The solution of differential equation $(x + y)^2 \frac{dy}{dx} = a^2$, is
 a. $y = a \tan^{-1}\left(\frac{x+y}{a}\right) + C$ b. $y = a \tan^{-1}\left(\frac{x+y}{2}\right) + C$
 c. $y = a \tan^{-1}(x + y) + C$ d. $y = \tan^{-1}\left(\frac{x+y}{a}\right) + C$
26. The solution of the differential equation $\frac{dy}{dx} = \frac{y}{x} + \frac{\phi(y/x)}{\phi'(y/x)}$ is
 a. $x \phi(y/x) = C$ b. $\phi(y/x) = Cx$
 c. $y \phi(y/x) = C$ d. $\phi(y/x) = Cy$
27. If $x \frac{dy}{dx} = y(\log y - \log x + 1)$, then the solution of the equation is
 a. $\log \frac{x}{y} = Cy$ b. $\log \frac{x}{y} = Cx$ c. $\log \frac{y}{x} = Cy$ d. $\log \frac{y}{x} = Cx$
28. If a curve passes through the point $\left(1, \frac{\pi}{4}\right)$ and its slope $\frac{dy}{dx}$ at any point (x, y) is given by $\frac{dy}{dx} = \frac{y}{x} - \cos^2\left(\frac{y}{x}\right)$, then the equation of the curve is
 a. $y = \tan^{-1}\left\{\log\left(\frac{e}{x}\right)\right\}$ b. $y = x \tan^{-1}\left\{\log\left(\frac{x}{e}\right)\right\}$
 c. $y = x \tan^{-1}\left\{\log\left(\frac{e}{x}\right)\right\}$ d. None of these
29. The solution of the differential equation $(x - y) dy - (x + y) dx = 0$, is
 a. $\tan^{-1} \frac{x}{y} + \frac{1}{2} \log(x^2 + y^2) = C$
 b. $\tan^{-1} \frac{y}{x} - \frac{1}{2} \log(x^2 + y^2) = C$
 c. $\cot^{-1}\left(\frac{y}{x}\right) + \frac{1}{2} \log(x^2 + y^2) = C$
 d. None of the above
30. The general solution of $y^2 dx + (x^2 - xy + y^2) dy = 0$, is
 a. $\tan^{-1}\left(\frac{x}{y}\right) + \log y + C = 0$
 b. $2 \tan^{-1}\left(\frac{x}{y}\right) + \log x + C = 0$
 c. $\log(y + \sqrt{x^2 + y^2}) + \log y + C = 0$
 d. $\sin^{-1}\left(\frac{x}{y}\right) + \log y + C = 0$
31. The solution of the differential equation $\frac{dy}{dx} = \frac{xy}{x^2 + y^2}$, is
 a. $ay^2 = e^{x^2/y^2}$ b. $ay = ex^{x/y}$
 c. $y = e^{x^2} + e^{y^2} + C$ d. $y = e^{x^2} + y^2 + C$
32. The solution of differential equation $y dx + (2\sqrt{xy} - x) dy = 0$, is
 a. $\log|y| - \sqrt{\frac{x}{y}} = C$ b. $\log|y| + \sqrt{\frac{x}{y}} = C$
 c. $\log|y| + 2\sqrt{\frac{x}{y}} = C$ d. None of these

33. The solution of the differential equation $x^2 \frac{dy}{dx} = x^2 + xy + y^2$, is
- $\tan^{-1}\left(\frac{y}{x}\right) = 2 \log x + C$
 - $\tan^{-1}\left(\frac{y}{x}\right) = 3 \log x + C$
 - $\tan^{-1}\left(\frac{y}{x}\right) = \log x + C$
 - $\tan^{-1}\left(\frac{y}{x}\right) = 4 \log x + C$
34. Which of the following is the integrating factor of $x \log x \frac{dy}{dx} + y = 2 \log x$?
- x
 - e^x
 - $\log x$
 - $\log(\log x)$
35. The solution of the differential equation $(1 + y^2)dx + (x - e^{-\tan^{-1} y})dy = 0$ is
- $ye^{\tan^{-1} x} = \tan^{-1} x + C$
 - $xe^{\tan^{-1} y} = \tan^{-1} y + C$
 - $y = \tan^{-1} x \cdot e^{\tan^{-1} x} + C$
 - $y = xe^{\tan^{-1} x} + C$
36. The solution of the differential equation is $\cos^2 x \frac{dy}{dx} - (\tan 2x)y = \cos^4 x$, $|x| < \frac{\pi}{4}$, where $y\left(\frac{\pi}{6}\right) = \frac{3\sqrt{3}}{8}$ is
- $\frac{1}{2} \cdot \frac{\cos 2x}{1 - \tan^2 x}$
 - $\frac{1}{2} \cdot \frac{\sin 2x}{1 - \tan^2 x}$
 - $\frac{\sin 2x}{1 + \tan^2 x}$
 - None of these
37. The solution of the equation $x \frac{dy}{dx} + 2y = x^2 \log_e x$ is
- $16yx^2 = x^4 \log(x^4/e) + C$
 - $yx^2 = \frac{1}{4}x^4 \log x - \frac{1}{16}x^4 + C$
 - $16yx^2 = 4x^4 \log x - x^4 + C$
 - All of the above
38. If $\phi(x)$ is a differentiable function, then the solution of the differential equation $dy + \{y\phi'(x) - \phi(x) \cdot \phi'(x)\} dx = 0$ is
- $y = \{\phi(x) - 1\} + Ce^{-\phi(x)}$
 - $y\phi(x) = \{\phi(x)\}^2 + C$
 - $ye^{\phi(x)} = \phi(x)e^{\phi(x)} + C$
 - None of these
39. The solution of the differential equation $\frac{dy}{dx} + \frac{3x^2}{1+x^3}y = \frac{\sin^2 x}{1+x^3}$, is
- $y(1+x^3) = x + \frac{1}{2} \sin 2x + C$
 - $y(1+x^3) = Cx + \frac{1}{2} \sin 2x$
 - $y(1+x^3) = Cx - \frac{1}{2} \sin 2x$
 - $y(1+x^3) = \frac{x}{2} - \frac{1}{4} \sin 2x + C$
40. Consider the differential equation $y^2 dx + \left(x - \frac{1}{y}\right) dy = 0$. If $y(1) = 1$, then x is given by
- $1 - \frac{1}{y} + \frac{e^{1/y}}{e}$
 - $4 - \frac{2}{y} - \frac{e^{1/y}}{e}$
 - $3 - \frac{1}{y} + \frac{e^{1/y}}{e}$
 - $1 + \frac{1}{y} - \frac{e^{1/y}}{e}$
41. The solution of differential equation $\frac{dy}{dx} - 3y \cot x = \sin 2x$, where $y = 2$ and $x = \frac{\pi}{2}$ is
- $y = 4 \sin^3 x + 2 \sin^2 x$
 - $y = 4 \sin^3 x - 2 \sin^2 x$
 - $y = 2 \sin^3 x + 4 \sin^2 x$
 - $y = 2 \sin^3 x - 4 \sin^2 x$
42. The solution of differential equation $\left[\frac{e^{-2\sqrt{x}}}{\sqrt{x}} - \frac{y}{\sqrt{x}}\right] \frac{dx}{dy} = 1$, ($x \neq 0$) is
- $y e^{2\sqrt{x}} = 2\sqrt{x} + C$
 - $y e^{2\sqrt{x}} = 3\sqrt{x} + C$
 - $2y e^{2\sqrt{x}} = 3\sqrt{x} + C$
 - $y e^{\sqrt{x}} = 2\sqrt{x} + C$
43. The solution of differential equation $(x^2 - 1) \frac{dy}{dx} + 2xy = \frac{1}{x^2 - 1}$ is
- $y(x^2 - 1) = \frac{1}{2} \log \left| \frac{x-1}{x+1} \right| + C$
 - $y(x^2 + 1) = \frac{1}{2} \log \left| \frac{x-1}{x+1} \right| + C$
 - $y(x^2 + 1) = \frac{1}{3} \log \left| \frac{x-1}{x+1} \right| + C$
 - $y(x^2 - 1) = \frac{1}{3} \log \left| \frac{x-1}{x+1} \right| + C$
44. The solution of the differential equation $x \cos x \left(\frac{dy}{dx}\right) + y(x \sin x + \cos x) = 1$ is
- $xy = \sin x + C \cos x$
 - $xy + \cos x + C \sin x = 0$
 - $xy + \sec x + C \sin x = 0$
 - None of these
45. The solution of differential equation $\cos x dy = y(\sin x - y) dx$, where $0 < x < \frac{\pi}{2}$, is
- $\sec x = (\tan x + C)y$
 - $y \sec x = \tan x + C$
 - $y \tan x = \sec x + C$
 - $\tan x = (\sec x + C)y$
46. The solution of differential equation $(xy^5 + 2y) dx - x dy = 0$, is
- $9x^8 + 4x^9 y^4 = 9y^4 C$
 - $9x^8 - 4x^9 y^4 - 9y^4 C = 0$
 - $x^8(9 + 4y^4) = 10y^4 C$
 - None of the above

47. The solution of the differential equation $\frac{dy}{dx} = e^{x-y}(e^x - e^y)$ is
 a. $e^y = (e^x + 1) + Ce^{-e^x}$ b. $e^y = (e^x - 1) + C$
 c. $e^y = (e^x - 1) + Ce^{-e^x}$ d. None of these
48. If $y = f(x)$ passing through (1, 2) satisfies the differential equation $y(1 + xy)dx - xdy = 0$, then
 a. $f(x) = \frac{2x}{2 - x^2}$ b. $f(x) = \frac{x + 1}{x^2 + 1}$
 c. $f(x) = \frac{x - 1}{4 - x^2}$ d. $f(x) = \frac{4x}{1 - x^2}$
49. If $x dy = y(dx + ydy)$, $y(1) = 1$ and $y(x) > 0$. Then, $y(-3)$ is equal to
 a. 3 b. 2
 c. 1 d. 0
50. The solution of the differential equation $x dx + y dy + \frac{x dy - y dx}{x^2 + y^2} = 0$, is
 a. $y = x \tan\left(\frac{x^2 + y^2 + C}{2}\right)$ b. $x = y \tan\left(\frac{x^2 + y^2 + C}{2}\right)$
 c. $y = x \tan\left(\frac{C - x^2 - y^2}{2}\right)$ d. None of these

BITSAT Archives

1. The form of the differential equation of the central conics $ax^2 + by^2 = 1$ is [2014]
 a. $x = y \frac{dy}{dx}$
 b. $x \left(\frac{dy}{dx}\right)^2 + xy \frac{d^2y}{dx^2} - y \frac{dy}{dx} = 0$
 c. $x + y \frac{d^2y}{dx^2} = 0$
 d. None of the above
2. The solution of the differential equation $x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots = \frac{dx - dy}{dx + dy}$ is [2014]
 a. $2ye^{2x} = Ce^{2x} + 1$ b. $2ye^{2x} = Ce^{2x} - 1$
 c. $ye^{2x} = Ce^{2x} + 2$ d. None of these
3. The solution of the differential equation $x = 1 + xy \frac{dy}{dx} + \frac{x^2 y^2}{2!} \left(\frac{dy}{dx}\right)^2 + \frac{x^3 y^3}{3!} \left(\frac{dy}{dx}\right)^3 + \dots$ is [2014]
 a. $y = \log x + C$
 b. $y^2 = (\log x)^2 + C$
 c. $y = \log x + xy$
 d. $xy = x^y + C$
4. The general solution of the differential equation $\frac{dy}{dx} + \sin\left(\frac{x+y}{2}\right) = \sin\left(\frac{x-y}{2}\right)$ is [2013]
 a. $\log \tan\left(\frac{y}{2}\right) = C - 2 \sin x$
 b. $\log \tan\left(\frac{y}{4}\right) = C - 2 \sin\left(\frac{x}{2}\right)$
 c. $\log \tan\left(\frac{y}{2} + \frac{\pi}{4}\right) = C - 2 \sin x$
 d. None of the above
5. By eliminating the arbitrary constants A and B from $y = Ax^2 + Bx$, we get the differential equation [2012]
 a. $\frac{d^3y}{dx^3} = 0$ b. $x^2 \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2y = 0$
 c. $\frac{d^2y}{dx^2} = 0$ d. $x^2 \frac{d^2y}{dx^2} + y = 0$
6. The order and degree of the differential equation $\sqrt{\frac{dy}{dx}} - 4 \frac{dy}{dx} - 7x = 0$ are [2011]
 a. 1 and $\frac{1}{2}$ b. 2 and 1 c. 1 and 1 d. 1 and 2
7. The differential equation of all non-vertical lines in a plane is [2010]
 a. $\frac{d^2y}{dx^2} = 0$ b. $\frac{d^2x}{dy^2} = 0$
 c. $\frac{dy}{dx} = 0$ d. $\frac{dx}{dy} = 0$
8. The solution of $\frac{dy}{dx} = \frac{ax + g}{by + f}$ represents a circle, when [2009]
 a. $a = b$ b. $a = -b$ c. $a = -2b$ d. $a = 2b$
9. The equation of the curve satisfying the equation $(xy - x^2) \frac{dy}{dx} = y^2$ and passing through the point $(-1, 1)$, is [2009]
 a. $y = (\log y - 1)x$ b. $y = (\log y + 1)x$
 c. $x = (\log x - 1)y$ d. $x = (\log x - 1)y$
10. The solution of the differential equation $\frac{dy}{dx} = \frac{xy + y}{xy + x}$ is [2008]
 a. $x + y - \log\left(\frac{Cy}{x}\right)$ b. $x + y = \log(Cxy)$
 c. $x - y - \log\left(\frac{Cx}{y}\right)$ d. $y - x = \log\left(\frac{Cx}{y}\right)$

11. The solution of the differential equation $xy^2 dy - (x^3 + y^3) dx = 0$ is [2008]
 a. $y^3 = 3x^3 + C$ b. $y^3 = 3x^3 \log(Cx)$
 c. $y^3 = 3x^3 + \log(Cx)$ d. $y^3 + 3x^3 = \log(Cx)$
12. The solution of the differential equation $\frac{dy}{dx} - y \tan x = e^x \sec x$ is [2008]
 a. $y = e^x \cos x + C$ b. $y \cos x = e^x + C$
 c. $y = e^x \sin x + C$ d. $y \sin x = e^x + C$
13. The solution of the differential equation $\frac{dy}{dx} + \frac{2yx}{1+x^2} = \frac{1}{(1+x^2)^2}$ is [2007]
 a. $y(1+x)^2 = C + \tan^{-1} x$ b. $\frac{y}{1+x^2} = C + \tan^{-1} x$
 c. $y \log(1+x^2) = C + \tan^{-1} x$ d. $y(1+x^2) = C + \sin^{-1} x$
14. The differential equation representing a family of circles touching Y-axis at the origin, is [2006]
 a. $x^2 + y^2 - 2xy \frac{dy}{dx} = 0$ b. $x^2 + y^2 + 2xy \frac{dy}{dx} = 0$
 c. $x^2 - y^2 - 2xy \frac{dy}{dx} = 0$ d. $x^2 - y^2 + 2xy \frac{dy}{dx} = 0$
15. The general solution of the differential equation $(2x - y + 1)dx + (2y - x + 1)dy = 0$ is [2006]
 a. $x^2 + y^2 + xy - x + y = C$ b. $x^2 + y^2 - xy + x + y = C$
 c. $x^2 - y^2 + 2xy - x + y = C$ d. $x^2 - y^2 - 2xy + x - y = C$
16. The degree of the differential equation $y(x) = 1 + \frac{dy}{dx} + \frac{1}{1 \cdot 2} \left(\frac{dy}{dx}\right)^2 + \frac{1}{1 \cdot 2 \cdot 3} \left(\frac{dy}{dx}\right)^3 + \dots$ is [2005]
 a. 2 b. 3
 c. 1 d. None of these
17. The solution of $x^2 + y^2 - 2xy \frac{dy}{dx} = 0$ is [2005]
 a. $x^2 - y^2 = Cx$ b. $x^2 + y^2 = Cx$
 c. $2(x^2 - y^2) = Cx$ d. None of these

Answer with Solutions

Practice Exercise

1. (b) Clearly, order = 3

i.e. order of the highest derivative is $\frac{d^3 y}{dx^3}$.

The given differential equation can be written as

$$\left(\frac{d^2 y}{dx^2}\right)^5 \frac{d^3 y}{dx^3} + 4 \left(\frac{d^2 y}{dx^2}\right)^3 + \left(\frac{d^3 y}{dx^3}\right)^2 = (x^2 - 1) \frac{d^3 y}{dx^3}$$

Clearly, degree = 2 $\therefore m = 3, n = 2$

2. (d) Since, the equation is not a polynomial in all differential coefficients, so its degree is not defined.

3. (a) Given, $\sqrt{\frac{d^2 y}{dx^2}} = \sqrt[3]{\frac{dy}{dx} + 5} \Rightarrow \left(\frac{d^2 y}{dx^2}\right)^3 = \left(\frac{dy}{dx} + 5\right)^2$

Order is 2 and degree is 3.

4. (a) Given, $\left(\frac{d^2 y}{dx^2}\right)^{3/2} = \left(\frac{dy}{dx}\right)^{1/2} + 4$

On squaring both sides, we get

$$\begin{aligned} \left(\frac{d^2 y}{dx^2}\right)^3 &= \frac{dy}{dx} + 8 \left(\frac{dy}{dx}\right)^{1/2} + 16 \\ \Rightarrow \left[\left(\frac{d^2 y}{dx^2}\right)^3 - \frac{dy}{dx} - 16\right]^2 &= 64 \frac{dy}{dx} \\ \Rightarrow \left(\frac{d^2 y}{dx^2}\right)^6 - 32 \left(\frac{d^2 y}{dx^2}\right)^3 - 2 \left(\frac{dy}{dx}\right) \left(\frac{d^2 y}{dx^2}\right)^3 \\ &\quad + \left(\frac{dy}{dx}\right)^2 - 32 \frac{dy}{dx} + 256 = 0 \end{aligned}$$

So, it is clear that order is 2 and degree is 6.

5. (b) On differentiating the given equation, we get

$$2(x - h) + 2(y - k) \frac{dy}{dx} = 0$$

$$\text{or } (x - h) + (y - k) \frac{dy}{dx} = 0 \quad \dots(i)$$

Again differentiating, we get

$$1 + (y - k) \frac{d^2 y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = 0 \quad \dots(ii)$$

From Eq. (ii), we get

$$(y - k) = \frac{\left[-1 + \left(\frac{dy}{dx}\right)^2\right]}{\frac{d^2 y}{dx^2}}$$

From Eq. (i), we get

$$\begin{aligned} (x - h) &= -(y - k) \frac{dy}{dx} \\ \Rightarrow (x - h) &= \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right] \frac{dy}{dx}}{\frac{d^2 y}{dx^2}} \end{aligned}$$

On substituting values of $(x - h)$ and $(y - k)$ in the given relation, we get the required relation.

$$\text{i.e. } \left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2 \left(\frac{d^2 y}{dx^2}\right)^2$$

6. (d) The equation of family of parabola with axis parallel to Y-axis is $(x - a)^2 = A(y - b)$

Here, a, b and A are arbitrary constants.

On differentiating with respect to x , we get

$$2(x - a) = A \frac{dy}{dx}$$

Again differentiating, $2 = A \frac{d^2y}{dx^2}$

Now, differentiating, $\frac{d^3y}{dx^3} = 0$

7. (a) **Hint** Let the centre of circle be $(0, k)$, then the radius of circle is equal to k , i.e. $r = k$ as the circle passes through origin.

Thus, equation of circle is

$$(x - 0)^2 + (y - k)^2 = k^2 \Rightarrow x^2 + y^2 - 2ky = 0$$

$$\Rightarrow k = \frac{x^2 + y^2}{2y} \quad \dots(i)$$

$$2x + 2y \frac{dy}{dx} - 2k \frac{dy}{dx} = 0 \Rightarrow x + (y - k) \frac{dy}{dx} = 0$$

8. (c) We have, $y = (c_1 + c_2) \cos(x + c_3) - c_4 e^{x + c_5}$
 $\Rightarrow y = (c_1 \cos c_3 + c_2 \cos c_3) \cos x$
 $\quad - (c_1 \sin c_3 + c_2 \sin c_3) \sin x - c_4 e^{c_5} e^x$
 $\Rightarrow y = A \cos x - B \sin x + C e^x$
 where, $A = c_1 \cos c_3 + c_2 \cos c_3$
 $B = c_1 \sin c_3 + c_2 \sin c_3$ and $C = -c_4 e^{c_5}$

It is an equation containing three arbitrary constants.

So, the order of the differential equation is 3.

9. (d)

10. (c) We know that, $x \cos \alpha + y \sin \alpha = p \quad \dots(i)$

On differentiating Eq. (i) w.r.t. x , we get

$$\cos \alpha + \sin \alpha \frac{dy}{dx} = 0 \Rightarrow \tan \alpha = -\frac{1}{y_1} \quad \left[\because \frac{dy}{dx} = y_1 \right]$$

$$\therefore \sin \alpha = \frac{1}{\sqrt{1 + y_1^2}}, \cos \alpha = \frac{-y_1}{\sqrt{1 + y_1^2}} \quad \dots(ii)$$

$$\text{From Eqs. (i) and (ii), we get } \frac{-xy_1}{\sqrt{1 + y_1^2}} + \frac{y}{\sqrt{1 + y_1^2}} = p$$

$$\Rightarrow (y - xy_1)^2 = p^2(1 + y_1^2)$$

11. (b) Given, $y = e^x(a \cos x + b \sin x)$

On differentiating both sides w.r.t. x , we get

$$y_1 = e^x(-a \sin x + b \cos x) + e^x(a \cos x + b \sin x)$$

$$\Rightarrow y_1 = e^x(-a \sin x + b \cos x) + y$$

Again, differentiating both sides w.r.t. x , we get

$$y_2 = e^x(-a \cos x - b \sin x) + e^x(-a \sin x + b \cos x) + y_1$$

$$\Rightarrow y_2 - 2y_1 + 2y = 0$$

12. (b) **Hint** Let $y = mx + c$ be the general equation of the straight line.

On differentiating both sides w.r.t. x , we get $\frac{dy}{dx} = m$

On substituting it in given equation

$$\frac{dy}{dx} + x \left(\frac{dy}{dx} \right)^2 - y = 0$$

13. (c) Slope $= \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{1}{2y} \Rightarrow 2y dy = dx$

On integrating both sides, we get $y^2 = x + C$
 which passes through $(4, 3)$.

$$9 = 4 + C \Rightarrow C = 5$$

So, the equation of the curve is $y^2 = x + 5$.

14. (c) $\frac{dy}{dx} = \frac{ax + h}{by + k} \Rightarrow (by + k)dy = (ax + h)dx$

On integrating, we get $by^2 + ky = \frac{a}{2}x^2 + hx + C$

For this to represent a parabola, one of the term either x^2 or y^2 is zero, therefore either $a = 0, b \neq 0$ or $a \neq 0, b = 0$.

15. (c) **Hint** $2x \frac{dy}{dx} = y + 3 \Rightarrow 2 \frac{dy}{y + 3} = \frac{dx}{x}$

16. (c) $\frac{dV}{F - kV} = \frac{1}{M} dt$

On integrating, we get

$$\int \frac{dV}{F - kV} = \frac{1}{M} \int dt$$

$$\Rightarrow -\frac{1}{k} \log(F - kV) = \frac{t}{M} + C \quad \dots(i)$$

$$\text{When } t = 0, V = 0 \Rightarrow -\frac{1}{k} \log F = C$$

On substituting it in Eq. (i), we get

$$\frac{1}{k} [(\log F - \log(F - kV))] = \frac{t}{M}$$

$$\Rightarrow \log \left(\frac{F}{F - kV} \right) = \frac{kt}{M} \Rightarrow \frac{F - kV}{F} = e^{-kt/M}$$

$$\Rightarrow \frac{kV}{F} = (1 - e^{-kt/M}) \Rightarrow V = \frac{F}{k} (1 - e^{-kt/M})$$

17. (c) $\therefore \int \frac{y}{\sqrt{1 - y^2}} dy = \int dx$

$$\Rightarrow -\sqrt{1 - y^2} = x + C \Rightarrow (x + C)^2 + y^2 = 1$$

Hence, the centre is $(-C, 0)$ and radius is 1.

18. (b) **Hint** We have, $\frac{dy}{dx} = 1 - \frac{1}{x^2} \Rightarrow y = x + \frac{1}{x} + C$

19. (a) **Hint** $(x^2 - yx^2) \frac{dy}{dx} + y^2 + xy^2 = 0$

$$\Rightarrow \frac{1 - y}{y^2} dy + \frac{1 + x}{x^2} dx = 0$$

$$\Rightarrow \left(\frac{1}{y^2} - \frac{1}{y} \right) dy + \left(\frac{1}{x^2} + \frac{1}{x} \right) dx = 0$$

20. (a) $\frac{dy}{dx} = \frac{x \log x^2 + x}{\sin y + y \cos y}$

On separating the variables and integrating, we get

$$\int (\sin y + y \cos y) dy = \int (x \log x^2 + x) dx$$

$$\Rightarrow -\cos y + y \sin y + \cos y = \frac{x^2}{2} \log x^2 - \int \frac{x^2}{2} \cdot \frac{1}{x^2} \cdot 2x dx$$

$$\quad + \int x dx + C$$

$$y \sin y = \frac{x^2}{2} 2 \log x - \int x dx + \int x dx + C$$

$$\therefore y \sin y = x^2 \log x + C$$

21. (b)

22. (a) **Hint** Given, $p'(t) = \frac{dp(t)}{dt} = 0.5 p(t) - 450$

$$\Rightarrow \frac{2dp(t)}{p(t) - 900} = dt \Rightarrow \int \frac{2dp(t)}{p(t) - 900} = \int dt$$

$$\Rightarrow 2 \log |p(t) - 900| = t + C$$

To find the value of C , substitute $t = 0$,

23. (a) Here, $\frac{dy}{dx} = y + 3 > 0$ and $y(0) = 2$

$$\Rightarrow \int \frac{dy}{y+3} = \int dx \Rightarrow \log |y+3| = x + C$$

$$\text{But } y(0) = 2 \Rightarrow \log |2+3| = 0 + C$$

$$\therefore C = \log_e 5$$

$$\Rightarrow \log |y+3| = x + \log_e 5$$

$$\text{When } x = \log_e 2$$

$$\Rightarrow \log |y+3| = \log_e 2 + \log_e 5 = \log_e 10$$

$$\therefore y+3 = 10 \Rightarrow y = 7$$

24. (b) Put $x + y = v$ and $1 + \frac{dy}{dx} = \frac{dv}{dx}$

Therefore, the differential equation reduces to

$$\frac{dv}{dx} = (1 + \cos v) + \sin v = 2 \cos^2 \frac{v}{2} + 2 \sin \frac{v}{2} \cos \frac{v}{2}$$

$$= 2 \cos^2 \frac{v}{2} \left(1 + \tan \frac{v}{2} \right) \Rightarrow \int \frac{\sec^2 \left(\frac{v}{2} \right)}{2 \left[1 + \tan \left(\frac{v}{2} \right) \right]} dv = \int dx$$

$$\therefore \log \left[1 + \tan \left(\frac{x+y}{2} \right) \right] = x + C$$

25. (a) **Hint** Put $x + y = t \Rightarrow 1 + \frac{dy}{dx} = \frac{dt}{dx}$

$$\Rightarrow \frac{dy}{dx} = \left(\frac{dt}{dx} - 1 \right)$$

$$\text{Then, given equation reduces to } t^2 \left(\frac{dt}{dx} - 1 \right) = a^2$$

$$\Rightarrow t^2 \frac{dt}{dx} = a^2 + t^2 \Rightarrow \int dx = \int \frac{t^2}{a^2 + t^2} dt$$

$$\Rightarrow \int dx = \int \frac{t^2 + a^2 - a^2}{a^2 + t^2} dt$$

26. (b) Let $\frac{y}{x} = v \therefore \frac{dy}{dx} = v + x \frac{dv}{dx}$

$$\text{Then, } \frac{dy}{dx} = \frac{y}{x} + \frac{\phi(y/x)}{\phi'(y/x)}$$

$$\text{reduces to } v + x \frac{dv}{dx} = v + \frac{\phi(v)}{\phi'(v)} \Rightarrow \frac{\phi'(v)}{\phi(v)} dv = \frac{dx}{x}$$

On integrating, we get

$$\log \phi(v) = \log x + \log C \Rightarrow \phi(v) = Cx \Rightarrow \phi\left(\frac{y}{x}\right) = Cx$$

27. (a) $\frac{dy}{dx} = \frac{y}{x} \left(\log \frac{y}{x} + 1 \right)$

$$\text{Put } y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$$

$$\therefore v + x \frac{dv}{dx} = v \log v + v \Rightarrow \frac{dv}{v \log v} = \frac{dx}{x}$$

On integrating, we get

$$\log(\log v) = \log x + \log C = \log Cx$$

$$\therefore \log \frac{y}{x} = Cx$$

28. (c) **Hint** Put $y = vx$

$$\text{Given equation reduces to } \sec^2 v dx = \frac{-1}{x} dx$$

29. (b) **Hint** $\frac{dy}{dx} = \frac{x+y}{x-y}$

...(i)

$$\text{Put } y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx} \text{ Eq. (i) reduces to}$$

$$\Rightarrow \frac{1+v}{1+v^2} dv = \frac{dx}{x}$$

$$\Rightarrow \int \frac{1}{1+v^2} dv - \int \frac{v}{1+v^2} dx = \log |x| + C$$

30. (a) **Hint** $\frac{dx}{dy} + \left(\frac{x}{y} \right)^2 - \left(\frac{x}{y} \right) + 1 = 0$

$$\text{Put } v = \frac{x}{y} \Rightarrow x = vy \Rightarrow \frac{dx}{dy} = v + y \frac{dv}{dy}$$

$$\therefore \frac{dv}{v^2 + 1} + \frac{dy}{y} = 0$$

31. (a) **Hint** Put $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

$$\text{Given equation reduces to } \left(\frac{1}{v^3} + \frac{1}{v} \right) dv = -\frac{dx}{x}$$

32. (b) Given, $y dx + (2\sqrt{xy} - x) dy = 0$

This is homogeneous equation.

To simplify it, put $y = vx$.

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = v + x \frac{dv}{dx}$$

$$\therefore \frac{dy}{dx} = \frac{y}{x - 2\sqrt{xy}} \Rightarrow v + x \frac{dv}{dx} = \frac{v}{1 - 2\sqrt{v}}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{2v^{3/2}}{1 - 2\sqrt{v}}$$

$$\Rightarrow \left(\frac{1 - 2\sqrt{v}}{2v^{3/2}} \right) dv = \frac{dx}{x}$$

On integrating both sides w.r.t. x , we get

$$-v^{-1/2} - \log |v| = \log x + \log C$$

$$\Rightarrow \left(\frac{y}{x} \right)^{-1/2} + \log \left| \frac{y}{x} \right| = -\log x - \log C$$

$$\Rightarrow \sqrt{\frac{x}{y}} + \log |y| = -\log C \Rightarrow \sqrt{\frac{x}{y}} + \log |y| = C$$

33. (c) Hint $\frac{dy}{dx} = \frac{x^2 + xy + y^2}{x^2}$... (i)

Put $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Eq. (i) reduces to $\frac{1}{1+v^2} dv = \frac{1}{x} dx$

34. (c) Given equation is $x \log x \cdot \frac{dy}{dx} + y = 2 \log x$

$\Rightarrow \frac{dy}{dx} + y \cdot \frac{1}{x \log x} = \frac{2}{x}$

This is of the form $\frac{dy}{dx} + Py = Q$

Integrating factor = $e^{\int P dx} = e^{\int \frac{1}{x \log x} dx}$

Put $\log x = t \Rightarrow \frac{1}{x} dx = dt$

$\therefore IF = e^{\int \frac{1}{t} dt} = e^{\log t} = e^{\log \log x} = \log x$

35. (b) Given differential equation is

$(1 + y^2)dx + (x - e^{-\tan^{-1} y})dy = 0$

$\Rightarrow \frac{dx}{dy} = \frac{e^{-\tan^{-1} y} - x}{1 + y^2}$

$\Rightarrow \frac{dx}{dy} + \frac{1}{1 + y^2} x = \frac{e^{-\tan^{-1} y}}{1 + y^2}$

which becomes a linear equation of the form $\frac{dx}{dy} + Rx = S$

where, $R = \frac{1}{1 + y^2}, S = \frac{e^{-\tan^{-1} y}}{1 + y^2}$

$IF = e^{\int R dy} = e^{\int \frac{1}{1 + y^2} dy} = e^{\tan^{-1} y}$

Solution of this differential equation is

$x \times IF = \int S \times IF dy + C$

$\Rightarrow x \times e^{\tan^{-1} y} = \int \frac{e^{-\tan^{-1} y}}{1 + y^2} \times e^{\tan^{-1} y} dy + C$

$\Rightarrow x e^{\tan^{-1} y} = \int \frac{e^0}{1 + y^2} dy + C$

$\Rightarrow x e^{\tan^{-1} y} = \int \frac{1}{1 + y^2} dy + C$

$\Rightarrow x e^{\tan^{-1} y} = \tan^{-1} y + C$

36. (b)

37. (d) Hint $\frac{dy}{dx} + \frac{2}{x} y = x \log x$

$\therefore IF = e^{\int \frac{2}{x} dx} = e^{2 \log x} = x^2$

Hence, required solution is

$y(IF) = \int (x \log x) x^2 dx + C$

$\Rightarrow x^2 y = \int \log x \cdot x^3 dx + C$

$\Rightarrow x^2 y = \log x \cdot x^4 - \frac{x^4}{16} + C$ [integration by parts]

38. (a) We have, $dy + \{y\phi'(x) - \phi(x) \cdot \phi'(x)\} dx = 0$

$\Rightarrow \frac{dy}{dx} + \phi'(x) \cdot y = \phi(x) \cdot \phi'(x)$... (i)

$\therefore IF = e^{\int \phi'(x) dx} = e^{\phi(x)}$

$\therefore$ Solution is $y e^{\phi(x)} = \int \phi(x) \cdot \phi'(x) e^{\phi(x)} dx$

$\Rightarrow y e^{\phi(x)} = \int e^{\phi(x)} \cdot \phi(x) \cdot \phi'(x) dx$

$\Rightarrow y e^{\phi(x)} = \int \phi(x) \cdot e^{\phi(x)} \cdot \phi'(x) dx$

$\Rightarrow y \cdot e^{\phi(x)} = \phi(x) \cdot e^{\phi(x)} - \phi(x) e^{\phi(x)} + C$

$\therefore y = \{\phi(x) - 1\} + C e^{-\phi(x)}$

39. (d) $\frac{dy}{dx} + \frac{3x^2}{1 + x^3} y = \frac{\sin^2 x}{1 + x^3}$

Here, $P = \frac{3x^2}{1 + x^3}$

$\therefore IF = e^{\int P dx} = e^{\log(1 + x^3)} = 1 + x^3$

Thus, solution is $y(1 + x^3) = \int \frac{\sin^2 x}{1 + x^3} (1 + x^3) dx$

$\Rightarrow y(1 + x^3) = \int \frac{1 - \cos 2x}{2} dx$

$\therefore y(1 + x^3) = \frac{1}{2} x - \frac{\sin 2x}{4} + C$

40. (d) Hint $\frac{dx}{dy} + \frac{1}{y^2} \cdot x = \frac{1}{y^3}$ which is a linear differential equation in x.

$\therefore IF = e^{\int \frac{1}{y^2} dy} = e^{-1/y}$

$\therefore$ Complete solution is

$x \cdot e^{-1/y} = \int \frac{1}{y^3} \cdot e^{-1/y} dy + C$

$\Rightarrow x \cdot e^{-1/y} = \int \frac{1}{y} \cdot \frac{1}{y^2} \cdot e^{-1/y} dy + C$

Put $-\frac{1}{y} = t \Rightarrow \frac{1}{y^2} dy = dt$

41. (b) Hint Here, $P = -3 \cot x, Q = \sin 2x$

$\therefore IF = e^{-3 \int \cot x dx} = e^{-3 \log |\sin x|} = e^{\log |\sin x|^{-3}}$

$\Rightarrow IF = \frac{1}{\sin^3 x}$

$\therefore y \times IF = \int Q \times IF dx + C$

$\Rightarrow y \times \frac{1}{\sin^3 x} = \int \frac{1}{\sin^3 x} \sin 2x dx + C$

$\Rightarrow y \times \frac{1}{\sin^3 x} = 2 \int \frac{\sin x \cos x}{\sin^3 x} dx + C$

$\Rightarrow \frac{y}{\sin^3 x} = 2 \int \cot x \operatorname{cosec} x dx + C$

42. (a) Hint $\frac{dy}{dx} = \frac{e^{-2\sqrt{x}}}{\sqrt{x}} - \frac{y}{\sqrt{x}} \Rightarrow \frac{dy}{dx} + \frac{1}{\sqrt{x}} y = \frac{e^{-2\sqrt{x}}}{\sqrt{x}}$

Here, $P = \frac{1}{\sqrt{x}}, Q = \frac{e^{-2\sqrt{x}}}{\sqrt{x}}$

$$\begin{aligned} \therefore \quad \text{IF} &= e^{\int \frac{1}{\sqrt{x}} dx} \Rightarrow \text{IF} = e^{2x^{1/2}} = e^{2\sqrt{x}} \\ \therefore \quad y \cdot \text{IF} &= \int Q \times \text{IF} dx + C \\ \therefore \quad ye^{2\sqrt{x}} &= \int e^{2\sqrt{x}} \times \frac{e^{-2\sqrt{x}}}{\sqrt{x}} dx + C \end{aligned}$$

43. (a) The given differential equation is

$$(x^2 - 1) \frac{dy}{dx} + 2xy = \frac{1}{x^2 - 1} \Rightarrow \frac{dy}{dx} + \frac{2x}{x^2 - 1} y = \frac{1}{(x^2 - 1)^2}$$

This is a linear differential equation of the form

$$\frac{dy}{dx} + Py = Q$$

$$\text{Here, } P = \frac{2x}{x^2 - 1} \text{ and } Q = \frac{1}{(x^2 - 1)^2}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \frac{2x}{x^2 - 1} dx} = e^{\log(x^2 - 1)} = (x^2 - 1)$$

The general solution of the given differential equation is

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C$$

$$\Rightarrow y(x^2 - 1) = \int \frac{1}{x^2 - 1} dx + C \Rightarrow y(x^2 - 1) = \frac{1}{2} \log \left| \frac{x-1}{x+1} \right| + C$$

which is the required solution.

$$44. (a) \text{ Given, } x \cos x \left(\frac{dy}{dx} \right) + y(x \sin x + \cos x) = 1$$

$$\text{We can write, } \frac{dy}{dx} + y \left(\tan x + \frac{1}{x} \right) = \left(\frac{1}{x \cos x} \right)$$

which is a linear differential equation.

$$\therefore \text{IF} = e^{\int \left(\tan x + \frac{1}{x} \right) dx} = e^{\log \sec x + \log x} = e^{\log(x \sec x)} = x \sec x$$

Now, required solution

$$y(\text{IF}) = \int \text{IF} \cdot \frac{1}{x \cos x} dx + C$$

$$\Rightarrow y(x \sec x) = \int x \sec x \cdot \frac{1}{x \cos x} dx + C$$

$$\Rightarrow xy \sec x = \int \sec^2 x dx + C$$

$$\Rightarrow xy \sec x = \tan x + C$$

On multiplying by $\cos x$, we get

$$xy = \sin x + C \cos x$$

$$45. (a) \text{ Since, } \cos x dy = y \sin x dx - y^2 dx$$

$$\Rightarrow \frac{1}{y^2} \frac{dy}{dx} - \frac{1}{y} \tan x = -\sec x$$

$$\text{Put } -\frac{1}{y} = z \Rightarrow \frac{1}{y^2} \frac{dy}{dx} = \frac{dz}{dx}$$

$$\therefore \frac{dz}{dx} + (\tan x) z = -\sec x$$

This is a linear differential equation. Therefore,

$$\text{IF} = e^{\int \tan x dx} = e^{\log \sec x} = \sec x$$

Hence, the solution is

$$z \cdot (\sec x) = \int -\sec x \cdot \sec x dx + C_1$$

$$\Rightarrow -\frac{1}{y} \sec x = -\tan x + C_1$$

$$\therefore \sec x = y(\tan x + C)$$

$$46. (a)$$

$$47. (c) \text{ Given, } \frac{dy}{dx} = \frac{e^x}{e^y} (e^x - e^y) \Rightarrow e^y \frac{dy}{dx} + e^x \cdot e^y = e^x \cdot e^x$$

$$\text{Let } e^y = t \Rightarrow e^y \frac{dy}{dx} = \frac{dt}{dx}$$

$$\text{Then, given equation reduces to } \frac{dt}{dx} + e^x t = e^{2x}$$

$$\text{Here, } P = e^x \text{ and } Q = e^{2x}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int e^x dx} = e^{e^x}$$

Required solution is

$$t \cdot e^{e^x} = \int e^{2x} \cdot e^{e^x} dx + C$$

$$\Rightarrow e^y = (e^x - 1) + Ce^{-e^x}$$

$$48. (a)$$

$$49. (a)$$

$$50. (c)$$

BITSAT Archives

$$1. (b) \text{ We have, } ax^2 + by^2 = 1$$

On differentiating both sides w.r.t. x , we get

$$2ax + 2by \frac{dy}{dx} = 0$$

$$\Rightarrow ax + by \frac{dy}{dx} = 0 \quad \dots(i)$$

$$\Rightarrow \frac{-a}{b} = \frac{y}{x} \frac{dy}{dx} \quad \dots(ii)$$

Again, differentiating Eq. (i) w.r.t. x , we get

$$a + b \left(\frac{dy}{dx} \right)^2 + by \frac{d^2y}{dx^2} = 0$$

$$\Rightarrow -\frac{a}{b} = \left(\frac{dy}{dx} \right)^2 + y \frac{d^2y}{dx^2} \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get

$$\frac{y}{x} \frac{dy}{dx} = \left(\frac{dy}{dx} \right)^2 + y \frac{d^2y}{dx^2} \Rightarrow y \left(\frac{dy}{dx} \right) = x \left(\frac{dy}{dx} \right)^2 + xy \frac{d^2y}{dx^2}$$

$$2. (b) \text{ We have, } \frac{x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots}{1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots} = \frac{dx - dy}{dx + dy}$$

On applying componendo and dividendo, we get

$$\begin{aligned} \frac{\left(x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots \right) + \left(1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots \right)}{\left(x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots \right) - \left(1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots \right)} &= \frac{(dx - dy) + (dx + dy)}{(dx - dy) - (dx + dy)} \end{aligned}$$

$$\Rightarrow \frac{\left(1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\frac{x^4}{4!}+\dots\right)}{-\left(1-x+\frac{x^2}{2!}-\frac{x^3}{3!}+\dots\right)} = \frac{2dx}{-2dy}$$

$$\Rightarrow \frac{e^x}{-e^{-x}} = -\frac{dx}{dy} \Rightarrow \frac{dy}{dx} = \frac{e^{-x}}{e^x}$$

$$\Rightarrow \frac{dy}{dx} = e^{-2x} \Rightarrow dy = e^{-2x} dx$$

On integrating both sides, we get

$$y = \frac{e^{-2x}}{(-2)} + C_1 \Rightarrow 2y = -e^{-2x} + 2C_1$$

$$\Rightarrow 2y = -e^{-2x} + C \quad [\text{where, } C = 2C_1]$$

$$\Rightarrow 2ye^{2x} = -1 + e^{2x} C \Rightarrow 2ye^{2x} = Ce^{2x} - 1$$

3. (b) **Hint** The given equation is reduced to $x = e^{xy\left(\frac{dy}{dx}\right)}$

$$\Rightarrow \log x = xy \frac{dy}{dx} \Rightarrow y dy = \frac{\log x}{x} dx$$

$$\Rightarrow \int y dy = \int \frac{1}{x} \log x dx \quad [\text{where, } C = 2C']$$

4. (b) **Hint** $\frac{dy}{dx} = \sin\left(\frac{x-y}{2}\right) - \sin\left(\frac{x+y}{2}\right)$

$$\Rightarrow \frac{dy}{dx} = -2 \cos\left(\frac{x}{2}\right) \sin\left(\frac{y}{2}\right)$$

$$\Rightarrow \frac{dy}{\sin\left(\frac{y}{2}\right)} = -2 \cos\left(\frac{x}{2}\right) dx$$

$$\Rightarrow \frac{1}{2} \int \operatorname{cosec}\left(\frac{y}{2}\right) dy = -\int \cos\left(\frac{x}{2}\right) dx$$

$$\Rightarrow \frac{1}{2} \left[\frac{\log\left\{\operatorname{cosec}\left(\frac{y}{2}\right) - \cot\left(\frac{y}{2}\right)\right\}}{\frac{1}{2}} \right] = -\frac{\sin\left(\frac{x}{2}\right)}{\frac{1}{2}} + C$$

5. (b) **Hint** Given, $y = Ax^2 + Bx$... (i)

$$\frac{dy}{dx} = 2Ax + B$$

$$\Rightarrow \frac{d^2y}{dx^2} = 2A$$

$$\therefore \frac{dy}{dx} - \frac{d^2y}{dx^2} x = B$$

6. (d) Given, $\sqrt{\frac{dy}{dx}} - 4\frac{dy}{dx} - 7x = 0$

On squaring, we get

$$\frac{dy}{dx} = 16\left(\frac{dy}{dx}\right)^2 + 49x^2 + 56x \frac{dy}{dx}$$

Here, order is 1 and degree is 2.

7. (a) **Hint** The general equation of all non-vertical lines in a plane is

$$ax + by = 1$$

where, $b \neq 0$

Now, differentiate it twice.

8. (b) We have, $\frac{dy}{dx} = \frac{ax+g}{by+f}$

$$\Rightarrow (by+f)dy = (ax+g)dx$$

On integrating, we get

$$\frac{by^2}{2} + fy = \frac{ax^2}{2} + gx + C$$

$$\Rightarrow ax^2 - by^2 + 2gx - 2fy + c = 0$$

which represents a circle, if $a = -b$.

9. (a) We have, $(xy - x^2) \frac{dy}{dx} = y^2$

$$\Rightarrow y^2 \frac{dx}{dy} = xy - x^2 \Rightarrow \frac{1}{x^2} \frac{dx}{dy} - \frac{1}{x} \cdot \frac{1}{y} = -\frac{1}{y^2}$$

Put $\frac{1}{x} = v \Rightarrow -\frac{1}{x^2} \frac{dx}{dy} = \frac{dv}{dy}$

$$\therefore \frac{dv}{dy} + \frac{v}{y} = \frac{1}{y^2}, \text{ which is linear.}$$

$$\therefore \text{IF} = e^{\int \frac{1}{y} dy} = e^{\log y} = y$$

$$\therefore \text{The solution is } vy = \int \frac{1}{y^2} \cdot y dy + C$$

$$\Rightarrow \frac{y}{x} = \log y + C \Rightarrow y = x(\log y + C)$$

which passes through the point $(-1, 1)$.

$$\therefore 1 = -1(\log 1 + C)$$

i.e. $C = -1$

Thus, the equation of the curve is $y = x(\log y - 1)$

10. (d) **Hint** $\frac{(1+y)}{y} dy = \frac{(1+x)}{x} dx$

$$\Rightarrow \int \left(\frac{1}{y} + 1\right) dy = \int \left(\frac{1}{x} + 1\right) dx$$

11. (b) **Hint** $\frac{dy}{dx} = \frac{x^3 + y^3}{xy^2}$... (i)

It is a homogeneous differential equation.

Put $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Eq. (i) reduces to

$$\Rightarrow v^2 dv = \frac{dx}{x}$$

12. (b) Given linear differential equation is

$$\frac{dy}{dx} - y \tan x = e^x \sec x$$

$$\therefore \text{IF} = e^{\int -\tan x dx} = e^{-\log \sec x} = \frac{1}{\sec x}$$

$\therefore$ Complete solution is

$$y \cdot \frac{1}{\sec x} = \int e^x \sec x \cdot \frac{1}{\sec x} dx + C$$

$$\Rightarrow \frac{y}{\sec x} = e^x + C$$

$$\Rightarrow y \cos x = e^x + C$$

13. (a) **Hint** Here, $P = \frac{2x}{1+x^2}$ and $Q = \frac{1}{(1+x^2)^2}$

$$\text{Now, IF} = e^{\int P dx} = e^{\int \frac{2x}{1+x^2} dx} = e^{\log(1+x^2)} = 1+x^2$$

$\therefore$ Solution of differential equation is

$$y(1+x^2) = \int \frac{1}{(1+x^2)^2} (1+x^2) dx + C$$

14. (d) Since, the circle touches the Y-axis, therefore the centre lies on the X-axis. Let the centre be $(h, 0)$.

$\therefore$ Radius of circle = h

The equation of circle is given by

$$(x-h)^2 + (y-0)^2 = h^2$$

$$\Rightarrow x^2 + y^2 - 2hx = 0 \quad \dots(i)$$

On differentiating both sides w.r.t. x , we get

$$2x + 2y \frac{dy}{dx} - 2h = 0 \Rightarrow h = x + y \frac{dy}{dx}$$

Putting the value of h in Eq. (i)

$$x^2 + y^2 - 2x \left(x + y \frac{dy}{dx} \right) = 0$$

$$\Rightarrow -x^2 + y^2 - 2xy \frac{dy}{dx} = 0 \Rightarrow x^2 - y^2 + 2xy \frac{dy}{dx} = 0$$

which is the required differential equation.

15. (b) Given differential equation is

$$(2x - y + 1)dx + (2y - x + 1)dy = 0$$

$$\Rightarrow 2x dx + 2y dy - (y dx + x dy) + dx + dy = 0$$

$$\Rightarrow (2x dx + 2y dy) - d(xy) + dx + dy = 0$$

On integrating both sides, we get

$$x^2 + y^2 - xy + x + y = C$$

16. (c) Given that,

$$y(x) = 1 + \frac{dy}{dx} + \frac{1}{1 \cdot 2} \left(\frac{dy}{dx} \right)^2 + \frac{1}{1 \cdot 2 \cdot 3} \left(\frac{dy}{dx} \right)^3 + \dots$$

$$\text{or } y(x) = 1 + \frac{1}{1!} \left(\frac{dy}{dx} \right) + \frac{1}{2!} \left(\frac{dy}{dx} \right)^2 + \frac{1}{3!} \left(\frac{dy}{dx} \right)^3 + \dots$$

$$\Rightarrow y(x) = e^{dy/dx}$$

Taking log on both sides, we get

$$\log y(x) = \frac{dy}{dx}$$

$\therefore$ The degree of this equation is 1.

17. (a) **Hint** This is a homogeneous equation.

Put $y = vx$

$$\text{and } \frac{dy}{dx} = v + x \frac{dv}{dx}$$

Then, Eq. (i) reduces to

$$\Rightarrow -\frac{2v}{1-v^2} dv = -\frac{dx}{x}$$

22

Probability

Probability

Probability is a measure or estimation of how likely it is that something will happen or that a statement is true. The higher degree of probability, the more likely the event is to happen or in a longer series of samples the greater the number of times such event is expected to happen.

Or

Mathematical measurement of the possibility of an event is called probability.

Important Terminology

Here, we are introducing some important terminology, which are used in probability.

- (i) **Experiment** An activity which gives results in some well-defined outcomes, is called an experiment.
- (ii) **Random Experiment** The experiment about which no confirm prediction is possible, is called the random experiment.
- (iii) **Sample Space** The set of all possible outcomes of an experiment, is called the sample space, which is denoted by S .
- (iv) **Event** Every subset of sample space is defined as the event. It is denoted by E .

Types of Events

According to possibility of outcomes and sample points, events are defined as follows:

- (i) **Null Event or Impossible Event** It has no element and is denoted by ϕ .
- (ii) **Sure Event** Since, $S \subseteq S$, so S is an event which is called sure event.
- (iii) **Simple Event or Elementary Event** It has only one sample point.
- (iv) **Mixed Event or Composite Event or Compound Event** This event has two or more than two sample points or elements.
- (v) **Equally Likely Events** Outcomes are said to be equally likely when we have no reason to believe that one is more likely to occur than the other.

(vi) **Mutually Exclusive Events** Events E_1 and E_2 are mutually exclusive, if $E_1 \cap E_2 = \phi$.

Events $E_1, E_2, E_3, \dots, E_n$ are said to be mutually exclusive events, if

$$E_1 \cap E_2 \cap \dots \cap E_n = \phi$$

(vii) **Mutually Exclusive and Exhaustive Events** Events $E_1, E_2, E_3, \dots, E_n$ are mutually exclusive and exhaustive events, if

$$E_i \cap E_j = \phi, \text{ where } i \neq j \text{ and } i, j = 1, 2, 3, \dots, n$$

$$\text{and } E_1 \cup E_2 \cup E_3 \cup \dots \cup E_n = S$$

(viii) **Complement of an Event E** It is denoted by E' or E^c or $\bar{E}$ and it is the set of all sample points of sample space other than sample points of event E .

Probability of an Event

Let E be an event and $P(E)$ denotes the probability of occurrence of the event E . Then, we have

$$\begin{aligned} P(E) &= \frac{n(E)}{n(S)} \\ &= \frac{\text{Number of cases favourable to event } E}{\text{Total number of cases in the sample space}} \end{aligned}$$

It must be clearly understood that, all the cases considered in the above definition should be equally likely.

- NOTE** (i) $P(S) = 1$; $P(\phi) = 0$ (ii) $0 \leq P(E) \leq 1$
 (iii) If $A \subseteq B$, then $P(A) \leq P(B)$ (iv) $P(A) + P(\bar{A}) = 1$
 (v) If $P(A) = \frac{m}{n}$, then
 (a) Probability of odds in favour of $A = \frac{P(A)}{P(\bar{A})} = \frac{m}{n-m}$
 (b) Probability of odds against $A = \frac{P(\bar{A})}{P(A)} = \frac{n-m}{m}$

Addition Theorems on Probability

If $P(A+B)$ or $P(A \cup B)$ = Probability of occurrence of atleast one event A or B and $P(AB)$

or $P(A \cap B)$ = Probability of happening of events A and B together, then

(i) **When Events are Not Mutually Exclusive** If A and B are two events which are not mutually exclusive, then

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$\text{or } P(A+B) = P(A) + P(B) - P(AB)$$

For any three events A, B, C ,

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) + P(A \cap B \cap C)$$

$$\text{or } P(A+B+C) = P(A) + P(B) + P(C) - P(AB) - P(BC) - P(CA) + P(ABC)$$

(ii) **When Events are Mutually Exclusive** If A and B are mutually exclusive events, then

$$n(A \cap B) = 0 \Rightarrow P(A \cap B) = 0$$

$$\therefore P(A \cup B) = P(A) + P(B)$$

For any three events A, B, C which are mutually exclusive,

$$\begin{aligned} P(A \cap B) &= P(B \cap C) = P(C \cap A) \\ &= P(A \cap B \cap C) = 0 \end{aligned}$$

$$\therefore P(A \cup B \cup C) = P(A) + P(B) + P(C)$$

The probability of happening of anyone of several mutually exclusive events is equal to the sum of their probabilities, i.e. if $A_1, A_2, \dots, A_n$ are mutually exclusive events, then

$$P(A_1 + A_2 + \dots + A_n) = P(A_1) + P(A_2) + \dots + P(A_n)$$

$$\text{i.e. } P(\sum A_i) = \sum P(A_i)$$

(iii) **Some Other Theorems**

(a) Let A and B be two events associated with a random experiment, then

$$P(\bar{A} \cap B) = P(B) - P(A \cap B)$$

$$P(A \cap \bar{B}) = P(A) - P(A \cap B)$$

(b) If $B \subset A$, then $P(A \cap \bar{B}) = P(A) - P(B)$

$$P(B) \leq P(A)$$

Similarly, if $A \subset B$, then $P(\bar{A} \cap B) = P(B) - P(A)$

$$P(A) \leq P(B)$$

NOTE Probability of occurrence of neither A nor B is

$$P(\bar{A} \cap \bar{B}) = P(\overline{A \cup B}) = 1 - P(A \cup B)$$

(iv) **Generalisation of the Addition Theorem**

If $A_1, A_2, \dots, A_n$ are n events associated with a random experiment, then

$$\begin{aligned} P\left(\bigcup_{i=1}^n A_i\right) &= \sum_{i=1}^n P(A_i) - \sum_{\substack{i,j=1 \\ i \neq j}}^n P(A_i \cap A_j) \\ &\quad + \sum_{\substack{i,j,k=1 \\ i \neq j \neq k}}^n P(A_i \cap A_j \cap A_k) \\ &\quad + \dots + (-1)^{n-1} P(A_1 \cap A_2 \cap \dots \cap A_n) \end{aligned}$$

If all the events $A_i; i=1, 2, \dots, n$ are mutually

exclusive, then $P\left(\bigcup_{i=1}^n A_i\right) = \sum_{i=1}^n P(A_i)$.

- NOTE** • $P(\bar{A} \cap \bar{B}) = 1 - P(A \cup B)$
 • $P(\bar{A} \cup \bar{B}) = 1 - P(A \cap B)$
 • $P(A) = P(A \cap B) + P(A \cap \bar{B})$
 • $P(B) = P(B \cap A) + P(B \cap \bar{A})$

$$\begin{aligned}
P(\text{exactly one of } E_1, E_2 \text{ occurs}) &= P(E_1 \cap E_2') + P(E_1' \cap E_2) \\
&= P(E_1) - P(E_1 \cap E_2) + P(E_2) - P(E_1 \cap E_2) \\
&= P(E_1) + P(E_2) - 2P(E_1 \cap E_2)
\end{aligned}$$

- $P(\text{neither } E_1 \text{ nor } E_2) = P(E_1' \cap E_2') = 1 - P(E_1 \cup E_2)$
- $P(E_1' \cup E_2') = 1 - P(E_1 \cap E_2)$

Notations Used in Probability

Following are the important notations used in probability:

Verbal description of events	Equivalent set theoretic notation
Only A occurs	$A \cap \bar{B} \cap \bar{C}$
Both A and B but not C occur	$A \cap B \cap \bar{C}$
All the three events occur	$A \cap B \cap C$
Atleast one occurs	$A \cup B \cup C$
Atleast two occur	$(A \cap B) \cup (B \cap C) \cup (A \cap C)$
One and no more occurs	$(A \cap \bar{B} \cap \bar{C}) \cup (\bar{A} \cap B \cap \bar{C}) \cup (\bar{A} \cap \bar{B} \cap C)$
Exactly two of A, B and C occur	$(A \cap B \cap \bar{C}) \cup (\bar{A} \cap B \cap C) \cup (A \cap \bar{B} \cap C)$
None occurs	$\bar{A} \cap \bar{B} \cap \bar{C} = \overline{A \cup B \cup C}$
Not more than two occur	$(A \cap B) \cup (B \cap C) \cup (A \cap C) - (A \cap B \cap C)$
Exactly one of A and B occurs	$(A \cap \bar{B}) \cup (\bar{A} \cap B)$

Multiplication Theorems on Probability

If A and B are two events associated with a random experiment, then

$$P(A \cap B) = P(A) \cdot P\left(\frac{B}{A}\right), \text{ if } P(A) \neq 0$$

or
$$P(A \cap B) = P(B) \cdot P\left(\frac{A}{B}\right), \text{ if } P(B) \neq 0$$

Extension of Multiplication Theorem

If $A_1, A_2, \dots, A_n$ are n events related to a random experiment, then

$$\begin{aligned}
P(A_1 \cap A_2 \cap A_3 \cap \dots \cap A_n) &= P(A_1) \cdot P\left(\frac{A_2}{A_1}\right) \\
&\quad \cdot P\left(\frac{A_3}{A_1 \cap A_2}\right) \dots P\left(\frac{A_n}{A_1 \cap A_2 \cap \dots \cap A_{n-1}}\right)
\end{aligned}$$

Conditional Probability

Let A and B be two events associated with a random experiment. Then, the probability of occurrence of A under

the condition that B has already occurred and $P(B) \neq 0$, is called the conditional probability and it is denoted by $P\left(\frac{A}{B}\right)$. Thus, $P\left(\frac{A}{B}\right)$ = Probability of occurrence of A , given

that B has already happened $= \frac{P(A \cap B)}{P(B)} = \frac{n(A \cap B)}{n(B)}$

Similarly, $P\left(\frac{B}{A}\right)$ = Probability of occurrence of B , given that A has already happened

$$P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{n(A \cap B)}{n(A)}$$

Properties of Conditional Probability

Let A and B be two events of a sample space S of an experiment, then

(i) $P\left(\frac{S}{A}\right) = P\left(\frac{A}{A}\right) = 1$

(ii) $P\left(\frac{A'}{B}\right) = 1 - P\left(\frac{A}{B}\right)$, where A' is the complement of A .

Total Probability Theorem

If an event A can occur with one of the n mutually exclusive and exhaustive events $B_1, B_2, \dots, B_n$ and the probabilities

$P\left(\frac{A}{B_1}\right), P\left(\frac{A}{B_2}\right), \dots, P\left(\frac{A}{B_n}\right)$ are known, then

$$P(A) = \sum_{i=1}^n P(B_i) \cdot P\left(\frac{A}{B_i}\right)$$

Baye's Theorem

If an event A can occur with one of the n mutually exclusive and exhaustive events $B_1, B_2, \dots, B_n$ and the probabilities

$P\left(\frac{A}{B_i}\right)$ are known, then

$$P\left(\frac{B_i}{A}\right) = \frac{P(B_i) \cdot P\left(\frac{A}{B_i}\right)}{\sum_{i=1}^n P(B_i) \cdot P\left(\frac{A}{B_i}\right)}$$

Independent Events

Two events are said to be independent, if the occurrence of one does not depend upon the other. If $E_1, E_2, \dots, E_n$ are independent events, then

$$P(E_1 \cap E_2 \cap E_3 \cap \dots \cap E_n) = P(E_1) \cdot P(E_2) \dots P(E_n)$$

If E and F are independent events, then the pairs E and $\bar{F}$, $\bar{E}$ and F , $\bar{E}$ and $\bar{F}$ are also independent.

Properties of Independent Events

If A and B are two independent events, then

- A' and B are also independent events.
- A and B' are also independent events.
- A' and B' are also independent events.

Important Results

If n letters corresponding to n envelopes are placed in the envelopes at random, then

- Probability that all letters are in right envelopes = $\frac{1}{n!}$
- Probability that all letters are not in right envelopes = $1 - \frac{1}{n!}$
- Probability that no letter is in right envelopes = $\frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots + (-1)^n \frac{1}{n!}$
- Probability that exactly r letters are in right envelopes = $\frac{1}{r!} \left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \dots + (-1)^{n-r} \frac{1}{(n-r)!} \right)$

Probability Distribution

A random variable is a real valued function whose domain is the sample space of a random experiment. A random variable is usually denoted by the capital letters $X, Y, Z, \dots$ and so on.

The random variable may be of two types as given below.

1. Discrete Random Variable

A random variable which can take only finite or countably infinite number of values is called a discrete random variable.

2. Continuous Random Variable

A random variable which can take any value between two given limits is called a continuous random variable.

Probability Distribution of a Random Variable

If the values of a random variable together with the corresponding probabilities are given, then this description is called a probability distribution of the random variable.

If a random variable X takes values, $x_1, x_2, x_3, \dots, x_n$ with respective probabilities $p_1, p_2, p_3, \dots, p_n$, then

X	x_1	x_2	x_3	$\dots$	x_n
$P(X)$	p_1	p_2	p_3	$\dots$	p_n

is known as the probability distribution of X .

Mean

If X is a discrete random variable which assumes values $x_1, x_2, x_3, \dots, x_n$ with respective probabilities $p_1, p_2, p_3, \dots, p_n$, then the mean $\bar{X}$ of X is defined as

$$\bar{X} = p_1 x_1 + p_2 x_2 + \dots + p_i x_i \quad \text{or} \quad \bar{X} = \sum_{i=1}^n p_i x_i$$

The mean of a random variable X is also known as its mathematical expectation and it is denoted by $E(X)$.

Variance

If X is a discrete random variable which assumes values $x_1, x_2, x_3, \dots, x_n$ with the respective probabilities $p_1, p_2, \dots, p_n$, then variance of X is defined as

$$\text{Var}(X) = \sum_{i=1}^n p_i x_i^2 - \left(\sum_{i=1}^n p_i x_i \right)^2$$

- NOTE**
- The mean of a random variable X is also known as its mathematical expectation or expected value and is denoted by $E(X)$.
 - The variance and standard deviation of a random variable are always non-negative.

Bernoulli Trials

Trials of a random experiment are called Bernoulli trials, if they satisfy the following conditions:

- There should be a finite number of trials.
- The trials should be independent of each other.
- Each trial has exactly two outcomes i.e. success or failure.
- The probability of success (or failure) remains the same in each trial.

Binomial Distribution

The probability of r successes in n independent Bernoulli trials is denoted by $P(X=r)$ and is given by

$$P(X=r) = {}^nC_r p^r q^{n-r}$$

where, p = Probability of success

and q = Probability of failure and $p + q = 1$

- Mean = np
- Variance = npq
- Mean is always greater than variance.

Practice Exercise

- A single letter is selected at random from the word 'PROBABILITY'. The probability that it is a vowel, is
 a. $\frac{3}{11}$ b. $\frac{4}{11}$ c. $\frac{2}{11}$ d. 0
- A five digit numbers is formed by the digits 1, 2, 3, 4, 5 without repetition. Find the probability that the number formed is divisible by 4.
 a. $\frac{1}{5}$ b. $\frac{6}{5}$ c. $\frac{4}{5}$ d. None
- Three identical dice are rolled. The probability that the same number will appear on each of them is
 a. $\frac{1}{6}$ b. $\frac{1}{36}$ c. $\frac{1}{18}$ d. $\frac{3}{28}$
- A determinant is chosen at random from the set of all determinants of order 2 with elements 0 and 1 only. The probability that value of the determinant chosen is positive, is
 a. $\frac{1}{8}$ b. $\frac{3}{16}$
 c. $\frac{1}{4}$ d. None of these
- In shuffling a pack of playing cards, four cards are incidently dropped. The probability that the missing cards should be one from each unit is
 a. $\frac{1}{256}$ b. $\frac{2}{20825}$
 c. $\frac{2197}{20825}$ d. None of these
- If three distinct numbers are chosen randomly from the first 100 natural numbers, then the probability that all three of them are divisible by both 2 and 3, is
 a. $\frac{4}{55}$ b. $\frac{4}{35}$ c. $\frac{4}{33}$ d. $\frac{4}{1155}$
- A four digit numbers is formed with the digits from 1, 2, 3, 4, 5, without repetition. The probability that it is divisible by 3, is
 a. $\frac{1}{3}$ b. $\frac{1}{4}$ c. $\frac{1}{5}$ d. $\frac{1}{6}$
- A and B stand in a ring along with 10 other persons. If the arrangement is at random, then the probability that there are exactly 3 persons between A and B, is
 a. $\frac{1}{11}$ b. $\frac{2}{11}$ c. $\frac{3}{11}$ d. $\frac{1}{12}$
- One function is selected from all the functions $F: S \rightarrow S$, where $S = \{1, 2, 3, 4, 5, 6\}$. The probability that it is onto function, is
 a. $\frac{5}{324}$ b. $\frac{7}{324}$ c. $\frac{5}{162}$ d. $\frac{5}{81}$
- There are 2 teams with n persons in each. The probability of selecting 2 persons from one team and 1 person from the other team is $\frac{6}{7}$, then n is equal to
 a. 3 b. 4 c. 5 d. 6
- If $x_1, x_2, \dots, x_{50}$ are fifty real numbers such that $x_r < x_{r+1}$ for $r = 1, 2, 3, \dots, 49$. Five numbers out of these are picked up at random. The probability that the five numbers have x_{20} as the middle number, is
 a. $\frac{{}^{20}C_2 \times {}^{30}C_2}{{}^{50}C_5}$ b. $\frac{{}^{30}C_2 \times {}^{19}C_2}{{}^{50}C_5}$
 c. $\frac{{}^{19}C_2 \times {}^{31}C_2}{{}^{50}C_5}$ d. None of these
- Two numbers are selected randomly from the set $S = \{1, 2, 3, 4, 5, 6\}$ without replacement one-by-one. The probability that minimum of the two numbers is less than 4, is
 a. $\frac{1}{15}$ b. $\frac{14}{15}$ c. $\frac{1}{5}$ d. $\frac{4}{5}$
- If two events A and B are mutually exclusive events such that $P(A) = \frac{3x+1}{3}$ and $P(B) = \frac{1-x}{4}$, then the set of possible values of x lies in the interval
 a. $[0, 1]$ b. $\left[\frac{1}{3}, \frac{2}{3}\right]$ c. $\left[-\frac{1}{3}, \frac{5}{9}\right]$ d. $\left[-\frac{7}{9}, \frac{4}{9}\right]$
- An urn contains nine balls of which three are red, four are blue and two are green. Three balls are drawn at random without replacement from the urn. The probability that the three balls have different colours, is
 a. $\frac{1}{3}$ b. $\frac{2}{7}$ c. $\frac{1}{21}$ d. $\frac{2}{23}$
- Three houses are available in a locality. Three persons apply for the houses. Each applies for one house without consulting others. The probability that all the three apply for the same house, is
 a. $\frac{7}{9}$ b. $\frac{8}{9}$ c. $\frac{1}{9}$ d. $\frac{2}{9}$
- If a number of two digits is formed with the digits 2, 3, 5, 7, 9 without repetition of digits, then the probability that the number formed 35, is
 a. $\frac{1}{10}$ b. $\frac{1}{20}$ c. $\frac{1}{30}$ d. None
- If the papers of 4 students can be checked by anyone of the 7 teachers, then the probability that all the 4 papers are checked by exactly 2 teachers, is equal to
 a. $\frac{12}{49}$ b. $\frac{6}{49}$ c. $\frac{9}{49}$ d. $\frac{15}{49}$

18. If the word 'UNIVERSITY' is arranged randomly, then the probability that both 'I' are not together, is
 a. $\frac{3}{5}$ b. $\frac{2}{5}$ c. $\frac{4}{5}$ d. $\frac{3}{5}$
19. If 6 objects are distributed at random among 6 persons, then the probability that atleast one person does not get any object, is
 a. $\frac{313}{324}$ b. $\frac{315}{322}$ c. $\frac{317}{324}$ d. $\frac{319}{324}$
20. The probability of not getting a sum of 7 in a single throw with a pair of dice, is
 a. $\frac{1}{6}$ b. $\frac{2}{3}$ c. $\frac{1}{3}$ d. $\frac{5}{6}$
21. The events E_1 and E_2 have probabilities 0.25 and 0.50 respectively. If the probability that both E_1 and E_2 occur simultaneously is 0.14. Then, the probability that neither E_1 nor E_2 occurs is
 a. 0.39 b. 0.25
 d. 0.11 d. None of these
22. Four persons are selected at random from a group of 3 men, 2 women and 4 children. What is the chance that exactly two of them are children?
 a. 9/21 b. 10/23 c. 11/24 d. 10/21
23. A coin is tossed 3 times by 2 persons. What is the probability that both get equal number of heads?
 a. $\frac{3}{8}$ b. $\frac{1}{9}$ c. $\frac{5}{16}$ d. None
24. A bag contains 30 balls numbered from 1 to 30. One ball is drawn at random. Find the probability that the number of the ball drawn will be a multiple of 3 or 7.
 a. $\frac{14}{30}$ b. $\frac{40}{900}$ c. $\frac{13}{30}$ d. None
25. A probability that a leap year selected at random contains either 53 Sunday or 53 Monday, is
 a. $\frac{2}{7}$ b. $\frac{4}{7}$ c. $\frac{3}{7}$ d. $\frac{1}{7}$
26. For the three events A, B and C , P (exactly one of the events A or B occurs) = P (exactly one of the events B or C occurs) = P (exactly one of the events C or A occurs) = p and P (all the three events occur simultaneously) = p^2 where $0 < p < 1/2$. Then, the probability of atleast one of the three events A, B and C occurring, is
 a. $\frac{3p + 2p^2}{2}$ b. $\frac{p + 3p^2}{4}$ c. $\frac{p + 3p^2}{2}$ d. $\frac{3p + 2p^2}{4}$
27. A, B, C are events such that
 $P_r(A) = 0.3, P_r(B) = 0.4, P_r(C) = 0.8$
 $P_r(AB) = 0.08, P_r(AC) = 0.28$ and $P_r(ABC) = 0.09$.
 If $P_r(A \cup B \cup C) \geq 0.75$, then $P_r(BC)$ lies in the interval
 a. $0.23 \leq x \leq 0.48$ b. $0.25 \leq x \leq 0.30$
 c. $0.49 \leq x \leq 0.74$ d. None of these
28. If A and B are two events, then the probability that exactly one of them occurs, is given by
 a. $P(A) + P(B) - 2P(A \cap B)$
 b. $P(A \cap B') - P(A' \cap B)$
 c. $P(A \cup B) + P(A \cap B)$
 d. $P(A') + P(B') + 2P(A' \cap B')$
29. Probability that in the toss of two dice, we obtain an even sum or a sum less than 5, is
 a. $\frac{1}{2}$ b. $\frac{1}{6}$ c. $\frac{2}{3}$ d. $\frac{5}{9}$
30. A number is chosen at random among the first 120 natural numbers. The probability of the number chosen being a multiple of 5 or 15, is
 a. $\frac{1}{8}$ b. $\frac{1}{5}$ c. $\frac{1}{24}$ d. $\frac{1}{6}$
31. For any two events A and B , if $P(A \cup B) = P(A \cap B)$, then
 a. $P(A) = P(B)$ b. $P(A) > P(B)$
 c. $P(A) < P(B)$ d. None of these
32. For any two independent events E_1 and E_2 , $P\{(E_1 \cup E_2) \cap (\bar{E}_1 \cap \bar{E}_2)\}$ is
 a. $< \frac{1}{4}$ b. $> \frac{1}{4}$ c. $\geq \frac{1}{2}$ d. None
33. Five horses are in a race. Mr. A selects two of the horses at random and bets on them. The probability that Mr. A selected the winning horse is
 a. $\frac{4}{5}$ b. $\frac{3}{5}$ c. $\frac{1}{5}$ d. $\frac{2}{5}$
34. A bag contains 3 red and 3 white balls. Two balls are drawn one-by-one. The probability that they are of different colours, is
 a. $\frac{3}{10}$ b. $\frac{2}{5}$ c. $\frac{3}{5}$ d. None
35. Let X be a set containing n elements. Two subsets A and B of X are chosen at random. The probability that $A \cup B = X$ is
 a. $\frac{2^n C_n}{2^{2n}}$ b. $\frac{1}{2^n} C_n$
 c. $1 \cdot 3 \cdot 5 \dots (2n-1) 2^n \cdot n!$ d. $(3/4)^n$
36. In a hurdle race, a runner has probability p of jumping over a specific hurdle. In 5 trials, if the runner succeeded 3 times, then the conditional probability that the runner had succeeded in the first trial, is
 a. $\frac{3}{5}$ b. $\frac{2}{5}$ c. $\frac{1}{5}$ d. None
37. A committee of 4 students is selected at random from a group consisting of 8 boys and 4 girls. If there is atleast one girl in the committee, then the probability that there are exactly 2 girls in the committee, is
 a. $\frac{7}{99}$ b. $\frac{13}{99}$ c. $\frac{14}{99}$ d. None

38. If one Indian and four American men and their wives are to be seated randomly around a circular table. Then, the conditional probability that the Indian man is seated adjacent to his wife given that each American man is seated adjacent to his wife, is
 a. $\frac{1}{2}$ b. $\frac{1}{3}$ c. $\frac{2}{5}$ d. $\frac{1}{5}$
39. If the events A and B are such that $P(A) = \frac{1}{4}$, $P(A/B) = \frac{1}{2}$ and $P(B/A) = \frac{2}{3}$. Then, $P(B)$ is equal to
 a. $\frac{1}{2}$ b. $\frac{1}{6}$ c. $\frac{1}{3}$ d. $\frac{2}{3}$
40. If $P(A) = \frac{2}{5}$, $P(B) = \frac{3}{10}$ and $P(A \cap B) = \frac{1}{5}$, then $P\left(\frac{A}{B}\right) \cdot P\left(\frac{B'}{A'}\right)$ is equal to
 a. $\frac{5}{9}$ b. $\frac{5}{7}$ c. $\frac{25}{42}$ d. 1
41. If A and B are two events such that $P(A) = \frac{1}{2}$, $P(B) = \frac{1}{3}$, $P\left(\frac{A}{B}\right) = \frac{1}{4}$, then $P(A' \cap B')$ is equal to
 a. $\frac{1}{12}$ b. $\frac{3}{4}$ c. $\frac{1}{4}$ d. $\frac{3}{16}$
42. If $P(A) = \frac{3}{10}$, $P(B) = \frac{2}{5}$ and $P(A \cup B) = \frac{3}{5}$, then $P\left(\frac{B}{A}\right) + P\left(\frac{A}{B}\right)$ is equal to
 a. $\frac{1}{4}$ b. $\frac{1}{3}$ c. $\frac{5}{12}$ d. $\frac{7}{12}$
43. If two events A and B are such that $0 < P(A)$, $P(B) < 1$ then $P\left(\frac{A}{B}\right) + P\left(\frac{\bar{A}}{\bar{B}}\right)$ is equal to
 a. 1 b. $\frac{3}{2}$
 c. $\frac{1}{2}$ d. None of these
44. A purse contains 4 copper coins and 3 silver coins. The second purse contains 6 copper coins and 2 silver coins. A coin is taken out from any purse. The probability that it is a copper coin, is
 a. $\frac{4}{7}$ b. $\frac{37}{56}$ c. $\frac{3}{7}$ d. $\frac{3}{4}$
45. Bag A contains 2 white and 3 red balls and bag B contains 4 white and 5 red balls. One ball is drawn at random from one of the bags and is found to be red. The probability that it was drawn from the bag B is
 a. $\frac{5}{9}$ b. $\frac{4}{9}$
 c. $\frac{25}{52}$ d. None of these
46. The chances of defective screws in three boxes A, B and C are $\frac{1}{5}, \frac{1}{6}$ and $\frac{1}{7}$, respectively. A box is selected at random and a screw drawn from it at random is found to be defective. Then, the probability that it come from box A , is
 a. $\frac{16}{29}$ b. $\frac{1}{15}$ c. $\frac{27}{59}$ d. $\frac{42}{107}$
47. In three throws of two dice, the probability of throwing doublets not more than twice is
 a. $\frac{1}{6}$ b. $\frac{5}{72}$ c. $\frac{215}{216}$ d. None
48. A and B are two independent events. The probability that both A and B occur is $\frac{1}{6}$ and the probability that neither of them occurs is $\frac{1}{3}$. The probability of occurrence of A is
 a. $\frac{1}{2}, \frac{1}{3}$ b. $\frac{1}{3}, \frac{1}{4}$ c. $\frac{1}{2}, \frac{1}{4}$ d. None
49. The probability that a 50 year old man will be alive at 60 is 0.83 and the probability that a 45 year old woman will be alive at 55 is 0.87. The probability that atleast one of the will be alive ten years hence, is
 a. 0.221 b. 0.779 c. 0.669 d. 0.758
50. The probability that any of the men A_1, A_2, A_3, A_4 is alive after 95 years of age is $\frac{1}{2}$. The probability that A_1 will die at the age of 95 and will be the first to die is
 a. $\frac{15}{16}$ b. $\frac{15}{64}$ c. $\frac{1}{4}$ d. $\frac{8}{15}$
51. A man throws a fair coin a number of times and gets 2 points for each head he throws and 1 point for each tail he throws. The probability that he gets exactly 6 points is
 a. $\frac{21}{32}$ b. $\frac{23}{32}$ c. $\frac{41}{64}$ d. $\frac{43}{64}$
52. There are 5 balls numbered 1 to 5 and 5 boxes numbered 1 to 5. The balls are kept in the boxes, one in each box. The probability that exactly 2 balls are kept in the corresponding numbered boxes and the remaining 3 balls in the wrong boxes, is
 a. $\frac{1}{5}$ b. $\frac{1}{6}$ c. $\frac{1}{10}$ d. $\frac{1}{12}$
53. A draws two cards at random from a pack of 52 cards. After returning them to the pack and shuffling it, B draws two cards at random. The probability that their draws contain exactly one common card is
 a. $\frac{25}{546}$ b. $\frac{50}{663}$ c. $\frac{25}{663}$ d. $\frac{24}{563}$
54. Let A, B and C try to hit a target simultaneously but independently. Their respective probabilities of hitting the targets are $\frac{3}{4}, \frac{1}{2}$ and $\frac{5}{8}$. The probability that the target is hit by A or B but not by C , is
 a. $\frac{21}{64}$ b. $\frac{7}{8}$ c. $\frac{7}{32}$ d. $\frac{9}{64}$

55. Let A and B be two events such that $P(\overline{A \cup B}) = \frac{1}{6}$, $P(A \cap B) = \frac{1}{4}$ and $P(\overline{A}) = \frac{1}{4}$, where

$\overline{A}$ stands for complement of event A . Then, events A and B are

- mutually exclusive and independent
 - independent but not equally likely
 - equally likely but not independent
 - equally likely and mutually exclusive
56. A bag contains 17 tickets numbered 1 to 17. A ticket is drawn and replaced, then one more ticket is drawn and replaced. Probability that first number drawn is even and second is odd, is
- 82/289
 - 72/289
 - 64/289
 - 63/280
57. Three letters are to be sent to different persons and addresses on the three envelopes are also written. Without looking at the addresses, the probability that the letters go into the right envelope is equal to
- $\frac{1}{27}$
 - $\frac{1}{9}$
 - $\frac{4}{27}$
 - $\frac{1}{6}$
58. A fair coin is tossed repeatedly. If tail appears on first four tosses, then the probability of head appearing on fifth toss is equal to
- $\frac{1}{2}$
 - $\frac{1}{32}$
 - $\frac{31}{32}$
 - $\frac{1}{5}$
59. A die is thrown and a card is selected at random from a deck of 52 playing cards. The probability of getting an even number on the die and a spade card is
- $\frac{1}{2}$
 - $\frac{1}{4}$
 - $\frac{1}{8}$
 - $\frac{3}{4}$
60. If A and B are two independent events such that $P(\overline{A}) = \frac{7}{10}$, $P(\overline{B}) = \alpha$ and $P(A \cup B) = \frac{4}{5}$, then the value of α is
- 1
 - 5/7
 - 2/7
 - 1/4
61. In a throw of a die, the probability of getting one in even number of throw is
- $\frac{5}{36}$
 - $\frac{5}{11}$
 - $\frac{6}{11}$
 - $\frac{1}{6}$
62. Two aeroplanes I and II, bomb a target in succession. The probabilities of I and II scoring a hit correctly are 0.3 and 0.2, respectively. The second plane will bomb only, if the first misses the target. The probability that the target is hit by the second plane, is
- 0.06
 - 0.14
 - 0.32
 - 0.7
63. A discrete random variable X has the following probability distribution
- | X | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|--------|-----|------|------|------|-------|--------|------------|
| $P(X)$ | C | $2C$ | $2C$ | $3C$ | C^2 | $2C^2$ | $7C^2 + C$ |
- The value of C and the mean of the distribution are
- 1/10 and 3.66
 - 1/20 and 2.66
 - 1/15 and 1.33
 - None of these

64. A random variable X has the probability distribution

X	1	2	3	4	5	6	7	8
$P(X)$	0.15	0.23	0.12	0.10	0.20	0.08	0.07	0.05

For the events $E = \{X \text{ is a prime number}\}$ and $F = \{X < 4\}$, $P(E \cup F)$ is equal to

- 0.87
 - 0.77
 - 0.35
 - 0.50
65. If 10% of bolts produced by a machine are defective, then the probability that out of a sample selected at random, of 7 bolts, not more than 1 is defective, is
- $(1.6)^6(0.9)^4$
 - $(0.9)^6(1.6)$
 - $(1.6)^4(0.9)^4$
 - None
66. If the mean and variance of a binomial variate X are α and 1 respectively, then the probability that X takes a value greater than one equal to
- 13/16
 - 12/16
 - 9/16
 - 11/16
67. A fair coin is tossed n times. If X is the number of times head occur and $P(X = 4)$, $P(X = 5)$ and $P(X = 6)$ are in AP, then n is equal to
- 13
 - 7
 - 11
 - 12
68. If the mean and variance of a binomial distribution are 4 and 3, respectively. Then, the probability of getting exactly six successes in this distribution is
- ${}^{16}C_6 \left(\frac{1}{4}\right)^{10} \left(\frac{3}{4}\right)^6$
 - ${}^{16}C_6 \left(\frac{1}{4}\right)^6 \left(\frac{3}{4}\right)^{10}$
 - ${}^{12}C_6 \left(\frac{1}{4}\right)^{10} \left(\frac{3}{4}\right)^6$
 - None of these
69. A multiple choice examination has 5 questions. Each question has three alternative answers of which exactly one is correct. The probability that a student will get 4 or more correct answers just by guessing is
- $\frac{17}{3^5}$
 - $\frac{13}{3^5}$
 - $\frac{11}{3^5}$
 - $\frac{10}{3^5}$
70. A die is thrown 20 times. Getting a number greater than 4 is considered a success. Then, mean and variance of the number of successes are
- 6.6, 4.4
 - 6.5, 4.5
 - 6.3, 4.3
 - 6.2, 4.2
71. A fair coin is tossed at a fixed number of times. If the probability of getting 7 heads is equal to getting 9 heads, then the probability of getting 2 heads is
- $\frac{15}{2^8}$
 - $\frac{2}{15}$
 - $\frac{15}{2^{13}}$
 - $\frac{4}{9}$
72. A die is thrown 100 times, getting an even number is considered a success. The variance of the number of successes is
- 10
 - 25
 - 18
 - 10
73. A coin is tossed 7 times. Each time a man calls head. The probability that he wins the toss atleast 4 occasions is
- $\frac{1}{4}$
 - $\frac{5}{8}$
 - $\frac{1}{2}$
 - $\frac{1}{6}$

BITSAT Archives

- Five persons A, B, C, D and E are in queue of a shop. The probability that A and E are always together, is [2014]
 - $\frac{1}{4}$
 - $\frac{2}{3}$
 - $\frac{2}{5}$
 - $\frac{3}{5}$
- The probability of simultaneous occurrence of atleast one of two events A and B is p . If the probability that exactly one of A, B occurs is q , then $P(A') + P(B')$ is equal to [2014]
 - $2 - 2p + q$
 - $2 + 2p - q$
 - $3 - 3p + q$
 - $2 - 4p + q$
- If A and B are two events such that $P(A) = 0.6$, $P(B) = 0.2$ and $P\left(\frac{A}{B}\right) = 0.5$, then $P\left(\frac{A'}{B'}\right)$ is equal to [2013]
 - $\frac{1}{10}$
 - $\frac{3}{10}$
 - $\frac{3}{8}$
 - $\frac{6}{7}$
- A bag contains 3 white and 5 black balls. One ball is drawn at random. Then, the probability that it is white, is [2011]
 - $\frac{1}{8}$
 - $\frac{3}{8}$
 - $\frac{5}{8}$
 - $\frac{3}{5}$
- For any two events A and B , if $P(A \cup B) = 5/6$, $P(A \cap B) = 1/3$, $P(B) = 1/2$, then $P(A)$ is [2011]
 - $1/2$
 - $2/3$
 - $1/3$
 - None of these
- If $\frac{1+3p}{3}$, $\frac{1-p}{4}$ and $\frac{1-2p}{2}$ are mutually exclusive events. Then, range of p is [2010]
 - $\frac{1}{3} \leq p \leq \frac{1}{2}$
 - $\frac{1}{4} \leq p \leq \frac{1}{2}$
 - $\frac{1}{3} \leq p \leq \frac{2}{3}$
 - $\frac{1}{3} \leq p \leq \frac{2}{5}$
- If A and B are two events such that $P(A) = \frac{3}{4}$ and $P(B) = \frac{5}{8}$, then [2010]
 - $P(A \cup B) \geq 3/4$
 - $P(A' \cap B) \leq 1/4$
 - $\frac{3}{8} \leq P(A \cap B) \leq \frac{5}{8}$
 - All of these
- A die is tossed twice. The probability of having a number greater than 4 on each toss is [2009]
 - $\frac{1}{3}$
 - $\frac{1}{9}$
 - $\frac{2}{3}$
 - $\frac{1}{12}$
- The probability that a leap year selected at random will contain either 53 Thursday or 53 Friday, is [2009]
 - $3/7$
 - $2/7$
 - $5/7$
 - $1/7$
- An unbiased die is tossed until a number greater than 4 appears. The probability that an even number of tosses is needed, is [2009]
 - $\frac{1}{2}$
 - $\frac{2}{5}$
 - $\frac{1}{5}$
 - $\frac{2}{3}$
- The mean and variance of a binomial variable X are 2 and 1, respectively. The probability that X takes values greater than 1, is [2009]
 - $\frac{5}{16}$
 - $\frac{8}{16}$
 - $\frac{11}{16}$
 - $\frac{1}{16}$
- If A and B are independent events of a random experiment such that $P(A \cap B) = \frac{1}{6}$ and $P(\bar{A} \cap \bar{B}) = \frac{1}{3}$, then $P(A)$ is equal to [2008]
 - $\frac{1}{4}$
 - $\frac{1}{3}$
 - $\frac{5}{7}$
 - $\frac{2}{3}$
- For $k = 1, 2, 3$, the box B_k contains k red balls and $(k+1)$ white balls. Let $P(B_1) = \frac{1}{2}$, $P(B_2) = \frac{1}{3}$ and $P(B_3) = \frac{1}{6}$. A box is selected at random and a ball is drawn from it. If a red ball is drawn, then the probability that it has come from box B_2 , is [2008]
 - $\frac{35}{78}$
 - $\frac{14}{39}$
 - $\frac{10}{13}$
 - $\frac{12}{13}$
- The probability that the same number appear on throwing three dice simultaneously, is [2007]
 - $\frac{1}{36}$
 - $\frac{5}{36}$
 - $\frac{1}{6}$
 - $\frac{4}{13}$
- A coin is tossed n times. If the probability of getting head atleast once is greater than 0.8, then the least value of n is [2007]
 - 2
 - 3
 - 5
 - 4
- Let A and B be two events and $P(A') = 0.3$, $P(B) = 0.4$, $P(A \cap B') = 0.5$, then $P(A \cup B')$ is [2008]
 - 0.5
 - 0.8
 - 1
 - 0.1

Answer with Solutions

Practice Exercise

1. (b) Total number of words = 11

Number of vowels (O, A, I, I) = 4

$$\therefore \text{Required probability} = \frac{4}{11}$$

2. (a) Total number of five digit numbers = $5! = 120$

Now, a number will be divisible by 4, if the last two digits are divisible by 4. Therefore, the last two digits can be 12, 24, 32, 52, i.e. they can be filled in 4 ways.

The remaining three places can be filled in $3!$ ways = 6

Hence, favourable number of ways = $4 \times 6 = 24$

$$\therefore \text{Required probability} = \frac{24}{120} = \frac{1}{5}$$

3. (b) Exhaustive number of cases = $6^3 = 216$

The same number can appear on each of the dice in the following ways (1, 1, 1), (2, 2, 2), (3, 3, 3) ... (6, 6, 6)

So, favourable number of cases = 6

$$\text{Hence, required probability} = \frac{6}{216} = \frac{1}{36}$$

4. (b) Since, each of the four places in a determinant of order 2 can be filled in two ways either by 0 or by 1.

Hence, total number of ways = $2^4 = 16$

Further, the value of the determinant will be positive in the following 3 cases:

$$\begin{vmatrix} 1 & 1 \\ 0 & 1 \end{vmatrix} \text{ or } \begin{vmatrix} 1 & 0 \\ 1 & 1 \end{vmatrix} \text{ or } \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix}$$

$$\text{So, required probability} = \frac{3}{16}$$

5. (c) **Hint** Number of possible ways by which 4 cards can be dropped are ${}^{52}C_4$.

One card from each suit means that there is one diamond, one club, one spade and one heart cards.

Hence, number of favourable ways

$$= {}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1 = ({}^{13}C_1)^4$$

6. (d) Here, $n(S) = {}^{100}C_3$

Let E = All three of them are divisible by both 2 and 3.

$\Rightarrow$ Divisible by 6 i.e. {6, 12, 18, ..., 96}

Thus, out of 16, we have to select 3.

i.e. $n(E) = {}^{16}C_3$

$$\therefore \text{Required probability} = \frac{{}^{16}C_3}{{}^{100}C_3} = \frac{4}{1155}$$

7. (c) Four digit numbers = ${}^5P_4 = 120$

It is divisible by 3 in 4! ways = 24

$$\therefore \text{Required probability} = \frac{24}{120} = \frac{1}{5}$$

8. (b) Number of ways of arranging 3 persons between A and B = $2 \times ({}^{10}P_3) \times 7! = 2 \times 10!$

Total number of arrangement of 12 persons is 11!.

$$\therefore \text{Required probability} = \frac{2 \times 10!}{11!} = \frac{2}{11}$$

9. (a) Total number of functions is 6^6 and number of onto function = 6!

$$\therefore \text{Required probability} = \frac{6!}{6^6} = \frac{5}{324}$$

10. (b) Required probability = $\frac{2({}^nC_2) \cdot ({}^nC_1)}{({}^{2n}C_3)} = \frac{6}{7}$

$$\Rightarrow \frac{3n}{2(2n-1)} = \frac{6}{7} \therefore n = 4$$

11. (b) Here, $n(S) = {}^{50}C_5$, $n(E) = {}^{30}C_2 \times {}^{19}C_2$

$$\therefore P(E) = \frac{{}^{30}C_2 \times {}^{19}C_2}{{}^{50}C_5}$$

12. (d) Here, two numbers are selected from {1, 2, 3, 4, 5, 6}.

$\Rightarrow n(S) = 6 \times 5$ [as one-by-one without replacement]

Also, the minimum of the two numbers is less than 4.

$$\therefore n(E) = 6 \times 4$$

We can select one from (1, 2, 3, 4) and other from (1, 2, 3, 4, 5, 6).

$$\therefore \text{Required probability} = \frac{n(E)}{n(S)} = \frac{24}{30} = \frac{4}{5}$$

13. (c) $\therefore 0 \leq \frac{3x+1}{3} \leq 1, 0 \leq \frac{1-x}{4} \leq 1$ and $0 \leq \frac{3x+1}{3} + \frac{1-x}{4} \leq 1$

$$\therefore 0 \leq 3x+1 \leq 3, 0 \leq 1-x \leq 4, 0 \leq \frac{12x+4+3-3x}{12} \leq 1$$

$$\Rightarrow -1 \leq 3x \leq 2, 0 \leq 1-x \leq 4, 0 \leq 9x+7 \leq 12$$

$$\Rightarrow -\frac{1}{3} \leq x \leq \frac{2}{3}, -1 \leq -x \leq 3, -7 \leq 9x \leq 5$$

$$\Rightarrow -\frac{1}{3} \leq x \leq \frac{2}{3}, -3 \leq x \leq 1, -\frac{7}{9} \leq x \leq \frac{5}{9}$$

$$\therefore -\frac{1}{3} \leq x \leq \frac{5}{9}$$

14. (b) Total number of cases = ${}^9C_3 = 84$

Number of favourable cases = ${}^3C_1 \cdot {}^4C_1 \cdot {}^2C_1 = 24$

$$\therefore p = \frac{24}{84} = \frac{2}{7}$$

15. (c) All the three persons have three options to apply for a house.

$\therefore$ Total number of cases = 3^3

Now, favourable cases = 3 (either all has applied for house 1 or 2 or 3)

$$\therefore \text{Required probability} = \frac{3}{3^3} = \frac{1}{9}$$

16. (b) Required probability $= \frac{1}{{}^5P_2} = \frac{1}{20}$
17. (b) Total ways in which papers can be checked is equal to 7^4 . Now, two teachers who have to check all the papers can be selected in 7C_2 ways and papers can be checked by them in $(2^4 - 2)$ favourable ways.

$$\text{Thus, required probability} = \frac{{}^7C_2 \cdot (2^4 - 2)}{7^4} = \frac{6}{49}$$

18. (c) Total number of ways $= \frac{10!}{2!}$
 Favourable number of ways for I come together is $9!$.
 Thus, probability that I come together

$$= \frac{9! \times 2!}{10!} = \frac{2}{10} = \frac{1}{5}$$

 Hence, required probability $= 1 - \frac{1}{5} = \frac{4}{5}$

19. (d) Number of ways of distributing 6 objects to 6 persons $= 6^6$

Number of ways of distributing 1 object to each person $= 6!$

$$\therefore \text{Required probability} = 1 - \frac{6!}{6^6} = 1 - \frac{5!}{6^5} = \frac{319}{324}$$

20. (d) Favourable cases are (1, 6), (2, 5), (3, 4), (4, 3), (5, 2), (6, 1).

$$\text{Probability of getting a sum } 7 = \frac{6}{36} = \frac{1}{6}$$

$$\text{Required probability} = 1 - \frac{1}{6} = \frac{5}{6}$$

21. (a) We have, $P(E_1) = 0.25$, $P(E_2) = 0.50$, $P(E_1 \cap E_2) = 0.14$

$$\begin{aligned} \therefore \text{Required probability} &= P(\overline{E_1} \cap \overline{E_2}) = P(\overline{E_1 \cup E_2}) \\ &= 1 - P(E_1 \cup E_2) = 1 - \{P(E_1) + P(E_2) - P(E_1 \cap E_2)\} \\ &= 1 - \{0.25 + 0.50 - 0.14\} = 0.39 \end{aligned}$$

22. (d) There are $(3M + 2W + 4C) = 9$ persons

Number of ways of selecting 4 persons

$$= {}^9C_4 = \frac{9 \times 8 \times 7 \times 6}{1 \times 2 \times 3 \times 4} = 126 \text{ numbers}$$

Number of ways of selecting 4 persons, in which 2 are children, are

$$(i) \quad 2C \text{ and } 2M \Rightarrow {}^4C_2 \times {}^3C_2 = 6 \times 3 = 18 \text{ number}$$

$$(ii) \quad 2C \text{ and } 2W \Rightarrow {}^4C_2 \times {}^2C_2 = 6 \times 1 = 6 \text{ number}$$

$$(iii) \quad 2C \text{ and } 1M \text{ and } 1W = {}^4C_2 \times {}^3C_1 \times {}^2C_1 \\ = 6 \times 3 \times 2 = 36$$

$$\text{Number of favourable cases} = 18 + 6 + 36 = 60$$

$$\therefore \text{Required probability} = \frac{60}{126} = \frac{10}{21}$$

23. (c) Probability of getting no head in three throws

$$= \left(\frac{1}{2}\right)^3 = \frac{1}{8}$$

Probability of getting 1 head in three throws

$$= {}^3C_1 \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right) = \frac{3}{8}$$

Probability of getting 2 head in three throws

$$= {}^3C_2 \left(\frac{1}{2}\right)^1 \left(\frac{1}{2}\right)^2 = \frac{3}{8}$$

Probability of getting 3 head in three throws

$$= {}^3C_3 \left(\frac{1}{2}\right)^0 \left(\frac{1}{2}\right)^3 = \frac{1}{8}$$

Therefore, the required probability,

$$P = \frac{1}{8} \cdot \frac{1}{8} + \frac{3}{8} \cdot \frac{3}{8} + \frac{3}{8} \cdot \frac{3}{8} + \frac{1}{8} \cdot \frac{1}{8} = \frac{20}{64} = \frac{5}{16}$$

24. (c) The probability of the number being a multiple of 3 is

$$P(3, 6, 9, 12, 15, 18, 21, 24, 27, 30) = \frac{10}{30}$$

The probability of the number being a multiple of 7 is

$$P(7, 14, 21, 28) = \frac{4}{30}$$

Here, these two events are not mutually exclusive, it means $P(21) = \frac{1}{30}$.

The probability of getting a number which is multiple of 3 or 7 is

$$= \frac{10}{30} + \frac{4}{30} - \frac{1}{30} = \frac{13}{30}$$

25. (c) A leap year consists of 366 days comprising of 52 weeks and 2 days. There are 7 possibilities for these 2 extra days (i) Sunday, Monday, (ii) Monday, Tuesday (iii) Tuesday, Wednesday (iv) Wednesday, Thursday (v) Thursday, Friday (vi) Friday, Saturday, (vii) Saturday, Sunday.

Let us consider two events.

A : The leap year contains 53 Sunday

B : The leap year contains 53 Monday

Then, we have

$$P(A) = \frac{2}{7}, P(B) = \frac{2}{7}, P(A \cap B) = \frac{1}{7}$$

So, required probability $= P(A \cup B)$

$$= P(A) + P(B) - P(A \cap B) = \frac{2}{7} + \frac{2}{7} - \frac{1}{7} = \frac{3}{7}$$

26. (a) We know that, if

P (exactly one of A or B occurs)

$$= P(A) + P(B) - 2P(A \cap B)$$

Therefore, $P(A) + P(B) - 2P(A \cap C) = p$... (i)

Similarly, $P(B) + P(C) - 2P(C \cap A) = p$... (ii)

and $P(C) + P(A) - 2P(C \cap A) = p$... (iii)

On adding Eqs. (i), (ii) and (iii), we get

$$2[P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A)] = 3p$$

$$\Rightarrow P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) = \frac{3p}{2} \dots (iv)$$

We are also given that

$$P(A \cap B \cap C) = p^2 \quad \dots(v)$$

Now, $P(\text{atleast one } A, B \text{ and } C)$

$$\begin{aligned} &= P(A) + P(B) + P(C) \\ &\quad - P(A \cap B) - P(B \cap C) - P(C \cap A) + P(A \cap B \cap C) \\ &= \frac{3p}{2} + p^2 \quad [\text{from Eqs. (iv) and (v)}] \\ &= \frac{3p + 2p^2}{2} \end{aligned}$$

27. (a) Let $P_r(B \cap C) = x$. Then, we have

$$\begin{aligned} &P_r(A \cup B \cup C) \geq 0.75 \\ \Rightarrow &P_r(A) + P_r(B) + P_r(C) - P_r(B \cap C) - P_r(C \cap A) \\ &\quad - P_r(A \cap B) + P_r(A \cap B \cap C) \geq 0.75 \\ \Rightarrow &0.3 + 0.4 + 0.8 - x - 0.28 - 0.08 + 0.09 \geq 0.75 \\ \Rightarrow &0.48 - x \geq 0 \Rightarrow 0.48 \geq x \\ \Rightarrow &x \leq 0.48 \quad \dots(i) \end{aligned}$$

$$\text{Similarly, } P_r(A \cup B \cup C) \leq 1 \Rightarrow 0.23 - x \leq 0$$

$$\Rightarrow 0.23 \leq x \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $0.23 \leq x \leq 0.48$

28. (a) $P(\text{Exactly one of the events})$

$$= P(A) + P(B) - 2P(A \cap B)$$

29. (d) Let A be the event of obtaining an even sum and B be the event of obtaining a sum less than five.

Then, we have to find $P(A \cup B)$.

Since, A, B are not mutually exclusive,

$$\begin{aligned} \therefore P(A \cup B) &= P(A) + P(B) - P(A \cap B) \\ &= \frac{18}{36} + \frac{6}{36} - \frac{4}{36} = \frac{5}{9} \end{aligned}$$

[since, there are 18 ways to get an even sum and 6 ways to get a sum less than 5 i.e. (1, 3), (3, 1), (2, 2), (1, 2), (2, 1), (1, 1) and 4 ways to get an even sum less than 5 i.e. (1, 3), (3, 1), (2, 2), (1, 1)]

30. (b) In first 120 natural numbers, total number of multiples of 5, $n(A) = 24$ and total number of multiples of 15,

$$n(B) = 8 \text{ and } n(A \cap B) = 8.$$

$$\begin{aligned} \therefore n(A \cup B) &= n(A) + n(B) - n(A \cap B) \\ &= 24 + 8 - 8 = 24 \end{aligned}$$

$$\therefore \text{Required probability} = \frac{24}{120} = \frac{1}{5}$$

31. (a) Given, $P(A \cup B) = P(A \cap B)$

This is possible only when $P(A) = P(B)$.

32. (a) Since, $\overline{E_1} \cap \overline{E_2} = \overline{E_1 \cup E_2}$

$$\text{and } (E_1 \cup E_2) \cap (\overline{E_1} \cap \overline{E_2}) = \phi$$

$$P\{(E_1 \cup E_2) \cap (\overline{E_1} \cap \overline{E_2})\} = P(\phi) = 0 < 1/4$$

33. (d) The probability that Mr. A selected the losing horse

$$= \frac{4}{5} \times \frac{3}{4} = \frac{3}{5}$$

The probability that Mr. A selected the winning horse

$$= 1 - \frac{3}{5} = \frac{2}{5}$$

34. (c) Let A be an event that drawn ball is red and B be an event that drawn ball is white.

Then, AB and BA are two disjoint cases of the given event.

$$\begin{aligned} \therefore P(AB + BA) &= P(AB) + P(BA) \\ &= P(A) \cdot P\left(\frac{B}{A}\right) + P(B) \cdot P\left(\frac{A}{B}\right) = \frac{3}{6} \cdot \frac{3}{5} + \frac{3}{6} \cdot \frac{3}{5} = \frac{3}{5} \end{aligned}$$

35. (d) We know that, the number of subset of a set containing n elements is 2^n . Therefore, the number of ways of choosing A and B is ${}^{2^n}C_1 \times {}^{2^n}C_1 = 2^n \times 2^n = 4^n$

When the set A consisting of r elements is chosen from X , then the probability of choosing the set B from amongst the remaining $(n - r)$ elements is $2^{n-r} / 2^n$.

Hence, the probability that A and B have no common element is given by

$$\sum_{r=0}^n \frac{{}^nC_r \cdot 2^{n-r}}{2^n} = \frac{1}{4^n} \sum {}^nC_r 2^{n-r} = \frac{1}{4^n} (1 + 2)^n = (3/4)^n$$

[by binomial theorem]

36. (a)

37. (d) Let A denote the event that atleast one girl will be chosen and B the event that exactly 2 girls will be chosen. We require $P(B/A)$.

Since, A denotes the event that atleast one girl will be chosen and A denotes that no girl is chosen i.e. 4 boys are chosen.

$$\text{Then, } P(A') = \frac{{}^8C_4}{{}^{12}C_4} = \frac{70}{495} = \frac{14}{99} \text{ and } P(A) = 1 - \frac{14}{99} = \frac{85}{99}$$

$$\begin{aligned} \text{Now, } P(A \cap B) &= P(2 \text{ boys and } 2 \text{ girls}) \\ &= \frac{{}^8C_2 \cdot {}^2C_2}{{}^{12}C_4} = \frac{6 \times 28}{495} = \frac{56}{165} \end{aligned}$$

$$\text{Thus, } P(B/A) = \frac{P(A \cap B)}{P(A)} = \frac{56}{165} \times \frac{99}{85} = \frac{168}{425}$$

38. (c) Let E be the event when each American man is seated adjacent to his wife and A be the event when Indian man is seated adjacent of his wife.

$$\text{Now, } n(A \cap E) = (4!) \times (2!)^5$$

Event when each American man is seated adjacent to his wife.

$$\text{Again, } n(E) = (5!) \times (2!)^4$$

$$\therefore P\left(\frac{A}{E}\right) = \frac{n(A \cap E)}{n(E)} = \frac{(4!) \times (2!)^5}{(5!) \times (2!)^4} = \frac{2}{5}$$

39. (c) Given that, $P(A) = \frac{1}{4}$, $P\left(\frac{A}{B}\right) = \frac{1}{2}$ and $P\left(\frac{B}{A}\right) = \frac{2}{3}$

$$\text{We know that, } P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)}$$

$$\text{and } P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)}$$

$$\therefore P(B) = \frac{P\left(\frac{B}{A}\right) \cdot P(A)}{P\left(\frac{A}{B}\right)} = \frac{\left(\frac{2}{3}\right) \left(\frac{1}{4}\right)}{\left(\frac{1}{2}\right)} = \frac{1}{3}$$

40. (a) Hint $P(A) = \frac{2}{5}$, $P(B) = \frac{3}{10}$, $P(A \cap B) = \frac{1}{5}$, then

$$P(\bar{A}) = 1 - P(A) = \frac{3}{5}, P(\bar{B}) = \frac{7}{10}$$

$$\therefore P(A' \cap B') = 1 - P(A \cup B) = 1 - P(A) - P(B) + P(A \cap B) \\ = 1 - \frac{2}{5} - \frac{3}{10} + \frac{1}{5} = 1 - \frac{1}{2} = \frac{1}{2}$$

$$\text{Now, } P\left(\frac{A}{B}\right) \cdot P\left(\frac{B'}{A'}\right) = \frac{P(A \cap B)}{P(B)} \cdot \frac{P(A' \cap B')}{P(A')}$$

41. (c) Hint $P(A' \cap B') = 1 - P(A \cup B)$
 $= 1 - P(A) - P(B) + P(A \cap B)$
 $= 1 - P(A) - P(B) + P\left(\frac{A}{B}\right) \cdot P(B)$

42. (d) $\because P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $\Rightarrow \frac{3}{5} = \frac{3}{10} + \frac{2}{5} - P(A \cap B) \Rightarrow P(A \cap B) = \frac{1}{10}$
 $\therefore P\left(\frac{B}{A}\right) + P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(A)} + \frac{P(A \cap B)}{P(B)}$
 $= \frac{1}{10} \left[\frac{10}{3} + \frac{5}{2} \right] = \frac{1}{10} \left[\frac{20 + 15}{6} \right] = \frac{35}{60} = \frac{7}{12}$

43. (a) $P\left(\frac{A}{B}\right) + P\left(\frac{\bar{A}}{\bar{B}}\right) = \frac{P(A \cap B)}{P(B)} + \frac{P(\bar{A} \cap \bar{B})}{P(\bar{B})}$
 $= \frac{P(A \cap B) + P(\bar{A} \cap \bar{B})}{P(\bar{B})} = \frac{P(\bar{B})}{P(\bar{B})} = 1$

44. (b) Required probability $= \frac{1}{2} \times \frac{4}{7} + \frac{1}{2} \times \frac{6}{8}$
 $= \frac{2}{7} + \frac{3}{8} = \frac{16 + 21}{56} = \frac{37}{56}$

45. (c) Let E_1 be the event that the ball is drawn from bag A, E_2 be the event that ball is drawn from bag B and E be the event that the ball drawn is red. We have to find $P(E_2/E)$.
 As both the bags are equally likely to be selected, we have

$$P(E_1) = P(E_2) = \frac{1}{2}$$

$$\text{Also, } P(E/E_1) = \frac{3}{5} \text{ and } P(E/E_2) = \frac{5}{9}$$

Hence, by Baye's theorem,

$$P(E_2/E) = \frac{P(E_2) \cdot P(E/E_2)}{P(E_1) \cdot P(E/E_1) + P(E_2) \cdot P(E/E_2)}$$

$$= \frac{\frac{1}{2} \cdot \frac{5}{9}}{\frac{1}{2} \cdot \frac{3}{5} + \frac{1}{2} \cdot \frac{5}{9}} = \frac{25}{52}$$

46. (d) Here, $P(E_1) = P(E_2) = P(E_3) = \frac{1}{3}$

$$\therefore P\left(\frac{A}{E_1}\right) = \frac{1}{5}, P\left(\frac{A}{E_2}\right) = \frac{1}{6}, P\left(\frac{A}{E_3}\right) = \frac{1}{7}$$

$$\therefore P\left(\frac{E_1}{A}\right) = \frac{\frac{1}{3} \times \frac{1}{5}}{\frac{1}{3} \times \frac{1}{5} + \frac{1}{3} \times \frac{1}{6} + \frac{1}{3} \times \frac{1}{7}} = \frac{42}{107}$$

47. (c) Total number of possible cases in a throw of two dice is $6 \times 6 = 36$.

Favourable case $[(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (6, 6)] = 6$

$$\text{Probability of getting double} = \frac{6}{36} = \frac{1}{6}$$

Probability of getting all three double

$$= \frac{1}{6} \times \frac{1}{6} \times \frac{1}{6} = \frac{1}{216}$$

$\therefore$ Probability of throwing doublets not more than twice

$$= 1 - \frac{1}{216} = \frac{215}{216}$$

48. (a) Let $P(A) = p_1$ and $P(B) = p_2$

$$\text{Then, } P(AB) = p_1 p_2 = \frac{1}{6} \quad \dots(i)$$

$$\text{Also, } q_1 q_2 = \frac{1}{3} \text{ or } (1 - p_1)(1 - p_2) = \frac{1}{3}$$

$$\text{or } 1 - (p_1 + p_2) + p_1 p_2 = \frac{1}{3}$$

$$\text{or } p_1 + p_2 = 1 + \frac{1}{6} - \frac{1}{3} = \frac{7}{6} - \frac{1}{3}$$

$$\Rightarrow p_1 + p_2 = \frac{7 - 2}{6} = \frac{5}{6} \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$p_1 = \frac{1}{2} \text{ or } \frac{1}{3}$$

49. (b) Probability of the man living upto 60 $= p_1 = 0.83$

Probability of the man not living upto 60

$$= q_1 = 1 - 0.83 = 0.17$$

Probability of the woman living upto 55

$$= p_2 = 0.87$$

Probability of the woman not living upto 55

$$= q_2 = 1 - 0.87 = 0.13$$

Probability that none of them lives for 10 yr

$$= q_1 q_2 = 0.17 \times 0.13 = 0.221$$

Probability that atleast one of them lives for next 10 yr

$$= 1 - 0.221 = 0.779$$

50. (b)

51. (d) $P(HHH) + P(HHTT) + P(HTTTT) + P(TTTTTT)$

$$= \frac{1}{2^3} + {}^4C_2 \frac{1}{2^4} + {}^5C_1 \frac{1}{2^5} + \frac{1}{2^6}$$

$$= \frac{43}{64}$$

52. (b) The number of ways of choosing the 2 correct boxes is $({}^5C_2)$.

The number of ways of choosing 3 wrong boxes is

$$3! \left(-\frac{1}{3!} + \frac{1}{2!} \right)$$

$$\therefore \text{Required probability} = ({}^5C_2) \cdot 3! \left(-\frac{1}{3!} + \frac{1}{2!} \right) \div 5!$$

$$= \frac{10 \times 2}{120} = \frac{1}{6}$$

53. (b) The probability of both drawing the common cards x ,
 $P(X) = (\text{Probability of } A \text{ drawing the card } x \text{ and any other card } y) \times (\text{Probability of } B \text{ drawing the card } x \text{ and a card other than } y)$

$$= \frac{{}^{51}C_1}{{}^{52}C_2} \times \frac{{}^{50}C_1}{{}^{52}C_2}, \forall x, \text{ where } x \text{ has 52 values.}$$

$\therefore$ Required probability $= \sum P(X)$

$$= 52 \times \frac{51 \times 50 \times 4}{52 \times 51 \times 52 \times 51} = \frac{50}{663}$$

54. (a) $P(A \cup B \cap \bar{C}) = P(A \cup B) \times P(\bar{C})$
 $= [P(A) + P(B) - P(A \cap B)] \times P(\bar{C})$
 $= \left(\frac{3}{4} + \frac{1}{2} - \frac{3}{8} \right) \times \frac{3}{8} \left[\because P(A \cap B) = P(A) \cdot P(B) = \frac{3}{4} \cdot \frac{1}{2} = \frac{3}{8} \right]$
 $= \frac{7}{8} \cdot \frac{3}{8} = \frac{21}{64}$

55. (b) Since, $1 - P(A \cup B) = \frac{1}{6} \Rightarrow P(\bar{A}) - P(B) + \frac{1}{4} = \frac{1}{6}$

$$\Rightarrow P(B) = \frac{1}{3} \text{ and } P(A) = \frac{3}{4}$$

$$\text{Now, } P(A \cap B) = \frac{1}{4} = P(A) P(B)$$

Hence, the events A and B are independent events but not equally likely.

56. (b) Let A be the event that first drawn number is even and B be the event that the second drawn number is odd.

$$\therefore \text{Total number of even numbers} = \left(\frac{17}{2} \right) = 8$$

$$\Rightarrow P(A) = \frac{8}{17} \text{ and } P(B) = \frac{9}{17}$$

$$\Rightarrow P(A \cap B) = P(A) \times P(B) = \frac{8}{17} \times \frac{9}{17} = \frac{72}{289}$$

57. (d) Total number of ways of placing 3 letters in three envelopes $= 3!$

Out of these ways, only one way is correct.

$$\text{Hence, the required probability} = \frac{1}{3!} = \frac{1}{6}$$

58. (a) Appearance of head on fifth toss does not depend on the outcomes of first four tosses.

$$\text{Hence, } P(\text{head on 5th toss}) = \frac{1}{2}$$

59. (c) Let S be the sample space, then

$$n(S) = 6 \times 52 \Rightarrow n(S) = 312$$

Let E be the required event.

$$\text{i.e. } n(E) = 3 \times 13$$

$$\therefore \text{Required probability} = \frac{n(E)}{n(S)} = \frac{3 \times 13}{6 \times 52} = \frac{1}{8}$$

60. (c) $\therefore P(A \cup B) = 1 - P(\bar{A}) \cdot P(\bar{B}) = \frac{4}{5}$

$$\Rightarrow 1 - \frac{7\alpha}{10} = \frac{4}{5}$$

$$\therefore \frac{7\alpha}{10} = \frac{2}{10} \Rightarrow \alpha = \frac{2}{7}$$

61. (b) Required probability

$$= \left(\frac{5}{6} \right) \left(\frac{1}{6} \right) + \left(\frac{5}{6} \right)^3 \left(\frac{1}{6} \right) + \left(\frac{5}{6} \right)^5 \left(\frac{1}{6} \right) + \dots$$

$$= \frac{(5/6) \cdot (1/6)}{1 - \left(\frac{5}{6} \right)^2} = \frac{5}{36 - 25} = \frac{5}{11}$$

62. (c) Hint Let the events be $A =$ 1st aeroplane hit the target

$B =$ 2nd aeroplane hit the target

and their corresponding probabilities are

$$P(A) = 0.3 \text{ and } P(B) = 0.2$$

$$\Rightarrow P(\bar{A}) = 0.7 \text{ and } P(\bar{B}) = 0.8$$

$\therefore$ Required probability

$$= P(\bar{A})P(B) + P(\bar{A})P(\bar{B})P(\bar{A})P(B) + \dots$$

63. (a) Since, $\sum p_i = 1$, we have

$$C + 2C + 2C + 3C + C^2 + 2C^2 + 7C^2 + C = 1$$

$$\text{i.e. } 10C^2 + 9C - 1 = 0$$

$$\text{i.e. } (10C - 1)(C + 1) = 0$$

$$\Rightarrow C = \frac{1}{10}, C = -1$$

Therefore, the permissible value of $C = \frac{1}{10}$.

$$\text{Mean} = \sum_{i=1}^n x_i p_i = \sum_{i=1}^7 x_i p_i$$

$$= 1 \times \frac{1}{10} + 2 \times \frac{2}{10} + 3 \times \frac{2}{10} + 4 \times \frac{3}{10} + 5 \left(\frac{1}{10} \right)^2$$

$$+ 6 \times 2 \left(\frac{1}{10} \right)^2 + 7 \left[7 \left(\frac{1}{10} \right)^2 + \frac{1}{10} \right]$$

$$= \frac{1}{10} + \frac{4}{10} + \frac{6}{10} + \frac{12}{10} + \frac{5}{100} + \frac{12}{100} + \frac{49}{100} + \frac{7}{10} = 3.66$$

64. (b) Given, $E = \{X \text{ is a prime number}\} = \{2, 3, 5, 7\}$

$$\therefore P(E) = P(X = 2) + P(X = 3) + P(X = 5) + P(X = 7)$$

$$\Rightarrow P(E) = 0.23 + 0.12 + 0.20 + 0.07 = 0.62$$

$$\text{and } F = \{X < 4\} = \{1, 2, 3\}$$

$$\Rightarrow P(F) = P(X = 1) + P(X = 2) + P(X = 3)$$

$$\Rightarrow P(F) = 0.15 + 0.23 + 0.12 = 0.5$$

$$\text{and } E \cap F = \{X \text{ is prime number as well as } < 4\} = \{2, 3\}$$

$$P(E \cap F) = P(X = 2) + P(X = 3)$$

$$= 0.23 + 0.12 = 0.35$$

$\therefore$ Required probability, $P(E \cup F)$

$$= P(E) + P(F) - P(E \cap F)$$

$$= 0.62 + 0.5 - 0.35 = 0.77$$

65. (b) $p = \frac{10}{100} = \frac{1}{10}, q = \frac{9}{10}, p = 0.1, q = 0.9, n = 7$

$\therefore$ Required probability $= P(0) + P(1)$

$$= {}^nC_0(q)^7 + {}^nC_1 q^6 p = {}^7C_0 (0.9)^7 + {}^7C_1 (0.9)^6 (0.1)$$

$$= (0.9)^7 + 7 \times (0.9)^6 \times 0.1 = (0.6)^6 [0.9 + 0.7] = 1.6 \times (0.9)^6$$

66. (d)

67. (b) Since, ${}^nC_4 \frac{1}{2^n}$, ${}^nC_5 \frac{1}{2^n}$ and ${}^nC_6 \frac{1}{2^n}$ are in AP.

Also, nC_4 , nC_5 and nC_6 are in an AP.

$$\therefore 2 \cdot {}^nC_5 = {}^nC_4 + {}^nC_6$$

Dividing by nC_5 both sides, we get

$$\begin{aligned} 2 &= \frac{{}^nC_4}{{}^nC_5} + \frac{{}^nC_6}{{}^nC_5} = \frac{5}{n-4} + \frac{n-5}{6} \\ &= \frac{n^2 - 9n + 50}{6(n-4)} \end{aligned}$$

$$\Rightarrow n^2 - 21n + 98 = 0$$

$$\Rightarrow n = 7, 14$$

68. (b) Here, $npq = 3$ and $np = 4$

$$\therefore \frac{npq}{np} = \frac{3}{4} \Rightarrow q = \frac{3}{4}, p = \frac{1}{4} \text{ and } n = 16$$

$$\therefore \text{Probability of exactly six successes} = {}^{16}C_6 \left(\frac{1}{4}\right)^6 \left(\frac{3}{4}\right)^{10}$$

69. (c) $\therefore$ Probability of guessing a correct answer, $p = \frac{1}{3}$

and probability of guessing a wrong answer, $q = \frac{2}{3}$

$\therefore$ The probability of guessing a 4 or more correct answer

$$\begin{aligned} &= {}^5C_4 \left(\frac{1}{3}\right)^4 \cdot \frac{2}{3} + {}^5C_5 \left(\frac{1}{3}\right)^5 \\ &= 5 \cdot \frac{2}{3^5} + \frac{1}{3^5} = \frac{11}{3^5} \end{aligned}$$

70. (a) Here, $p = \frac{2}{6} = \frac{1}{3}$, $q = 1 - \frac{1}{3} = \frac{2}{3}$

$$\therefore \text{Mean} = np = 20 \times \frac{1}{3} = 6.6$$

$$\text{Variance} = npq = 20 \times \frac{1}{3} \times \frac{2}{3} = \frac{40}{9} = 4.4$$

71. (c) $\therefore P(X=7) = P(X=9)$

$$\Rightarrow {}^nC_7 \cdot \left(\frac{1}{2}\right)^7 \cdot \left(\frac{1}{2}\right)^{n-7} = {}^nC_9 \cdot \left(\frac{1}{2}\right)^{n-9} \cdot \left(\frac{1}{2}\right)^9$$

$$\Rightarrow {}^nC_7 = {}^nC_9 \Rightarrow n = 16 \quad [\because {}^nC_x = {}^nC_y \Rightarrow x + y = n]$$

$$\text{Now, } P(X=2) = {}^{16}C_2 \cdot \left(\frac{1}{2}\right)^2 \cdot \left(\frac{1}{2}\right)^{14} = \frac{{}^{16}C_2}{2^{16}} = \frac{16 \cdot 15}{2^{17}} = \frac{15}{2^{13}}$$

72. (b) Let E = Event of getting an even number = $\{2, 4, 6\}$

$$\text{i.e. } n(E) = 3$$

$$\therefore \text{Probability of success, } p = \frac{3}{6} = \frac{1}{2}$$

$$\text{And probability of failure, } q = \frac{1}{2}$$

$$\therefore \text{Variance} = npq = 100 \times \frac{1}{2} \times \frac{1}{2} = 25$$

73. (c) The man has to win atleast 4 times.

$\therefore$ Required probability

$$\begin{aligned} &= {}^7C_4 \left(\frac{1}{2}\right)^4 \cdot \left(\frac{1}{2}\right)^3 + {}^7C_5 \cdot \left(\frac{1}{2}\right)^5 \cdot \left(\frac{1}{2}\right)^2 + {}^7C_6 \left(\frac{1}{2}\right)^6 \cdot \frac{1}{2} + {}^7C_7 \cdot \left(\frac{1}{2}\right)^7 \\ &= ({}^7C_4 + {}^7C_5 + {}^7C_6 + {}^7C_7) \times \frac{1}{2^7} = \frac{64}{2^7} = \frac{1}{2} \end{aligned}$$

BITSAT Archives

1. (c) $\therefore$ Total number of ways = 5!

and favourable number of ways = 2.4!

$$\therefore \text{Required probability} = \frac{2.4!}{5!} = \frac{2}{5}$$

2. (a) Since, P (exactly one of A, B occurs) = q .

$$\therefore P(A \cup B) - P(A \cap B) = q$$

$$\Rightarrow p - P(A \cap B) = q \Rightarrow P(A \cap B) = p - q$$

$$\Rightarrow 1 - P(A' \cup B') = p - q \Rightarrow P(A' \cup B') = 1 - p + q$$

$$\Rightarrow P(A') + P(B') - P(A' \cap B') = 1 + q - p$$

$$\begin{aligned} \Rightarrow P(A') + P(B') &= (1 - p + q) + [1 - P(A \cup B)] \\ &= (1 - p + q) + (1 - p) = 2 - 2p + q \end{aligned}$$

3. (c) $\therefore P(A \cap B) = P(A/B) \cdot P(B) = 0.5 \times 0.2 = 0.1$

$$\begin{aligned} \therefore P(A'/B') &= \frac{P(A' \cap B')}{P(B')} = \frac{P(A \cup B) - P(A \cap B)}{P(B')} \\ &= \frac{1 - P(A \cup B)}{1 - P(B)} = \frac{1 - P(A) - P(B) + P(A \cap B)}{1 - 0.2} \\ &= \frac{1 - 0.6 - 0.2 + 0.1}{0.8} = \frac{3}{8} \end{aligned}$$

4. (b) Required probability = $\frac{{}^3C_1}{{}^8C_1} = \frac{3}{8}$

5. (b) Hint Given, $P(A \cup B) = \frac{5}{6}$

$$P(A \cap B) = \frac{1}{3}, P(B) = \frac{1}{2}$$

$$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

6. (a) Since, the probability lies between 0 and 1.

$$\therefore 0 \leq \frac{1+3p}{3} \leq 1, 0 \leq \frac{1-p}{4} \leq 1, 0 \leq \frac{1-2p}{2} \leq 1$$

$$\Rightarrow 0 \leq 1+3p \leq 3, 0 \leq 1-p \leq 4, 0 \leq 1-2p \leq 2$$

$$\Rightarrow -\frac{1}{3} \leq p \leq \frac{2}{3}, -3 \leq p \leq 1, -\frac{1}{2} \leq p \leq \frac{1}{2} \quad \dots(i)$$

Again, the events are mutually exclusive.

$$\therefore 0 \leq \frac{1+3p}{3} + \frac{1-p}{4} + \frac{1-2p}{2} \leq 1$$

$$\Rightarrow 0 \leq 13-3p \leq 12 \Rightarrow \frac{1}{3} \leq p \leq \frac{13}{5} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\max \left\{ -\frac{1}{3}, -3, -\frac{1}{2}, \frac{1}{3} \right\} \leq p \leq \min \left\{ \frac{2}{3}, 1, \frac{1}{2}, \frac{13}{5} \right\}$$

$$\Rightarrow \frac{1}{3} \leq p \leq \frac{1}{2}$$

7. (b) $A \subseteq A \cup B \Rightarrow P(A) \leq P(A \cup B) \Rightarrow P(A \cup B) \geq 3/4$

$$\text{Also, } P(A \cap B) = P(A) + P(B) - P(A \cup B) \\ \geq P(A) + P(B) - 1 = \frac{3}{4} + \frac{5}{8} - 1 = \frac{3}{8}$$

$$\text{Now, } A \cap B \subseteq B \Rightarrow P(A \cap B) \leq P(B) = \frac{5}{8}$$

$$\therefore \frac{3}{8} \leq P(A \cap B) \leq \frac{5}{8} \quad \dots(i)$$

$$\text{Next, } P(A \cap B') = P(A) - P(A \cap B)$$

$$\Rightarrow \frac{3}{4} - \frac{5}{8} \leq P(A \cap B') \leq \frac{3}{4} - \frac{3}{8} \Rightarrow \frac{1}{8} \leq P(A \cap B') \leq \frac{3}{8}$$

$$\therefore P(A' \cap B) = P(B) - P(A \cap B)$$

$$\therefore P(A \cap B) = P(B) - P(A' \cap B) \quad [\text{using Eq. (i)}]$$

$$\Rightarrow \frac{3}{8} \leq P(B) - P(A' \cap B) \leq \frac{5}{8} \Rightarrow 0 \leq P(A' \cap B) \leq \frac{1}{4}$$

8. (b) Required probability $= P(A) \cdot P(B) = \frac{2}{6} \cdot \frac{2}{6} = \frac{1}{9}$

9. (a) A leap year consists of 366 days, i.e. 52 full weeks and two extra days. These two extra days can be anyone of the following possible outcomes ; (i) Monday and Tuesday, (ii) Tuesday and Wednesday, (iii) Wednesday and Thursday, (iv) Thursday and Friday, (v) Friday and Saturday (vi) Saturday and Sunday (vii) Sunday and Monday.

Let A and B be the event that a leap year contains 53 Thursday and 53 Friday, respectively. Then,

$$P(A) = \frac{2}{7}, P(B) = \frac{2}{7} \text{ and } P(A \cap B) = \frac{1}{7}$$

$\therefore$ Required probability is given by

$$P(A \cup B) = P(A) + P(B) - P(A \cap B) \\ = \frac{2}{7} + \frac{2}{7} - \frac{1}{7} = \frac{3}{7}$$

10. (b) p = Probability of success (s) $= \frac{2}{6} = \frac{1}{3}$

$$q = \text{Probability of failure (f)} = 1 - \frac{1}{3} = \frac{2}{3}$$

Probability that success occurs in even number of tosses

$$= p(fs) + p(fffs) + p(fffffs) + \dots$$

$$= qp + q^3p + q^5p + \dots = \frac{qp}{1 - q^2}$$

$$= \frac{\frac{2}{3} \times \frac{1}{3}}{1 - \left(\frac{2}{3}\right)^2} = \frac{\frac{2}{9}}{1 - \frac{4}{9}} = \frac{2}{9} \times \frac{9}{5} = \frac{2}{5}$$

11. (c)

12. (b) Given that, $P(A \cap B) = \frac{1}{6}$ and $P(\bar{A} \cap \bar{B}) = \frac{1}{3}$

Since, A and B are independent.

$$\therefore P(A) \cdot P(B) = \frac{1}{6} \text{ and } P(\bar{A}) \cdot P(\bar{B}) = \frac{1}{3}$$

$$\Rightarrow [1 - P(A)][1 - P(B)] = \frac{1}{3}$$

$$\Rightarrow 1 - [P(A) + P(B)] + P(A)P(B) = \frac{1}{3}$$

$$\Rightarrow 1 + \frac{1}{6} - \frac{1}{3} = P(A) + P(B) \Rightarrow P(A) + P(B) = \frac{5}{6}$$

$$\Rightarrow P(A) = \frac{1}{3}, P(B) = \frac{1}{2}$$

13. (b) In a box, $B_1 = 1R, 2W$, $B_2 = 2R, 3W$ and $B_3 = 3R, 4W$

$$\text{Also given that, } P(B_1) = \frac{1}{2}, P(B_2) = \frac{1}{3} \text{ and } P(B_3) = \frac{1}{6}$$

$$\therefore P\left(\frac{B_2}{R}\right) = \frac{P(B_2) \cdot P\left(\frac{R}{B_2}\right)}{P(B_1) \cdot P\left(\frac{R}{B_1}\right) + P(B_2) \cdot P\left(\frac{R}{B_2}\right) + P(B_3) \cdot P\left(\frac{R}{B_3}\right)} \\ = \frac{\frac{1}{3} \times \frac{2}{5}}{\frac{1}{2} \times \frac{1}{3} + \frac{1}{3} \times \frac{2}{5} + \frac{1}{6} \times \frac{3}{7}} = \frac{\frac{2}{15}}{\frac{1}{6} + \frac{2}{15} + \frac{1}{14}} \\ = \frac{\frac{2}{15}}{\frac{2/15}{35 + 28 + 15}} = \frac{2}{15} \times \frac{210}{78} = \frac{14}{39}$$

14. (a) Total number of favourable cases = 6

$$\text{Total number of cases} = 216$$

$$\therefore \text{ Required probability} = \frac{6}{216} = \frac{1}{36}$$

15. (b) Let X be the number of heads getting in n tossed. Therefore, X follows binomial distribution with parameters

$$n, p = \frac{1}{2}, q = \frac{1}{2}$$

Given that, $P(X \geq 1) \geq 0.8$

$$\therefore 1 - P(X = 0) \geq 0.8 \Rightarrow P(X = 0) \leq 0.2$$

$$\Rightarrow {}^nC_0 \left(\frac{1}{2}\right)^n \left(\frac{1}{2}\right)^0 \leq 0.2 \Rightarrow \frac{1}{2^n} \leq \frac{1}{5} \Rightarrow 2^n \geq 5$$

$\therefore$ The least value of n is 3.

16. (b) Given that, $P(A') = 0.3$, $P(B) = 0.4$ and $P(A \cap B') = 0.5$

$$P(B') = 1 - P(B) = 1 - 0.4 = 0.6$$

$$P(A) = 1 - P(A') = 1 - 0.3 = 0.7$$

$$P(A \cup B') = P(A) + P(B') - P(A \cap B') \\ = 0.7 + 0.6 - 0.5 = 0.8$$

23

Vector Algebra

Introduction

Vectors represent one of the most important mathematical system, which is used to handle different types of problems in Geometry, Mechanics and other branches of applied Mathematics, Physics and Engineering.

Representation of a Vector

A vector is represented by a line segment. e.g. $\mathbf{a} = \overrightarrow{AB}$

Here, A is called the initial point and B is called the terminal point.

Magnitude or modulus of $\mathbf{a}$ is $|\mathbf{a}| = |\overrightarrow{AB}| = AB$.

Types of Vector

Vectors can be defined into following types:

- (i) **Zero or Null Vector** A vector whose magnitude is zero and has arbitrary direction, is known as zero or null vector.
- (ii) **Unit Vector** A vector whose modulus is unity, is known as unit vector.
A unit vector in the direction of a vector $\mathbf{a}$ is denoted by $\hat{\mathbf{a}}$, thus $|\hat{\mathbf{a}}| = 1$.

$$\hat{\mathbf{a}} = \frac{\mathbf{a}}{|\mathbf{a}|}$$

- (iii) **Like and Unlike Vectors** The vectors which have same direction, are called like vectors and which have opposite direction, are called unlike vectors.
- (iv) **Collinear or Parallel Vectors** Vectors having the same or parallel support, are called collinear vectors.
- (v) **Coinitial Vectors** Two or more vectors having the same initial point, are called coinital vectors.
- (vi) **Coplanar Vectors** A system of vectors is said to be coplanar, if their support is parallel to the same plane.

- (vii) **Coterminous Vectors** Vectors which have same terminal points, are called coterminous vectors. e.g.

Here, $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are coterminous vectors.

- (viii) **Negative of a Vector** A vector is said to be negative of a given vector, if its magnitude is the same as that of the given vector but direction is opposite.

e.g.

- (ix) **Reciprocal of a Vector** A vector having same direction as that of a given vector $\mathbf{a}$ but magnitude equal to the reciprocal of the given vector, is known as the reciprocal of $\mathbf{a}$ and it is denoted by $\mathbf{a}^{-1}$.

$$|\mathbf{a}^{-1}| = \frac{1}{|\mathbf{a}|}$$

- (x) **Localised and Free Vectors** Those vectors which have not fixed initial point, are called free vectors and a vector which is drawn parallel to a given vector through a specified point in space, is called localised vector.

- (xi) **Position Vectors** The vector $\mathbf{OA}$ which represents the position of the point A with respect to a fixed point O , are called position vectors.

- (xii) **Equal Vectors** Two vectors $\mathbf{a}$ and $\mathbf{b}$ are said to be equal, if

(a) $|\mathbf{a}| = |\mathbf{b}|$

(b) they have the same or parallel support

(c) they have same direction

e.g.

- (xiii) **Orthogonal Vectors** Two vectors are called orthogonal, if the angle between them is a right angle.

Components of a Vector in Two and Three Dimensional System

- (i) Any vector $\mathbf{r}$ can be expressed as a linear combination of two unit vectors $\hat{\mathbf{i}}$ and $\hat{\mathbf{j}}$ at right angle. i.e.

$$\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}}$$

The vectors $x\hat{\mathbf{i}}$ and $y\hat{\mathbf{j}}$ are vector components of vector $\mathbf{r}$. The scalars x and y are called the scalar components of $\mathbf{r}$ in the direction of X -axis and Y -axis.

$$|\mathbf{r}| = \sqrt{x^2 + y^2} \Rightarrow \theta = \tan^{-1} \frac{y}{x}$$

- (ii) The position vector of $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$

The vectors $x\hat{\mathbf{i}}, y\hat{\mathbf{j}}$ and $z\hat{\mathbf{k}}$ are vector components of $\mathbf{r}$. The scalars x, y and z are scalar components of $\mathbf{r}$ in the direction of X -axis, Y -axis and Z -axis.

$$|\mathbf{r}| = \sqrt{x^2 + y^2 + z^2}$$

Direction cosines of $\mathbf{r}$ are $\cos\alpha, \cos\beta$ and $\cos\gamma$ such

$$\text{that } \cos\alpha = l = \frac{x}{|\mathbf{r}|}$$

$$\cos\beta = m = \frac{y}{|\mathbf{r}|}$$

$$\cos\gamma = n = \frac{z}{|\mathbf{r}|}$$

Addition of Vectors

The addition of two vectors $\mathbf{a}$ and $\mathbf{b}$ is denoted by $\mathbf{a} + \mathbf{b}$ and it is known as resultant of $\mathbf{a}$ and $\mathbf{b}$.

There are following three methods of addition of vectors:

(i) Triangle Law of Addition

If two vectors $\mathbf{a}$ and $\mathbf{b}$ lie along the two sides of a triangle in consecutive order (as shown in the figure), then third side represents the sum (resultant) $\mathbf{a} + \mathbf{b}$ i.e.

$$\mathbf{c} = \mathbf{a} + \mathbf{b}$$

(ii) Parallelogram Law of Addition

If two vectors are represented by two adjacent sides of a parallelogram, then their sum is represented by the diagonal of the parallelogram.

$$\mathbf{OQ} = \mathbf{OP} + \mathbf{PQ} \Rightarrow \mathbf{c} = \mathbf{a} + \mathbf{b}$$

(iii) Addition in Component Form

If the vectors are defined in terms of $\hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}$, i.e. if

$$\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}, \quad \mathbf{b} = b_1\hat{\mathbf{i}} + b_2\hat{\mathbf{j}} + b_3\hat{\mathbf{k}}$$

Then, $\mathbf{a} + \mathbf{b} = (a_1 + b_1)\hat{\mathbf{i}} + (a_2 + b_2)\hat{\mathbf{j}} + (a_3 + b_3)\hat{\mathbf{k}}$

Properties of Vector Addition

Following are the properties of vector addition:

- **Closure property** The sum of two vectors is always a vector.

- **Commutativity** For any two vectors $\mathbf{a}$ and $\mathbf{b}$, we have

$$\mathbf{a} + \mathbf{b} = \mathbf{b} + \mathbf{a}$$

- **Associativity** For any three vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$, we have

$$\mathbf{a} + (\mathbf{b} + \mathbf{c}) = (\mathbf{a} + \mathbf{b}) + \mathbf{c}$$

- **Additive identity** For any vector $\mathbf{a}$, we have

$$\mathbf{0} + \mathbf{a} = \mathbf{a} + \mathbf{0}$$

- **Additive inverse** For every vector $\mathbf{a}$, $(-\mathbf{a})$ is the additive inverse of the vector $\mathbf{a}$.
i.e. $\mathbf{a} + (-\mathbf{a}) = (-\mathbf{a}) + \mathbf{a} = \mathbf{0}$

Subtraction of Vectors

If $\mathbf{a}$ and $\mathbf{b}$ are two vectors, then

$$\mathbf{a} - \mathbf{b} = \mathbf{a} + (-\mathbf{b})$$

e.g. If $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}$

and $\mathbf{b} = b_1\hat{\mathbf{i}} + b_2\hat{\mathbf{j}} + b_3\hat{\mathbf{k}}$

Then, $\mathbf{a} - \mathbf{b} = (a_1 - b_1)\hat{\mathbf{i}} + (a_2 - b_2)\hat{\mathbf{j}} + (a_3 - b_3)\hat{\mathbf{k}}$

Multiplication of a Vector by a Scalar

If $\mathbf{a}$ is a vector and m is a scalar, then $m\mathbf{a}$ is a vector whose magnitude is m times the magnitude of $\mathbf{a}$.

Properties of Scalar Multiplication

Following are the properties of scalar multiplication:

$$m(-\mathbf{a}) = -m\mathbf{a}$$

$$(-m)(-\mathbf{a}) = m\mathbf{a}$$

$$m(n\mathbf{a}) = (mn)\mathbf{a} = n(m\mathbf{a})$$

$$(m+n)\mathbf{a} = m\mathbf{a} + n\mathbf{a}$$

$$m(\mathbf{a} + \mathbf{b}) = m\mathbf{a} + m\mathbf{b}$$

Linearly Independent Vectors

The vectors $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n$ in a plane are said to be linearly independent, iff

$$x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_n\mathbf{a}_n = \mathbf{0}$$

$$\Rightarrow x_1 = x_2 = \dots = x_n = 0$$

Linearly independent vectors are precisely non-collinear vectors.

Linearly Dependent Vectors

The vectors $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n$ are said to be linearly dependent, iff there exists scalars $x_1, x_2, \dots, x_n$ not all zero such that

$$x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + x_3\mathbf{a}_3 + \dots + x_n\mathbf{a}_n = \mathbf{0}$$

Linearly dependent vectors in a plane are precisely collinear or parallel vectors.

- NOTE**
- (i) Two collinear vectors are linearly dependent.
 - (ii) Two non-zero and non-collinear vectors are linearly independent.
 - (iii) Any three non-coplanar vectors are linearly independent.
 - (iv) Any three coplanar vectors are linearly dependent.
 - (v) Any four vectors in three-dimensional space are linearly dependent.

Test of Collinearity

- (i) Two vectors $\mathbf{a}$ and $\mathbf{b}$ are collinear or parallel or linearly dependent, iff $\mathbf{a} = k\mathbf{b}$ for some scalar k .
- (ii) Three vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are collinear, if there exists scalars x, y, z such that $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = \mathbf{0}$, where $x + y + z = 0$.

Also, the points A, B, C are collinear, if $\mathbf{AB} = k\mathbf{BC}$ for some scalar k .

Test of Coplanarity

- (i) A vector $\mathbf{c}$ is coplanar with the vectors $\mathbf{a}$ and $\mathbf{b}$, if $\mathbf{c} = \lambda\mathbf{a} + \mu\mathbf{b}$ for some scalars λ and μ .
- (ii) Three vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$, are coplanar or linearly dependent, iff there are scalars x, y, z (not all zero) such that $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = \mathbf{0}$.
- (iii) Four vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d}$ are coplanar, iff there exist scalars x, y, z, u not all zero such that $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} + u\mathbf{d} = \mathbf{0}$, where, $x + y + z + u = 0$

Section Formula

Let $\mathbf{a}$ and $\mathbf{b}$ be two vectors represented by OA and OB and the point P divides AB in the ratio $m:n$.

If P divides AB in the ratio $m:n$ internally, then

$$\mathbf{r} = \frac{m\mathbf{b} + n\mathbf{a}}{m + n}$$

If P divides AB in the ratio $m:n$ externally, then

$$\mathbf{r} = \frac{m\mathbf{b} - n\mathbf{a}}{m - n}$$

Mid-point Formula

If $C(c)$ is the mid-point of AB , then

$$c = \frac{a+b}{2}$$

Centroid of a Triangle

$$\text{Centroid of } \triangle ABC = \frac{a+b+c}{3}$$

where, a, b and c are the position vectors of the vertices with respect to origin O .

Product of Two Vectors

There are two types of product of two vectors:

1. Scalar or Dot Product of Two Vectors

The scalar product of two vectors a and b is expressed as

$$a \cdot b = |a| |b| \cos \theta$$

where, $0 \leq \theta \leq \pi$

$$\therefore a \cdot b \leq |a| |b|$$

NOTE • If $a \cdot b > 0$, then the angle between a and b is acute.

• If $a \cdot b < 0$, then the angle between a and b is obtuse.

Geometrical Interpretation

OL is the projection of vector b in the direction of vector a .

$$OL = b \cos \theta \quad [\because |a| = a \text{ and } |b| = b]$$

$$a \cdot b = a(b \cos \theta) = (ab) \cos \theta = b(a \cos \theta)$$

$$\Rightarrow \cos \theta = \frac{a \cdot b}{ab}$$

Projection of b in the direction of OA

$$= OL = \frac{a \cdot b}{|a|}$$

$$OL = \frac{a \cdot b}{|a|} \hat{a} = \frac{a \cdot b}{|a|^2} a$$

Projection of a in the direction of

$$OB = OM = \frac{a \cdot b}{b}$$

$$OM = \frac{a \cdot b}{|b|^2} b$$

Properties of Scalar Product

Following are the properties of scalar product:

- $a \cdot b = b \cdot a$ [commutativity]

- $a \cdot (b + c) = a \cdot b + a \cdot c$ [distributivity]
- $\hat{i} \cdot \hat{i} = \hat{j} \cdot \hat{j} = \hat{k} \cdot \hat{k} = 1$
- $\hat{i} \cdot \hat{j} = \hat{j} \cdot \hat{i} = 0, \hat{j} \cdot \hat{k} = \hat{k} \cdot \hat{j} = 0, \hat{k} \cdot \hat{i} = \hat{i} \cdot \hat{k} = 0$
- For any two vectors a and b
 - (a) $|a + b| = |a| + |b| \Rightarrow a \parallel b$
 - (b) $|a + b|^2 = |a|^2 + |b|^2 \Rightarrow a \perp b$
 - (c) $|a + b| = |a - b| \Rightarrow a \perp b$
- If dot product of two vectors is zero, then atleast one of the vectors is a zero vector or they are perpendicular.

Application of Dot Product

Let a particle be placed at O and a force f represented by OB be acting on the particle at O .

Then,

$$\text{Work done} = (\text{Force}) \cdot (\text{Displacement})$$

$$\text{i.e. } W = f \cdot d$$

2. Vector Product of Two Vectors

The vector product of two non-null and non-parallel vectors a and b is expressed as

$$a \times b = ab \sin \theta \hat{n}$$

where, $|a| = a, |b| = b,$

where θ is the angle between a, b and $\hat{n}$ is a unit vector perpendicular to the plane of a and b such that a, b and $\hat{n}$ form a right handed system.

$$|a \times b| = |a| |b| \sin \theta$$

Geometrical Interpretation of Vector Product

Modulus of $a \times b$ is the area of the parallelogram whose adjacent sides are represented by a and b .

$$|a \times b| = \text{Area of parallelogram } OACB.$$

Properties of Vector Product

Following are the properties of vector product:

- $a \times b \neq b \times a$
 - where, $a \times b = -(b \times a)$
- $a \times b = 0$
 - $\Leftrightarrow a \parallel b$ or collinear and $a = 0$ or $b = 0$
- $\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = 0$
- $\hat{i} \times \hat{j} = \hat{k}, \hat{j} \times \hat{k} = \hat{i}, \hat{k} \times \hat{i} = \hat{j}$
- $\hat{j} \times \hat{i} = -\hat{k}, \hat{k} \times \hat{j} = -\hat{i}, \hat{i} \times \hat{k} = -\hat{j}$
- Lagrange's identity, $|a \times b|^2 = |a|^2 |b|^2 - (a \cdot b)^2$
- $(ma) \times b = m(a \times b) = a \times (mb)$
- $a \times (b + c) = a \times b + a \times c$

Vector Product in Terms of Components

If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$

Then,
$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

Angle between Two Vectors

If θ is the angle between two vectors $\mathbf{a}$ and $\mathbf{b}$, then $\sin\theta = \frac{|\mathbf{a} \times \mathbf{b}|}{ab}$, if

$$\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}, \mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$$

$$\sin^2\theta = \frac{(a_2b_3 - a_3b_2)^2 + (a_1b_3 - a_3b_1)^2 + (a_1b_2 - a_2b_1)^2}{(a_1^2 + a_2^2 + a_3^2)(b_1^2 + b_2^2 + b_3^2)}$$

Vector Normal to the Plane of Two Given Vectors

The vectors of magnitude λ normal to the plane of $\mathbf{a}$ and $\mathbf{b}$ are

$$\pm \frac{\lambda(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$$

Condition for Vectors to be Parallel

If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$ are parallel, then

$$\mathbf{a} \times \mathbf{b} = 0 \text{ or } \frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3}$$

Condition for Three Points A, B, C to be Collinear

Determine $\mathbf{AB}$ and $\mathbf{BC}$ and show that

$$\mathbf{AB} \times \mathbf{BC} = 0 \text{ or } \mathbf{AB} = k\mathbf{BC}$$

where, k is any scalar.

Area of Parallelogram and Triangle

- The area of a parallelogram with adjacent sides $\mathbf{a}$ and $\mathbf{b}$ is $|\mathbf{a} \times \mathbf{b}|$.
- The area of a parallelogram with diagonals $\mathbf{a}$ and $\mathbf{b}$ is $\frac{1}{2}|\mathbf{a} \times \mathbf{b}|$.
- The area of a plane quadrilateral $ABCD$ is $\frac{1}{2}|\mathbf{AC} \times \mathbf{BD}|$, where AC and BD are diagonals.
- The area of a triangle with adjacent sides $\mathbf{a}$ and $\mathbf{b}$ is $\frac{1}{2}|\mathbf{a} \times \mathbf{b}|$.

(v) The area of a $\triangle ABC$ is $\frac{1}{2}|\mathbf{AB} \times \mathbf{AC}|$.

(vi) If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are position vectors of vertices of $\triangle ABC$, then area = $\frac{1}{2}|(\mathbf{a} \times \mathbf{b}) + (\mathbf{b} \times \mathbf{c}) + (\mathbf{c} \times \mathbf{a})|$.

If $(\mathbf{a} \times \mathbf{b}) + (\mathbf{b} \times \mathbf{c}) + (\mathbf{c} \times \mathbf{a}) = 0$,

then three points with position vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are collinear.

Moment

The moment or torque of a force F acting at A about any point O is given by

$$\mathbf{M} = \mathbf{r} \times \mathbf{F}$$

where, r is the position vector of A with respect to point O , i.e. $r = \mathbf{OA}$.

The magnitude of the moment is $M = |\mathbf{M}|$.

i.e. $|\mathbf{M}| = |\mathbf{OA} \times \mathbf{F}|$

$$= F(OA \sin\theta) = FOM$$

Scalar Triple Product

The scalar triple product of three vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ is defined as

$$(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = |\mathbf{a}||\mathbf{b}||\mathbf{c}|\sin\theta\cos\phi$$

where, θ is the angle between $\mathbf{a}$ and $\mathbf{b}$ and ϕ is the angle between $\mathbf{a} \times \mathbf{b}$ and $\mathbf{c}$. It is also defined as $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$.

Geometrical Interpretation of a Scalar Triple Product

The scalar triple product $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$ represents the volume of the parallelepiped whose coterminous edges $\mathbf{a}, \mathbf{b}, \mathbf{c}$ form a right handed system of vectors.

Properties of Scalar Triple Product

Following are the properties of scalar triple product :

- If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}, \mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$ and $\mathbf{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$.
- Then, $(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$
- $(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$
- $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = [\mathbf{b} \ \mathbf{c} \ \mathbf{a}] = [\mathbf{c} \ \mathbf{a} \ \mathbf{b}]$
- $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = -[\mathbf{b} \ \mathbf{a} \ \mathbf{c}]$
- $[k\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = k[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$
- $[\mathbf{a} + \mathbf{b} \ \mathbf{c} \ \mathbf{d}] = [\mathbf{a} \ \mathbf{c} \ \mathbf{d}] + [\mathbf{b} \ \mathbf{c} \ \mathbf{d}]$
- If $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$, then $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar.

Some Important Points

- (i) For points with position vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$ will be coplanar, if

$$[\mathbf{d} \ \mathbf{b} \ \mathbf{c}] + [\mathbf{d} \ \mathbf{c} \ \mathbf{a}] + [\mathbf{d} \ \mathbf{a} \ \mathbf{b}] = [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$$
- (ii) The volume of the tetrahedron whose three adjacent (coterminal edges) are represented by the vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$, is $\frac{1}{6}[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$.
- (iii) The volume of the triangular prism whose adjacent sides are represented by the vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$, is $\frac{1}{2}[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$.
- (iv) If $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0 \Leftrightarrow \mathbf{a} \cdot \mathbf{b}$ and $\mathbf{c}$ are coplanar and $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$, if any two of the three vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are collinear or equal.
- (v) Let $\mathbf{p} = x_1\mathbf{a} + x_2\mathbf{b} + x_3\mathbf{c}$
 $\mathbf{q} = y_1\mathbf{a} + y_2\mathbf{b} + y_3\mathbf{c}$
 $\mathbf{r} = z_1\mathbf{a} + z_2\mathbf{b} + z_3\mathbf{c}$

$$\text{Then, } [\mathbf{p} \ \mathbf{q} \ \mathbf{r}] = \begin{vmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{vmatrix} [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$$

Vector Triple Product

Let $\mathbf{a}, \mathbf{b}, \mathbf{c}$ be any three vectors, then the expression $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is a vector and is called a vector triple product.

Geometrical Interpretation of $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$

Consider the expression $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ which itself is a vector, since it is a cross product of two vectors $\mathbf{a}$ and $(\mathbf{b} \times \mathbf{c})$. Now, $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is a vector perpendicular to the plane containing $\mathbf{a}$ and $(\mathbf{b} \times \mathbf{c})$ but $\mathbf{b} \times \mathbf{c}$ is a vector perpendicular to the plane $\mathbf{b}$ and $\mathbf{c}$, therefore $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is a vector lies in the plane of $\mathbf{b}$ and $\mathbf{c}$ and perpendicular to $\mathbf{a}$.

Hence, we can express $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ in terms of $\mathbf{b}$ and $\mathbf{c}$.

i.e. $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = x\mathbf{b} + y\mathbf{c}$, where x and y are scalars.

- $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$
- $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{b} \cdot \mathbf{c})\mathbf{a}$
- $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} \neq \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$

Application of Vectors to Geometry

Geometrical Bisector of an Angle

- (a) If $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are unit vectors along the sides of an angle, then $\hat{\mathbf{a}} + \hat{\mathbf{b}}$ and $\hat{\mathbf{a}} - \hat{\mathbf{b}}$ are respectively the vectors along the internal and external bisectors of angle.
- (b) The bisectors of the angles between the lines $\mathbf{r} = x\mathbf{a}$ and $\mathbf{r} = y\mathbf{b}$, is given by

$$\mathbf{r} = k \left(\frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|} \right), (k \in \mathbb{R})$$

Practice Exercise

1. If $|\alpha + \beta| = |\alpha - \beta|$, then
 - a. α is parallel to β
 - b. α is perpendicular to β
 - c. $|\alpha| = |\beta|$
 - d. None of the above
2. If $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are two unit vectors and θ is the angle between them, then $\hat{\mathbf{a}} + \hat{\mathbf{b}}$ is a unit vector, if
 - a. $\theta = \frac{\pi}{3}$
 - b. $\theta = \frac{\pi}{4}$
 - c. $\theta = \frac{\pi}{2}$
 - d. $\theta = \frac{2\pi}{3}$
3. If the vector $-\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ bisects the angle between the vector $\mathbf{c}$ and the vector $3\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$, then the unit vector in the direction of $\mathbf{c}$, is
 - a. $\frac{1}{15}(11\hat{\mathbf{i}} + 10\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 - b. $-\frac{1}{15}(11\hat{\mathbf{i}} - 10\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 - c. $-\frac{1}{15}(11\hat{\mathbf{i}} + 10\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$
 - d. $-\frac{1}{15}(11\hat{\mathbf{i}} + 10\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
4. In a trapezoid, the vector $\mathbf{BC} = \lambda \mathbf{AD}$, we will then find that $\mathbf{P} = \mathbf{AC} + \mathbf{AD}$ is collinear with $\mathbf{AD}$. If $\mathbf{P} = \mu \mathbf{AD}$, then
 - a. $\mu = \lambda + 1$
 - b. $\lambda = \mu + 1$
 - c. $\lambda + \mu = 1$
 - d. $\mu = 2 + \lambda$
5. Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be three non-zero vectors, no two of which are collinear and the vector $\mathbf{a} + \mathbf{b}$ is collinear with $\mathbf{c}$ while $\mathbf{b} + \mathbf{c}$ is collinear with $\mathbf{a}$, then $\mathbf{a} + \mathbf{b} + \mathbf{c}$ is equal to
 - a. $\mathbf{a}$
 - b. $\mathbf{b}$
 - c. $\mathbf{c}$
 - d. None

6. A vector $\mathbf{a}$ has component $2p$ and 1 with respect to a rectangular cartesian system. The system is rotated through a certain angle about the origin in the counter clockwise sense. If with respect to new system, $\mathbf{a}$ has components $p+1$ and 1 , then
 a. $p=0$ b. $p=1$ or $p=-1/3$
 c. $p=-1$ or $p=1/3$ d. $p=1$ or $p=-1$
7. If the sum of two unit vectors is a unit vector, then the magnitude of their difference is
 a. $\sqrt{2}$ b. $\sqrt{3}$ c. $\sqrt{5}$ d. $\sqrt{7}$
8. If the position vectors of $\mathbf{P}$, $\mathbf{Q}$, $\mathbf{R}$ and $\mathbf{S}$ are $2\hat{i} + \hat{j}$, $\hat{i} - 3\hat{j}$, $3\hat{i} + 2\hat{j}$ and $\hat{i} + \mu\hat{j}$ respectively and $\mathbf{PQ} \parallel \mathbf{RS}$, then the value of μ is
 a. -7 b. 7 c. -6 d. None
9. If $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are unit vectors inclined at an angle α , $\alpha \in [0, \pi]$ to each other and $|\hat{\mathbf{a}} + \hat{\mathbf{b}}| < 1$. Then, α belongs to
 a. $\left(\frac{\pi}{3}, \frac{2\pi}{3}\right)$ b. $\left(\frac{2\pi}{3}, \pi\right)$ c. $\left(0, \frac{\pi}{3}\right)$ d. $\left(\frac{\pi}{4}, \frac{3\pi}{4}\right)$
10. Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be three non-zero vectors which are pairwise non-collinear. If $\mathbf{a} + 3\mathbf{b}$ is collinear with $\mathbf{c}$ and $\mathbf{b} + 2\mathbf{c}$ is collinear with $\mathbf{a}$, then $\mathbf{a} + 3\mathbf{b} + 6\mathbf{c}$ is equal to
 a. $\mathbf{a} + \mathbf{c}$ b. $\mathbf{a}$ c. $\mathbf{c}$ d. 0
11. If the vectors $\mathbf{AB} = 3\hat{i} + 4\hat{k}$ and $\mathbf{AC} = 5\hat{i} - 2\hat{j} + 4\hat{k}$ are the sides of $\triangle ABC$, then the length of the median through A is (in unit)
 a. $\sqrt{18}$ b. $\sqrt{72}$ c. $\sqrt{33}$ d. $\sqrt{45}$
12. If $\mathbf{a}$ and $\mathbf{b}$ are non-collinear vectors, then the value of α for which the vectors $\mathbf{u} = (\alpha - 2)\mathbf{a} + \mathbf{b}$ and $\mathbf{v} = (2 + 3\alpha)\mathbf{a} - 3\mathbf{b}$ are collinear, is
 a. $\frac{3}{2}$ b. $\frac{2}{3}$ c. $\frac{-3}{2}$ d. $\frac{-2}{3}$
13. If $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1$ and $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = \cos \theta$, then the maximum value of θ is
 a. $\frac{\pi}{3}$ b. $\frac{\pi}{2}$ c. $\frac{2\pi}{3}$ d. $\frac{2\pi}{5}$
14. If the resolved parts of the force vector $5\hat{i} + 4\hat{j} + 2\hat{k}$ along and perpendicular to the vector $3\hat{i} + 4\hat{j} - 5\hat{k}$ are α and β respectively. Then, the value of α is
 a. $\frac{21}{50}(3\hat{i} + 4\hat{j} - 5\hat{k})$ b. $\frac{21}{50}(3\hat{i} - 4\hat{j} + 5\hat{k})$
 c. $\frac{11}{50}(2\hat{i} - 4\hat{j} + 3\hat{k})$ d. $\frac{1}{50}(187\hat{i} + 116\hat{j} + 205\hat{k})$
15. Let $|\mathbf{a}| = 2\sqrt{2}$, $|\mathbf{b}| = 3$ and the angle between $\mathbf{a}$ and $\mathbf{b}$ is $\frac{\pi}{4}$. If a parallelogram is constructed with adjacent sides $2\mathbf{a} - 3\mathbf{b}$ and $\mathbf{a} + \mathbf{b}$, then its longer diagonal is of length
 a. 10 b. 8 c. $2\sqrt{26}$ d. 6
16. Let $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} - 2\hat{k}$ be three vectors. A vector in the plane of $\mathbf{b}$ and $\mathbf{c}$, whose projection on $\mathbf{a}$ is of magnitude $\sqrt{(2/3)}$, is
 a. $2\hat{i} + 3\hat{j} - 3\hat{k}$ b. $2\hat{i} + 3\hat{j} + 3\hat{k}$
 c. $-2\hat{i} - \hat{j} + 5\hat{k}$ d. $2\hat{i} + \hat{j} + 5\hat{k}$
17. The vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are equal in length and taken pairwise, they make equal angles. If $\mathbf{a} = \hat{i} + \hat{j}$, $\mathbf{b} = \hat{j} + \hat{k}$ and $\mathbf{c}$ makes an obtuse angle with X -axis, then $\mathbf{c}$ is equal to
 a. $-\hat{i} + 4\hat{j} - \hat{k}$ b. $\hat{i} + \hat{k}$
 c. $\frac{1}{3}(-\hat{i} + 4\hat{j} - \hat{k})$ d. $\frac{\hat{i} - 4\hat{j} + \hat{k}}{3}$
18. If $\mathbf{a}$ and $\mathbf{b}$ are two non-collinear vectors such that $|\mathbf{a}| = 3$, $|\mathbf{b}| = 4$ and $\mathbf{a} - \mathbf{b} = \hat{i} + 2\hat{j} + 3\hat{k}$, then the value of $\left\{ \frac{\mathbf{a}}{|\mathbf{a}|^2} - \frac{\mathbf{b}}{|\mathbf{b}|^2} \right\}^2$ is equal to
 a. $\frac{1}{24}$ b. $\frac{5}{72}$ c. $\frac{7}{72}$ d. $\frac{7}{48}$
19. If the points $P(\mathbf{a} + \mathbf{b} - \mathbf{c})$, $Q(2\mathbf{a} + 3\mathbf{b})$ and $R(\mathbf{b} + t\mathbf{c})$ are collinear, where $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ are three coplanar vectors, then the value of t is
 a. -2 b. $-1/2$ c. $1/2$ d. 2
20. If the three vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ with magnitude 3 , 4 and 5 respectively and $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then the value of $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$ is
 a. -23 b. -25
 c. 30 d. 26
21. The angle between the vectors $\mathbf{a} = 2\hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{b} = 6\hat{i} - 3\hat{j} + 2\hat{k}$ is
 a. $\cos^{-1} \frac{3}{11}$ b. $\cos^{-1} \frac{2}{11}$ c. $\cos^{-1} \frac{4}{21}$ d. $\cos^{-1} \frac{3}{22}$
22. If $\mathbf{a} = \hat{i} + 2\hat{j} + 3\hat{k}$, $\mathbf{b} = -\hat{i} + 2\hat{j} + \hat{k}$ and $\mathbf{c} = 3\hat{i} + \hat{j}$, then p such that $\mathbf{a} + p\mathbf{b}$ is at right angle to $\mathbf{c}$, will be
 a. 7 b. 9 c. 3 d. 5
23. If three vectors $\mathbf{a} = \hat{i} + \hat{j} - \hat{k}$, $\mathbf{b} = -\hat{i} + 2\hat{j} + \hat{k}$ and $\mathbf{c} = -\hat{i} + 2\hat{j} - \hat{k}$, then the unit vector perpendicular to both $\mathbf{a} + \mathbf{b}$ and $\mathbf{b} + \mathbf{c}$, is
 a. $\frac{\hat{i}}{\sqrt{3}}$ b. $\hat{k}$ c. $\frac{\hat{k}}{\sqrt{3}}$ d. $\frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{3}}$
24. The vector $\mathbf{c}$ directed along the internal bisector of the angle between the vectors $\mathbf{a} = 7\hat{i} - 4\hat{j} - 4\hat{k}$ and $\mathbf{b} = -2\hat{i} - \hat{j} + 2\hat{k}$ with $|\mathbf{c}| = 5\sqrt{6}$, is
 a. $\frac{2}{3}(\hat{i} - 7\hat{j} + 2\hat{k})$ b. $\frac{5}{3}(\hat{i} - 7\hat{j} + 2\hat{k})$
 c. $\frac{7}{3}(\hat{i} - 7\hat{j} - \hat{k})$ d. $\frac{2}{3}(\hat{i} + 7\hat{j} - 2\hat{k})$

25. If a unit vector $\hat{d}$ is equally inclined at an angle α with the vectors $\mathbf{a} = \cos \theta \cdot \hat{i} + \sin \theta \cdot \hat{j}$, $\mathbf{b} = -\sin \theta \cdot \hat{i} + \cos \theta \cdot \hat{j}$ and $\mathbf{c} = \hat{k}$. Then, α is equal to
- a. $\cos^{-1}\left(\frac{1}{\sqrt{2}}\right)$ b. $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$
 c. $\cos^{-1}\left(\frac{1}{3}\right)$ d. $\frac{\pi}{2}$
26. Vectors $\mathbf{a}$ and $\mathbf{b}$ are such that $|\mathbf{a}| = 1$, $|\mathbf{b}| = 4$ and $\mathbf{a} \cdot \mathbf{b} = 2$. If $\mathbf{c} = 2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}$, then the angle between $\mathbf{b}$ and $\mathbf{c}$ is
- a. $\frac{\pi}{6}$ b. $\frac{5\pi}{6}$ c. $\frac{\pi}{3}$ d. $\frac{2\pi}{3}$
27. If the vectors $\mathbf{c}, \mathbf{a} = x\hat{i} + y\hat{j} + z\hat{k}$ and $\mathbf{b} = \hat{j}$ are such that $\mathbf{a}, \mathbf{c}$ and $\mathbf{b}$ form a right handed system, then $\mathbf{c}$ is equal to
- a. $z\hat{i} - x\hat{k}$ b. 0 c. $y\hat{i}$ d. $-z\hat{i} + x\hat{k}$
28. If the vectors $\mathbf{a} = \hat{i} - \hat{j} + 2\hat{k}$, $\mathbf{b} = 2\hat{i} + 4\hat{j} + \hat{k}$ and $\mathbf{c} = \lambda\hat{i} + \hat{j} + \mu\hat{k}$ are mutually orthogonal, then (λ, μ) is equal to
- a. $(-3, 2)$ b. $(2, -3)$ c. $(-2, 3)$ d. $(3, -2)$
29. If the non-zero vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are related by $\mathbf{a} = 8\mathbf{b}$ and $\mathbf{c} = -7\mathbf{b}$. Then, the angle between $\mathbf{a}$ and $\mathbf{c}$ is
- a. π b. 0 c. $\frac{\pi}{4}$ d. $\frac{\pi}{2}$
30. Let $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ be two unit vectors. If the vectors $\mathbf{c} = \hat{\mathbf{a}} + 2\hat{\mathbf{b}}$ and $\mathbf{d} = 5\hat{\mathbf{a}} - 4\hat{\mathbf{b}}$ are perpendicular to each other, then the angle between $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ is
- a. $\frac{\pi}{6}$ b. $\frac{\pi}{2}$ c. $\frac{\pi}{3}$ d. $\frac{\pi}{4}$
31. Let $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} - 2\hat{k}$ be three vectors. A vector of the type $\mathbf{b} + \lambda\mathbf{c}$ for some scalar λ , whose projection on $\mathbf{a}$ is of magnitude $\frac{\sqrt{2}}{3}$, is
- a. $2\hat{i} + \hat{j} + 5\hat{k}$ b. $2\hat{i} + 3\hat{j} - 3\hat{k}$
 c. $2\hat{i} - \hat{j} + 5\hat{k}$ d. $2\hat{i} + 3\hat{j} + 3\hat{k}$
32. The vector $(\hat{i} \times \mathbf{a} \cdot \mathbf{b})\hat{i} + (\hat{j} \times \mathbf{a} \cdot \mathbf{b})\hat{j} + (\hat{k} \times \mathbf{a} \cdot \mathbf{b})\hat{k}$ is equal to
- a. $\mathbf{b} \times \mathbf{a}$ b. $\mathbf{a}$ c. $\mathbf{a} \times \mathbf{b}$ d. $\mathbf{b}$
33. If $\hat{\mathbf{a}}, \hat{\mathbf{b}}$ and $\hat{\mathbf{c}}$ are unit vectors satisfying $\hat{\mathbf{a}} - \sqrt{3}\hat{\mathbf{b}} + \hat{\mathbf{c}} = 0$, then the angle between the vectors $\hat{\mathbf{a}}$ and $\hat{\mathbf{c}}$ is
- a. $\frac{\pi}{4}$ b. $\frac{\pi}{3}$ c. $\frac{\pi}{6}$ d. $\frac{\pi}{2}$
34. If a vector $\mathbf{r}$ of magnitude $3\sqrt{6}$ is directed along the bisector of the angle between the vectors $\mathbf{a} = 7\hat{i} - 4\hat{j} - 4\hat{k}$ and $\mathbf{b} = -2\hat{i} - \hat{j} + 2\hat{k}$, then $\mathbf{r}$ is equal to
- a. $\hat{i} - 7\hat{j} + 2\hat{k}$ b. $\hat{i} + 7\hat{j} - 2\hat{k}$
 c. $\hat{i} + 7\hat{j} + 2\hat{k}$ d. $\hat{i} - 7\hat{j} - 2\hat{k}$
35. There are three vectors $\mathbf{a} = \hat{i} + \hat{j}$, $\mathbf{b} = \hat{j} + \hat{k}$ and $\mathbf{c} = x\hat{\mathbf{a}} + y\hat{\mathbf{b}}$. If the vectors $\hat{i} - 2\hat{j} + \hat{k}$, $3\hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{c}$ are coplanar, then $\frac{x}{y}$ is equal to
- a. -2 b. -3 c. $\frac{2}{3}$ d. -1
36. If $\mathbf{b} = 4\hat{i} + 3\hat{j}$ and $\mathbf{c}$ are two vectors perpendicular to each other in the XY-plane. Then, a vector in the same plane having projections 1 and 2 along $\mathbf{b}$ and $\mathbf{c}$ respectively, is
- a. $\hat{i} + 2\hat{j}$ b. $2\hat{i} - \hat{j}$ c. $2\hat{i} + \hat{j}$ d. None
37. The value of λ for which the points $P(1, 0, 3)$, $Q(-1, 3, 4)$, $R(1, 2, 1)$ and $S(\lambda, 2, 5)$ are coplanar, is
- a. 3 b. -2 c. 5 d. -1
38. If $\hat{\mathbf{a}} = 2\hat{i} + \hat{j} - \hat{k}$ and $\mathbf{b} = \hat{j} + \hat{k}$, then the vector $\mathbf{c}$ such that $\mathbf{a} \cdot \mathbf{c} = 4$ and $\mathbf{a} \times \mathbf{c} = \mathbf{b}$, is
- a. $\hat{i} + \hat{j} - \hat{k}$ b. $3\hat{i} - \hat{j} + \hat{k}$ c. $\hat{i} + 3\hat{j} + \hat{k}$ d. $2\hat{i} - \hat{j} - \hat{k}$
39. Let $\mathbf{a} = 2\hat{i} + \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and a unit vector $\hat{\mathbf{c}}$ be coplanar. If $\hat{\mathbf{c}}$ is perpendicular to $\mathbf{a}$, then $\hat{\mathbf{c}}$ is equal to
- a. $(-\hat{j} + \hat{k})$ b. $\pm \frac{1}{\sqrt{2}}(-\hat{j} + \hat{k})$
 c. $\pm \frac{1}{\sqrt{2}}(\hat{j} + \hat{k})$ d. None of these
40. If $\mathbf{a} = \frac{1}{\sqrt{10}}(3\hat{i} + \hat{k})$ and $\mathbf{b} = \frac{1}{7}(2\hat{i} + 3\hat{j} - 6\hat{k})$, then the value of $(2\mathbf{a} - \mathbf{b}) \cdot [(\mathbf{a} \times \mathbf{b}) \times (\mathbf{a} + 2\mathbf{b})]$ is
- a. -3 b. 5 c. 3 d. -5
41. If $\mathbf{a} = \hat{j} - \hat{k}$ and $\mathbf{c} = \hat{i} - \hat{j} - \hat{k}$. Then, the vector $\mathbf{b}$ satisfying $\mathbf{a} \times \mathbf{b} + \mathbf{c} = 0$ and $\mathbf{a} \cdot \mathbf{b} = 3$, is
- a. $-\hat{i} + \hat{j} - 2\hat{k}$ b. $2\hat{i} - \hat{j} + 2\hat{k}$
 c. $\hat{i} - \hat{j} - 2\hat{k}$ d. $\hat{i} + \hat{j} - 2\hat{k}$
42. If vectors $\mathbf{a}$ and $\mathbf{b}$ are not perpendicular and $\mathbf{c}, \mathbf{d}$ are two vectors satisfying $\mathbf{b} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$ and $\mathbf{a} \cdot \mathbf{d} = 0$. Then, the vector $\mathbf{d}$ is equal to
- a. $\mathbf{c} + \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{b}$ b. $\mathbf{b} + \left(\frac{\mathbf{b} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{c}$
 c. $\mathbf{c} - \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{b}$ d. $\mathbf{b} - \left(\frac{\mathbf{b} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{c}$
43. If the vectors $p\hat{i} + \hat{j} + \hat{k}$, $\hat{i} + q\hat{j} + \hat{k}$ and $\hat{i} + \hat{j} + r\hat{k}$ ($p \neq q \neq r \neq 1$) are coplanar, then the value of $pqr - (p + q + r)$ is
- a. -2 b. 2
 c. 0 d. -1
44. If $\mathbf{u}, \mathbf{v}$ and $\mathbf{w}$ are three non-coplanar vectors, then $(\mathbf{u} + \mathbf{v} - \mathbf{w}) \cdot (\mathbf{u} - \mathbf{v}) \times (\mathbf{v} - \mathbf{w})$ is equal to
- a. 0 b. $\mathbf{u} \cdot \mathbf{v} \times \mathbf{w}$
 c. $\mathbf{u} \cdot \mathbf{w} \times \mathbf{v}$ d. $3\mathbf{u} \cdot \mathbf{v} \times \mathbf{w}$

45. Let $\mathbf{b}$ and $\mathbf{c}$ be non-collinear vectors. If $\mathbf{a}$ is a vector such that $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = 4$ and $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (x^2 - 2x + 6)\mathbf{b} + \sin y \cdot \mathbf{c}$, then (x, y) lies on the line
 a. $x + y = 0$ b. $x - y = 0$ c. $x = 1$ d. $y = \pi$
46. Let $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ be two non-collinear unit vectors. If $\mathbf{u} = \hat{\mathbf{a}} - (\hat{\mathbf{a}} \cdot \hat{\mathbf{b}})\hat{\mathbf{b}}$ and $\mathbf{v} = \hat{\mathbf{a}} \times \hat{\mathbf{b}}$, then $|\mathbf{v}|$ is equal to
 a. $|\mathbf{u}|$ b. $|\mathbf{u}| + |\mathbf{v} \cdot \hat{\mathbf{a}}|$
 c. $2|\mathbf{v}|$ d. $|\mathbf{u}| + \mathbf{u} \cdot (\hat{\mathbf{a}} + \hat{\mathbf{b}})$
47. The value of $[(\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} - \mathbf{c}) \times (\mathbf{c} - \mathbf{a})]$ is
 a. 0 b. $2[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$ c. $3[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$ d. None
48. A vector $\mathbf{c}$ of magnitude $20\sqrt{6}$ directed along the bisector of the angle between $\mathbf{a} = 7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$ and $\mathbf{b} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, is
 a. $\pm \frac{5}{3}(2\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + \hat{\mathbf{k}})$ b. $\pm \frac{3}{5}(\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 c. $\pm \frac{5}{3}(\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 7\hat{\mathbf{k}})$ d. $\pm \frac{5}{3}(\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
49. If $\hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}$ are the unit vectors and $\mathbf{a}$ is a vector such that $\mathbf{a} \times \mathbf{r} = \hat{\mathbf{j}}$, then $\mathbf{a} \cdot \mathbf{r}$ is
 a. -1 b. 0 c. 1 d. None
50. If $\mathbf{a}$ makes an acute angle with $\mathbf{b}$ and $\mathbf{r} \times \mathbf{b} = \mathbf{c} \times \mathbf{b}$, then $\mathbf{r}$ is equal to
 a. $\mathbf{a} \times \hat{\mathbf{i}} - \mathbf{b}$ b. $\mathbf{c} \times \mathbf{a}$ c. $\mathbf{c} - \frac{\mathbf{c} \cdot \mathbf{a}}{\mathbf{b} \cdot \mathbf{a}} \cdot \mathbf{b}$ d. $\mathbf{c} + \frac{\mathbf{c} \cdot \mathbf{a}}{\mathbf{b} \cdot \mathbf{a}} \cdot \mathbf{b}$
51. The vectors $(a, a + 1, a + 2)$, $(a + 3, a + 4, a + 5)$, $(a + 6, a + 7, a + 8)$ are coplanar for
 a. $\forall a \in \mathbb{R}$ b. $\forall a \notin \mathbb{R}$
 c. $a = \sqrt{-3}$ d. None of these
52. If $\mathbf{a} = \lambda\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$, $\mathbf{b} = 2\hat{\mathbf{i}} + \lambda\hat{\mathbf{j}} - \hat{\mathbf{k}}$, $\mathbf{c} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 6$, then λ is equal to
 a. -8 or 3 b. -9 or 3 c. -3 or +9 d. 8 or 5
53. If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar vectors, then the scalar triple product $[2\mathbf{a} - \mathbf{b}, 2\mathbf{b} - \mathbf{c}, 2\mathbf{c} - \mathbf{a}]$ is
 a. 2 b. -3 c. 0 d. None
54. If $\mathbf{a}$ is perpendicular to $\mathbf{b}$ and $\mathbf{c}$, $a = 2, b = 3, c = 4$ and angle between $\mathbf{b}$ and $\mathbf{c}$ is $\frac{2\pi}{3}$, then $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$ is equal to
 a. $7\sqrt{3}$ b. $9\sqrt{3}$ c. $12\sqrt{3}$ d. $5\sqrt{3}$
55. If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are non-zero and non-collinear vectors, then $[\mathbf{a} \ \mathbf{b} \ \mathbf{i}] + [\mathbf{a} \ \mathbf{b} \ \mathbf{j}] + [\mathbf{a} \ \mathbf{b} \ \mathbf{k}] =$
 a. $\mathbf{a} + \mathbf{b}$ b. $\mathbf{a} \times \mathbf{b}$ c. $\mathbf{a} - \mathbf{b}$ d. $\mathbf{b} \times \mathbf{a}$
56. Let $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$. If $\mathbf{c}$ is a vector such that $\mathbf{a} \cdot \mathbf{c} = |\mathbf{c}|$, $|\mathbf{c} - \mathbf{a}| = 2\sqrt{2}$ and the angle between $\mathbf{a} \times \mathbf{b}$ and $\mathbf{c}$ is 30° , then $|(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}|$ is equal to
 a. $\frac{1}{2}$ b. $\frac{3\sqrt{3}}{2}$
 c. 3 d. $\frac{3}{2}$
57. Let the vectors $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$. If $\mathbf{c}$ is a vector such that $\mathbf{a} \cdot \mathbf{c} = |\mathbf{c}|$ and $|\mathbf{c} - \mathbf{a}| = 2\sqrt{2}$, angle between $\mathbf{a} \times \mathbf{b}$ and $\mathbf{c}$ is 45° , then $|(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}|$ is
 a. 3 b. $\frac{\sqrt{3}}{2}$ c. $\frac{3\sqrt{2}}{2}$ d. $\frac{2\sqrt{2}}{3}$
58. If the three vectors $\mathbf{a} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$ and $\mathbf{c} = \hat{\mathbf{i}}$ and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \alpha \mathbf{a} + \beta \mathbf{b}$, then the value of $\alpha + \beta$ is
 a. 2 b. 3 c. 0 d. None

BITSAT Archives

1. The unit vector perpendicular to the vectors $\hat{\mathbf{i}} - \hat{\mathbf{j}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}}$ forming a right handed system, is [2014]
 a. $\hat{\mathbf{k}}$ b. $-\hat{\mathbf{k}}$ c. $\frac{\hat{\mathbf{i}} - \hat{\mathbf{j}}}{\sqrt{2}}$ d. $\frac{\hat{\mathbf{i}} + \hat{\mathbf{j}}}{\sqrt{2}}$
2. Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be non-zero vectors such that no two are collinear and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3}|\mathbf{b}||\mathbf{c}|\mathbf{a}$. If θ is the acute angle between the vectors $\mathbf{b}$ and $\mathbf{c}$, then $\sin \theta$ is equal to [2013]
 a. $\frac{2\sqrt{2}}{3}$ b. $\frac{\sqrt{2}}{3}$ c. $\frac{2}{3}$ d. $\frac{1}{3}$
3. If $|\mathbf{a}| = 2, |\mathbf{b}| = 5$ and $|\mathbf{a} \times \mathbf{b}| = 8$, then $|\mathbf{a} \cdot \mathbf{b}|$ is equal to [2013]
 a. 3 b. 4 c. 5 d. 6
4. The work done by the force $4\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ in moving a particle along a straight line from the point $(3, 2, -1)$ to $(2, -1, 4)$ is [2012]
 a. 0 unit b. 4 units c. 15 units d. 19 units
5. If $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 0$, then the correct statement is [2011]
 a. out of $\mathbf{a}, \mathbf{b}, \mathbf{c}$, any two vectors are parallel
 b. $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are coplanar
 c. any two are equal among $\mathbf{a}, \mathbf{b}, \mathbf{c}$
 d. atleast one statement is correct
6. If $2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + \lambda\hat{\mathbf{k}}$ are perpendicular to each other, then λ is equal to [2011]
 a. -3 b. -2 c. -1 d. 0
7. If $\mathbf{a} \cdot \hat{\mathbf{i}} = 4$, then $(\mathbf{a} \times \hat{\mathbf{j}}) \cdot (2\hat{\mathbf{j}} - 3\hat{\mathbf{k}})$ is equal to [2010]
 a. 12 b. 2 c. 0 d. -12

8. The vector $\mathbf{a}$ is equal to [2010]
 a. $(\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{j}})\hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{k}})\hat{\mathbf{k}}$ b. $(\mathbf{a} \cdot \hat{\mathbf{j}})\hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{k}}$
 c. $(\mathbf{a} \cdot \hat{\mathbf{k}})\hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{j}})\hat{\mathbf{k}}$ d. $(\mathbf{a} \cdot \mathbf{a})(\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$
9. If $\mathbf{r} \cdot \mathbf{a} = 0$, $\mathbf{r} \cdot \mathbf{b} = 0$, and $\mathbf{r} \cdot \mathbf{c} = 0$ for some non-zero vector $\mathbf{r}$. Then, the value of $[\mathbf{a} \mathbf{b} \mathbf{c}]$ is [2009]
 a. 0 b. $1/2$ c. 1 d. 2
10. Let $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ be three vectors such that $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = \mathbf{b} \cdot (\mathbf{c} + \mathbf{a}) = \mathbf{c} \cdot (\mathbf{a} + \mathbf{b}) = 0$ and $|\mathbf{a}| = 1$, $|\mathbf{b}| = 4$, $|\mathbf{c}| = 8$, then $|\mathbf{a} + \mathbf{b} + \mathbf{c}|$ is equal to [2009]
 a. 13 b. 81 c. 9 d. 5
11. The position vector of P and Q are respectively $\mathbf{a}$ and $\mathbf{b}$. If R is a point on PQ such that $\mathbf{PR} = 5 \mathbf{PQ}$, then the position vector of R is [2008]
 a. $5\mathbf{b} - 4\mathbf{a}$ b. $5\mathbf{b} + 4\mathbf{a}$ c. $4\mathbf{b} - 5\mathbf{a}$ d. $4\mathbf{b} + 5\mathbf{a}$
12. If the position vectors of A , B and C are respectively $2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$ and $3\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$, then $\cos^2 A$ is equal to [2008]
 a. 0 b. $\frac{6}{41}$ c. $\frac{35}{41}$ d. 1
13. Let $\mathbf{a}$ be a unit vector, $\mathbf{b} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} + 3\hat{\mathbf{k}}$. Then, the maximum value of $[\mathbf{a} \mathbf{b} \mathbf{c}]$, is [2008]
 a. -1 b. $\sqrt{10} + \sqrt{6}$ c. $\sqrt{10} - \sqrt{6}$ d. $\sqrt{59}$
14. The unit vector which is orthogonal to the vector $3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ and is coplanar with the vectors $2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, is [2007]
 a. $\frac{2\hat{\mathbf{i}} - 6\hat{\mathbf{j}} + \hat{\mathbf{k}}}{\sqrt{41}}$ b. $\frac{2\hat{\mathbf{i}} - 3\hat{\mathbf{j}}}{\sqrt{13}}$
 c. $\frac{3\hat{\mathbf{j}} - \hat{\mathbf{k}}}{\sqrt{10}}$ d. $\frac{4\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 3\hat{\mathbf{k}}}{\sqrt{34}}$
15. Let $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ be three non-coplanar vectors and $\mathbf{p}$, $\mathbf{q}$, $\mathbf{r}$ be vectors defined by the relations

$$\mathbf{p} = \frac{\mathbf{b} \times \mathbf{c}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}, \mathbf{q} = \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}, \mathbf{r} = \frac{\mathbf{a} \times \mathbf{b}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}$$
 Then, the value of the expression $(\mathbf{a} + \mathbf{b}) \cdot \mathbf{p} + (\mathbf{b} + \mathbf{c}) \cdot \mathbf{q} + (\mathbf{c} + \mathbf{a}) \cdot \mathbf{r}$ is [2007]
 a. 0 b. 1 c. 2 d. 3
16. If $\hat{\mathbf{a}}$, $\hat{\mathbf{b}}$ and $\hat{\mathbf{c}}$ are mutually perpendicular unit vectors, then $|\hat{\mathbf{a}} + \hat{\mathbf{b}} + \hat{\mathbf{c}}|$ is equal to [2007]
 a. 3 b. $\sqrt{3}$ c. $\frac{\sqrt{a^2 + b^2 + c^2}}{3}$ d. 1
17. The projection of the vector $2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ on the vector $\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ is [2006]
 a. $-\frac{3}{\sqrt{14}}$ b. $\frac{3}{\sqrt{14}}$ c. $-\frac{\sqrt{3}}{2}$ d. $\frac{3}{\sqrt{2}}$
18. If $\mathbf{a} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ and $\mathbf{b} = 3\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, then the angle between the vectors $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$ is [2005]
 a. 60° b. 90° c. 45° d. 55°
19. If the vectors $\alpha\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\hat{\mathbf{i}} + \beta\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}} + \lambda\hat{\mathbf{k}}$ ($\alpha, \beta, \gamma \neq 1$) are coplanar, then the value of $\frac{1}{1-\alpha} + \frac{1}{1-\beta} + \frac{1}{1-\gamma}$ is [2005]
 a. -1 b. 0 c. 1 d. $1/2$
20. If a vector α lie in the plane of β and γ , then which is correct? [2005]
 a. $[\alpha \beta \gamma] = 0$ b. $[\alpha \beta \gamma] = 1$ c. $[\alpha \beta \gamma] = 3$ d. $[\beta \gamma \alpha] = 1$
21. If $\alpha = 2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$, $\beta = -\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$ and $\gamma = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, then what is the value of $(\vec{\alpha} \times \vec{\beta}) \cdot (\vec{\alpha} \times \vec{\gamma})$? [2005]
 a. 47 b. 74
 c. -74 d. None of these

Answer with Solutions

Practice Exercise

1. (b) $\because |\alpha + \beta| = |\alpha - \beta|$
 $\therefore |\alpha + \beta|^2 = |\alpha - \beta|^2$
 $\Rightarrow (\alpha + \beta) \cdot (\alpha + \beta) = (\alpha - \beta) \cdot (\alpha - \beta)$
 $\Rightarrow \alpha \cdot \alpha + \alpha \cdot \beta + \beta \cdot \alpha + \beta \cdot \beta = \alpha \cdot \alpha - \alpha \cdot \beta - \beta \cdot \alpha + \beta \cdot \beta$
 $\Rightarrow \alpha^2 + 2\alpha \cdot \beta + \beta^2 = \alpha^2 - 2\alpha \cdot \beta + \beta^2$ [$\because \alpha \cdot \beta = \beta \cdot \alpha$]
 $\Rightarrow 4\alpha \cdot \beta = 0$ or $\alpha \cdot \beta = 0$
 Hence, $\vec{\alpha}$ and $\vec{\beta}$ are perpendicular to each other.
2. (d) $(\mathbf{a} + \mathbf{b})^2 = 1 + 1 + 2(1 \cdot 1 \cos \theta) = 1$
 $\therefore \cos \theta = -1/2$
 $\therefore \theta = \frac{2\pi}{3}$
3. (d) Let $x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ be the unit vector along $\mathbf{c}$. Since, $-\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ bisects the angle between $\mathbf{c}$ and $3\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$.
 $\therefore \lambda(-\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) = (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) + \frac{3\hat{\mathbf{i}} + 4\hat{\mathbf{j}}}{5}$
 $\Rightarrow x + \frac{3}{5} = -\lambda, y + \frac{4}{5} = \lambda$ and $z = -\lambda$
 Now, $x^2 + y^2 + z^2 = 1 \Rightarrow \left(-\lambda - \frac{3}{5}\right)^2 + \left(\lambda + \frac{4}{5}\right)^2 + \lambda^2 = 1$
 But $\lambda \neq 0$ because $\lambda = 0$ implies that given vectors are parallel.
 $\therefore \lambda = \frac{2}{15} \Rightarrow x = \frac{-11}{15}, y = \frac{-10}{15}$ and $z = \frac{-2}{15}$
 Hence, $x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}} = \frac{-1}{15}(11\hat{\mathbf{i}} + 10\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$

4. (a) We have, $\mathbf{P} = \mathbf{AC} + \mathbf{BD} = \mathbf{AC} + \mathbf{BC} + \mathbf{CD}$
 $= \mathbf{AC} + \lambda \mathbf{AD} + \mathbf{CD} = \lambda \mathbf{AD} + (\mathbf{AC} + \mathbf{CD})$
 $= \lambda \mathbf{AD} + \mathbf{AD} = (\lambda + 1) \mathbf{AD}$

Therefore, $\mathbf{P} = \mu \mathbf{AD} = \mu = \lambda + 1$

5. (d) Given that, $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are non-zero and non-collinear vectors and vector $(\mathbf{a} + \mathbf{b})$ is collinear with $\mathbf{c}$ and vector $(\mathbf{b} + \mathbf{a})$ collinear with $\mathbf{a}$.

$\Rightarrow (\mathbf{a} + \mathbf{b}) = x \mathbf{c} \quad \dots(i)$

$(\mathbf{b} + \mathbf{c}) = y \mathbf{a} \quad \dots(ii)$

where, x and y are scalars.

From Eq. (i), $(\mathbf{a} + \mathbf{b}) + \mathbf{c} = x \mathbf{c} + \mathbf{c}$

$\Rightarrow (\mathbf{a} + \mathbf{b} + \mathbf{c}) = (x + 1) \mathbf{c} \quad \dots(iii)$

From Eq. (ii),

$\mathbf{a} + (\mathbf{b} + \mathbf{c}) = \mathbf{a} + y \mathbf{a}$

$\Rightarrow (\mathbf{a} + \mathbf{b} + \mathbf{c}) = (y + 1) \mathbf{a} \quad \dots(iv)$

From Eqs. (iii) and (iv),

$(x + 1) \mathbf{c} = (y + 1) \mathbf{a} \Rightarrow \mathbf{c} = \left(\frac{y + 1}{x + 1} \right) \mathbf{a}$

So, $\mathbf{c}$ and $\mathbf{a}$ are collinear which contradicts the given condition that no two of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are collinear.

6. (b) Clearly, $\mathbf{a} = 2p\hat{\mathbf{i}} + \hat{\mathbf{j}}$

On rotation, let $p + 1$ and 1

$\therefore \mathbf{b} = (p + 1)\hat{\mathbf{i}} + \hat{\mathbf{j}}$

Now, under rotation about origin,

$|\mathbf{a}| = |\mathbf{b}| \Rightarrow |\mathbf{a}|^2 = |\mathbf{b}|^2$

$\Rightarrow 4p^2 + 1 = (p + 1)^2 + 1 \Rightarrow 4p^2 = p^2 + 2p + 1$

$\Rightarrow 3p^2 - 2p - 1 = 0 \Rightarrow (p - 1)(3p + 1) = 0$

$\Rightarrow p = 1 \text{ or } -\frac{1}{3}$

7. (b)

8. (c) $\mathbf{PQ} = (\hat{\mathbf{i}} - 3\hat{\mathbf{j}}) - (2\hat{\mathbf{i}} + \hat{\mathbf{j}}) = -\hat{\mathbf{i}} - 4\hat{\mathbf{j}}$

$\mathbf{RS} = -2\hat{\mathbf{i}} + (\mu - 2)\hat{\mathbf{j}}$

$\mathbf{PQ} \parallel \mathbf{RS} \Rightarrow \mathbf{PQ} = \lambda \mathbf{RS}$

$\Rightarrow -\hat{\mathbf{i}} - 4\hat{\mathbf{j}} = [\lambda\{-2\hat{\mathbf{i}} + (\mu - 2)\hat{\mathbf{j}}\}]$

$\Rightarrow \lambda = 1/2 \text{ and } \mu = -6$

9. (b) Since, $|\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 < 1$

$\Rightarrow 2 + 2 \cos \alpha < 1 \Rightarrow 4 \cos^2 \frac{\alpha}{2} < 1$

$\Rightarrow \cos \frac{\alpha}{2} < \frac{1}{2} \Rightarrow \alpha \in \left(\frac{2\pi}{3}, \pi \right)$

10. (d) As $\mathbf{a} + 3\mathbf{b}$ is collinear with $\mathbf{c}$.

$\therefore \mathbf{a} + 3\mathbf{b} = \lambda \mathbf{c} \quad \dots(i)$

Also, $\mathbf{b} + 2\mathbf{c}$ is collinear with $\mathbf{a}$.

$\Rightarrow \mathbf{b} + 2\mathbf{c} = \mu \mathbf{a} \quad \dots(ii)$

From Eq. (i), $\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = (\lambda + 6) \mathbf{c} \quad \dots(iii)$

From Eq. (ii), $\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = (1 + 3\mu) \mathbf{a} \quad \dots(iv)$

From Eqs. (iii) and (iv), we get

$(\lambda + 6) \mathbf{c} = (1 + 3\mu) \mathbf{a}$

Since, $\mathbf{a}$ is not collinear with $\mathbf{c}$.

$\therefore \lambda + 6 = 1 + 3\mu = 0$

From Eq. (iv), $\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = 0$

11. (c)

12. (b) Since, vectors $\mathbf{u}$ and $\mathbf{v}$ are collinear.

$\therefore \mathbf{u} = \lambda \mathbf{v}$

$\Rightarrow \{(\alpha - 2)\mathbf{a} + \mathbf{b}\} = \lambda\{(2 + 3\alpha)\mathbf{a} - 3\mathbf{b}\}$

On comparing, we get

$(2 + 3\alpha)\lambda = \alpha - 2 \quad \dots(i)$

and $1 = -3\lambda \Rightarrow \lambda = -\frac{1}{3}$

$\therefore (2 + 3\alpha)\left(-\frac{1}{3}\right) = \alpha - 2 \Rightarrow \alpha = \frac{2}{3}$

13. (c) $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = \begin{vmatrix} \mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \\ \mathbf{c} \cdot \mathbf{a} & \mathbf{c} \cdot \mathbf{b} & \mathbf{c} \cdot \mathbf{c} \end{vmatrix} = \begin{vmatrix} 1 & \cos \theta & \cos \theta \\ \cos \theta & 1 & \cos \theta \\ \cos \theta & \cos \theta & 1 \end{vmatrix}$

$= 1 - 3 \cos^2 \theta + 2 \cos^3 \theta = (1 - \cos \theta)^2 (1 + 2 \cos \theta)$

$\Rightarrow 1 + 2 \cos \theta \geq 0 \Rightarrow \theta \leq \frac{2\pi}{3}$

14. (a) Unit vector along $3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}} = \frac{3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}}}{5\sqrt{2}}$

$\therefore \alpha = \left\{ (5\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \cdot \frac{3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}}}{5\sqrt{2}} \right\} \left(\frac{3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}}}{5\sqrt{2}} \right)$
 $= \frac{21}{50} (3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}})$

15. (c) Here, $\mathbf{a} \cdot \mathbf{b} = 2\sqrt{2} \cdot 3 \cdot \frac{1}{\sqrt{2}} = 6$

The diagonals are $2\mathbf{a} - 3\mathbf{b} \pm (\mathbf{a} + \mathbf{b})$.

$\therefore$ Length of diagonals are

$|3\mathbf{a} - 2\mathbf{b}|^2 = 9 \cdot 8 + 4 \cdot 9 - 12 \cdot 6 = 36$

and $|\mathbf{a} - 4\mathbf{b}|^2 = 8 + 16 \cdot 9 - 8 \cdot 6 = 104$

So, the length of the longer diagonal is $\sqrt{104}$, i.e. $2\sqrt{26}$ units.

16. (a) Hint Any vector $\mathbf{r}$ in the plane of $\mathbf{b}$ and $\mathbf{c}$ is

$\mathbf{r} = \mathbf{b} + \lambda \mathbf{c}$

or $\mathbf{r} = (1 + \lambda)\hat{\mathbf{i}} + (2 + \lambda)\hat{\mathbf{j}} - (1 + 2\lambda)\hat{\mathbf{k}} \quad \dots(i)$

$\therefore$ Projection of $\mathbf{r}$ on $\mathbf{a}$ is $\sqrt{\frac{2}{3}}$.

$\therefore \frac{\mathbf{r} \cdot \mathbf{a}}{|\mathbf{a}|} = \sqrt{\frac{2}{3}}$

17. (c) Let $\mathbf{c} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$

Then, $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = x^2 + y^2 + z^2 = 2 \quad \dots(i)$

Since, $\mathbf{c}$ makes an obtuse angle with X-axis.

$\therefore \mathbf{c} \cdot \hat{\mathbf{i}} < 0$

$\Rightarrow x < 0 \quad \dots(ii)$

It is given that $\mathbf{a}, \mathbf{b}, \mathbf{c}$ taken pairwise make equal angles.

$\therefore \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|} = \frac{\mathbf{a} \cdot \mathbf{c}}{|\mathbf{a}||\mathbf{c}|} = \frac{\mathbf{b} \cdot \mathbf{c}}{|\mathbf{b}||\mathbf{c}|}$

$$\Rightarrow \frac{1}{2} = \frac{x+y}{2} = \frac{y+z}{2} \Rightarrow x+y=1=y+z$$

$$\Rightarrow x = z \text{ and } y = 1 - z$$

Putting $x = z$ and $y = 1 - z$ in Eq. (i), we get

$$z^2 + (1-z)^2 + z^2 = 0$$

$$\Rightarrow 3z^2 - 2z - 1 = 0 \Rightarrow (3z+1)(z-1) = 0$$

$$z = 1, -1/3$$

$$\text{Since, } x = z \text{ and } < 0$$

$$\therefore x = z = -\frac{1}{3}$$

$$\text{Hence, } \mathbf{c} = \frac{1}{3}(-\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - \hat{\mathbf{k}})$$

18. (c) we know that

$$\left\{ \frac{\mathbf{a}}{|\mathbf{a}|^2} - \frac{\mathbf{b}}{|\mathbf{b}|^2} \right\}^2 = \left\{ \frac{\mathbf{a}-\mathbf{b}}{|\mathbf{a}||\mathbf{b}|} \right\}^2$$

$$= \frac{|\mathbf{a}-\mathbf{b}|^2}{|\mathbf{a}|^2|\mathbf{b}|^2} = \frac{1+4+9}{9 \times 16} = \frac{7}{72}$$

19. (d) Given that, points P, Q and R are collinear, so there exist three scalars x, y and z such that

$$x(\mathbf{a} + \mathbf{b} - \mathbf{c}) + y(2\mathbf{a} + 3\mathbf{b}) + z(\mathbf{b} + t\mathbf{c}) = 0$$

On comparing the coefficients of $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$, we get

$$x + 2y + 0 = 0 \quad \dots(i)$$

$$x + 3y + z = 0 \quad \dots(ii)$$

$$-x + tz = 0 \quad \dots(iii)$$

On solving Eqs. (i) and (ii) by cross-multiplication method

$$\frac{x}{2-0} = \frac{-y}{1-0} = \frac{z}{3-2} = \lambda \quad [\text{say}]$$

$$\Rightarrow x = 2\lambda, y = -2\lambda, z = \lambda$$

These values of x, y and z will satisfy Eq. (iii).

$$\therefore -2\lambda + t\lambda = 0 \Rightarrow \lambda(t-2) = 0$$

$$\therefore \lambda \neq 0$$

$$\therefore t-2=0 \Rightarrow t=2$$

20. (b) Given, $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$

On squaring both sides, we get

$$|\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = 0$$

$$\Rightarrow \mathbf{a}^2 + \mathbf{b}^2 + \mathbf{c}^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 0$$

$$\Rightarrow 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = -(9 + 16 + 25)$$

$$\therefore \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} = -25$$

21. (c) The angle between $\mathbf{a}$ and $\mathbf{b}$ is θ .

$$\text{So, } \cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{ab} = \frac{(2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}) \cdot (6\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}})}{3 \cdot 7} = \frac{4}{21}$$

$$\therefore \theta = \cos^{-1} \frac{4}{21}$$

22. (d) Given, $\mathbf{a} + p\mathbf{b}$ is at right angle to $\mathbf{c}$.

$$\therefore (\mathbf{a} + p\mathbf{b}) \cdot \mathbf{c} = 0$$

$$\text{Also, } \mathbf{a} \cdot \mathbf{c} = 5 \text{ and } \mathbf{b} \cdot \mathbf{c} = -1$$

$$\Rightarrow 5 - p = 0$$

$$\therefore p = 5$$

$$23. (b) (\mathbf{a} + \mathbf{b}) \times (\mathbf{b} + \mathbf{c}) = 3\hat{\mathbf{j}} \times (-2\hat{\mathbf{i}} + 4\hat{\mathbf{j}}) = 6\hat{\mathbf{k}}$$

So, required unit vector is $\hat{\mathbf{k}}$.

$$24. (b) \text{ Let } \mathbf{a} = 7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}} \text{ and } \mathbf{b} = -2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$$

$$\text{Now, required vector } \mathbf{c} = \alpha \left(\frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|} \right)$$

$$= \alpha \left(\frac{7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}}{9} + \frac{-2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}}{3} \right) = \frac{\alpha}{9} (\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$\Rightarrow |\mathbf{c}|^2 = \frac{\alpha^2}{81} \times 54 = 150 \Rightarrow \alpha = \pm 15$$

$$\therefore \mathbf{c} = \pm \frac{5}{3} (\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$25. (b) \text{ Let } \hat{\mathbf{d}} \cdot \mathbf{a} = \hat{\mathbf{d}} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \cos \alpha$$

$$\Rightarrow \hat{\mathbf{d}} \cdot (\mathbf{a} - \mathbf{k}) = 0$$

Since, $\hat{\mathbf{d}}$ is parallel to $(\mathbf{a} - \mathbf{k}) \times (\mathbf{b} - \mathbf{k})$.

$$\therefore \mathbf{d} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ \cos \theta & \sin \theta & -1 \\ -\sin \theta & \cos \theta & -1 \end{vmatrix}$$

$$\Rightarrow \hat{\mathbf{d}} = \frac{(\cos \theta - \sin \theta) \hat{\mathbf{i}} + (\cos \theta + \sin \theta) \hat{\mathbf{j}} + \hat{\mathbf{k}}}{\sqrt{3}}$$

$$\cos \alpha = \hat{\mathbf{d}} \cdot \mathbf{k} = \frac{1}{\sqrt{3}} \Rightarrow \alpha = \cos^{-1} \left(\frac{1}{\sqrt{3}} \right)$$

$$26. (b) \text{ Here, } |\mathbf{a} \times \mathbf{b}|^2 = |\mathbf{a}|^2 |\mathbf{b}|^2 - (\mathbf{a} \cdot \mathbf{b})^2 = 16 - 4 = 12$$

$$\text{and } |\mathbf{c}|^2 = (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}) \cdot (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b})$$

$$= 4|\mathbf{a} \times \mathbf{b}|^2 + 9|\mathbf{b}|^2 = 4 \cdot 12 + 9 \cdot 16$$

$$= 192 \Rightarrow |\mathbf{c}| = 8\sqrt{3}$$

$$\text{Now, } \mathbf{b} \cdot \mathbf{c} = \mathbf{b} \cdot (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}) = -3|\mathbf{b}|^2 = -48$$

$$\therefore \cos \theta = \frac{\mathbf{b} \cdot \mathbf{c}}{|\mathbf{b}||\mathbf{c}|} = -\frac{48}{4 \cdot 8\sqrt{3}} = -\frac{\sqrt{3}}{2}$$

$$\therefore \theta = \frac{5\pi}{6}$$

$$27. (a) \text{ Here, } \mathbf{c} = \mathbf{b} \times \mathbf{a} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 0 & 1 & 0 \\ x & y & z \end{vmatrix} = z\hat{\mathbf{i}} - x\hat{\mathbf{k}}$$

28. (a) Since, the given vectors are mutually authogonal.

$$\therefore \mathbf{a} \cdot \mathbf{b} = 2 - 4 + 2 = 0$$

$$\mathbf{a} \cdot \mathbf{c} = \lambda - 1 + 2\mu = 0 \quad \dots(i)$$

$$\text{and } \mathbf{b} \cdot \mathbf{c} = 2\lambda + 4 + \mu = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\mu = 2 \text{ and } \lambda = -3$$

$$\text{Hence, } (\lambda, \mu) = (-3, 2)$$

29. (a) Since, $\mathbf{a} = 8\mathbf{b}$ and $\mathbf{c} = -7\mathbf{b}$

So, $\mathbf{a}$ is parallel to $\mathbf{b}$ and $\mathbf{c}$ is anti-parallel to $\mathbf{b}$.

Since, $\mathbf{a}$ and $\mathbf{c}$ are anti-parallel.

So, the angle between $\mathbf{a}$ and $\mathbf{c}$ is π .

30. (c) Given that, $\mathbf{a}$ and $\mathbf{b}$ are unit vectors, i.e. $|\hat{\mathbf{a}}| = |\hat{\mathbf{b}}| = 1$.

$$\mathbf{c} = \hat{\mathbf{a}} + 2\hat{\mathbf{b}}, \mathbf{d} = 5\hat{\mathbf{a}} - 4\hat{\mathbf{b}}$$

$\mathbf{c}$ and $\mathbf{d}$ are perpendicular to each other, i.e. $\mathbf{c} \cdot \mathbf{d} = 0$.

$$\text{Now, } \mathbf{c} \cdot \mathbf{d} = 0 \Rightarrow (\hat{\mathbf{a}} + 2\hat{\mathbf{b}}) \cdot (5\hat{\mathbf{a}} - 4\hat{\mathbf{b}}) = 0$$

$$\Rightarrow 5\hat{\mathbf{a}} \cdot \hat{\mathbf{a}} - 4\hat{\mathbf{a}} \cdot \hat{\mathbf{b}} + 10\hat{\mathbf{b}} \cdot \hat{\mathbf{a}} - 8\hat{\mathbf{b}} \cdot \hat{\mathbf{b}} = 0$$

$$\Rightarrow 6\hat{\mathbf{a}} \cdot \hat{\mathbf{b}} = 3 \Rightarrow \hat{\mathbf{a}} \cdot \hat{\mathbf{b}} = \frac{1}{2}$$

So, the angle between $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ is $\frac{\pi}{3}$.

31. (b) Given, $\mathbf{a} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}, \mathbf{b} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$

$$\text{Now, } \mathbf{b} + \lambda\mathbf{c} = (1 + \lambda)\hat{\mathbf{i}} + (2 + \lambda)\hat{\mathbf{j}} + (-1 - 2\lambda)\hat{\mathbf{k}}$$

$$\therefore \text{Projection of } (\mathbf{b} + \lambda\mathbf{c}) \text{ on } \mathbf{a} = \frac{(\mathbf{b} + \lambda\mathbf{c}) \cdot \mathbf{a}}{|\mathbf{a}|} = \sqrt{\frac{2}{3}} \quad [\text{given}]$$

$$\Rightarrow \frac{2(1 - \lambda) - (2 + \lambda) + (-1 - 2\lambda)}{\sqrt{4 + 1 + 1}} = \sqrt{\frac{2}{3}}$$

$$\Rightarrow \frac{-\lambda - 1}{\sqrt{6}} = \frac{\sqrt{2}}{\sqrt{3}} \Rightarrow \lambda + 1 = 2 \Rightarrow \lambda = 1$$

$$\therefore \mathbf{b} + \lambda\mathbf{c} = 2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$$

32. (c)

33. (b) $\sqrt{3}\hat{\mathbf{b}} = (\hat{\mathbf{a}} + \hat{\mathbf{c}}) \Rightarrow 3|\hat{\mathbf{b}}|^2 = |\hat{\mathbf{a}}|^2 + |\hat{\mathbf{c}}|^2 + 2\hat{\mathbf{a}} \cdot \hat{\mathbf{c}}$

$$\Rightarrow 3(1) = 1 + 1 + 2\hat{\mathbf{a}} \cdot \hat{\mathbf{c}} \Rightarrow 2\hat{\mathbf{a}} \cdot \hat{\mathbf{c}} = 1$$

$$\Rightarrow |\hat{\mathbf{a}}| |\hat{\mathbf{c}}| \cos \theta = \frac{1}{2} \Rightarrow \cos \theta = \frac{1}{2}$$

$$\therefore \theta = \frac{\pi}{3}$$

34. (a) **Hint** The required vector $\mathbf{r} = \lambda(\hat{\mathbf{a}} + \hat{\mathbf{b}})$, where λ is a scalar.

$$\Rightarrow \mathbf{r} = \lambda \left(\frac{1}{9}(7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}) + \frac{1}{3}(-2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \right)$$

$$\Rightarrow \mathbf{r} = \frac{\lambda}{9}(\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$\text{But } |\mathbf{r}|^2 = 54$$

35. (b) **Hint** Let $P_1 = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}, P_2 = 3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$

$$P_3 = \mathbf{c} = x\mathbf{a} + y\mathbf{b} = x(\hat{\mathbf{i}} + \hat{\mathbf{j}}) + y(\hat{\mathbf{j}} + \hat{\mathbf{k}})$$

$$= x\hat{\mathbf{i}} + (x + y)\hat{\mathbf{j}} + y\hat{\mathbf{k}} = \mathbf{c}$$

Since, P_1, P_2, P_3 are coplanar.

$$\therefore \begin{vmatrix} 1 & -2 & 1 \\ 3 & 2 & -1 \\ x & x+y & y \end{vmatrix} = 0$$

36. (b) Let $\mathbf{c} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}}$

$$\text{Then, } \mathbf{b} \perp \mathbf{c} \Rightarrow \mathbf{b} \cdot \mathbf{c} = 0 \Rightarrow 4x + 3y = 0$$

$$\Rightarrow \frac{x}{3} = \frac{y}{-4} = \lambda$$

$$\Rightarrow x = 3\lambda, y = -4\lambda$$

$$\therefore \mathbf{c} = \lambda(3\hat{\mathbf{i}} - 4\hat{\mathbf{j}})$$

Let the required vector be $\alpha = p\hat{\mathbf{i}} + q\hat{\mathbf{j}}$. Then, the projections of α on $\mathbf{b}$ and $\mathbf{c}$ are $\frac{\alpha \cdot \mathbf{b}}{|\mathbf{b}|}$ and $\frac{\alpha \cdot \mathbf{c}}{|\mathbf{c}|}$, respectively.

$$\therefore \alpha \cdot \frac{\mathbf{b}}{|\mathbf{b}|} = 1 \text{ and } \frac{\alpha \cdot \mathbf{c}}{|\mathbf{c}|} = 2 \quad [\text{given}]$$

$$\Rightarrow 4p + 3q = 5 \text{ and } 3p - 4q = 10$$

$$\Rightarrow p = 2, q = -1$$

$$\therefore \vec{\alpha} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}}$$

37. (d) Since, points P, Q, R and S are coplanar.

$$\therefore [\mathbf{PQ} \ \mathbf{PR} \ \mathbf{PS}] = 0$$

$$\Rightarrow \begin{vmatrix} -2 & 3 & 1 \\ 0 & 2 & -2 \\ \lambda - 1 & 2 & 2 \end{vmatrix} = 0 \Rightarrow \lambda = -1$$

38. (a) **Hint** Given $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}, \mathbf{b} = \hat{\mathbf{j}} + \hat{\mathbf{k}}$

$$\text{Let } \mathbf{c} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$$

$$\text{Since, } \mathbf{a} \cdot \mathbf{c} = 4 \Rightarrow 2x + y - z = 4$$

$$\text{and } \mathbf{a} \times \mathbf{c} = \mathbf{b}$$

$$\therefore \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 1 & -1 \\ x & y & z \end{vmatrix} = \hat{\mathbf{j}} + \hat{\mathbf{k}}$$

39. (b) $\mathbf{a} \times (\mathbf{a} \times \mathbf{b}) = (\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b}$

$$= 3(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) - 6(\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}) = -9\hat{\mathbf{j}} + 9\hat{\mathbf{k}}$$

$$\therefore \text{Required unit vector} = \frac{\mathbf{a} \times (\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times (\mathbf{a} \times \mathbf{b})|} = \pm \frac{1}{\sqrt{2}}(-\hat{\mathbf{j}} + \hat{\mathbf{k}})$$

40. (d) Given, $\mathbf{a} = \frac{1}{\sqrt{10}}(3\hat{\mathbf{i}} + \hat{\mathbf{k}})$ and $\mathbf{b} = \frac{1}{7}(2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}})$

$$\begin{aligned} \therefore (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \times \mathbf{b}) \times (\mathbf{a} + 2\mathbf{b})\} \\ = (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \times \mathbf{b}) \times \mathbf{a} + (\mathbf{a} \times \mathbf{b}) \times 2\mathbf{b}\} \\ = (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \cdot \mathbf{a})\mathbf{b} + (\mathbf{b} \cdot \mathbf{a})\mathbf{a} + 2(\mathbf{a} \cdot \mathbf{b})\mathbf{b} - 2(\mathbf{b} \cdot \mathbf{b})\mathbf{a}\} \\ = (2\mathbf{a} - \mathbf{b}) \cdot \{1(\mathbf{b}) - (0)\mathbf{a} + 2(0)\mathbf{b} - 2(1)\mathbf{a}\} \\ [\because \mathbf{a} \cdot \mathbf{b} = 0 \text{ and } \mathbf{a} \cdot \mathbf{a} = \mathbf{b} \cdot \mathbf{b} = 1] \\ = (2\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} - 2\mathbf{a}) = -(4|\mathbf{a}|^2 + 4\mathbf{a} \cdot \mathbf{b} + |\mathbf{b}|^2) \\ = -(4 + 0 + 1) = -5 \end{aligned}$$

41. (a) We have, $\mathbf{a} \times \mathbf{b} + \mathbf{c} = 0$

$$\Rightarrow \mathbf{a} \times (\mathbf{a} \times \mathbf{b}) + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b} + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow 3\mathbf{a} - 2\mathbf{b} + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow 2\mathbf{b} = 3\mathbf{a} + \mathbf{a} \times \mathbf{c}$$

$$\Rightarrow 2\mathbf{b} = 3\hat{\mathbf{j}} - 3\hat{\mathbf{k}} - 2\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}} \\ = -2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$$

$$\therefore \mathbf{b} = -\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$$

42. (c) Given, $\mathbf{a} \cdot \mathbf{b} \neq 0, \mathbf{a} \cdot \mathbf{d} = 0$... (i)

$$\text{and } \mathbf{b} \times \mathbf{c} = \mathbf{b} \times \mathbf{d} \Rightarrow \mathbf{b} \times (\mathbf{c} - \mathbf{d}) = 0$$

$$\therefore \mathbf{b} \parallel (\mathbf{c} - \mathbf{d}) \Rightarrow \mathbf{c} - \mathbf{d} = \lambda \mathbf{b}$$

$$\Rightarrow \mathbf{d} = \mathbf{c} - \lambda \mathbf{b} \quad \dots (ii)$$

Taking dot product with $\mathbf{a}$, we get

$$\begin{aligned} \mathbf{a} \cdot \mathbf{d} &= \mathbf{a} \cdot \mathbf{c} - \lambda \mathbf{a} \cdot \mathbf{b} \\ \Rightarrow 0 &= \mathbf{a} \cdot \mathbf{c} - \lambda (\mathbf{a} \cdot \mathbf{b}) \quad [\text{from Eq. (i)}] \\ \Rightarrow \lambda &= \frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}} \quad \dots(\text{iii}) \\ \therefore \mathbf{d} &= \mathbf{c} - \frac{(\mathbf{a} \cdot \mathbf{c})}{(\mathbf{a} \cdot \mathbf{b})} \mathbf{b} \end{aligned}$$

43. (a) **Hint** Given, $\mathbf{a} = p\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + q\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + r\hat{\mathbf{k}}$ are coplanar and $p \neq q \neq r \neq 1$.

Since, $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar.

$$\therefore [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$$

44. (b) Here, $(\mathbf{u} - \mathbf{v}) \times (\mathbf{v} - \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{v} \times \mathbf{w} + \mathbf{w} \times \mathbf{u}$

$$\begin{aligned} \therefore (\mathbf{u} + \mathbf{v} - \mathbf{w}) \cdot (\mathbf{u} - \mathbf{v}) \times (\mathbf{v} - \mathbf{w}) \\ &= (\mathbf{u} + \mathbf{v} - \mathbf{w}) \cdot (\mathbf{u} \times \mathbf{v} + \mathbf{v} \times \mathbf{w} + \mathbf{w} \times \mathbf{u}) \\ &= \mathbf{u} \cdot \mathbf{v} \times \mathbf{w} + \mathbf{v} \cdot \mathbf{w} \times \mathbf{u} - \mathbf{w} \cdot \mathbf{u} \times \mathbf{v} \\ &= \mathbf{u} \cdot \mathbf{v} \times \mathbf{w} \end{aligned}$$

45. (c) By expanding $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$, we get

$$\mathbf{a} \cdot \mathbf{c} = x^2 - 2x + 6, \mathbf{a} \cdot \mathbf{b} = -\sin y$$

$$\text{Given, } \mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = 4$$

$$\Rightarrow x^2 - 2x + 2 = \sin y$$

$$\Rightarrow \sin y = x^2 - 2x + 2 = (x - 1)^2 + 1 \geq 1$$

$$\text{But } \sin y \leq 1$$

So, both sides are equal only for $x = 1$.

46. (a) $\mathbf{v} = \mathbf{a} \times \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \sin \theta \hat{\mathbf{n}} = \sin \theta \hat{\mathbf{n}}$

where, θ is the angle between $\mathbf{a}$ and $\mathbf{b}$. $[\because |\mathbf{a}| = 1 = |\mathbf{b}|]$

$$\therefore |\mathbf{v}| = \sin \theta$$

$$\text{Now, } \mathbf{u} = \mathbf{a} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{b} = \mathbf{a} - (\cos \theta) \mathbf{b}$$

$$\begin{aligned} \Rightarrow |\mathbf{u}|^2 &= [\mathbf{a} - (\cos \theta) \mathbf{b}] \cdot [\mathbf{a} - (\cos \theta) \mathbf{b}] \\ &= \mathbf{a}^2 + \cos^2 \theta \mathbf{b}^2 - 2 \cos \theta \mathbf{a} \cdot \mathbf{b} \\ &= 1 + \cos^2 \theta - 2 \cos^2 \theta = 1 - \cos^2 \theta = \sin^2 \theta \end{aligned}$$

$$\therefore |\mathbf{u}| = \sin \theta, \text{ thus } |\mathbf{v}| = |\mathbf{u}|$$

47. (a) The given value

$$\begin{aligned} (\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} \times \mathbf{c} - \mathbf{b} \times \mathbf{a} - \mathbf{c} \times \mathbf{c} + \mathbf{c} \times \mathbf{a}) \\ &= (\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} \times \mathbf{c} + \mathbf{a} \times \mathbf{b} + \mathbf{c} \times \mathbf{a}) \\ &= \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) + 0 + 0 - \mathbf{b} \cdot (\mathbf{c} \times \mathbf{a}) \\ &= [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] - [\mathbf{b} \ \mathbf{c} \ \mathbf{a}] = 0 \end{aligned}$$

48. (d) Let $\mathbf{a} = 7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$ and $\mathbf{b} = -2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ be the position vectors of points A and B respectively. Then the bisector of $\angle AOB$ divides AB in the ratio $OA : OB$, i.e. $9 : 3$ or $3 : 1$. Therefore, the vector lying along the bisector

$$\begin{aligned} &= \frac{3(-2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) + (7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}})}{3 + 1} \\ &= \frac{1}{4} (\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \end{aligned}$$

Hence, the required vector

$$\begin{aligned} &= \pm 20\sqrt{6} \cdot \frac{1}{4} \left(\frac{\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}}{\sqrt{54}} \right) \\ &= \pm \frac{5}{3} (\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \end{aligned}$$

49. (d) Given, $\mathbf{a} \times \mathbf{r} = \hat{\mathbf{j}}$

Since, $\hat{\mathbf{j}}$ is perpendicular to both $\mathbf{a}$ and $\mathbf{r}$.

$$\therefore \mathbf{a} \cdot \hat{\mathbf{j}} = 0 \text{ and } \mathbf{r} \cdot \hat{\mathbf{j}} = 0$$

If the angle between $\mathbf{a}$ and $\mathbf{r}$ is θ , then $\mathbf{a} \cdot \mathbf{r} = |\mathbf{a}| |\mathbf{r}| \cos \theta$

$$\begin{aligned} &= ar \cos \theta = \sqrt{a^2 r^2 \cos^2 \theta} = \sqrt{a^2 r^2 (1 - \sin^2 \theta)} \\ &= \sqrt{a^2 r^2 \cdot (\mathbf{a} \times \mathbf{r})^2} = \sqrt{a^2 r^2 - 1} \end{aligned}$$

50. (c) Given, $\mathbf{r} \times \mathbf{b} = \mathbf{c} \times \mathbf{b}$ and $\mathbf{r} \cdot \mathbf{a} = 0$

$$\Rightarrow \mathbf{r} \times \mathbf{b} - \mathbf{c} \times \mathbf{b} = 0 \Rightarrow (\mathbf{r} - \mathbf{c}) \times \mathbf{b} = 0$$

$\Rightarrow (\mathbf{r} - \mathbf{c})$ and $\mathbf{b}$ are parallel vectors.

$$\text{Therefore, } (\mathbf{r} - \mathbf{c}) = \lambda \mathbf{b}$$

$$\Rightarrow \mathbf{r} = \mathbf{c} + \lambda \mathbf{b} \quad \dots(\text{i})$$

$$\text{We have, } \mathbf{r} \cdot \mathbf{a} = 0$$

$$\Rightarrow (\mathbf{c} + \lambda \mathbf{b}) \cdot \mathbf{a} = 0 \Rightarrow \mathbf{c} \cdot \mathbf{a} + \lambda \mathbf{b} \cdot \mathbf{a} = 0$$

$$\lambda = -\frac{\mathbf{c} \cdot \mathbf{a}}{\mathbf{b} \cdot \mathbf{a}}$$

On putting λ in Eq. (i), we get $\mathbf{r} = \mathbf{c} - \frac{\mathbf{c} \cdot \mathbf{a}}{\mathbf{b} \cdot \mathbf{a}} \mathbf{b}$

51. (a) Vectors $(a, a+1, a+2)$, $(a+3, a+4, a+5)$ and $(a+6, a+7, a+8)$ are coplanar.

$$\therefore \begin{vmatrix} a & a+1 & a+2 \\ a+3 & a+4 & a+5 \\ a+6 & a+7 & a+8 \end{vmatrix} = 0$$

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\begin{vmatrix} a & 1 & 2 \\ a+3 & 1 & 2 \\ a+6 & 1 & 2 \end{vmatrix} = 0$$

Vectors are coplanar, $\forall a \in R$.

$$52. (a) [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = \begin{vmatrix} \lambda & 2 & -3 \\ 2 & \lambda & -1 \\ 1 & 2 & 1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - C_3$, we get

$$6 = \lambda^2 + 5\lambda - 18 \Rightarrow \lambda^2 + 5\lambda - 24 = 0$$

$$\therefore \lambda = -8 \text{ or } 3$$

53. (c) Given $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar vectors.

So, $2\mathbf{a} - \mathbf{b}$, $2\mathbf{b} - \mathbf{c}$, $2\mathbf{c} - \mathbf{a}$ are also coplanar vectors.

$$\therefore [2\mathbf{a} - \mathbf{b} \ 2\mathbf{b} - \mathbf{c} \ 2\mathbf{c} - \mathbf{a}] = 0$$

54. (c) $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = \mathbf{a} \cdot (bc \sin \theta \hat{\mathbf{n}})$

$$\begin{aligned} &= \mathbf{a} \cdot \left(3 \times 4 \sin \frac{2\pi}{3} \hat{\mathbf{n}} \right) = \mathbf{a} \cdot \left(12 \times \frac{\sqrt{3}}{2} \hat{\mathbf{n}} \right) \\ &= 6\sqrt{3} |\mathbf{a}| |\hat{\mathbf{n}}| \\ &= 6\sqrt{3} \times 2 \times 1 \\ &= 12\sqrt{3} \end{aligned}$$

55. (b) we have,

$$\begin{aligned} &[\mathbf{a} \ \mathbf{b} \ \hat{\mathbf{i}}] + [\mathbf{a} \ \mathbf{b} \ \hat{\mathbf{j}}] + [\mathbf{a} \ \mathbf{b} \ \hat{\mathbf{k}}] \\ &= \{(\mathbf{a} \times \mathbf{b}) \cdot \hat{\mathbf{i}}\} \hat{\mathbf{j}} + \{(\mathbf{a} \times \mathbf{b}) \cdot \hat{\mathbf{j}}\} \hat{\mathbf{i}} + \{(\mathbf{a} \times \mathbf{b}) \cdot \hat{\mathbf{k}}\} \hat{\mathbf{k}} \\ &= \mathbf{a} \times \mathbf{b} \end{aligned}$$

56. (d) $|\mathbf{c} - \mathbf{a}| = 2\sqrt{2} \Rightarrow |\mathbf{c}|^2 + |\mathbf{a}|^2 - 2\mathbf{a} \cdot \mathbf{c} = 8$

$$\Rightarrow |\mathbf{c}|^2 + (\sqrt{9})^2 - 2|\mathbf{c}| = 8$$

$$\Rightarrow |\mathbf{c}|^2 - 2|\mathbf{c}| + 1 = 0 \Rightarrow (|\mathbf{c}| - 1)^2 = 0$$

$$\Rightarrow |\mathbf{c}| = 1$$

Now, $\mathbf{a} \times \mathbf{b} = 2\mathbf{i} - 2\mathbf{j} + \mathbf{k}$

$$\therefore |\mathbf{a} \times \mathbf{b}| = \sqrt{4 + 4 + 1} = 3$$

Hence, $[(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}] = |\mathbf{a} \times \mathbf{b}| |\mathbf{c}| \sin 30^\circ = 3 \times 1 \times \frac{1}{2} = \frac{3}{2}$

57. (c) $|\mathbf{a}|^2 = 9 \Rightarrow |\mathbf{b}|^2 = 2$

$$\therefore |\mathbf{c} - \mathbf{a}|^2 = |\mathbf{c}|^2 + |\mathbf{a}|^2 - 2\mathbf{c} \cdot \mathbf{a} = 8$$

$$\Rightarrow |\mathbf{c}|^2 + 9 - 2|\mathbf{c}| = 8$$

$$\Rightarrow |\mathbf{c}| = 1$$

Now, $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 1 & -2 \\ 1 & 1 & 0 \end{vmatrix} = 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$

$$\Rightarrow |\mathbf{a} \times \mathbf{b}| = 3$$

$$\therefore |(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}| = |\mathbf{a} \times \mathbf{b}| |\mathbf{c}| \sin 45^\circ = 3(1) \left(\frac{1}{\sqrt{2}} \right) = \frac{3\sqrt{2}}{2}$$

58. (c) $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \alpha \mathbf{a} + \beta \mathbf{b}$

$$\therefore (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{b} \cdot \mathbf{c}) \mathbf{a} = \alpha \mathbf{a} + \beta \mathbf{b}$$

Here, $\alpha = -\mathbf{b} \cdot \mathbf{c}, \beta = \mathbf{a} \cdot \mathbf{c}$

Therefore, $\alpha + \beta = \mathbf{a} \cdot \mathbf{c} - \mathbf{b} \cdot \mathbf{c} = (\mathbf{a} - \mathbf{b}) \cdot \mathbf{c} = \{(\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) - (\hat{\mathbf{i}} + \hat{\mathbf{j}})\} \cdot \hat{\mathbf{i}} = \hat{\mathbf{k}} \cdot \hat{\mathbf{i}} = 0$

BITSAT Archives

1. (a) Required unit vector $= \frac{(\hat{\mathbf{i}} - \hat{\mathbf{j}}) \times (\hat{\mathbf{i}} + \hat{\mathbf{j}})}{|(\hat{\mathbf{i}} - \hat{\mathbf{j}}) \times (\hat{\mathbf{i}} + \hat{\mathbf{j}})|} = \frac{\hat{\mathbf{k}} + \hat{\mathbf{k}}}{2} = \frac{2\hat{\mathbf{k}}}{2} = \hat{\mathbf{k}}$

2. (a) We have, $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{b} \cdot \mathbf{c}) \mathbf{a} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - \{(\mathbf{b} \cdot \mathbf{c}) + \frac{1}{3} |\mathbf{b}| |\mathbf{c}|\} \mathbf{a} = 0$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) = 0 \text{ and } \mathbf{b} \cdot \mathbf{c} + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0$$

$$\Rightarrow |\mathbf{b}| |\mathbf{c}| \cos \theta + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0 \quad [\because \theta \text{ is the angle between } \mathbf{b} \text{ and } \mathbf{c}]$$

$$\Rightarrow \cos \theta = -\frac{1}{3} \therefore \sin \theta = \sqrt{\frac{8}{9}} = \frac{2\sqrt{2}}{3}$$

3. (d) Since, $\sin \theta = \frac{|\mathbf{a} \times \mathbf{b}|}{|\mathbf{a}| |\mathbf{b}|} = \frac{8}{10} = \frac{4}{5}$

$$\therefore \cos \theta = \pm \frac{3}{5}$$

Now, $\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta = 2 \times 5 \times \left(\pm \frac{3}{5} \right) = \pm 6 \Rightarrow |\mathbf{a} \cdot \mathbf{b}| = 6$

4. (c)

5. (b) Since, scalar triple product is zero, then $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar.

6. (b) Since, given vectors are perpendicular.

$$\therefore (2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + \lambda\hat{\mathbf{k}}) = 0$$

$$\Rightarrow 2 - 4 - \lambda = 0 \Rightarrow \lambda = -2$$

7. (d) $(\mathbf{a} \times \hat{\mathbf{j}}) \cdot (2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) = \mathbf{a} \cdot \{\hat{\mathbf{j}} \times (2\hat{\mathbf{j}} - 3\hat{\mathbf{k}})\} = \mathbf{a} \cdot (-3\hat{\mathbf{i}}) = -3(\mathbf{a} \cdot \hat{\mathbf{i}}) = -12 \quad [\because \mathbf{a} \cdot \hat{\mathbf{i}} = 4]$

8. (a) Let $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}$, then

$$\mathbf{a} \cdot \hat{\mathbf{i}} = a_1, \mathbf{a} \cdot \hat{\mathbf{j}} = a_2, \mathbf{a} \cdot \hat{\mathbf{k}} = a_3$$

$$\therefore \mathbf{a} = (\mathbf{a} \cdot \hat{\mathbf{i}}) \hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{j}}) \hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{k}}) \hat{\mathbf{k}}$$

9. (a) The given condition mean that $\mathbf{r}$ is perpendicular to all three vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$.

This is possible only if they are coplanar.

$$\therefore [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$$

10. (c) Adding vectors

$$\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = \mathbf{b} \cdot (\mathbf{c} + \mathbf{a}) = \mathbf{c} \cdot (\mathbf{a} + \mathbf{b}) = 0, \text{ we get}$$

$$2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 0$$

Now, $|\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 1 + 16 + 64 = 81$

$$\therefore |\mathbf{a} + \mathbf{b} + \mathbf{c}| = 9$$

11. (a) Given, $\mathbf{PR} = 5 \mathbf{PQ}$

It means R divides PQ externally in the ratio $5 : 4$.

$$\therefore \text{Position vector of } R = \frac{5\mathbf{b} - 4\mathbf{a}}{5 - 4} = 5\mathbf{b} - 4\mathbf{a}$$

12. (c) Hint Let $\mathbf{OA} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\mathbf{OB} = \hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$

and $\mathbf{OC} = 3\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$

$$\therefore a = |\mathbf{OA}| = \sqrt{6}, b = |\mathbf{OB}| = \sqrt{35}$$

and $c = |\mathbf{OC}| = \sqrt{41}$

Hence, $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$

13. (d) Given, $\mathbf{b} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} + 3\hat{\mathbf{k}}$

Now, $\mathbf{b} \times \mathbf{c} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 1 & -1 \\ 1 & 0 & 3 \end{vmatrix} = \hat{\mathbf{i}}(3 - 0) - \hat{\mathbf{j}}(6 + 1) + \hat{\mathbf{k}}(0 - 1) = 3\hat{\mathbf{i}} - 7\hat{\mathbf{j}} - \hat{\mathbf{k}}$

Now, $|\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}| = \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = |\mathbf{a}| |\mathbf{b} \times \mathbf{c}| \cos \theta = 1(\sqrt{3^2 + 7^2 + 1^2}) \cos \theta = \sqrt{59} \cos \theta$

$$[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]_{\max} = \sqrt{59} \cdot 1 \quad [\because \text{maximum value of } \cos \theta \text{ is } 1]$$

Hence, maximum value is $\sqrt{59}$.

14. (c) As we know, a vector coplanar to $\mathbf{a}$, $\mathbf{b}$ and orthogonal to $\mathbf{c}$ is $\lambda \{(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}\}$.

$\therefore$ A vector coplanar to $(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$, $(\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}})$ and orthogonal to $(3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})$

$$= \lambda [(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) \times (\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}})] \times (3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}]$$

$$= \lambda (-21\hat{\mathbf{j}} + 7\hat{\mathbf{k}})$$

$$\therefore \text{Required unit vector} = \pm \frac{(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}}{|(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}|}$$

$$= \pm \frac{-21\hat{\mathbf{j}} + 7\hat{\mathbf{k}}}{\sqrt{(-21)^2 + (7)^2}} = \pm \frac{(3\hat{\mathbf{j}} - \hat{\mathbf{k}})}{\sqrt{10}}$$

15. (d) Given that, $\mathbf{p} = \frac{\mathbf{b} \times \mathbf{c}}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]}$, $\mathbf{q} = \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]}$ and $\mathbf{r} = \frac{\mathbf{a} \times \mathbf{b}}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]}$

$$\therefore \mathbf{a} \cdot \mathbf{p} = \frac{\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]} = \frac{\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]} = 1$$

$$\text{and } \mathbf{a} \cdot \mathbf{q} = \mathbf{a} \cdot \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]} = \frac{\mathbf{a} \cdot (\mathbf{c} \times \mathbf{a})}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]} = 0$$

$$\text{Similarly, } \mathbf{b} \cdot \mathbf{q} = \mathbf{c} \cdot \mathbf{r} = 1$$

$$\text{and } \mathbf{a} \cdot \mathbf{r} = \mathbf{b} \cdot \mathbf{p} = \mathbf{c} \cdot \mathbf{q} = \mathbf{c} \cdot \mathbf{p} = \mathbf{b} \cdot \mathbf{r} = 0$$

$$\therefore (\mathbf{a} + \mathbf{b}) \cdot \mathbf{p} + (\mathbf{b} + \mathbf{c}) \cdot \mathbf{q} + (\mathbf{c} + \mathbf{a}) \cdot \mathbf{r}$$

$$= \mathbf{a} \cdot \mathbf{p} + \mathbf{b} \cdot \mathbf{p} + \mathbf{b} \cdot \mathbf{q} + \mathbf{c} \cdot \mathbf{q} + \mathbf{c} \cdot \mathbf{r} + \mathbf{a} \cdot \mathbf{r}$$

$$= 1 + 1 + 1 = 3$$

16. (b) Since, $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are mutually perpendicular to each other then

$$\therefore \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = 0$$

$$\text{Now, } |\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = (\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) \quad [\because |\mathbf{a}|^2 = \mathbf{a} \cdot \mathbf{a}]$$

$$= |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a})$$

$$= 1 + 1 + 2(0 + 0 + 0)$$

$$[\because \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = 0]$$

$$\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = 3 \therefore |\mathbf{a} + \mathbf{b} + \mathbf{c}| = \sqrt{3}$$

17. (c) Let $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ and $\mathbf{b} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$

$$\text{Projection of } \mathbf{a} \text{ on } \mathbf{b} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|}$$

$$= \frac{(2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 3\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}})}{\sqrt{1^2 + (-2)^2 + 1^2}}$$

$$= \frac{2 - 2 - 3}{\sqrt{6}} = -\frac{3}{\sqrt{6}} = -\frac{\sqrt{3}}{2}$$

18. (b) Given, $\mathbf{a} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ and $\mathbf{b} = 3\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$

$$\text{Now, } \mathbf{a} + \mathbf{b} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}} + 3\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}} = 4\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$$

$$\text{and } \mathbf{a} - \mathbf{b} = (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) - (3\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$= -2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$$

Let θ be the angle between $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$.

$$\therefore \cos \theta = \frac{(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b})}{|\mathbf{a} + \mathbf{b}| |\mathbf{a} - \mathbf{b}|}$$

$$= \frac{(4\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) \cdot (-2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}})}{|4\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}| |-2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}|}$$

$$= \frac{-8 + 3 + 5}{\sqrt{16 + 1 + 1} \sqrt{4 + 9 + 25}} = 0 \Rightarrow \theta = 90^\circ$$

19. (c) Hint Since, the given vectors $\alpha \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\hat{\mathbf{i}} + \beta \hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}} + \lambda \hat{\mathbf{k}}$ are coplanar.

$$\therefore \begin{vmatrix} \alpha & 1 & 1 \\ 1 & \beta & 1 \\ 1 & 1 & \gamma \end{vmatrix} = 0$$

$$\text{Applying } C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_2$$

$$\Rightarrow \begin{vmatrix} \alpha & 1-\alpha & 0 \\ 1 & \beta-1 & 1-\beta \\ 1 & 0 & \gamma-1 \end{vmatrix} = 0$$

$$\Rightarrow (1-\alpha)(1-\beta)(1-\gamma) \begin{vmatrix} \alpha & 1 & 0 \\ 1-\alpha & 1 & 0 \\ 1-\beta & -1 & 1 \\ 1-\gamma & 0 & -1 \end{vmatrix} = 0$$

20. (a) Since, α lies in the plane of β and γ .

It means that, all three vectors are coplanar.

$$\therefore [\alpha \ \beta \ \gamma] = 0$$

$$\text{21. (c) Hint } (\vec{\alpha} \times \vec{\beta}) = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 3 & -1 \\ -1 & 2 & -4 \end{vmatrix}$$

$$\text{and } (\alpha \times \gamma) = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 3 & -1 \\ 1 & 2 & 1 \end{vmatrix}$$

24

Statistics

Introduction

Statistics is concerned with scientific method for collecting, organising, summarising, presenting and analysing data as well as with drawing valid conclusions and making reasonable decision on the basis of such analysis.

Measure of Central Tendency

An average or a central value of the statistical (series) data is the value of the variable which describes the characteristics of entire distribution.

There are five types of central tendency

1. Arithmetic Mean

The sum of all the observations divided by the number of observations, is called arithmetic mean and it is denoted by $\bar{x}$.

(i) Mean of Ungrouped or Individual Data

If $x_1, x_2, x_3, \dots, x_n$ are n observations, then mean by

(a) Direct method

$$\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n} \Rightarrow \bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$$

(b) Shortcut method

$$\bar{x} = A + \frac{1}{n} \sum_{i=1}^n d_i$$

where, A = Assumed mean and $d_i = x_i - A$

(ii) Mean of Grouped or Continuous Data

If $x_1, x_2, \dots, x_n$ are n observations whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then formula will be

(a) **Direct Method**

$$\bar{x} = \frac{f_1x_1 + f_2x_2 + \dots + f_nx_n}{f_1 + f_2 + \dots + f_n}$$

$$\bar{x} = \frac{1}{N} \sum_{i=1}^n f_i x_i, \text{ where } N = \sum_{i=1}^n f_i$$

(b) **Shortcut Method** If $d_i = x_i - A$, where A is assumed mean, then

$$\text{Mean } (\bar{x}) = A + \frac{1}{N} \sum_{i=1}^n f_i d_i$$

where, $\sum f_i = N$

(c) **Step Deviation Method** If $u_i = \frac{x_i - A}{h}$, where A is assumed mean, then

$$\text{Mean } (\bar{x}) = A + h \frac{1}{N} \sum_{i=1}^n f_i u_i$$

NOTE • The algebraic sum of the deviations of all the variates from their arithmetic mean is zero.

i.e. $\sum(x - \bar{x}) = 0$ or $\sum d_i = 0$

• The sum of the squares of the deviations of a set of values is minimum when taken about mean.

i.e. $\sum(x - \bar{x})^2 \leq \sum(x - A)^2$

(iii) **Weighted Arithmetic Mean**

Let $w_1, w_2, w_3, \dots, w_n$ be the weights assigned to the values $x_1, x_2, x_3, \dots, x_n$ respectively, then the weighted arithmetic mean is defined as

$$\text{Weighted arithmetic mean} = \frac{w_1x_1 + w_2x_2 + \dots + w_nx_n}{w_1 + w_2 + \dots + w_n}$$

(iv) **Combined Mean**

For two sets of observations,

$$\bar{x}_{12} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

where,

$\bar{x}_{12}$ = Combined mean of both the sets

n_1 = Number of first set of observations

n_2 = Number of second set of observations

$\bar{x}_1$ = Mean of the first set of observations

$\bar{x}_2$ = Mean of the second set of observations

2. Geometric Mean

The n th root of the product of the values, is called geometric mean.

(i) **For Ungrouped Data**

The geometric mean of n observations $x_1, x_2, \dots, x_n$, is defined as (when none of them being zero)

$$G = (x_1 \cdot x_2 \cdot x_3 \cdot \dots \cdot x_n)^{1/n}$$

$$\Rightarrow \log G = \frac{1}{n} \sum_{i=1}^n \log x_i$$

$$G = \text{antilog} \left(\frac{\log x_1 + \log x_2 + \dots + \log x_n}{n} \right)$$

(ii) **For Grouped Data**

Let $x_1, x_2, \dots, x_n$ be n observations and whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then geometric mean is given by

$$GM = (x_1^{f_1} \cdot x_2^{f_2} \cdot \dots \cdot x_n^{f_n})^{\frac{1}{N}}$$

where,

$$N = \sum_{i=1}^n f_i$$

We can also write,

$$GM = \text{antilog} \left(\frac{\sum_{i=1}^n f_i \log x_i}{N} \right)$$

3. Harmonic Mean

The harmonic mean of any series is the reciprocal of the arithmetic mean of the reciprocals of the observations.

(i) **For Ungrouped Data**

If $x_1, x_2, \dots, x_n$ be n observations, then harmonic mean is given by

$$HM = \frac{n}{\frac{1}{x_1} + \frac{1}{x_2} + \dots + \frac{1}{x_n}}$$

$$HM = \frac{n}{\sum_{i=1}^n \frac{1}{x_i}}$$

(ii) **For Grouped Data**

If $x_1, x_2, \dots, x_n$ be n observations, whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then harmonic mean is given by

$$HM = \frac{\sum_{i=1}^n f_i}{\sum_{i=1}^n \frac{f_i}{x_i}}$$

NOTE It is known that $AM \geq GM \geq HM$, when $x_1, x_2, \dots, x_n > 0$

4. Median

The median is the middle most point in a rank ordered set of measures.

(i) Median for Ungrouped or Individual Data

Suppose n observations are arranged in ascending or descending order.

(a) If n is an odd number, then

$$\text{Median} = \text{Value of } \left(\frac{n+1}{2}\right)\text{th term}$$

(b) If n is an even number, then

$$\text{Median} = \frac{\text{Value of } \left(\frac{n}{2}\right)\text{th term} + \text{Value of } \left(\frac{n}{2} + 1\right)\text{th term}}{2}$$

(ii) Median for Discrete Frequency Data

By arranging the data in ascending or descending order and by finding the cumulative frequency, find $\frac{N}{2}$, where

$$N = \sum f_i.$$

Now, see the cumulative frequency just greater than $\frac{N}{2}$. The corresponding value of x is median.

(iii) Median for Continuous or Grouped Data

In this case, the class corresponding to the cumulative frequency just greater than $\frac{N}{2}$, is called the median class

and the value of median is obtained by the following formula

$$\text{Median} = l + \left(\frac{\frac{N}{2} - c}{f} \right) \times h$$

where,

l = Lower limit of median class

f = Frequency of median class

h = size of median class

c = Cumulative frequency of class before median class

NOTE Cumulative frequency is defined as a consecutive sum of frequencies.

5. Mode

Mode is the value of the variate which occurs most frequently.

Mode can be calculated in following ways :

(i) Mode for Individual Data

The value which is repeated maximum number of times is the mode of the given series.

(ii) Mode for Discrete Data

The mode is the value of the variate corresponding to the maximum frequency.

(iii) Mode for Continuous Data

The class which has maximum frequency, is called modal class or group. The mode is given by the formula

$$\text{Mode} = l + \frac{f_1 - f_0}{2f_1 - f_2 - f_0} \times h$$

where, l = Lower limit of the modal class
(the class having maximum frequency)

f_1 = Frequency of the modal class

f_0 = Frequency of the class preceding the modal class

f_2 = Frequency of the class succeeding the modal class

h = Width of the modal class

NOTE Let AM, GM and HM be the arithmetic mean, geometric mean and harmonic mean respectively, then the following relations are given below

$$> (AM)(HM) = (GM)^2$$

$$> \text{Mode} = 3\text{Median} - 2\text{Mean} \quad [\text{Empirical formula}]$$

Measure of Skewness

Skewness describes the degree to which the data deviates from symmetry. If the distribution of the data is not symmetrical, it is said to be asymmetrical or skewed.

Types of Distribution**1. Symmetrical Distribution/Bell Shaped Distribution**

In this distribution, mean, median and mode are all located at one point.

**2. Positively Skewed Distribution**

In this distribution, observations are mostly concentrated towards the smaller values and there are some extremely high values.

3. Negatively Skewed Distribution

In this distribution, observations are mostly concentrated towards the larger values and there are some extremely low values.

The following is the important method of measuring skewness.

Karl Pearson's Coefficient of Skewness

The method is most frequently used for measuring skewness. The formula for measuring coefficient of skewness is as follows:

$$Sk_p = \frac{\text{Mean} - \text{Mode}}{\sigma}$$

or

$$Sk_p = \frac{3(\text{Mean} - \text{Median})}{\sigma}$$

where, Sk_p = Pearsonian (or Karl Pearson's) coefficient of skewness.

The value of this coefficient will be zero, if it is a symmetrical distribution. If the value is greater than zero, then it is positively skewed and if the value is less than zero, then it is negatively skewed distribution.

Measures of Dispersion

Dispersion means 'scatteredness'. Dispersion measures the degree of scatteredness of the variable about a central value.

There are following measures of dispersion

1. Range

The difference between the maximum and the minimum observation is called range.

i.e. $\text{Range} = L - S$

$$\text{Coefficient of range} = \frac{L - S}{L + S}$$

where, L = Maximum observation and S = Minimum observation

2. Quartile Deviation

It is one-half of the difference between the third and the first quartile.

i.e. $QD = \frac{Q_3 - Q_1}{2}$

and coefficient of $QD = \frac{Q_3 - Q_1}{Q_3 + Q_1}$

where, Q_1 = Value of $\frac{n}{4}$ th term and Q_3 = Value of $\frac{3n}{4}$ th term

3. Mean Deviation (MD)

The mean (mode or median) of the absolute deviations of the values of the variable from a measure of their average is called mean deviation (MD).

(i) MD for Ungrouped Data

If $x_1, x_2, \dots, x_n$ are n observations, then $MD = \frac{\sum_{i=1}^n |x_i - z|}{n}$

where, z = mean or mode or median

(ii) MD for Grouped Data

If corresponding frequencies of each observation are $f_1, f_2, \dots, f_n$, then

$$MD = \frac{\sum_{i=1}^n f_i |x_i - z|}{N}, \text{ where } \sum_{i=1}^n f_i = N$$

$$\text{Coefficient of MD} = \frac{\text{Mean deviation}}{\text{Corresponding average}} \times 100\%$$

Standard deviation

Standard deviation is also known as root mean square deviation because it is the square root of the means of the square deviation from the arithmetic mean. It is denoted by σ .

(i) For Ungrouped Data

$$(a) \text{ SD } = \sigma = \sqrt{\frac{\sum d^2}{n}}, \text{ where } d = x - \bar{x}$$

when we take deviation from the assumed mean A , then

$$(b) \text{ SD } = \sigma = \sqrt{\frac{\sum d^2}{n} - \left(\frac{\sum d}{n}\right)^2}, \text{ where } d = x - A$$

(ii) For Grouped Data (Discrete and Continuous Series)

$$(a) \sigma = \sqrt{\frac{\sum f d^2}{\sum f}}, \text{ where } d = x - \bar{x}$$

$$(b) \sigma = \sqrt{\frac{\sum f d^2}{\sum f} - \left(\frac{\sum f d}{\sum f}\right)^2}$$

where, $d = x - A$, A is assumed mean

$$(c) \sigma = i \sqrt{\frac{\sum f d'^2}{\sum f} - \left(\frac{\sum f d'}{\sum f}\right)^2}$$

where, $d' = \frac{x - A}{i}$, i = width of the class

- NOTE**
- We use formula (a), only when we get the mean as an integer, otherwise calculations become difficult.
 - Quartile deviation = $\frac{2}{3}\sigma$
and Mean deviation = $\frac{4}{5}\sigma$

4. Variance

Variance is the arithmetic mean of the squares of deviations about mean $\bar{x}$ and denoted as $\text{var}(X)$ or σ^2 .

So, variance is defined as the square of standard deviation.

$$\therefore \text{Variance} = (\text{Standard deviation})^2$$

Combined Standard Deviation

Let n_1 and n_2 be the sizes of two series. Their means and standard deviations are $\bar{x}_1, \bar{x}_2$ and σ_1, σ_2 , respectively.

$$\text{Let combined mean be } \bar{x} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2} = \bar{x}_{12}$$

$\therefore$ For two series, combined standard deviation is

$$\sigma_{12} \text{ or } \sigma = \sqrt{\frac{n_1 \sigma_1^2 + n_2 \sigma_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$$

$$\sigma_{12} \text{ or } \sigma = \sqrt{\frac{n_1 (\sigma_1^2 + d_1^2) + n_2 (\sigma_2^2 + d_2^2)}{n_1 + n_2}}$$

where,

n_1, n_2 = Number of observations of series

$\bar{x}_1$ and $\bar{x}_2$ = Mean value of respective series

σ_{12} = Standard deviations of σ_1 and σ_2

$$d_1 = (\bar{x}_1 - \bar{x}_{12}), \quad d_2 = (\bar{x}_2 - \bar{x}_{12}).$$

Effects of Average and Dispersion on Change of Origin and Scale

	Change of origin	Change of scale
Mean	Dependent	Dependent
Median	Dependent	Dependent
Mode	Dependent	Dependent
Standard deviation	Not dependent	Dependent
Variance	Not dependent	Dependent

Coefficient of Variation

Less the coefficient of variation, more consistent is the data.

$$\text{Thus, } CV = \frac{\sigma}{\bar{x}} \times 100$$

The distribution having smaller value of the coefficient of variation has less variability around the central value than the distribution having greater value of the coefficient of variation.

For two distributions having equal means, the distribution having greater standard deviation (or variance) is said to be more variable or dispersed than other.

Practice Exercise

- A student obtain 75%, 80% and 85% marks in three subjects. If the marks of another subject are added, then his average cannot be less than
a. 60% b. 65% c. 80% d. 90%
- If a variable takes the values $0, 1, 2, \dots, n$ with frequencies proportional to the binomial coefficients ${}^nC_0, {}^nC_1, \dots, {}^nC_n$, then mean of the distribution is
a. $\frac{n}{2}$ b. $\frac{n(n+1)}{2}$
c. $\frac{n(n-1)}{2}$ d. None of these
- The mean height of 25 male workers in a factory is 161 cm and mean height of 35 female workers in the same factory is 158 cm. The combined mean height of 60 workers in the factory is
a. 159.25 b. 159.5 c. 159.75 d. 158.75
- In an English learning classes, there are 8 men, 7 women and 5 children whose mean ages separately are respectively 24, 20 and 6 yr. The mean age of English learning classes candidate is
a. 18.0 b. 18.1 c. 18.2 d. 18.3
- The average income of male employees in a financial sector company A was ₹ 520 and that of females was ₹ 420. The mean income of all the employees was ₹ 500. The percentage of male employees is
a. 50% b. 80% c. 40% d. 20%
- If g_1 and g_2 are the geometric means of two series of n_1 and n_2 items. Then, the GM of the series obtained on combining is
a. $[(g_1)^{n_1} (g_2)^{n_2}]^{\frac{1}{n_1+n_2}}$ b. $(g_1 g_2)^{\frac{n_1}{n_1+n_2}}$
c. $(g_1 g_2)^{\frac{n_2}{n_1+n_2}}$ d. $(g_1 g_2)^{\frac{n_1 n_2}{n_1+n_2}}$
- The mean and median of 100 items are 50 and 52, respectively. The value of largest item is 100. It was later found that, it is 110 not 100. The true mean and median are
a. 50.10, 51.5 b. 50.10, 52
c. 50, 52 d. None of these
- If the difference between mean and mode is 63, then the difference between mean and median is
a. 189 b. 21 c. 31.5 d. 48.5
- If a distribution has negative skewness, then in what order (lowest to highest) will the averages be?
a. Mean, mode, median b. Mean, median, mode
c. Mode, median, mean d. Median, mode, mean
- Which average is the most sensitive to extreme values?
a. Mean b. Median c. Mode d. None
- If the median and the range of four numbers $\{x, y, 2x+y, x-y\}$, where $0 < y < x < 2y$, are 10 and 28 respectively, then the mean of the numbers is
a. 18 b. 10 c. 5 d. 14
- The quartile deviation of daily wages (in ₹) of 7 persons given 12, 7, 15, 10, 17, 19 and 25 is
a. 14.5 b. 5 c. 9 d. 4.5
- If the mean deviations about the median of the numbers $a, 2a, \dots, 5a$ is 50, then $|a|$ is equal to
a. 3 b. 4 c. 5 d. 2
- If the mean deviation of number $1, 1+d, 1+2d, \dots, 1+100d$ from their mean is 255, then d is equal to
a. 10.0 b. 20.0 c. 10.1 d. 20.2
- The mean and SD of the marks of 200 candidates were found to be 40 and 15, respectively. Later, it was discovered that a score 40 was wrongly read as 50. The correct mean and SD are respectively
a. 14.98, 39.95 b. 39.95, 14.98
c. 39.95, 224.5 d. None of these
- If quartile deviation of a sample is 20, then the most likely value of SD is
a. 30 b. 12 c. 18 d. 13
- If $\sum_{i=1}^{18} (x_i - 8) = 9$ and $\sum_{i=1}^{18} (x_i - 8)^2 = 45$, then the standard deviation of $x_1, x_2, \dots, x_{18}$ is
a. $\frac{4}{9}$ b. $\frac{9}{4}$
c. $\frac{3}{2}$ d. None of these
- In a series of $2n$ observations, half of them equal a and remaining half equal $-a$. If the standard deviation of the observations is 2, then $|a|$ is equal to
a. $\frac{1}{n}$ b. $\sqrt{2}$ c. 2 d. $\frac{\sqrt{2}}{n}$
- If the variance of the observations $x_1, x_2, \dots, x_n$ is σ^2 , then the variance of $\alpha x_1, \alpha x_2, \dots, \alpha x_n$, $\alpha \neq 0$, is
a. σ^2 b. $\alpha \sigma^2$ c. $\alpha^2 \sigma^2$ d. $\frac{\sigma^2}{\alpha^2}$
- The mean of five observations is 4 and their variance is 5.2. If three of them are 1, 2, 6, then other two are
a. 4, 7 b. 2, 9 c. 5, 6 d. 2, 10

21. Mean of 5 observations is 7. If four of these observations are 6, 7, 8, 10 and one is missing, then the variance of all the five observations is
 a. 4 b. 6 c. 8 d. 2
22. The variance of first 50 even natural numbers is
 a. $\frac{833}{4}$ b. 833 c. 437 d. $\frac{437}{4}$
23. The mean of the numbers $a, b, 8, 5, 10$ is 6 and the variance is 6.80. Then, which one of the following gives possible values of a and b ?
 a. $a = 3, b = 4$ b. $a = 0, b = 7$
 c. $a = 5, b = 2$ d. $a = 1, b = 6$
24. Let $x_1, x_2, \dots, x_n$ be n observations, such that $\sum x_i^2 = 400$ and $\sum x_i = 80$. Then, the possible values of n among the following is
 a. 12 b. 9 c. 16 d. 15
25. One set containing five numbers has mean 8 and variance 24 and the second set containing three numbers has mean 8 and variance 24. Then, the variance of the combined set is
 a. 42 b. 24 c. 20 d. 25
